4559. GRUMBACH, A. Dissoziationserscheinungen an Pneumokokken. *Zentralbl. Bakt. I. Abt. Orig.* 120(3/4): 245-249. 6 fig. 1931.—In disagreement with Atkin but in agreement with Paul, the author finds that in pneumococci from 3 sources, daughter colonies are not identical with the R forms; the daughter colonies on ascites agar are never actually granular; they remain bile-sensitive, completely virulent, and on transplantation revert to papilla-bearing S colonies Thus they differ from the daughter colonies of *B. coli mutabile.* It remains to be seen whether or not the forms are really identical. Parallel with these morphologic dissociation phenomena frequently went the ability of the strains concerned to produce hemolysis in blood agar and blood bouillon in 48-72 hrs.

4560. GUSTAFSON, F. Streptococcus mast.—Streptococcus lact. Några kontrollförsök. *Skandinavisk Vet.-Tidskr.* 21(2): 41-47. 1931.—The author's studies indicate that the following methods for differentiation of *Streptococcus mastitidis* and *Strep. lactis* give tentative rather than conclusive results: coagulation of milk; color reaction in milk to which has been added litmus, indigo, carmine or methylene blue; growth in litmus milk at ± 10° C.; and hemolytic power. Several Danish investigators have come to the same conclusion in regard to the power of these 2 species to ferment different alcohols and sugars.—*From author's English summary.*

4561. HARRISON, F. C., H. L. A. TARR, and HAROLD HIBBERT. Studies on reactions relating to carbohydrates and polysaccharides. XXXIII. The synthesis of polysaccharides by bacteria and enzymes. *Canadian Jour. Res.* 3(5): 449-463. 1930.—Synthesis of a polysaccharide (levan) from simpler carbohydrates both by the agency of *Bacillus mesentericus* Trevisan and *B. subtilis* Cohn was studied. The action of these organisms is apparently specific in that they bring about polysaccharide formation only from carbohydrates containing a terminal fructofuranose residue in their molecule. A similar synthesis can be carried out by using the corresponding enzyme preparation from *B. mesentericus.*—*H. L. A. Tarr.*

4562. HARTWIGK, H. Zur Biologie mehrerer bei Meerkatzen (Cercopithecus) als Septikämieerreger festgestellter Streptokokkenarten. *Zentralbl. Bakt. I. Abt. Orig.* 120(5/6): 341-347. 1931.—From 6 guenon monkeys dead of infection, 2 species of streptococci were obtained: 1 species, to which 5 of the strains belonged, was assigned to the type of *Streptococcus anginosus,* the other was assigned to the type of *Strep. mitior.*

4563. HAUPT, H. Kurze Mitteilung über einen zur Züchtung des Bact. abortus Bang geeigneten Nährboden. *Zentralbl. Bakt. I. Abt. Orig.* 120(1/2): 130-131. 1931. Essentially, a nutrient agar with addition of alcoholic solutions of bromthymol blue and basic fuchsin, the former as indicator, the latter to inhibit the growth of gram-positive bacteria

4564. HIMMELFARB, J. K., und E. W. SKROTZKY. Zur Differentialdiagnose zwischen dem Bac. pestis und dem Bac. pseudotuberculosis rodentium auf Kohlehydratnährböden. *Zentralbl. Bakt. I. Abt. Orig.* 120(3/4): 196-199. 1931.—In parallel tests on 11 strains of *Bacillus pestis* and 5 of *B. pseudotuberculosis rodentium,* good differentiation was obtained with a medium composed of 0.5% peptone water (pH 7.2-7.3) with 0.5% of a solution of maltose, levulose, xylose or arabinose (saccharose, dextrin, mannit and galactose gave no differentiation). Freshly isolated cultures reacted the same as old, avirulent laboratory strains.

4565. HOLSTER, STEPHEN G. The microbic dissociation of Hemophilus influenzae. *Yale Jour. Biol. & Med.* 3(4): 321-340. 2 pl. 1931.—A single S-type colony of *H. influenzae* was dissociated by subculturing through many generations, 5 colony types being observed: S, RS, O, Sm, and R. Sequence of colony types was: S → RS → O → R on solid, and S → O → Sm in fluid media. The dissociants differ markedly from the parent S-type in cultural characteristics and in cell morphology. Prolonged cultivation on artificial media appears to have been the essential factor in inducing the dissociation. Delayed subculturing and variations in temp. apparently have very little effect on rate of dissociation. *Staphylococcus aureus* growing in association with *H. influenzae* appears to inhibit the dissociation; *Streptococcus hemolyticus* in association on blood agar inhibits it but slightly. Blood infusion broth tends to inhibit the appearance of R-type dissociants; blood infusion broth agar, to assist in the dissociation. In a fluid medium, granular or agglutinated growth is usually associated with the R-type, but may be associated with an O- or Sm-type. A phenolized broth apparently hastens dissociation of the S-type, but has little, if any, effect on the stable R-type.—*From author's summary & conclusions.*

4566. HUBBARD, ROGER S., and JOHN K. DEEGAN. Note on the action of the colon bacillus upon the non-glucose reducing substances in human blood. *Jour. Biol. Chem.* 86(2): 575-577. 1930.—From blood filtrate, prepared by Benedict's method, the simple reducing sugars were removed by addition of yeast and fermentation for 10 min. After removal of the yeast and of blood protein by precipitation with tungstic acid, pasteurization, and neutralization, the filtrate was inoculated with an organism having the cultural and morphological characters of *Bacillus coli communis,* and incubated at 38° C. for 18-72 hrs. Reducing sugars were decreased during this incubation. The non-glucose-reducing substance or substances were not identified.

4567. HUCKER, G. J., and C. S. PEDERSON. Studies on the Coccaceae. XVI. The genus Leuconostoc. *New York State [Geneva] Agric. Exp. Sta. Tech. Bull.* 167. 1-80. 6 pl., 10 fig. 1930.—A biochemical study was made of 80 strains and a survey of 86 additional strains of low-acid-producing types of streptococci (*Leuconostoc*). These cultures were isolated from slimy sugar solutions, from fermenting vegetables, and from milk and milk products. A survey of earlier work indicates that investigators studying fermenting vegetables, including sauerkraut, pickles, tomato products, etc.; those working with milk and milk products, such as starters, organisms from ripening cheese, etc.; and those studying organisms from sugar factories, have been dealing with identical or closely related organisms belonging in 1 genus. Study of a series of cultures has shown that they all produce approximately 45% levolactic acid from glucose, 20% CO_2, and 25% volatile products, including acetic acid and ethyl alcohol. In addition, the group produces mannitol from fructose and sucrose and a levulan or dextran from sucrose. These fundamental physiological characters give justification for placing these organisms in 1 genus, for which the name *Leuconostoc* has priority. Study of the morphology of the members of the genus shows that they are intermediate in form between streptococci and lactobacilli. Secondary physiological characters have been used for recognition of species within the genus. Of these secondary characters, fermentation of pentoses and sucrose were found most constant, and the species named are based on these reactions. The genus *Leuconostoc* is characterized and the 3 following species are recognized and described: *L. mesenterioides* Van Tieg.; *L.* dextranicus (*Lactococcus dextranicus* Beij.) (p. 67); and *L.* citrovorus (*Streptococcus citrovorus* Ham.) (p. 67).—*G. J. Hucker & C. S. Pederson.*

4568. ITANO, ARAO, and SATIYO ARAKAWA. Studies on Bacillus thermofibrincolus n. sp. III. Production of volatile acid and alcohol. VI [i.e., IV]. *Bull. Agric. Chem. Soc. Japan* 6(1/5): 17-18, 18-19. 1930.—Abstract. The species is not described here.

4569. IVANIĆ, STEVAN Z., and V. DIMITRIJEVIĆ-SPETH. Das Schichtröhrchen und seine Anwendung zur Sterilitätsprüfung und Züchtung aus Gemischen mit hemmenden Zusätzen sowie zur Untersuchung der "Tief-

enwirkung" von Desinfizientien, Immunstoffen und Bakteriophagen. *Zentralbl. Bakt. I. Abt. Orig.* 118(1/2): 91-101. 1930.—The stratum tube (consisting of an under layer of agar-gelatine with 1% dextrose and some China blue, and a top layer of nutritive broth) can be fractionally sterilized at about 95° without much mixing. Its practical applications are: Culture of pathogenic germs from mixtures of interfering substances; cultivation from clouding raw materials; sterility control of biological products; determination of specific colony inhibition in serum; liberation of bacteriophage; with bile as top layer, for cultivation from bactericidal body fluids. In this tube, inhibitors show striking differences in effect ("Tiefenwirkung") as compared with unstratified nutrients of the same kind. Experiments on bacteria which through various local changes can escape disinfectants temporarily in the depths, correspond more to the true behavior in the organism, in contrast with previous disinfection experiments in a closed liquid system.—*Authors' summary (transl. by W. A. Peabody).*

4570. **IVANOVICS, GEORG.** Ueber die Verfahren zur Anreicherung der Typhusbazillen. I. Die Bewertung der anreichernden Medien. *Zentralbl. Bakt. I. Abt. Orig.* 118(1/2): 101-107. 1930.—Müller's sodium tetrathionate bouillon is an ideal enrichment medium for typhoid bacilli, if the colon bacillus alone is to be dealt with. Good results are also obtained with sodium selenite bouillon, whereas brilliant green and malachite green are especially suitable for paratyphoid bacilli. The antagonistic action of the colon and typhoid bacilli is influenced by the medium used, in so far as it can hinder growth of colon bacilli. The enrichment media used were unable to influence the agglutinating capacity of typhoid bacilli.—*Author's summary (transl. by J. A. Bauer).*

4571. **KADLETZ, N.** Ueber die Rationalisierung der Methodik des Pipettierens bei bakteriologischen und serologischen Untersuchungen. *Zentralbl. Bakt. I. Abt. Orig.* 117(6): 431-432. 2 fig. 1930.—A double pipette is used, the outer sealed at the upper end, the inner open, the 2 connected by a rubber joint which allows the inner, sliding out, to take up, or, sliding in, to drop liquids.

4572. **KAUFFMANN, FRITZ, und CHIKAKO MITSUI.** Zwei neue Paratyphustypen mit bisher unbekanntem Phasenwechsel. *Zeitschr. Hyg. u. Infektionskr.* 111(5): 740-748. 1930.—The 2 new types were obtained from cases of acute gastro-enteritis; they are designated as "Brandenburg" (B group) and "Potsdam" (C group), respectively. The thermolabile antigen of the 2 types is identical, and bears no relation to that of Schottmüller, Breslau or Gärtner types, yet is closely related to that of the "Dar es Salaam" type, which belongs to the Gärtner group. In all 3 types, which are monophasic in the customary sense (not separated into specific and unspecific phases), a new alternation of phases (called α and β phases) was discovered in the thermolabile antigen. The α phase of the Dar es Salaam type, e.g., has the receptors "e," "n" and "w," while the β phase consists of the receptors "l" and "w." The thermostabile antigen of both phases is the same. According to Bruce White's scheme, then, the receptor formula of the Dar es Salaam type, hitherto regarded as a unit, is "e," "n," "l" and "w." Similarly, the Brandenburg and Potsdam types divide into the α phase "e-n-v" and the β phase "l-v," consisting thus of the receptors "e," "n," "l," and "v."—*Authors' summary (transl.).*

4573. **KLINCKOWSTRÖM, A. von.** Plagiocystia verrucosa n. g. et sp., eine neue Angehörige der Parasynascoten Bakterien. *Arkiv Bot.* 23A(3): 1-51. 39 fig. 1930.—The author adopts the Enderlein cyclogenetic concept for a new bacterial species obtained from the air, which he names **PLAGIOCYSTIA verrucosa** (p. 50). The genus is placed in the order Parasynascota Enderlein and the family Migulanidae Enderlein. It differs from the genus *Migulanum* (which contains the anthrax bacillus), in that cystites are produced; and from *Azotobacter*, in that branches are not formed. The organism is closely related to *Bacillus mesentericus*. An elaborate discussion of the life history, morphology, sexual and asexual reproduction is given. The author is convinced of the desirability of following the Enderlein terminology. He says "Früher oder später muss in den sauren Apfel gebissen werden."—*From abstract by C. E. Gabel.*

4574. **KOPELOFF, NICHOLAS.** Man versus microbes. xxiii+311p. Illus. Alfred A. Knopf: New York, 1930. Price $5.00.

4575. **LAPINSKI, ADAM.** Znaczenie proby siarkowodorowej w rozpoznawaniu laseczek grupy "Typhus-Coli." [The H_2S reaction as a means of differentiating bacilli of the colon-typhoid group.] *Pamietnik* 4(1): 9-12; French résumé, 42. 1928.—There are strains of paratyphoid A with which (as with paratyphoid B) H_2S blackens a Pb subacetate agar medium; therefore, this medium cannot replace Petruschky's litmus-whey. The Pb-agar medium has a certain application in differentiation of the colon bacillus from paratyphoid B and typhoid bacilli.

4576. **LLOYD, BLODWEN.** A marine denitrifying organism. *Jour. Bact.* 21(2): 89-96. 2 fig. 1931.—A marine denitrifying microorganism isolated from the Clyde Sea Area, and used for previous experimental work with Cranston on denitrification, is here described. It is named *Bacillus* costatus (p. 94), type cultures in American Collection of Type Cultures and British Collection of Type Cultures. The cultural, morphological and physiological features of this organism are given, and a summary of the experimental results is appended.—*B. Lloyd.*

4577. **LOEWENSTEIN, E.** Die Züchtung der Tuberkelbazillen aus dem strömenden Blute. *Zentralbl. Bakt. I. Abt. Orig.* 120(1/2): 127-129. 1931.—A medium consisting of eggs and a solution of asparagin in glycerol and distilled water yielded better results than any other medium.

4578. **LORENTZ, FRIEDR. H.** Der Charakter der Diphtheriebazillenkörnchen. *Zentralbl. Bakt. I. Abt. Orig.* 120(5/6): 331-341. 1931.—Experiments reported show that granule formation distinguishes diphtheria from pseudo-diphtheria bacilli, and also permits recognition of 2 types of diphtheria bacilli: (1) short cell bodies with thick shapeless granules; (2) long cell bodies with small spherical granules. Enrichment of the medium with N promotes cell division and growth, but not granule formation; S promotes granule formation. Slow growth or unfavorable conditions (low temp., insufficient nutrition, etc.) favor granule formation in the separation of types. Icebox temp. with liberal addition of S gives the long-bodied cell type with fine granules.—*Author's summary (transl.).*

4579. **MIRONE, GIUSEPPE.** Die entfärbende Wirkung der chinesischen Tusche in der mikroskopischen Technik. Methode zum Nachweis der Sporen. *Zentralbl. Bakt. I. Abt. Orig.* 120(3/4): 252-253. 1931.—The best preparations are made by staining the material, spread on a slide, with fuchsin Ziehl, covering with a thick layer of India ink, after 2 min. washing off with distilled water, and staining again with methylene blue. The microscopic field thus appears colorless, the vegetative portion of the organism blue, and the spores, with dark capsules, red.

4580. **[MODEL, L. M.]** МОДЕЛЬ, Л. М. О биохимизме питания и роста туберкулезных бацилл. [Biochemistry of nutrition and growth of tubercle bacilli.] [French summary.] Вопросы Туберкулеза. [*Voprosy Tuberkuleza*] 7(11): 1362-1369. 1929.—The author studied synthetic media in comparison with the classical glycerin, meat-peptone bouillon medium. Results showed that a simple synthetic medium, correctly compounded, is superior. K, Mg, PO_4, and SO_4 are indispensable; Ca, Na, and Cl are not necessary. The ammonium ion is the source of N. Presence of anion of complex organic acid is required for the assimilation of Mg. The best source of carbon is glycerin; carbohydrates in this sense are secondary in importance. Optimum Ph is 7.5. Na oleate hinders growth, as do other surface-active substances. When the surface tension of the medium

is below 0.700, growth becomes impossible. Lipoids (surface-active substances) play an important part in the resistance to tubercular infection.—*B. Van Rosen.*

4581. **MONTI, ACHILLE.** Sulla biologia dei ferrobacteri contenuti nelle acque di Pavia. [Biology of the iron bacteria living in the waters of Pavia.] *Boll. Soc. Ital. Biol. (Osservazioni eseguite direttamento sul pus di un paziente affetto da otite media purulenta cronica.) [Morphological study of Heliconema vincenti Sanarelli. Direct observations on the pus of a patient with a chronic purulent otitis media.] [With German summary.] *Lo Sperimentale* 84(5/6): 515-528. 1 pl. 1930.—Various dissociation forms of the organism, previously described in cultures, were observed in exudate directly from the patient.—*Maud L. Menten.*

4584. **PESCH, KARL L.** Das "Kolonoskop," ein Projektionsapparat für Kolonienzählung in Plattenkulturen. *Zentralbl. Bakt. I. Abt. Orig.* 120(3/4): 254-256. 5 fig. 1931.—This "colonioscope" furnishes sufficient magnification to permit recognition of exceedingly small colonies, counting of colonies on thickly grown culture plates, and observation of interesting colony forms, e.g., those of anthrax, gyroides and mycoides.

4585. **PETROFF, S. A., and WM. STEENKEN, Jr.** Biological studies of the tubercle bacillus. I. Instability of the organism—microbic dissociation. *Jour. Exp. Med.* 51(6): 831-845. 1930.—The authors describe the cultural characteristics, with special reference to topography of colony formation and virulence according to colony type, for study of which new methods and media were devised. 3 types of colonies were dissociated from avian tubercle bacilli: (1) perfectly round, smooth, easily emulsified, growing best on alkaline media, and highly pathogenic for chickens; (2) flat, moist with smooth surface and emulsified with difficulty; (3) flat and dry, center giving appearance of small pebbles, difficult to emulsify. (2) and (3) were not as virulent for chickens as (1). 3 colony types were dissociated from bovine tubercle bacilli: (1) perfectly round, smooth, moist, emulsified easily, growing best on alkaline media, highly pathogenic for guinea pigs and rabbits; (2) flat, moist, smooth surface and raised center, growing best on acid media and producing less extensive tuberculosis in laboratory animals; (3) flat, dry, structure appearing as small pebbles, emulsified with difficulty in saline, and only sometimes pathogenic for guinea pigs and rabbits. From BCG cultures, 2 extreme colony types were dissociated: (1) large, flat with large folds, appearing very waxy, growing best on acid media and non-pathogenic for guinea pigs and rabbits; (2) large flat colony, center appearing like a honey-comb, periphery veil-like, growing best on alkaline media and pathogenic for guinea pigs and slightly so for rabbits. Human tubercle bacilli were not yet completely dissociated; they present a number of variant unstable colonies. Reversion of types has been accomplished by changing the environment.—*Dorothy Diment.*

4586. **POE, CHARLES F.** Growth of anaerobes in crystal violet bile media. *Jour. Bact.* 19: 117-24. 1930.—Peptone-lactose broth containing varying amounts of bile and crystal violet were tested with anaerobes, a number requiring a dye concentration greater than 1:1000 to inhibit growth. *Clostridium welchii,* type 11, was most resistant. In bile media without dye, most anaerobes grew well at a bile content of 1-15%. Crystal violet in concentrations over 1:75,000 in lactose broth inhibits most anaerobes except *Cl. welchii,* type 11. Bile destroys the inhibitive power of crystal violet for most anaerobes.—*C. F. Poe.*

4587. **RICHTER, OSWALD.** Natrium ein notwendiges Nährelement für eine marine mikroärophile Leuchtbakterie. *Akad. Wiss. Wien. Math. Nat. Kl. Denkschr.* 101: 261-292. 2 pl. 1928.—Na has 2 functions as a constituent of a medium for growth of *Bacterium phosphoreum* (Cohn)—one as a necessary nutrient, the other as a regulator of osmotic pressure. The latter function can be equally well performed by any of a large series of common salts. The former is confined specifically to Na salts, these not being replaceable by K or Mg. Minute traces of Na salts are sufficient. Enough can be added to the medium by the ordinary method of transferring cultures with a wire loop. 2-3% NaCl is the optimal concentration for maximum growth and luminescence.—*R. D. Coghill.*

Path. & Bact.* 34(2): 283-285. 1 pl., 1 fig. 1931.—A simple and inexpensive method of cultivating giant colonies of bacteria and fungi is described, medicine bottles being used as containers for the culture media. The method enables a satisfactory photographic record of a colony to be made.—*J. F. D. Shrewsbury.*

4595. **SIEVERS, H., und E. MÜLLER.** Untersuchungen über den Stoffwechsel des Bacillus tetani. [Metabolism of B. tetani.] *Zeitschr. Biol.* 86(6): 527-534. 1927.

4596. **SONNENSCHEIN, CURT.** Umwandlung von Gelbkeimen in Typhusbakterien? *Zentralbl. Bakt. I. Abt. Orig.* 120(1/2): 40-47. 1931.—Using 5 strains of the organism called *Bacterium typhi flavum* by Dresel, v. Gara and Stickl (who claimed by special culture to have transformed 7 of 45 strains into typical typhoid bacilli), the author was unable to produce any such change of the yellow bacteria into anything similar to typhoid bacteria, nor the reverse.

4597. **SUNDERLIN, GERTRUDE, and C. H. WERKMAN.** Synthesis of vitamin B by microörganisms. *Jour. Bact.* 16(1): 17-33. 8 fig. 1928.—Synthesis of vitamin B by such biologically separated genera as Torula, Oöspora, Actinomyces and 4 genera of Eubacteriales reveals a general occurrence of its synthesis among widely

separated groups of lower plant forms. Whatever its chemical structure, vitamin B is a constituent prevalent in microörganisms; specifically, the following were found to produce it: *Torula rosea, Oospora lactis, Bacillus adhaerens, Bacterium coli, Bacillus subtilis, B. mycoides, Azotobacter chroococcum, Rhizobium leguminosarum,* and *Actinomyces.* Results showed no marked differences in ability of 3 strains of *Bact. coli* to synthesize vitamin B. Drying at 37° or at 100° C. for 48 hrs. does not materially diminish the vitamin potency of the bacterial mass. Several reasons are suggested to account for discrepancies in the literature dealing with synthesis of vitamin B by microörganisms. The conceptions and definitions of the vitamin are not in accord. After limiting by definition the meaning of the term to the legitimate conception expressed by Drummond, the authors find a multiplicity of methods employed to determine synthesis of a vitamin by microörganisms. Important among them are quantity of organism fed, period of feeding and time allowed for rats to become accustomed to the bacterial diet, manner of feeding organisms to rats, species of animal used as indicator.—*From authors' summary and conclusions.*

4598. SVARTZ, NANNA. Contribution à la question de la classification des clostridies iodophiles de l'intestin. *Acta Med. Scandinavica* 71(1/2): 1-9. 1929.—Several strains of iodophilic clostridia were isolated from feces and compared with similar organisms from soil and with 5 strains of *Bacillus amylobacter* from different bacteriological laboratories. The author concludes that the reaction of the medium determines the deposition of the iodophilic substance in the bacteria, relative carbohydrate content playing only a minor rôle. The author's strains of clostridia were not identical with any of the amylobacteria studied, but resembled *Clostridium butyricum* of Prazmowski. The strains of amylobacteria were not alike. The author believes a revision of the classification of amylobacteria is necessary.—*L. A. Barnes.*

4599. TODD, E. M. Virulence of haemolytic streptococci. I. The influence of oxygen on the production of glossy variants. *British Jour. Exp. Path.* 11: 350-391. 1930.—Virulent cultures of hemolytic streptococci are degenerated to glossy avirulent variants by long continued subculture on aerobic agar. This is due to natural selection of the variants by bacterial peroxide, and the following factors contribute to the process: (a) Glossy variants of certain strains are more resistant to inhibition by peroxide than virulent forms; (b) virulent colonies produce more peroxide, and therefore suffer earlier auto-sterilization than glossy colonies. Selection does not occur in anaerobic cultures when no peroxide is formed; it is accelerated by adding reagent H_2O_2 to the medium and by use of media which preserve peroxide. Natural selection of glossy variants is prevented and virulence maintained if accumulation of bacterial peroxide is prevented by adding catalase to the agar used for subculture; on the other hand, peroxidase does not appear to accelerate, and possibly tends to retard, the natural selection of glossy variants by peroxide.—*J. Bland.*

4600. TOYODA, MINORU. Resistenzversuche mit virulenten und avirulenten Bakterien. *Zentralbl. Bakt. I. Abt. Orig.* 120(3/4): 176-178. 1931.—Of bacteria rendered virulent by animal passage a Gärtner strain showed a rise in resistance to heat and disinfectants parallel with rise in virulence. On the other hand, a streptococcus and a pneumococcus strain were less resistant in the virulent than in the avirulent form.—*Author's summary (transl.).*

4601. WALD, ALFRED. Der Bacillus jordaniformis haemolyticus und sein Hämotoxin. *Zentralbl. Bakt. I. Abt. Orig.* 118(7/8): 406-410. 1930.—In 2 different stool investigations on the same person the author found a gram-negative, non-spore-forming bacterium, characterized by lively motility, gas-formation, especially on dextrose, liquefaction of Löffler serum and gelatine, and strong indol formation. It is not strongly pathogenic for guinea pigs or mice. It forms a hemolysin belonging to the true toxins. Neisser, in an appended footnote, assigns the bacillus to the Cloacae group (a term which he prefers to "Aerogenes group"). Because the organism differs in several particulars from *Bacillus cloacae* Jordan, it is named *Bacillus* jordaniformis haemolyticus (p. 406).

4602. WEICHARDT, WOLFGANG, Editor. Ergebnisse der Hygiene, Bakteriologie, Immunitätsforschung und experimentellen Therapie. Bd. 11. iv+929p. Julius Springer: Berlin, 1930. Price 128 M.

[Rio de Janeiro]* 3(4): 285-289. 1 pl. 1927.—A state of trophobiosis (see Wasmann 1902) is described, involving the symbiosis of *Acropyga (Rhizomyrma)* pickeli* (p. 287) on the roots of coffee trees, in the State of Parahyba, Brazil, with a coccid, *Rhizoecus coffeae* Laing.—*C. Zeimet.*

4607. COSTA, LIMA A. da. Supplemento ao 2° catalogo systematico dos insectos que vivem nas plantas do

Brasil e ensaio de bibliographia entomologica brasileira. [Supplement to the 2nd systematic catalogue of insects which live on the plants of Brazil, with bibliography.] *O Campo [Rio de Janeiro]* 1(7): 38-48. 1930.

4608. DAMMERMAN, K. W. The agricultural zoology of the Malay Archipelago. The animals injurious and beneficial to agriculture, horticulture and forestry in the Malay Peninsula, the Dutch East Indies and the Philippines. xi+473p. Map. 40 pl. (partly col.) 179 fig. J. H. de Bussy, Ltd.: Amsterdam, 1929. Pr. 2 £.—The book contains chapters devoted to: a general consideration of plant pests, insects of the soil fauna, internal plant parasites, external plant parasites, stored product pests, mammals and birds, beneficial animals, and the control of pests. The more important pests are listed and discussed.

4609. DAVIS, J. J. Insects of Indiana for 1928. *Proc. Indiana Acad. Sci.* 38: 299-314. 9 fig. 1928(1929).—Included are 20 spp. attacking cereal and forage crops; 16 on vegetable crops, 26 fruit insects; 20 on shade trees and shrubs; 16 on flower garden and ornamental greenhouse plants, 4 pests of stored grain and 14 household pests, animal parasites and miscellaneous.—*J. J. Davis.*

4610. HEADLEE, THOMAS J. Some tendencies in modern economic entomological research. *Jour. Econ. Ent.* 23(1): 28-38. 1930.—The economic entomologist must investigate even more deeply into the nature of insect life and its reaction to the physical and biological environment in which it is found. He needs a working knowledge of the principles of physics, chemistry, biology and entomology. He must not neglect any phase of entomology as unimportant for his purposes. His organization for research must involve the physical, chemical, biological points of view as well as the taxonomic, structural, developmental and physiological standpoints of his specialty. Chemical control is becoming increasingly important. Biological control and physical control are in their early stages of development. The opportunities for accomplishment in public service through economic entomological endeavor never were greater but the difficulty of the problems involved is constantly increasing and demanding greater and greater keenness.—*From author's summary.*

4611. HOWARD, L. O. The international aspects of entomology. *Congrès Internation. Xe Zool. à Budapest* 1927(2): 1181-1182. 1929.—The rapid increase in world population will sooner or later bring about widespread starvation, if not soon guarded against. The most obvious thing is to try to stop the loss of food through insects. Agriculture, especially in the newer countries, has made it possible for many insects to increase beyond measure. The annual insect damage in the United States alone approximates $2,000,000,000; the menace in Europe is not so obvious as elsewhere. Many trained men in all countries should be studying all phases of insect life in order to reduce waste and prevent future catastrophe.

4612. HYSLOP, J. A. United States of America: Outstanding entomological features. *Internat. Bull. Plant Protect.* 3(12): 180-182. 1929.—Notes on plant pests.

4613. JABLONOWSKI, J. The black locust-tree-scale, Lecanium robiniarum Dougl., and the European corn borer, Pyrausta nubilalis Hübn., a biological parallel. *Trans. 4th Internat. Congress Ent., Ithaca 1928.* 2: 455-462. 1929.—In Hungary, *L. robiniarum* attacks the American black locust, *Robinia pseudo-acacia,* and the European corn borer *Pyrausta nubilalis* attacks the introduced *Zea mays.* Marchal proved that *L. robiniarum* is merely a large form of *L. corni* Bouché. *Robinia* is free from *L. corni* in the U. S. A.; it became a host after being introduced into Europe. *P. nubilalis* was introduced into the U. S. A., not on corn, but on broom corn or hemp, which it attacks in Europe, in addition to millet, hops, and rarely *Artemisia.* In the U. S. A. it attacks over 200 plants. Hop is probably the original food. *Pyrameis cardui,* a pest of weeds, seems likely to become an important pest of lupine.—*N. F. Howard.*

4614. JEPSON, F. P. The control of "calotermes" in living plants. *Dept. Agric. Ceylon.—Bull.* 86. (1)-(11). 1929.—*Calotermes* constitutes an extremely serious menace to the tea industry in certain parts of Ceylon. Various control measures tried against *C. militaris* and *C. dilatatus* had been found unsatisfactory. Trials were made with Paris Green with 3 primary objects in view: to ascertain the action of Paris Green upon termites within the bushes; to find out whether the treatment could be carried out without injury to the bushes; and to determine the effect on the manufactured tea. To reach the galleries, a hole was bored with a brace and bit into the base of the stem, as near soil level as possible, in a downward direction, and the powder was blown into the galleries by means of an enema syringe of ball pattern, 2 or 3 squeezes of the bulb liberating about 1/12 oz. of Paris Green; then the holes were sealed over with cement or asphaltum. The insects begin to die a few days after treatment, but a period of 3-4 mo. must elapse before the entire colony is killed. In no case did the application of Paris Green injure the bushes. The cost of treating 3,000 bushes worked out at 2.1 cents per bush as carried out on an experimental scale. Sole dependence on this form of control is not advised. Preventive measures are recommended such as the elimination of snags and similar weak spots through which the winged adults gain access to the heart wood of woody plants.—*F. W. Urich.*

4615. KRUGER, G. Cirenaica: Some harmful insects. *Internat. Bull. Plant Protect.* 4(10): 146-147. 1930.—Notes on *Dociostaurus maroccanus, Opatroides punctulatus,* and *Polychrosis botrana.*

4616. LUTZ, FRANK E. In defense of insects. *Sci. Monthly* 32(4): 367-369. 1931.—The author stresses their value in cross-pollination of flowers, in soil-making, in furnishing food for other animals, and in keeping in check injurious spp. of insects.

4617. MAHDIHASSAN, S. The microorganisms of red and yellow lac insects. *Arch. Protistenk.* 68(3): 613-624. 1 pl., 6 fig. 1929.—It has been suggested that an insect dye stuff, like the lac dye, is derived directly from some chromogenic symbiotic microorganism of the insect. Blood smears of such insects show the absence of chromogenic symbionts, both in health and disease. Some lac insects are yellow colored, others are red, but in nearly all cases the secretion resin is yellow colored. *Lakshadia albizziae* and *L. ficii* have red and yellow colored forms of insects, both giving a yellow secretion. The symbionts here do not differ. In *L. ficii* they are identical as far as it can be seen. The color of such yellow and red insects seems to be due directly to the activity of the insects, which differ, while it may be indirectly due to the micro-organisms which are identical. An infectious malady "Grassi's Disease" causes mortality among lac insects growing in drought conditions and probably occurs among other scale insects and may be of world wide distribution.—*C. Zeimet.*

4619. MISTIKAWY, ABDEL MEGID. The locust problem in Egypt and its relation with other countries. *Bull. Soc. Roy. Ent. Egypte* 13(1/3): 29-41. Map. 1929.—Six spp. of grasshoppers are listed as injurious, but only *Schistocerca gregaria,* the desert locust, is treated in detail It has been important from earliest times; the worst recent outbreaks have been in 1891, 1915, 1928, with minor invasions in 1904, 1914 and 1927. The species is widespread in Africa, southwestern Asia and Spain. Solitary and migratory phases occur, with change from one to the other at times. It is probably not a permanent resident in Egypt, but migrates from 3 centers: Eastern Sudan and vicinity; northwestern Sudan; and Arabia; the last is most dangerous to Egypt. Migrations occur at various seasons, most often late fall or early spring; a north or west direction is usually taken. The invaders

often produce another injurious generation. It seems that return migration may sometimes occur. Mechanical control methods have been used.—*F. M. Wadley.*

4626. **BISSELL, THEO. L.** Some facts about the pecan weevil and suggestions for control. *Proc. Ann. Convent. Georgia-Florida Pecan Growers' Assoc.* 24: 24-27. 1930.—The pecan weevil (*Curculio caryae* Horn) infests pecans of the early maturing varieties Schley and Stuart. Adults emerge from the soil July to Sept. and cause half grown nuts to fall by their punctures. Oviposition begins after nuts have formed kernels. Larvae issue from nuts during the fall and burrow in soil. After 1 or 2 yrs. in soil cells, larvae mature and the resulting adults spend 1 yr. in same cells before emergence. Larvae are attacked by *Myiophasia nigrifrons* (Tachinidae) and by a fungus. Condition of soil surface affects entrance by larvae and exit by adults. The author recommends jarring pecan trees for weevils; cultivation to hinder larvae entering soil; early harvest of nuts to catch issuing larvae; encouraging birds to catch adults and larvae.—*T. H. Bissell.*

4627. **BODKIN, G. E.** A note on the utility of aerial photography in entomological field work. *Bull. Ent. Res.* [*London*] 20(4): 431. 3 pl. 1929.—Used to locate citrus gardens in Palestine in the campaign of fumigation against the "Black Scale," *Chrysomphalus ficus* Ashm.

4628. **BONDAR, GREGORIO.** A formiga de enxerto, praga dos cacauaes na Bahia. [An ant injurious to cacao-trees in Bahia.] *O Campo* [*Rio de Janeiro*] 1(3): 50-52. 5 fig. 1930.—The ant, *Azteca paraensis* Forel, feeds on the honeydew of Coccidae and other hemipterous cacao insects. Nests are located on limbs and trunks and are made with terminal buds gnawed by ants. The nests are enveloped by the intricate root system of epiphytic plants of the families Gesneraceae (*Codonanthe gracilis*), Orchidae (*Coryanthes speciosa, Epidendrum imathophillum*, etc.), Bromeliacae etc. Within a few years such double parasitism kills the trees. Cutting off nest-bearing limbs or pulling off epiphytic plants is recommended. —*G. Bondar* (*transl. by G. Maheux*).

4629. **C., W.** Mealy bugs on planting material and some preliminary data on control measures. *Pineapple News* [*Hawaii*] 4(7): 115-119. 1930.—Dipping infested plant material in dilutions of petrotine at a strength of not less than 1-50 showed promise.

4630. **DODGE, B. O.** Observations on a shothole disease and insect pests of the Japanese cherries. *Jour. New York Bot. Gard.* 30(352): 81-85. 1 fig. 1929.—A severe case of shothole that developed in some Japanese cherries was thought to be due either to *Bacterium pruni* or to the application of certain Volck oil and nicotine sulphate sprays, but the exact cause was not determined. About 10% of the West Indian peach scale, *Aulacaspis pentagona*, survived 3 lime-sulphur applications made in February and March. Trials made of 40% nicotine sulphate, 1: 800, plus 8 lb. fish oil soap to 100 gal., and of 2% Volck oil plus nicotine sulphate to make a 1: 1600 solution, applied June 16, were about equally effective in killing the young scale that hatched previous to the application from eggs laid June 7 and later. Some eggs, hatched after the applications were made, caused a few new infestations. 2 spp. of slug caterpillars, *Parasa fraterna* and *Adoneta spinuloides*, found feeding on leaves in September, were kept under control by insect parasites, while a 3rd sp., *Prolimacodes scapha*, was not numerous. The fall web-worm also infested 2 trees.—*M. F. Barrus.*

4631. **FOWLER, RODNEY.** Results of experimental tests for the control of codling moth as carried on at the Blackwood experimental orchard, season 1929-30. *Bull. Dept. Agric. S. Australia* 243. 1-15. 1930.—Arsenate of lead with the addition of fluxit in last 3 sprays gave good results. Arsenate of lead, 2 calyx sprays or calyx and first cover, followed by 3 oil sprays, using either Volck or Alboleum, gave good results and reduced the arsenical residue trouble. Best results from the standpoint of codling control were obtained with lead arsenate and oil combination, but the present cost of the oils is almost prohibitive. Lead arsenate and oil combinations when mixed before spraying left the highest % of arsenical residue per pound of fruit; also, it was most difficult to remove. Lead arsenate and oil combinations probably owe their extra efficiency to the fact that they make a heavy coverage on the fruit, which is not readily removed by rain or wind. A slight injury to the fruit follows the use of Volck or Alboleum, but the damage is not serious. Volck oil alone controls codling moth, but it seems to inhibit to some extent the coloring of red apples and causes some rustiness. Alboleum may be expected to give almost as satisfactory results as Volck. "Arsinette" alone gave very good results, but a suspicious amount of what may be arsenical residue was noticeable on the fruit at packing time. In a dry season applications of oil tend to collect the dust on foliage and fruit to the detriment of both. Arsenical dusts do not seem to give satisfactory results. It is not advisable to omit the calyx-spray.—*From author's summary.*

4632. **FROGGATT, J. L.** The banana weevil borer (Cosmopolites sordida Chevr.). *Queensland Dept. Agric. & Stock, Div. Ent. & Plant Path. Ent. Leafl.* 5. 1-4. 1 pl. [1928?].—Life history and control.

4633. **HARMAN, S. W.** Midsummer sprays for the peach cottony scale. *New York State Agric. Exp. Sta.* [*Geneva*] *Bull.* 552. 22p. 1 pl. 1928.—Experiments were made to ascertain the tolerance of peach foliage to spray applications of the more promising insecticides, as well as to determine the efficiency of these materials when used during the summer months in combating the peach cottony scale (*Pulvinaria amygdali* Ckll.?). The insecticides used in these tests were lubricating oil emul-

sions containing either Junior Red Engine oil or Diamond Paraffin oil, Volck, Medina Summer Emulsion, white mineral oil No. 11 emulsion, nicotine sulphate, ivory soap, potash fish-oil soap, lime-sulphur, bordeaux mixture, and bichloride of mercury. Under conditions governing the tests, white oil emulsions, namely, Volck, Medina Summer Emulsion, and white mineral oil No. 11 emulsion, caused little or no injury; but, when used in combination with bordeaux mixture or when applied on foliage retaining sulphur residues, they caused shothole injury and premature dropping of the peach leaves. Emulsions containing highly refined oils were more effective in combating the peach cottony scale than any of the other materials safe to use on peach foliage.—*Author's abstract.*

4634. **ILLINGWORTH, J. F. Longhorned grasshopper, Conocephalus saltator (Saussure), as a pest of pineapples in Hawaii.** *Proc. Hawaiian Ent. Soc.* 7(3): 407-408. 1931.—This grasshopper is a valuable predator upon the pineapple mealy bug, *Pseudococcus brevipes,* but the ♀♀, by depositing their eggs in the young fruit, sometimes give rise to the dry rot, characteristic of Kauai disease.

4635. **ILLINGWORTH, J. F. Tarsonemus ananas Tryon, a mite that is becoming a serious pest of pineapples in Hawaii.** *Proc. Hawaiian Ent. Soc.* 7(3): 409-410. 1931.—This mite was reported first as doing damage to pineapple in Queensland. Its attack causes dry rot or Kauai disease.

4636. **SCOTT, HUGH. Note on the life-history of the fig-tree moth, Ocnerogyia amanda, Staud. (Lymantriidae).** *Bull. Ent. Res.* [*London*] 20(1): 39-40. 1929.

ECONOMIC ENTOMOLOGY

CEREAL, FORAGE, AND OTHER FIELD CROPS

(See also in B. A. 6(1): Entries 82, 1345, 1848, 1856; and in this issue 3447, 3457, 3533, 3536, 4605, 4609, 4614, 4619, 4623, 4699, 4704, 4711, 4716, 4722, 4727, 4729, 5652, 5662, 5734, 5758)

4638. **ANDERSON, T. J. Control of maize stalk borers.** *Union So. Africa Dept. Agric. Pan-African Agric. and Vet. Conf. Pretoria Papers Agric. Sect. P.* 238-242. 1929.—A general discussion of control measures of *Busseola fusca* and *Sesamia calamistis,* the common stalk borers in maize, matama and millets.

4639. **FLINT, W. P. Effect on insects of treating seed corn with certain fungicides.** *Jour. Econ. Ent.* 23(2): 404-406. 1930.—This paper summarizes the insecticidal effect obtained by treating seed corn with certain fungicides. The work reported covers a period of 4 yrs. and the treatment of seed corn by 16 fungicides, all of which are quite generally marketed in the corn belt of the United States. While these fungicides are intended primarily for the prevention of injury to seed corn by diseases, certain claims have been made that they will also act as insecticides. The results of treating over 5,000 hills of corn with these materials failed to show that any of them had any marked effect in repelling or killing the corn field ant (*Lasius niger americanus* Emery), corn root aphid (*Anuraphis maidi-radicis*) (Forbes), seed-corn maggot (*Hylemyia cilicrura* Rond.), white grubs (*Phyllophaga* or *Lachnosterna* spp.), wireworms (*Elateridae*), corn seed beetles (*Agonoderus pallipes* Fabricius, *Clivinia impressifrons* Leconte), or thief ants (*Solenopsis molesta* Say).—*W. P. Flint.*

4640. **HUCKETT, H. C. Spraying and dusting experiments with potatoes on Long Island.** *New York State* [*Geneva*] *Agric. Exp. Sta. Bull.* 592. 1-38. 5 fig. 1931.—Experiments on Irish Cobbler and Green Mountain potatoes have been conducted during 5 successive seasons, 1926-1930, chiefly to determine whether during a given series of yrs. profitable increases in yield might be expected, especially if aphid (*Macrosiphum gei*) and leafhopper were controlled. Invariably the means taken to combat the various parasites were successful in protecting the foliage from injury, but this did not always result in profitable increased yields. The causes for these results, which are not in complete accord with the commonly accepted principles of dusting and spraying, are believed to be of an entirely local nature, even on Long Island. Undoubtedly, moisture, soil, and atmospheric conditions during July and August are important determining factors, which vary considerably in their influence during certain seasons from one part of Long Island to the other. At Riverhead the causes were sufficiently dominant to render spraying and dusting during mid-season of doubtful value.—*H. C. Huckett.*

4641. **JOHNSTON, H. B. Pink bollworm (Platyedra gossypiella, Saunders) in the Gezira District of the Sudan in 1927 and 1928.** *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 26. p. 1-27. 2 maps. 1929.—Data are presented on the extent of the infestation, which in some cases reached 55.5% of the bolls. The average infestation at 21 localities by pink bollworm in 1926-1927 was 3.85% and in 1927-1928 was 24.16%, while the average infestation by the Egyptian bollworm was 3.34% in 1926-1927 and 2.61% in 1928. Control measures were made possible by legislation and organized meetings for instruction, which gave very good cooperation. Clean-up of tenants' grass huts yielded 1.2 living larvae per lb. of seed found. The proportion of dead to live larvae found in the huts was 2.5: 1, while in seed lying in piles in the open field the proportion is from 6.5 to 8.1: 1, showing effect of sunlight. This has led to the practise of exposing cotton seed to the sunlight for at least 2 hours at 62°C., which gives effective control.

4642. **KANNAN, K. KUNHI. Ground grubs and their movements in soils.** *Jour. Mysore Agric. & Exp. Union* 12(1): 3-4. 1931.—From the author's observation and experiments it is concluded that the respiratory requirements of larvae of the palm beetle (*Oryctes rhinoceros*), of cockchafers, and of *Holotricha* have much to do with their movements and attacks on roots of sugar cane and other plants in the soil. It is believed that uniform manuring and thorough cultivation where root grubs are becoming serious may divert them from roots of the crops to food more natural to them, viz., the soil rich in organic matter.

4643. **KING, HAROLD H. A note on the use of dried poison bait against locusts in the Sudan.** *Bull. Ent. Res.* [*London*] 20(1): 99-101. 1929.—Description is given of the method of using sun-dried poison bran bait in control of *Schistocerca gregaria.* Results are reported as universally favorable.

4644. **LEONARD, M. D. An unrecorded food habit of the large tobacco suckfly in Porto Rico.** *Jour. Econ. Ent.* 23(3): 640-641. 1930.—*Dicyphus luridus* Gib., a minor leaf pest, is reported doing serious damage to flower buds of tobacco.

4645. **NEISWANDER, C. R., and L. L. HUBER. Height and silking as factors influencing European corn borer population.** *Ann. Ent. Soc. Amer.* 22(3): 527-542. 6 fig. 1929.—Experimental plots at Bono, Ohio, for several yrs. have shown a higher borer population on early varieties of corn of a given planting date than on late ones; succeeding planting dates for all 6 varieties have shown a significant reduction in the population. The variation in the population of the various planting dates is greater than for the varieties. Plant height and oviposition are definitely correlated; the greater the

average height of corn the more eggs are deposited. But there is only a slight correlation between oviposition and the height of individual plants within a plot. The correlation between silking and egg deposition is high but it must be considered that silking and height are closely correlated. Time of planting has an influence on the chances of survival: 10.16% of larvae placed on May 10 corn were recovered as compared with 5.72% on June 10 plantings. There was a heavier egg deposition and also a higher rate of survival on vigorous than on subnormal corn. The rate of survival is lower on the late-maturing varieties than on the early ones.—*M. W. Boesel.*

4646. **PIERCE, WILLIAM DWIGHT. The sugar cane insect problem in Negros.** *Proc. Ent. Soc. Washington* 32(6): 99-104. 1930.—A brief summary of the insect problem of sugar cane in North Negros [P. I.]. The mean temp. is 78-83°F., the mean humidity 82-88%. Rain falls on 200 days a year with an annual fall of 120-140 inches, varying considerably in monthly distribution on the island. Sunshine is 90-230 hrs. per month. In Jan. 1928 dead heart damage by borers in young cane was very high, averaging 2.4 dead shoots per stool, and 1.28 good shoot to every dead shoot. As a result of parasite redistribution this damage was greatly reduced. A system of clean culture calculated to reduce insect damage is outlined for each step in the culture of the crop. A list of spp. found doing damage includes 6 injuring seed cane in the ground, 11 injuring roots, 8 causing abnormalities of growth, 15 dead heart borers of young cane, 3 spp. injuring buds, 9 stalk borers, 2 stalk suckers, 15 leaf suckers, 4 leaf miners, 11 leaf eaters.

4647. **TORKA, V. Chlorops taeniopus Meig. als Weizenschädling.** *Zeitschr. Ent.* 16(1): 4-5. 1928.—In 1926 *C. taeniopus* did considerable damage to the heads of wheat in Upper Silesia. It was parasitized internally by *Coelinus niger* and externally by a Chalcid.

4648. **COLIZZA, C. Il moscerino delle viole (Dasyneura affinis Kieff., Diptera, Cecydomyidae) nell'Italia meridionale. [The violet midge (D. affinis, Diptera, Cecydomyidae) in southern Italy.]** *Boll. Lab. Zool. Gen. e Agraria* 21: 130-148. 6 fig. 1928.—*D. affinis,* by causing gall formations on the leaves, has been found very destructive to the cultivations of violets in the vicinity of Naples during the years 1926-28. The infestation, which was the severest during the first yr., decreased during the subsequent year, evidently due to the activity of the parasites *Platygaster* sp., *Tetrastichus* sp., *Torymus* sp., and *Eutelus mediterraneus* Mayr., which are described and illustrated. Descriptions of the adults (♀, ♂), egg, and mature larva* are given. The biology of this midge is described, covering the mating, oviposition, and number of generations, of which the author recorded 4 of 41, 39, 27, and 62 days duration respectively, and a 5th, of 206 days duration, running through the winter into the following spring. Means of control are discussed. Chemical sprays and fumigating with poisonous gases are impracticable, owing to the concealed position of the maggots, leaving as the only practicable and effective remedy, the cutting of the infested leaves and their prompt destruction. The author feels that the parasites mentioned are an effective check for the pest in question.—*C. Zeimet.*

4649. **LOCKLIN, H. D. Recommended dates for application of standard hot water treatment to hardy narcissus.** *Western Washington Agric. Exp. Sta. Bull.* 13-W. 32p. 8 fig. 1929.—It is impossible to give exact dates when a given variety of narcissus will always be in best condition for treatment which will apply to all seasons. Allowance must be made in dates given in the following list for the earliness and lateness of the season. In general, large flowered varieties (Victoria, Sassenheim, Spring Glory, Emperor, Von Sion, Sir Watkins, Golden Spur, and King Alfred) are in best condition for treatment from August 12 to August 26, while early treatment (July 30), gives the largest number of normal flowers for the small flowered varieties (Laurens Koster, Poeticus ornatus, and Campernelle regulosus).—*P. A. Glenn.*

4650. **LUNDBLAD, O. Morotbladloppan Trioza viridula Zett. dess biologi och uppträdande som skadedjur i Sverige. [The carrot psyllid, its biology and distribution in Sweden.]** [English summary.] *K. Landtbruks-Akad. Handl. och Tidskr. [Stockholm]* 68(3): 337-379. 19 fig. 1929.—Leaf curl of the carrot is caused by the Carrot Psyllid, *Trioza viridula.* The insect appeared first in the provinces of Blekinge, Smaland and Skane, and spread in all directions. It is now distributed all over Sweden, and causes great damage especially in the southern provinces, rendering impossible the cultivation of carrots in some districts. The 5 nymph-stages can easily be distinguished one from another by the number of wax-filaments surrounding the body. The number of these staffs increases rapidly from the first to the 5th instar.—*Trioza nigricornis* is sometimes also found on carrots in Sweden. Its eggs were previously unknown. They are provided with very long, fine stalks. Although the imago has been recorded on carrots, eggs and nymphs have been reported only on *Brassica,* which is perhaps its true host. The best remedy against the carrot psyllid is spraying with tobacco-extract, good results having been obtained in a series of experiments during 1923-1928. Two sprayings are necessary, the first as soon as the first weak curling has been noticed, the second a week or two later.—*From author's summary.*

4651. **MacDOUGALL, R. STEWART. Insect pests. No. X.** *Scottish Jour. Agric.* 14(1): 60-72. 4 fig. 1931.—A review of the club-horned (Staphylinidae, Silphidae) and saw-horned (Elateridae) beetles, and the turnip gall weevil (*Ceuthorhynchus pleurostigma*), with notes on life history, damage to crop plants, and control measures.

4652. **MILLER, N. C. E. Megymenum brevicorne F. Pentatomidae (Hemiptera-Heteroptera). A minor pest of Cucurbitaceae and Passifloraceae.** *Malayan Agric. Jour.* 17(12): 421-436. 7 fig. 1929.—All stages of *M. brevicorne* F. are described and figured. The duration of the life cycle and methods of control are given.—*N. C. E. Miller.*

4653. **PUSSARD, R. Contribution à l'étude morphologique et biologique de la teigne du lilas (Gracilaria syringella Fab.).** *Ann. Epiphyties* 14(2): 107-131. 8 fig. 1928.—Serious outbreaks of *G. syringella* were observed at Rouen in 1924 and 1925, the larvae feeding on *Syringa, Ligustrum* and *Fraxinus excelsior.* All stages of the insect, especially the embryonic development and the different larval forms, have been described in detail. From May to October, there are in France 3 generations. Over-wintering pupae transform into moths from the end of April, adults being most numerous by the beginning of May at the time of lilac blossoming. First generation larvae pupate about June 15th and moths appear with the first days of July. The 2nd generation develops in August and adults are seen about September 20th; the 3rd generation grows from end of September to October. At the end of Oct. wintering pupae are either in the soil or in crevices in bark. Eggs are laid in groups of 5-7 on lower side of leaves mainly

along the midrib. They hatch in about 10 days. During the first 2 weeks young larvae live as miners and are gregarious; then they come out and feed on a lower leaf. At that time they cut the main vein of the leaf at many points, fold the ends, and form a cone within which they feed. Parasites were scarce at Rouen in 1924 and 1925; on the other hand sparrows and the European earwig, *Forficula auricularia,* destroyed large numbers of larvae.—*R. Pussard (transl. by G. Maheux).*

4654. RAO RAMACHANDRA, Y. The mango-hopper problem in South India. *Agric. Jour. India* 25(1): 16-25. 1930.—In addition to the question of damage due to mango-hopper and mildew the author deals with several other aspects of mango culture in South India—times of flowerings of the trees; the fertilization and setting of the flowers; factors affecting fruit shedding, etc. The term mango-hopper is a collective name given to 3 spp. of Jassids, *Idiocerus atkinsoni, I. niveosparus* and *I. clypealus.* Of these *I. niveosparus* is the most injurious. An account is given of the life-history of the pest and the nature of the damage that it does. The following scheme of control measures is advocated: (1) A preliminary spray of Bordeaux mixture to be given to the inflorescences as the flowers begin to open for preventing the appearance of the mildew; (2) a thorough spray with fish oil resin soap to be given if the hoppers (nymphs) are noticed, to be repeated at intervals of a week in case further hatchings are noticed; (3) lastly, when the fruit has set, the trees should be irrigated with the object that there may be sufficient conservation of soil moisture to counteract the heavy fruit fall.—*H. Singh Pruthi.*

4655. BEESON, C. F. C. Sense of smell of longicorn beetles. *Nature [London]* 126(3166): 12. 1930.—Field work shows that the Indian sal heartwood borer is promptly attracted by the smell of newly felled *Shorea robusta,* especially of the sap. This fact has been utilized for control by felling trap trees.

4656. BOAS, J. E. V. Et nyt stort Angreb af Lyda arvensis. [A new mass attack of L. arvensis.] *Dansk Skovfor. Tiddskr.* 1930: 1-23. 1 fig. 1930.—Attacks of this sawfly on spruce are quite rare. However, a major infestation in Denmark is here reported. The activities, the work, the characteristics of the larvae and adults are reported upon. The literature is mentioned in brief. —*W. H. Meyer.*

4657. ECKSTEIN. Auffallendes Braunwerden der Endtriebe von alten Kiefern. *Zeitschr. Forst.- u. Jagdw.* 62(2): 120-121. 1930.—Investigation by the Möller Institute of broken-off terminal shoots with brown needles from normally growing pines indicated that the pine beetle (*Myelophilus piniperda*) working in the shoots was the cause of the dying off of the needles.—*J. Roeser, Jr.*

4658. ESCHERICH, K. Das Vorkommen forstschädlicher Insekten in Bayern. II Bericht: das Jahr 1928. [Occurrence of insects injurious to forests in Bavaria; 1928 report.] *Forstwiss. Centralbl.* 52(10): 457-478. 8 fig. 1930.—The occurrence of numerous spp. of insects is noted, together with notes on their life history and methods of control.—*W. N. Sparhawk.*

4659. ESCHERICH, K. Das neue Gesicht der Forstentomologie. [The new viewpoint in forest entomology.] *Forstwiss. Centralbl.* 52(12): 525-546. 1930.—Forest entomological research, formerly devoted largely to biotic factors (parasites), is now mostly in the field of abiotic factors, chiefly climatic. A multiple thermohygrostat in which insects can be bred under controlled conditions of temp. and humidity is illustrated and described briefly. —*W. N. Sparhawk.*

4660. FRANCIS, W. D. A raining or weeping tree in Australia. *Kew Bull. Misc. Inform.* 1931(3): 156-157. 1931.—The deposition of water from trees of *Glochidion ferdinandi* is discussed. The drops are the excretions of homopterous insects feeding on the tree.—*V. S. Summerhayes.*

4661. KALSHOVEN, L. G. E. De Biologie van de Djatitermiet (Kalotermes Tectonae damm.) in verband met zijn bestrijding. [Bionomics of K. tectonae as a basis for its control.] 127 p. 20 pl. H. Veenmann en Zonen: Wageningen, 1930.—Lignicole termites have caused serious damage to living teak trees in Java in recent yrs. This paper gives the results of biological studies begun in 1925, and the technique followed during the investigation; the silvicultural aspects of the problem will be dealt with later. The writer draws attention to the fact that there are only 2 true castes in the *Kalotermes* spp. of Java: the winged fertile form (imagines), and the sterile macrocephale form (soldiers). The external morphology is described in detail. *K. tectonae* has a wide distribution in the teak forests of Java, while *K. dalbergiae* has only been found in a small part of the island (Banjoemas, Kedoe).

The nests are nearly always several meters above ground in the living trunks due to the fact that the colonies are founded in the remnants of dead branches. The developing colonies extend their galleries into the sound wood of the main trunk, causing conspicuous swellings. Several tree species are hosts. There appear to be 7 stages in the development of the winged sexuales. No special soldier larvae were distinguished. Neoteinic individuals (substitute royal forms) in orphaned colonies initiate from individuals in the older stages of development when various stages are present. In incipient colonies the period of development of the eggs averages 57 days and for the first 3 larval stages it may last 15, 20 and 30 days respectively. In older communities these periods may be longer. Young members of a colony may grow into winged forms or deviate and develop into soldiers of neoteinics depending on the population of the colony.

Life history studies show that the growth of incipient colonies is very slow. The rate of development for the first 2½ yrs. is diagramed. The oldest colony age is probably 15 yrs., but the average is about 10. The number of eggs produced by a queen apparently increases with the growth of the colony, and then the period of growth is followed by a period of rather rapid decline in numerical strength, apparently due to decreasing egg production and to the losses of individuals during the swarming seasons. Under normal conditions winged forms are not produced before the 6th year. Colonies from which sexuales have emerged may not swarm the following year. When the wood is drying out imagines may be produced in subsequent periods. The original royal pair may be present to the last and the formation of neoteinics does not appreciably prolong the life of a colony. The members of a dying colony have a typical whitish and meager appearance. The method of swarming, foundation of new colonies and the nesting habits are described. The relation of other animals, chiefly ants, elaterids, scorpions and lizards is shown.—*H. J. MacAloney.*

4662. ORFILA, RICARDO N. Sobre Goniopterus gibberus Bsd. *Rev. Soc. Ent. Argentina* 2(5): 269-270. 1929. —This species, discovered as a pest on eucalyptus in La Plata, is reported from several other localities, and also as devouring flowers of *Chrysanthemum indicum* and *Celosia cristata.*

4665. KRIJGSMAN, B. J., en G. L. WINDRED. De Gastheerkeuze van Bloedzuigende Arthropoden. Deel II. Lyperosia exigua. [Host selection of blood sucking Arthropoda. II. Lyperosia exigua.] [German and English summaries.] *Nederlandsch-Indische Blad. Diergeneesk.* 42(2): 110-120. 1930.—Experiments begun with *Stomoxys* in the first part of this series continue with *Lyperosia exigua. Lyperosia* reacts to definite warmth stimuli with positive taxis, extension of proboscis and piercing; shows thigmotactic orientation and positive anemotaxis; and reacts to water with positive taxis, extension of proboscis, piercing and a weak sucking reaction. The skin odor of buffalo, Zebu, European cattle, horse and dog causes a positive taxis, extension of proboscis and piercing. Blood and serum give a positive taxis, extension of proboscis and sucking. *Lyperosia* apparently does not differentiate between the odor of individuals of the same host species, but can distinguish the odor of various mammal species. No definite localisation on the host, caused through local odor differences, was found.—*From authors' summary.*

4666. LUTZ, ADOLF. Sammeln, Präparieren, Untersuchen und Bestimmen der hygienisch wichtigen Insekten. [Collection, preparation, investigation and determination of hygienically important insects.] In: W. KOLLE, und A. v. WASSERMANN. Handbuch der pathogenen Mikroorganismen. 3. Aufl. W. KOLLE, R. KRAUS, und P. UHLENHUTH. Bd. 10, Lief. 37, p. 551-590. 25 fig. Gustav Fischer: Jena; Urban & Schwarzenberg: Berlin u. Wien, 1929.

4667. MELLO, E. JANSEN de. Medida do progresso e efficiencia dos serviços anti-larvarios nas campanhas contra a febre amarella. [Measure of the progress and efficiency of anti-larvae measures in campaigns against yellow fever.] [With English and French conclusions.] *Arch. Hygiene [Rio de Janeiro]* 4(2): 207-219. 2 graphs. 1930.—Mosquito and other indices are useful in measuring efficiency of anti-larvae measures in these campaigns. The following proportions should be computed: (1) the ratio of houses with breeding-places to all houses examined (house index) and (2) the ratio of breeding-places to the total number of houses visited (density index). The ratio of breeding-places to the total number of receptacles (deposit index) and other ratios interesting in special cases and localities may be of value. The ratio of receptacles found with living larvae-consuming fish to the total number of receptacles capable of supporting fish life (fish index), proposed by the author, has proved useful.—*From author's conclusions.*

4668. PHILADELPHY, A. Ueber Katzenräude beim Menschen. [Human infection with cat mange.] *Wien. Klin. Wochenschr.* 43(1): 268-270. 1930.—*Sarcoptes minor (Notoëdres cati)* and rarely *Chorioptes auricularis (Dermatophagus)* occur in man, at times with fatal results. The author observed 3 cases of cat mite infection in man. Of these, 2 exhibited skin symptoms within 24 hrs., 1 within 8 days. The species was not determined.

4669. SCHWETZ, J. Quelques observations sur les Phlébotomes de Stanleyville [Belgian Congo]. *Rev. Zool. Bot. Africaines* 18(1): 133-146. 1929.—Observations on the habits of adult species of *Phlebotomus* and on their host preferences are given. Apparently *P. schwetzi* attacks indiscriminately both man and cold-blooded animals, while *P. africanus* and *P. schoutedeni* seem to feed almost exclusively upon cold-blooded animals. Human leishmaniasis has not yet been found in the environs of Stanleyville or in that part of Belgian Congo, although it may exist in that region. Another species, *P. collarti,* was found in the region of Stanleyville near the Congo River, living entirely outside human habitations.—*J. L. Webb.*

4670. SINTON, J. A., and N. D. KEHAR. A field method for the estimation of the salinity of the water in mosquito-breeding places. *Indian Jour. Med. Res.* 18(1): 199-201. 1 fig. 1930.

4671. SMORODINZEW, I.-A., et A. N. ADOWA. Sur le rôle de la réaction du milieu dans l'écologie des larves d'Anopheles maculipennis. *Bull. Soc. Path. Exotique* 23(1): 38-43. 1930.—The cardinal factor in the suitability of water to the development of *A. maculipennis* is its alkalinity. The authors emphasize the danger of producing a culture-bed for malarial mosquitoes by hydraulic extraction of turfs, in which natural water of alkaline reaction is used.

4672. TRAVASSOS, LAURO. Über einige Arthropoden als Plagegeister der brasilianischen Küstenzonen. *Arch. Schiffs- u. Tropen-Hyg.* 33(Beih. 3): 273-279. 1929.—These are divided into (1) arthropod disease-carriers; (2) those whose bite causes small lesions; and (3) those which cause temporary pain but no permanent results. The author discusses the 2nd and 3rd classes. In the 2nd class he describes ticks (the horse-tick, *Amblyomma* sp., which attacks human beings as well as horses, and *Ornithodorus* sp.) "borrachudos" (Simulidae), the "tunga" of sand-flea, and "berne," the parasitic larvae of the fly *Dermatobia hominis,* which develops in the skin of human beings and lower animals. Of the members of the 3rd class he mentions only 2, the tabanid "motucas" and the ceratopogon "maruin."

INSPECTION AND REGULATION

(See also in B. A. 5(10): Entries 22868, 24211, 24240, 24264, 24740; 5(11): 26624, 28792, 28821)

4673. BOTTEL, A. E. Disinfection as applied in the [Mediterranean] fruit fly area [Florida]. *Month. Bull. Dept. Agric. California* 18(7): 406-408. 1 fig. 1929.

4674. BRANDES, E. W. Report of the committee on quarantine practice in relation to inter-regional movement of sugar-cane propagating material. *Trop. Agric. [Trinidad]* 6(12): 347. 1929.—An abstract.

4675. CALL, A. H. Inspection work for [Mediterranean] fruit fly in Florida, and how carried out. *Month. Bull. Dept. Agric. California* 18(7): 403-405. 2 fig. 1929.

4676. COX, JOHN P. Quarantine and patrols. *Month. Bull. Dept. Agric. California* 18(7): 393-396. 2 fig. 1929.—The discovery of the Mediterranean Fruit Fly (*Ceratitis capitata*) within the U. S. A. was the occasion for the

undertaking of an eradication campaign, in many respects unique in the history of applied entomology. In spite of the lack of comparable established precedents, a campaign was organized, based on the eradication of the insect by the elimination of its hosts, since there were available no known means of checking the pest. The first concern in the organization of the campaign was that of quarantines to check or control the movement of host fruits into, or out of, the infested or protective zones; the second step involving enforcement of these quarantines to ensure the safety of the protective zones. The enforcement of the quarantine involved, among other activities, the patrolling of the quarantine lines.—*C. H. Hadley.*

4677. **FERRIS, G. F. The effectiveness of a plant quarantine.** *Science* 71(1829): 68-69. 1930.—The mealybug, *Pseudococcus brevipes* Ckll., which is abundant on pineapples in Hawaii, occurs in Florida and Texas (not known to be established in California) on various hosts. This insect is not supposed to pass quarantine barriers; it is frequently reported as among the "pests intercepted" by quarantine officials; yet the author has frequently seen it alive on bananas and pineapples in markets in California. He concludes that belief in the effectiveness of a plant quarantine, founded on the alleged failure of legally excluded pests to become established, is not sound; their failure to become established may be due, as in this case, to biological rather than to legal barriers.

4678. **FERRIS, G. F. The plant quarantines once more.** *Science* 71(1850): 606-607. 1930.—Note on the effectiveness and dangers of plant quarantines.

4679. **FLEURY, A. C. California prepares to prevent [Mediterranean] fruit fly invasion.** *Month. Bull. Dept. Agric. California* 18(7): 386-389. 1929.

4680. **FULLAWAY, DAVID T. Some practical considerations in plant quarantine.** *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 1: 1119-1123. 1926(1928).—An address stressing the value of plant quarantines, with particular reference to the exclusion of insect pests. Research by the inspection staff should be encouraged; the factors governing the establishment of introduced insects should be studied. The exclusion of plants and of soil from the country is approved, and the establishment of quarantine stations for such plants as must be brought in is suggested.

4681. **HARDISON, A. C. The status of the White Fly Campaign [in California].** *Month. Bull. Dept. Agric. California* 16(3): 132-134. 1927.

4682. **HARRIGAN, F. V. Development of equipment and destruction of fruit.** *Month. Bull. Dept. Agric. California* 18(7): 409-412. 2 fig. 1929.—Maceration and steam sterilization best disposed of fruit infested with Mediterranean fruit fly in Florida though most was covered in pits with 3 ft. of lime or oil and earth. Corn-stubble shredders effectively destroyed truck crop host plants. Poison bait sprays were applied to trees with rigs from hand outfits to power machines of 50 gal. per min. capacity. Airplanes were used to locate abandoned and wild host trees in hammocks and swamps.—*H. J. Ryan.*

4683. **HARUKAWA, CHUKICHI. Scientific bases of plant quarantine in the countries of the Pacific.** *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 1: 1131-1140. 1926(1928).—An animal migrant would not be expected to be able to establish itself in a zoogeographical region unlike that in which it originated; but since the present division of the earth's surface into zoogeographical regions is based chiefly on the study of the distribution of mammals and birds, limits so set up may not apply to insects. Two regions, palaearctic and oriental, are represented in the Japanese empire, and the insect fauna is a mixture of oriental and palaearctic spp., overlapping to such a degree that no definite boundary between them can be drawn. The climate of Japan is variable; that of Formosa is like that of Calcutta; Korea has a climate characteristic of the temperate zone. *Hoplocampa pyricola* Rohwer, a pest of the sand pear, is palaearctic in origin; in the south of Japan, where climatic conditions are such as to make possible several broods per year, it remains 1-brooded. The rice borer, *Chilo simplex* Butler, has 4 broods per yr. in Formosa, and 2 per yr. in Kyushu, Shikoku, and Honshu. The paddy borer, *Schoenobius incertellus* Walker, indigenous to India or Ceylon, has 4-6 broods per yr. in Formosa, 2 per yr. in Kyushu and Shikoku. The Oriental Peach moth, *Laspeyresia molesta* Busck has, in Japan, 2-6 broods per yr. according to climatic conditions.

4684. **HERRICK, GLENN W. Some economic aspects of plant quarantines.** *Amer. Assoc. Nurserymen Ann. Conv.* 55: 80-97. 1930.

4685. **HERRICK, GLENN W. Some economic aspects of plant quarantines.** *Florists' Exchange* 74(12): 9, 32, 37. 1930.—Asserting that there has been no perceptible diminution in the stream of foreign pests coming to this country since 1912, and that no domestic quarantine measures ever established have checked or retarded the persistent natural spread of an active, flying insect, the author opposes large expenditures for quarantines and advocates the use of the major part of the funds now spent for domestic quarantines in a rigid study of the behavior of these introduced forms. Foreign plant quarantines may be maintained by inspection and certification at points of origin in foreign countries, cooperating with the authorities in those countries.—*C. G. Bowers.*

4686. **HOIDALE, P. A. The Mexican fruit worm situation.** *Jour. Econ. Ent.* 22(5): 786-789. 1929.—Quarantine regulations with destruction of secondary host trees and clean-up work seemed to be controlling the spread of this insect. At present the Mexican fruit worm (*Anastrepha*) is found in the lower Rio Grande valley.

4687. **KISLIUK, MAX, Jr. Air routes, German dirigible "Graf Zeppelin" and plant quarantines.** *Ent. News* 40(6): 196-197. 1929.—The potential danger of the introduction of insect pests by air routes is dealt with, and a list given of insects and plant diseases which were intercepted from the "Graf Zeppelin" on October 15, 1928, at Lakehurst, N. J.

4688. **KISLIUK, MAX, Jr. Plant quarantine inspection of the dirigible "Graf Zeppelin."** *Jour. Econ. Ent.* 22(3): 594-595. 1929.—List of insects and fungi on flowers of passengers.

4690. **McLAINE, L. S. The basis and aims of plant legislation.** *Jour. Econ. Ent.* 22(3): 449-454. 1929.—While entomological training is necessary for those connected with plant legislation, a knowledge of commerce, economics and transportation is essential for the successful operation of any regulation other than a straight embargo. All regulations should be framed with a scientific background. One solution of the difficulties connected with plant legislation is the establishment of adequate inspection services in all countries, so that all commodities exported may be accompanied by a clean bill of health of real value. A brief review is given of the recently reorganized Canadian service, dealing with both import and export shipments of plants and plant products.—*Author's abstract.*

4691. **NEWELL, WILMON, and J. H. MONTGOMERY. A new angle to plant quarantine activities.** *Proc. Florida State Hort. Soc.* 1929: 145-151. 1929.—The author discusses the added hazards of introduction of pests and diseases through airplane.

4692. **O'KANE, W. C. The quarantine situation in California.** *Monthly Bull. Dept. Agric. California* 18(8): 436-441. 1929.—California represents an extraordinary diversity of topography, crops, insect pests, plant diseases and equally in the quarantine and control measures necessary in meeting plant pests. Port inspection work is highly organized. Control and eradication problems, such as that of the white fly, are well carried out on a large scale. Close relations are maintained with various packing associations. County horticultural commissioners

represent an extensive and important phase of state quarantine and control work. Experiment station activities include many research projects. Problems awaiting solution, such as vegetable weevil, the walnut husk maggot, the date scale, the Hippolates fly, are the subject of extensive studies. Correlation of research, control, and quarantine requires special effort because of the multiplicity of problems in the extensive areas involved. A plan is suggested by which further correlation might be undertaken, this to include the activities of the U. S. Dept. of Agric. through its substations, research work of the Univ. of California, and the activities of the State Dept. of Agric.—*W. C. O'Kane.*

ECONOMIC ENTOMOLOGY

BIOLOGICAL CONTROL

H. S. SMITH, *Editor*

(See also in B. A. 6(1): Entries 1345, 1361, 1729, 1844, 1847, 1860, 2573, 2623, 2662, 2715; and in this issue 3455, 4340, 4640, 4647, 4648, 4707, 5702, 5734, 5758, 5770, 5779)

4703. **ARAVENA, REYNALDO O. Informe sobre el Oeceticus platensis Berg en la localidad de Arano, F. C. S.** *Rev. Soc. Ent. Argentina* 1(3): 61-62. 1927.—Attempts to control the pest by introducing the parasite *Parexorista caridei* have been totally ineffective. Birds, as shown by examination of stomach contents, almost never eat *Oeceticus* [*Oiketicus*].

4704. **d'EMMEREZ de CHARMOY, D. Phytalus (Col., Melol.) in sugar-cane in Mauritius.** *Bull. Ent. Res.* [*London*] 22(1): 83-87. 1931.—*Phytalus smithi* Arrow was apparently imported from Barbados and has now spread over an area of 46,000 acres with appreciable damage on 3200 acres. Since 1911 the total number of beetles collected was 1,704,000,000 at a cost of Rs. 0.055 per 100. During the past 5 yrs. 205,000,000 larvae have been dug up at a cost of Rs. 0.03 per 100. These measures have been very effective in reducing damage. *Tiphia parallela* was successfully introduced from Barbados in 1916 and at present is as completely established as in Barbados with parasitism of 7-30% (ave. 20%). *Elis thoracica* was introduced from Madagascar in 1917 and is now well established as a parasite. It might be worth while to introduce *E. caracasana* from Venezuela or British Guiana. Two other enemies of sugar cane, *Rhizotrogus gravidus* and *R. pallens,* are kept under control in Mauritius by *E. rufa;* and *Oryctes tarandus* is held in control by *Scolia oryctophaga,* which was introduced into Mauritius from Madagascar in 1917.

4705. **FERRIÈRE, CH., et P. VOUKASSOVITCH. Sur les parasites des Aphides et leurs hyperparasites.** *Bull. Soc. Ent. France* 1928(2): 26-29. 1928.—Breeding records of aphid parasites and hyperparasites near Belgrade are given. *Ephedrus lacertosus* was bred from *Macrosiphonella absinthi* and in turn was hyperparasitized by *Pachycrepis clavata. Praon volucre* was a parasite of *Megalosiphum picridis, M. sonchi, Anouraphis amygdali, Rhopalosiphum lactucae,* and *Aphis brassicae. Aphidius medicaginis* attacked an *Aphis* on *Chenopodium,* but was in turn almost completely destroyed by hyperparasites, especially *Aphidencyrtus aphidivorus. Aphidius lonicerae* was bred from *Megalosiphum sonchi. Aphidius ervi* was bred from *Megalosiphum picridis, Macrosiphum cyparissiae,* and *M. pisi,* and was strongly hyperparasitized. *Aphidius sonchi* and *A. cardui* were bred from *Macrosiphum cyparissiae,* and *Aphidius brassicae* from *Aphis brassicae. Lysiphlebus dissolutus* attacked aphids on *Carduus* and *Chenopodium,* but was in turn highly hyperparasitized. *Trioxys aceris* was bred from an *Aphis* on *Ballota foetida;* and another *Trioxys* from *Aphis mali.* The hyperparasites *Asaphes vulgaris, Lygocerus testaceimanus, Pachyneuron aphidis, Aphidencyrtus aphidivorus,* and *Allotria victrix* were numerous and each attacked several hosts.

4706. **FLANDERS, S. E. The mass production of Trichogramma minutum Riley and observations on the natural and artificial parasitism of the codling moth egg.** *Trans. 4th Internat. Congress Ent., Ithaca 1928.* 2: 110-130. 13 fig. 1929.—The mass production of *T. minutum* was undertaken by the author not only to restore the "balance of nature" but to incline "the balance to parasite superiority," in the fight against the codling moth, *Carpocapsa pomonella,* in walnut groves in Cali-

fornia. The ease and rapidity with which it can be reared in enormous numbers under laboratory conditions makes possible its commercial production. Of the several spp. of lepidopterous insects used in the experimental stages for quantity production, it was found that *Sitotroga cerealella* was the best adapted. Countless generations can be reared from stored grain under regulated conditions, the tropisms of the adults are such as to simplify their accumulation into egg deposition cages and their oviposition responses facilitate the collection of eggs. Under laboratory conditions the life-cycle of *Sitotroga* is about 28 days and its fecundity about 40 eggs per ♀. This correlation permits a high rate of reproduction. "It is interesting to note that it will oviposit through a 20-mesh screen into a strong current of air from an electric fan. The air current stimulates oviposition." In 1927 the development of rearing methods progressed rapidly. In May a daily production of about 25,000 *Trichogramma* was obtained; in July this figure was increased to 200,000 daily due to improved methods. Preparations were made to rear a million *Trichogramma* adults daily during 1928. Parasitized eggs for liberation were mailed from the laboratory in tubes $5 \times 3\frac{1}{2}$ inches, in units of 500,000 eggs per mailing tube. Emergence of these eggs was effectively retarded by storage at 2°-7° C. At the beginning of egg deposition and continuing at weekly intervals during the period of maximum egg deposition (portions of) the cards are suspended by wire from the trees infested by the codling moth. The rate of dispersion of the emerged parasites varied directly with the temp. and light intensity, and inversely with excessive air movement and surface moisture. In 1927 "the effect of the release of *Trichogramma* was to increase the percentage of parasitism from less than 1% up to as high as 52.4% on the most highly infested trees," due allowance having been made for natural parasitism. The following year artificial parasitism made increases over natural parasitism of as high as 26%. The author predicts that "in the near future standardized methods in rearing will reduce the cost of *Trichogramma* production to less than $10.00 per million" parasites, permitting "the liberation of enough parasites in local defined areas to over-balance nature, and by parasite superiority cause a reduction of the host to a point below the economic minimum."—*S. M. Dohanian.*

4707. HAZELHOFF, E. H. Biological control of a sugar-cane aphid by transferring its native parasite from the old to the young fields. *Trans. 4th Internat. Congress Ent. Ithaca 1928.* 2: 55-61. 3 fig. 1929.—In Java sugar-cane is grown in 3-annual rotations with other crops, so each year *Oregma lanigera* Zehnt. and its chalcid parasite *Encarsia flavoscutellum* Zehnt. have to migrate from the old to the young fields. If *Encarsia* becomes established in time, the pest is held in check; if not, a serious outbreak may occur. The percentage of parasitism by *Encarsia* is of high prognostic value, indicating whether control measures are necessary. If chemical or mechanical control is used where *Encarsia* is abundant, a considerable decrease of parasitism may give rise to a renewed outbreak of the pest. A combined method of chemical and biological control consists essentially in not disturbing those colonies where *Encarsia* is abundant, and in transferring *Encarsia* to those fields where it is absent or scarce.—*E. H. Hazelhoff.*

4708. JARVIS, HUBERT. The woolly aphis parasite (Aphelinus mali Hald.). *Queensland Dept. Agric. & Stock, Div. Ent. & Plant Path. Ent. Leafl. 3.* 1-3. 1 pl, [1928?].—Life history notes.

4709. KÖHLER, P. Apuntes biológicos. [Biological notes.] *Rev. Soc. Ent. Argentina* 3(1): 63-66. 1930.—The author describes 3 diseases of insects, caused respectively by the fungi *Botrytis bassiana* and *Microsporangium polyedricum*, and by the sporozoan *Nosema bombycis*, and suggests that practical use might be made of them in the problem of insect control.

4710. MARÉCHAL, P. Deux drames dans une ronce. *Bull. Soc. Sci. Seine-et-Oise 2 Ser.* 10: 34-38. 1 pl. 1929.—Description of a mixed nest of the Hymenoptera, *Pemphredon unicolor* F. and *Prosopis confusa* Nyl., the first parasitized by a *Gasteruption* sp. (Evaniidae), the second by an undetermined parasite. The author sets forth the disadvantages of the linear series of the nest chambers.—*P. Maréchal (transl. by A. C. Hodson).*

4711. MEYER, ANTONIO CORREIA. Insecto nocivo á canna de assucar. Uma pratica condemnavel—Os inimigos naturaes. [An insect injurious to sugar cane and its control.] *Bol. Agric. Zootech. e Vet.* [*Minas Geraes*] 2(11/12): 11-16. 5 fig. 1929.—The advantages of the control of *Diatraea saccharalis* Fabr. by means of its natural enemies.

4712. MISRA, M. P., P. S. NEGI, and S. N. GUPTA. The noctuid moth (Eublemma amabilis Moore); a predator of the lac insect and its control. *Jour. Bombay Nat. Hist. Soc.* 34(2): 431-446. 5 pl. 1930.—Redescription of the larva, pupa and adult of this moth with notes on its life-history. A list of the natural enemies and an account of control measures are also given. The authors contend that not a single sample of lac (out of the many examined from various parts of India) was found to be free from the attack of the moth.—*S. Ribeiro.*

4713. NEWMAN, L. J., and H. G. ANDREWARTHA. Blowfly parasite. The red-legged chalcid. Stenosterys fulvoventralis (Dodd). Order Hymenoptera. Family Encyrtidae. Genus Stenosterys. *Jour. Dept. Agric. W. Australia Series 2nd* 7(1): 89-95. 1 pl. 1930.—This parasite was first found in "The South Coast Country" and is thus apparently indigenous to Australia. It has also been found in East Australia, but that strain is less virile. Its eggs are laid in the larvae of the several spp. of sheep blow-flies, and the adults issue from the blow-fly pupae, the length of the life cycle varying from 29 to 72 days. The parasite has become established in several districts and many thousands of adults have been distributed among the sheep flocks. The results with this parasite are more encouraging than with the other 2 under experimentation, namely, *Mormoniella brevicornis* and *Alysia manducator.*—*L. O. Howard.*

4714. PLANK, H. K. Nematodes parasitic on Diatraea saccharalis Fabricius in Cuba. *Jour. Econ. Ent.* 22(6): 982-983. 1929.—*Hexameris meridionalis* Steiner was found in the larva of *D. saccharalis* from Cuba. Other hosts of this species are *Orchelium vulgare*, a cricket, and the grasshoppers *Melanoplus femur rubrum*, and *M. differentialis. Cephalobus elongatus* de Man (?) was recorded from a dead larva of *D. saccharalis.*

4715. POOS, F. W. An annotated list of some parasitic insects. *Proc. Ent. Soc. Washington* 30(8): 145-150. 1928.—Lists 63 spp. recorded from the following hosts: *Acrosternum hilaris, Alabama argillacea, Aphis pseudobrassicae, Autographa brassicae, Bedellia somnulentella, Cirphis unipunctata, Diabrotica vittata, Hymenia fascialis, Illinoia solanifolii, Lema trilineata, Phlegethontius secta, Phthorimaea glochinella, P. operculella, Phytomyza ilicis, Plutella maculipennis, Pontia rapae, Pyrausta ainsliei,* and *Thyridopteryx ephemeraeformis.*

4716. POTGIETER, J. T. A contribution to the biology of the brown swarm locust. *Union So. Africa Dept. Agric. Sci. Bull. 82.* (*Univ. Stellenbosch Sci. Bull. No. 6*) 1-48. 1 map, 8 pl. (1 col.), 1929.—The publication is the result of a study of the locust problem in So. Africa begun in 1924. Details of the life history of *Locustana pardalina* Walk. as revealed in cage experiments and in field observations are recorded. No grounds were found in support of Uvarov's "phase theory" and it is contended that the color manifestations are caused by Mendelian factors. The natural enemies of the brown locust received special attention and the following dipterous parasites were found most effective: The tailed maggot fly (*Symmictus costatus*); the Bombyliid fly (*Systoechus albidus*); the muscid fly (*Stomatorrhina lunata*); the dotted locust fly (*Wohlfahrtia euvittata*). *W. euvittata* was successfully

raised artificially and a summary is given of the main facts of its life cycle.—*P. A. van der Byl.*

4717. **RAMACHANDRA RAO, Y. The prickly-pear cochineal. Its utilization for destroying cactus in South India.** *Madras Agric. Jour.* 19(1): 14-15. 1 pl. 1931.—A brief discussion of a wild cochineal, *Dactylopius opuntiae* (*tomentosus*), introduced from Australia in 1926-1927 and used successfully to exterminate the prickly-pear.

4718. **SPEYER, E. R. Biological control of the greenhouse white-fly.** *Nature* [*London*] 126(3191): 1009-1010. 1930.—Very effective control has been obtained by distribution of the parasite *Encarsia formosa* which most readily attacks the white fly on tomato plants. In this manner parasite stock can be obtained in quantity. Infested branches with parasitized insects are packed in boxes and shipped to subscribers. The best time for obtaining parasite control in the greenhouses is between March and September, or at other seasons if the minimum temp. can be held above 55° F.

4719. **SMITH, LESLIE M. Macrorileya oecanthi Ashm., a hymenopterous egg parasite of tree crickets.** *Univ. California Publ. Ent.* 5(8): 165-172. 5 fig. 1930.—The egg* of *M. oecanthi* is inserted into the egg cavities of *Oecanthus niveus* and *O. californicus,* and placed on the outside of the host egg.* The larvae* tunnel through the pith channel of the stem, eating as many as 15 eggs of the host. Pupation occurs within the stem, and the adults* emerge during Aug. and Sept. An unidentified species of Pteromalid hyperparasite was reared from *M. oecanthi.*—*L. M. Smith.*

4720. **STEENBURGH, W. E. A season's work on the colonization in Ontario of Macrocentrus ancylivora Rohwer, a parasite of the Oriental peach moth (Laspeyresia molesta Busck).** *Canadian Ent.* 62(4): 71-75. 1 fig. 1930.—*M. ancylivora* found in 1929 suitable summer breeding conditions in the Niagara Peninsula and multiplied and spread over about 35 sq. miles. As a very small number of the available Oriental Peach moth larvae were taken in the collections, the parasite recoveries represent a very small percentage of *Macrocentrus* population in the district. Already an appreciable amount of control has been demonstrated at the colonization points and in nearby orchards. Collections and field observations indicate the probability of the parasite overwintering in either of its available hosts.—*From author's summary.*

4721. **STRASSBERGER, RICARDO. Los enemigos de Rothschildia jacobaeae Walker. [The enemies of R. jacobaeae.]** *Revista Soc. Ent. Argentina* 1(2): 57. 1926.

4722. **THOMPSON, W. R. The natural control of Pyrausta nubilalis Hb. in Europe.** *Congrès Internation. Xe Zool. à Budapest* 1927 Part 2. 1183-1195. 1 map, 1 fig. 1929.—In addition to a brief general discussion of the status of insects introduced into new areas and their control by parasites, this paper comprises an outline of some of the principal results secured by the investigators of the U. S. Bureau of Entomology in the study of the controlling factors of *P. nubilalis* in Europe. The differentiations of the principal bioclimatic zones in topography, climate and agriculture are discussed and a map indicates centers of investigation in Europe. The environmental factors under consideration are: A. Natural controlling factors, 1. Intrinsic limiting the ecological optimum, 2. Extrinsic, a. Organic, parasites, predators, disease, b. Inorganic, climatic and topographic, composition of soil. B. Artificial controlling factors, agricultural practices, topping, destruction of stalks, etc. The parasites studied are enumerated and tables are given showing nature and extent of variation of parasitic fauna by zones. Control of *P. nubilalis* in Europe is not due to any single cause but is produced by a complex group of agricultural, parasitic, and meteorological factors which varies quantitatively and qualitatively and some of these are considered hypothetically in the re-establishment of a natural equilibrium.—*J. S. Wade.*

4723. **THORPE, W. H. Observations on the parasites of the pine-shoot moth, Rhyacionia buoliana Schiff.** *Bull. Ent. Res.* [*London*] 21(3): 387-412. 8 fig. 1930.—In this preliminary study of the parasites of the pine-shoot moth, *R. buoliana,* in England, 28 spp. of primary and secondary parasites were obtained; of these, *Gelis fallax, Pimpla elegans, Hypantyx impressus, Microbracon abscissor* and *Eutelus mediterraneus* are new to Great Britain. These and the following are new parasites of *R. buoliana: Phaeogenes coryphaeus* (?), *P. mysticus* (?), *Hemiteles bicolorinus, H. palpator* (?), *Pimpla robusta, Clistopyga incitator, Eulimneria rufifemur, Omorgus mutabilis, O. borealis, O. ensator, Apanteles falcatus, Eubadizon extensor* and *Habrocytus acutigena;* 13 spp. were represented by not more than 2 specimens and are probably of little economic importance. Of the remaining 15, 2 (*H. acutigena* and *E. mediterraneus*) are definitely hyperparasites, and at least 2 of the Pimplines (*Pimpla ruficollis* and *P. brevicornis*) are likely to live as hyperparasites under certain conditions. The dominant or "key" parasites in this complex appear to be the braconid, *Orgilus obscurator,* and 2 ophionines, *Cremastus interruptor* and *O. mutabilis.* These were shipped to Canada and the first 2 have become established there. A brief account is given of the salient facts in the biology of each sp. and the more important diagnostic characters of the adults are described to facilitate accurate identification; the essential critical details of the mature larvae of *O. borealis**, *O. ensator**, *E. rufifemur**, *O. obscurator**, *O. mutabilis, C. interruptor**, *Pimpla examinator**, *P. brevicornis**, and *P. ruficollis**, are described. Of these spp. the majority attack the larva. *P. examinator* is the only true pupal parasite which is at all common, but *O. mutabilis* and *O. obscurator,* although essentially larval parasites, frequently remain in their host and complete their development after it has pupated. Four other spp., though normally living as larval parasites, may occasionally emerge from the pupa. One egg-parasite, *Trichogramma evanescens,* was recorded. None of the common spp. is confined to *R. buoliana,* and there is no reason to suppose that the other spp., about which less is known, are specific.

4724. **TILLYARD, R. J. The biological control of noxious weeds.** *Papers and Proc. Roy. Soc. Tasmania 1929.* 51-86, 8 pl. 1930.—(1) General principles: In the series host-plant, insect enemy, parasite or predator, hyperparasite, any given term is to be regarded as beneficial or injurious according to the economic position of the host-plant in relation to man; e.g., the ladybird beetle, *Cryptolaemus montrouzieri,* must be classed as highly beneficial in California, where it attacks mealybugs on citrus trees, and injurious in the *Opuntia*-infested areas of Queensland, where it checks the activities of the beneficial Cochineal Insect, *Dactylopius tomentosus,* introduced to help to control the prickly pear, *Opuntia* spp. In dealing with the introduction of insects to control noxious weeds, the theoretical risk depends mainly on the degree of specialization of the insect and the botanical position of the weed involved. The practical risks are next considered, and rules laid down for minimizing them, including the careful construction of quarantine insectaries and the carrying out of oviposition and starvation tests therein. Before a liberation permit is secured, negative results should be obtained from tests on a wide range of economic plants.—(2) Early history of biological control of noxious weeds: This section deals with the work done by the Hawaiian Sugar Planters' Assoc. Exper. Sta., Honolulu. Lantana has been partially controlled by *Agromyza lantanae, Crocidosema lantanae, Thecla echion* and *T. bazochii.* Experiments are being carried out on Nut-grass, Pamakani (*Eupatorium glandulosum*) and Gorse.—(3) Biological control of prickly pear in Australia. The Prickly Pear in Australia consists of various spp. of *Opuntia* of which *O. inermis* is the commonest. Sixty million acres are infested, in Queensland and northern N. S. W. The introduced insects are *Chelinidea tabulata, Dactylopius tomentosus, Tetranychus opuntiae* (Red Spider) and a group of tunnelling caterpillars of which one, *Cactoblastis cactorum* from Argentina, has proved highly successful; its work of destruction is completed by the

soft-rot *Bacillus opuntiarum*.—(4) Biological control of noxious weeds in New Zealand: An account of the work begun at the Cawthron Institute, Nelson, in which the weeds being studied are Gorse, Blackberry, Ragwort and Piri-piri (*Acaena sanguisorbae*). *Tyria jacobaeae*, introduced from England for ragwort control, appears to be promising. Blackberry is a very difficult problem.—(5) Biological control of noxious weeds in Australia: An account of the work being taken up at the new Commonwealth Entomological Laboratories in Canberra. The weeds being studied are St. John's Wort (*Hypericum perforatum*), Cockle Burrs (*Xanthium* spp.), Ragwort, Skeleton Weed, etc. *Chrysomela hyperici*, *C. varians* and *C. didymata* have been introduced for *Hypericum* control and are being tested under quarantine conditions.—*R. J. Tillyard.*

(See also in this issue Entries 3523, 4614, 4629, 4630, 4631, 4633, 4639, 4643, 4650, 4673, 4682, 4738)

4726. FLEMING, WALTER E., and REINHOLD WAGNER. Miscible carbon disulphide. *Indust. & Eng. Chem.* 20(8): 849-851. 1928.—A recently perfected miscible CS_2, of which the preparation and the physical properties are discussed in detail, is equally as effective as emulsions of this compound for destroying the soil-infesting stages of the Japanese beetle, *Popillia japonica* Newm. It is no more injurious to plants, and furthermore, has certain physical and chemical advantages. Preparation: Sufficient KOH is dissolved in a solution consisting of 7 parts alcohol (95% denatured) and 3 parts water by volume to give a concentration of 24.5 to 25%. Mix 55 parts by volume of blown castor oil with each 10 parts of the alcoholic KOH solution. Gradually raise the temp. with agitation to 93.3° C and hold at this temp. until the reaction between the oil and the alkali is complete. Cool the mixture to room temp. and add the CS_2 in the amount of 35 parts by volume to 65 parts of the castor oil soap. Stir until the mixture is homogeneous. The resulting mixture should contain about 52% of total solids and 48% of volatile constituents of which about 40% is CS_2.

4727. GERSDORFF, W. A., and W. M. DAVIDSON. New solvents for the active principles of pyrethrum. *Indust. & Eng. Chem.* 21(12): 1251-1253. 1929.—Methyl, ethyl, isopropyl, normal butyl, secondary butyl, and tertiary butyl alcohols, as well as benzene, xylene, carbon tetrachloride, chloroform, ethylene dichloride, amylene dichloride, tetrachloroethylene, and diethyl carbonate, completely removed from pyrethrum the insecticidal principles effective against *Myzus persicae*. Normal and secondary butyl alcohols at 10% concentrations in water and benzene, and CCl_4, ethylene dichloride, tetrachloroethylene, and diethyl carbonate at 5% concentrations in ethyl alcohol, killed 50% or more of these aphids without injury to cabbage. At 5% concentrations all the extracts except xylene and amylene dichloride gave effective control against *M. persicae* without injury to cabbage. Normal and secondary butyl alcohols showed markedly greater toxicity to these aphids than tertiary butyl and isopropyl alcohols, which, in turn, showed markedly greater toxicity than methyl and ethyl alcohols. If cost is taken into account, denatured ethyl alcohol appears to be the best of the solvents tried for extracting pyrethrum when the extract is to be diluted with water for application upon plants. Boiling point temp. gave no advantage over room temp. in the extraction of pyrethrum with these solvents.—*Authors' summary.*

4728. MARCANDIER. Recherches sur l'action antiseptique et insecticide des vapeurs de chloropicrine. II. Action insecticide de la chloropicrine. *Arch. Med. et Pharmac. Navales* 118(3): 205-237. 1 fig. 1928.—Chloropicrin was tested as an insecticidal fumigant both in flasks in the laboratory and in rooms. In a dosage of 10 to 20 gms. per cubic meter for 24 hrs. at 15° C. its vapors killed lice, *Pediculosis vestimenti*, and their eggs both in the open and when covered by cloth. If a higher dosage was used a shorter exposure was sufficient. Saturated vapor of chloropicrin or its water solution killed them in less than 15 min. Higher temp. favored the action of the fumigant. Both the adults and the larvae of moths (*Tineola biselliella, Tinea pellionella* and *Trichophaga tapetiella*) were killed by the vapors of chloropicrin in a dosage of 15-25 gms. per cu. meter for 48 hrs. As there is some doubt about the killing of the pupae of the 3 spp. of moths and the eggs of *T. biselliella* and *T. pellionella*, it is preferable to make 2 fumigations at an interval of 3 or 4 weeks. In a dosage of 10 to 20 gms. per cubic meter for 24 hrs., chloropicrin vapor killed bedbugs (*Cimex lectularius*), their eggs, and cockroaches (*Ectobius lividius, Blattella americana* and *Blatta orientalis*), both exposed and covered with cloth. The action on the eggs of cockroaches is not certain. It is therefore well to fumigate twice at an interval of 3 weeks. For the treatment of sarcoptic itch of man no superiority over other treatments has been shown. Experiments on simultaneous fumigation with formaldehyde in a Gonin fumigator as a disinfectant and chloropicrin as an insecticide showed that the 2 compounds did not interfere with each other, each exerting its characteristic action as if the other were absent. However, it is suggested that the chloropicrin should be added after the formaldehyde gas has been evolved from the generator.—*E. L. Griffin.*

4729. MARCOVITCH, S., and W. W. STANLEY. Insecticidal properties of cryolite and barium fluosilicate. *Indust. & Eng. Chem.* 22(2): 121. 1930.—Preliminary paper. Tests with the flea beetle and hornworm of tobacco and the Mexican bean beetle are reported.

4731. PAOLI, GUIDO. Alcune applicazioni delle soluzioni di cianuro di sodio nella lotta contro gl'insetti. [Use of sodium cyanide solution in insect control.] *Boll. R. Staz. Patol. Veg.* [*Firenze*] 9(3): 273-281. 4 fig. 1929.—NaCN solution poured on the ground or on other absorbent substances decomposed rapidly on exposure to air, with the formation of HCN. This is very effective in destroying insects in the ground or in dung, sewage, etc. It is particularly recommended for the destruction of nests of social insects, as termites and ants. $Ca(CN)_2$, the use of which is prohibited in Italy, can be used for slower fumigation of insects indoors, as in warehouses, bins, etc.—*Author's summary* (*transl. by R. A. Muttkowski*).

4732. PEET, C. H. Evaluation of insecticides. *Indust. & Eng. Chem.* 20(11): 1164-1165. 1928.—The following variables should be considered in testing an insecticide by the method of biological assay: Temp., which should be that of the insect's maximum activity; time interval between application of the insecticide and taking the result; humidity of the testing chamber; concentration of the toxic substances in its carrier; kind of sprayer; spraying pressure; agitation, if gases or mists are employed; condition of insect; replication of tests. Method for testing insecticides on the housefly (*Musca domestica* L.) and on aphids and red spiders are outlined.—*C. H. Richardson.*

4733. RIPLEY, L. B., and G. A. HEPBURN. Studies on the reactions of the Natal fruit-fly to fermenting

baits. A new olfactometer successully used with fruit-flies. *Union S. Africa Dept. Agric. Ent. Mem.* 6. pp. 19-53; 55-74. 7 fig. 1929.—An attempt is being made to control the Natal Fruit-fly [*Pterandrus rosa*] by baited traps and repellents, the former to be hung in trees where there is no fruit in stages susceptible to attack by the fly, the latter to be applied to trees bearing susceptible fruit. To test this scheme a detailed search is being made for substances that attract or repel the fruit-fly. Some 150 pure chemicals and a number of essential oils have been tested in field and laboratory, using several kinds of especially designed apparatus, including a new type of olfactometer, which is described in detail. A certain fermenting pollard bait is the strongest attractant known, owing its attractiveness to products of fermentation. Clove oil is nearly as strong an attractant. Its attractive ingredient is not eugenol and is not yet found. Linalyl acetate (occurring in peaches) is the only fruit ester yet found to be a strong attractant, but many volatile compounds occurring in fruits or fermenting baits are weak attractants. No mixtures of attractants tested attract more than certain of the ingredients used alone at a concentration equal to that of the mixture. The optimum concentration for trapping flies with linalyl acetate lies between .1 and .15% with 2.5% ethyl alcohol as a solvent, but higher concentrations are required to attract them from a distance. True repellents appear rare. Peppermint oil and isopropyl alcohol are among the strongest found. (Creosote and asafoetida attract.) Substances obscuring the odor of attractants, termed "obscurants," are numerous, e.g., fusel oil and turpentine, which obscure pollard bait. Visual reactions of the fly to color, luster, light intensity and to objects of different shapes have been studied as indicating the most attractive type of trap for holding the bait. Although highly sensitive to differences in light intensity, preferring lighter colored objects to darker ones, no color sense could be demonstrated. Lustrous objects are preferred to dull. Vitreous luster is preferred to metallic. Heavy glass jars are indicated as traps and have been satisfactory in practise.—*L. B. Ripley.*

4734. **ZACHER, F., und G. KUNIKE. Untersuchungen über die insektizide Wirkung von Oxyden und Karbonaten. (Beiträge zur Kenntnis der Vorratsschädlinge, 5. Beitrag.)** *Arb. Biol. Reichsanst. Land- u. Forstwirtsch.* 18(2): 201-231. 1930.—The insecticidal value of dusts, especially the oxides and carbonates of the light and heavy metals, which are relatively inactive from the chemical standpoint, was studied. The oxides and carbonates of Mg, Mn, Si and other metals, when very finely divided, acted as true contact insecticides upon *Periplaneta, Calandra, Phyllotreta* and other insects. They did not act as stomach poisons or fumigants. The weakly alkaline reaction of the solutions and the metallic radicals are not responsible for the effect, as very finely divided silicon dioxide was effective. Various stages of development were differently affected, as were the different spp. of insects. There seemed to be a relationship with body size, and especially with body surface and contents. The dusted insects became completely dry in a short time, so that loss of weight which caused death could be quantitatively determined. The dusting was not effective in moist air. Plant tissues were not altered by a solution of magnesium oxide, either visibly or in weight. Wheat plants treated with oxides and carbonates of Mg and Cu showed no effects upon growth or reproduction. The insecticidal action is apparently not a chemical one, but is a surface phenomenon of physical character so influencing the water outgo that the dusted animal succumbs in a few days, due to an overwhelming thirst. Because of the especially strong action under conditions of low humidity and high temp. these compounds should be of especial value in hot, arid regions.—*Zacher and Kunike (transl. by W. C. Cook).*

4751. **DAVIDSON, H. R.** The value of grazing for fattening pigs. *Scottish Jour. Agric.* 13(3): 288-293. 1930.—Several factors are involved in the grazing of pigs, many of them advantageous, some of them not. In the case of breeding pigs nearly all of the advantages do not, as a rule, apply. In the case of fattening pigs a number of experimental results indicate that when a ration is otherwise properly balanced the addition of green feed makes little if any difference. When young pigs are grazed for a few weeks after weaning, the advantages of exercise and exposure to fresh air and sunlight lead to an improvement in constitution which is reflected in relatively increased gains when the animals are fattened inside. Where green food must be consumed as being the cheapest available foodstuff, it may be fed, preferably cut and supplied in the sties, at a rate not exceeding an average of about 6 lb. per head daily.—*Author's summary.*

4753. **DUERDEN, J. E., and P. S. BOTHA.** Density variation in the fleece of the merino. *S. African Jour. Sci.* 27: 546. 1930.

4754. **ELSDON, G. D., and J. R. STUBBS.** The freezing point of milk as a means of detecting added water. *Analyst* 55(652): 423-432. 1930.—For the present it may be assumed that an average of 0.54 may be taken for calculating added water, but that no milk should be considered as watered on the evidence of the freezing point of a single sample alone, unless the depression falls below 0.53. It seems to be fairly well established that as a milk becomes sour the depression of the point increases, so that the method is applicable only to fresh milks or slightly sour milks after suitable correction. All the freezing points determined by the authors have been obtained on fresh milks. The acidities given are in ml. of *N*/10 NaOH for 10 cc. of milk. The Hortvet apparatus is recommended as a convenient and rapid process for the determination of the freezing point of milk.—*From authors' summary.*

4755. **FALTIN, ADOLF, és GÉZA DEDINSZKY.** A tehén- és juhtejzsír néhány állandójának változása évszakonként. [Seasonal changes of some constants of cow and sheep milk fat.] [German summary.] *Kisérletügyi Közlemények* 33(1): 62-77. 1930.—Weekly samples of creamery butter from Debreczen (in the Hungarian lowland plain) were studied for an entire year to find the variations in the Reichert-Meissl number, the Kuhlmann-Grossfeld butyric acid number, the Polenske number and the Raalte xylene number. Twenty-four samples of freshly churned butter from ewe's milk were also investigated. The Reichert-Meissl number averaged 26.94 in the creamery butter and 26.86 in the butter from the ewe's milk with ranges of 22.5 to 31.7 and 22.46 to 30.44 respectively. The averages for the butyric acid number were 18.82 for the creamery butter and 18.47 for the other with ranges of 17.9 to 20.9 and of 15.77 to 21.04. The Polenske number averaged 3.38 in the creamery butter and 3.75 in the butter from ewe's milk with ranges of 1.8 to 5.8 and 2.2 to 6.93 respectively. The xylene number averaged 18.27 in the creamery butter and 18.03 in the butter from ewe's milk with a range from 17.7 to 20.36 in the creamery butter. The Reichert-Meissl numbers were highest in the winter months and lowest in the summer when the animals were on pasture. The transition from pasture to stall feeding affected the butyric acid number and the xylene number less than it did the Reichert-Meissl number. The author believes the butyric acid number and the xylene number are advantageous in the judging of butter. Hungarian butter seems to be poorer in butyric acid than foreign butter is. The figures found for the Polenske number are higher than those usually reported in the literature on the subject. The Polenske number and the Reichert-Meissl number vary in direct proportion to each other. The results with the butter from ewe's milk are very similar to those from the creamery butter. As lactation advances the Reichert-Meissl number and the butyric acid number gradually decrease. The butyric acid number and the xylene number are correlated with the Reichert-Meissl number in fluctuation but are much less variable.—*J. L. Lush.*

4756. **HANSSON, NILS, und SVEN BENGTSSON.** Der allgemeine Nahrungsbedarf der Mastschweine beleuchtet durch praktische Fütterungsversuche. *Tierernährung* 1(5/6): 578-607. 1930.—Hansson's old feeding standard for fattening pigs was examined as to its applicability for swine of bacon type. A more liberal feeding than that stated in the norm gives a higher daily increase but also a higher food consumption per kgm. of growth; a less liberal feeding leads to decreased daily growth but also to a somewhat diminished food consumption per kgm. of gain. The old standard seems, therefore, to meet fairly well the feed requirement of swine of bacon type. The norm is stated in the bulletin and expressed in feed units.—*N. Hansson.*

4757. **HORN, VALENTIN, und THEOBALD PREIS.** Schweinemastversuche mit Gerste und Roggen. [English summary.] *Tierernährung* 2(6): 487-504. 1931.—In tests to determine the value of rye for fattening swine, various mixtures of rye and barley showed better gains than the lots with barley alone. In the main test the gains of the lots with a mixture of $\frac{2}{3}$ barley and $\frac{1}{3}$ rye and of those with barley and rye at equal parts were the same; whereas the gains of the groups with a mixture of $\frac{2}{3}$ rye and $\frac{1}{3}$ barley remained noticeably behind the gains of the other groups, mainly caused by the frequent heat and the smaller feed consumption during

these periods. The application of Vigantol to 2 groups leads to somewhat better gains. An unfavorable influence of feeding rye on the quality of meat and fat could not be proved in any case. Thus the results of the trials show, that rye mixed with barley produces at least the same effect in fattening swine as the feeding of barley alone, without any unfavorable influence on the quality of meat or fat.—*Authors' summary.*

4758. **INGHAM, L. W., DEVOE MEADE, and M. H. BERRY.** Calf feeding investigations. I. Raising dairy calves on nurse cow, whole milk, remade skim milk, and calf meal. *Maryland Agric. Exp. Sta. Bull.* 319. p. 277-302. 7 fig. 1930.—To determine whether or not it is possible to raise strong, healthy, vigorous calves by feeding substitutes for or supplements to whole milk, and to compare the cost and efficiency of several methods of feeding, 16 calves ranging in weight from 70 to 115 lb. and in age from 8 to 20 days were fed from Oct. 15 to Apr. 15. The animals were divided into 4 lots of 4 head each. Lot 1, composed of the 4 youngest and smallest calves, were all put on one nurse cow; lot 2 was hand-fed a minimum amount of whole milk; lot 3, hand-fed remade skim milk (1 part of skim milk powder to 9 parts of water); and lot 4, Maryland Calf Meal mixture (equal parts of ground yellow corn, ground oats, wheat bran, skim milk powder, and ½ part of linseed meal). The latter mixture was fed as a gruel, 1 part being mixed with 9 parts of water, to which was added 1% salt. These results indicate that large vigorous calves may be dropped from liquid feeding when from 30 to 45 days of age, while less vigorous calves should be continued to 60 days of age. The nurse cow is very satisfactory for raising delicate and valuable calves, but hand-feeding of whole milk is too costly a method. Approximately 100 lb. of whole milk and from 60 to 85 lb. of dry skim milk, part of which may be fed as a liquid, are required to raise a normal calf. Remade skim milk may be fed cold with good results. The method which included the Maryland Calf Meal mixture was somewhat cheaper than some of the other methods and reduced the whole milk, grain, and skim milk to a minimum.—*L. W. Ingham.*

4759. **KNEPP, EARL M.** Factors affecting tank type milk coolers. *Agric. Engineering* 11(9): 301-303. 3 fig. 1930.—The use of the agitator greatly increases the rate of cooling obtained by tank type coolers. It is possible to cool milk from 95 to 60° and below in the tank-type coolers using the agitator, in the same time that is required to obtain the same temperature in surface-cooled milk placed in a tank without agitation. When the tank operated at 45°, the agitator greatly reduced the rate of growth of bacteria. Operating the tank at 35° greatly increased the cost of operation, and would not be justified except where the dairyman received a good bonus for his milk, or had to ship it long distances. The number of kilowatt-hrs. used for each 100 B.T.U. of heat removed varied with the different machines, and temp. to which the milk was cooled, from 0.0583 to 0.0123. Even in well-insulated tanks the refrigeration lost through the sides of the tank was from 48-90 lb. of ice for each 24 hrs.—*Author's summary.*

4760. **[KOLMAKOV, D. V.]** КОЛМАКОВ, Д. В. Пух северного оленя и его применение. [The reindeer's down and its utilisation.] Советский Север. [*Soviet North* (*Moscow*)] 1930(1): 106-107. 1930.

4761. **KRZYWANEK, WILHELM, und HANNS BRUEGGEMANN.** Modellversuche zur Physiologie des Saugaktes. *Berliner Tierärztl. Wochenschr.* 46(40): 710-713. 4 fig. 1930.—By means of an artificial teat the action of the mouth of the calf during sucking was recorded and studied. The pressures in the mouth cavity of the calf ranged from +50 to −290 mm. of Hg. Perhaps the range would not be quite this large under normal conditions. The pressure exerted by the calf proceeds in a wave-like manner from the base to the point of the teat.—*J. L. Lush.*

4762. **LING, A. W., C. A. MacEACHARN, and C. COMELY.** The effect of different balanced rations on the yield and composition of milk from dairy cows. *Univ. Bristol Dept. Agric. and Hort. Bull.* 3. 3-18. [1930]. —From the results obtained it appears that, provided the rations are balanced as to starch equivalent and protein content and the constituents of the ration are such as not to cause digestive trouble, they will not seriously affect the yield or composition of the milk. Variations take place in the yield and composition of the milk of individual cows from day to day, but these cannot be correlated with the change of ration of the types investigated. In one of the rations fed the oil content was 10%, but this amount did not appear to depress the percentage of butter fat in the milk.

4763. **MACALIK, BASIL.** Dějiny chovu koní na Hané. [The history of horse raising in the Haná region, Czecho-Slovakia.] [French summary.] *Sbornik Československé Akad. Zemědělské* 5(3): 295-360. 1930.—Studies of skulls and of bones of horses recovered from prehistorical diluvial and alluvial beds prove that 2 spp. lived in the region of Haná: the heavy horse, with the size of the horse of the valley, and the light horse, about the size of oriental horses. In historic times the 2 spp. probably lived simultaneously. According to 18th century writers, Moravian horses were small; documents of the first half of the 19th century represent them as larger and stronger in the mountainous regions than in the plains in the region of Haná. According to studies of laboring conditions of that time, the horse of this country was vigorous, of an average height of 160-170 cm., with a lively temperament, and black or dun. Chestnut and white horses were not found in the region of Haná until the close of the 19th century, when the peasants were required to mate some of the emperor's stallions with suitable mares. The peasants have raised the horses with particular care. All the horses were raised on pasture, where they remained day and night. After the dividing up of the pastures in 1870-1885 the horses have been raised solely in stables. Until 1869 horse raising was under the direction of the ministry of war; since then it is under the ministry of agriculture. Government officials and some horse breeders determined the aim of breeding, which was the raising of a strong and massive horse for the artillery. In order to reach this goal, 2 associations of horse breeders were established: a central association of breeders of medium light horses, and another for the breeding of the heavy horse. Both maintain stud books. It is estimated that 87% of the horses of the region of Haná are light horses.—*From author's summary* (*transl. by W. R. Horlacher*).

4764. **M'CANDLISH, ANDREW C.** The length of life of the dairy cow. *Scottish Jour. Agric.* 13(3): 284-287. 1930.—It is known that dairy cows do not reach maximum production until they are 7 years of age, that is in their 5th lactation. Only a relatively small percentage, however, reach maturity, as their average life in the producing herd would appear not to exceed 4 years. When the animals which reach maturity are considered, it is found that those which calved for the 1st time at an early age have the shortest life but the longest period of usefulness, while those coming into production at higher ages have longer lives but shorter periods in the producing herd. In total lifetime production heifers calving for the 1st time at about 2½ years of age excel all other groups.—*Author's summary.*

4765. **MANGOLD, ERNST, und FILIPPO USUELLI.** Die schädliche Wirkung der Milch und der Veränderungen der H-Ionkonzentration auf die Infusorien des Wiederkäuermagens. *Wissensch. Arch. Landwirtsch. Abt. B. Tierernähr. u. Tierzucht* 3(2): 189-201. 1930.—Milk and several of its fermentation products accelerate the death rate of the infusoria of sheep's rumen contents. The injury to the infusoria was invariably greater, the more acidic the sample. It was concluded that injury to the infusoria of the contents of the rumen caused by feeding milk is principally due to acid formed from the milk by bacterial action.—*Author's summary* (*transl. by E. O. Whittier*).

4766. **NITSCHE, MAX.** Untersuchungen über die

Brauchbarkeit des absoluten und relativen Milchleistungsgrades als Beurteilungsmasstab für die Rentabilität des Einzeltieres im gesamten Kuhstand. *Wiss. Arch. Landw. Abt. B, Tierernähr. u. Tierzucht* 2(5): 599-625. 1930.—Yearly milk and feed records from 334 Schonhengster cows in the Landskroner milk control society were studied. Actual milk and butterfat yields appeared nearly to parallel relative production per feed unit (starch value) in feeds consumed. As total production increased, relative milk yields per 100 feed units also increased. The above relationship varied, dependent upon protein intake of individual cows. Groups of cows receiving 1 part protein per 6.0, 6.9, 7.8 and 8.7 feed units yielded 3,351, 2,753, 2,148 and 2,109 kgm. milk respectively; relative milk yields were 190, 168, 147 and 141 kgm. and feed protein per kgm. milk 5.29, 4.83, 3.51 and 2.60 kgm. Cows on low protein intakes appeared to draw on body protein, and restrict milk production. Protein requirements were influenced more by milk yield than by body weights. Utilization of feed for production by individual cows in a herd appears to be a basis for rating their relative efficiency or profitableness.—*R. B. Becker.*

4767. **OLDENBURG, F. Beeinflussung von Milch und Butter bei Fütterung der Milchkühe mit Kartoffeln, Sorte "Pepo."** *Tierernährung* 2(6): 482-486. 1931.—When potatoes were fed, no effect on flavor or taste of milk or butter could be detected. The consistency of the butter was rather soft, possibly due to the simultaneous feeding of sunflower cake. The quality of whipped cream, too, was rather unfavorable. There was no essential change in the normal physical constants of the milk. When mangels were fed (check period), the milk fat globules were larger than during the periods of feeding potatoes. The melting and running points of pure butterfat tended to decline, when potatoes were fed for a long time. The other physical constants of the butterfat were not essentially changed.—*Author's English summary.*

4768. **RAJSTIS, E., és J. SCHANDL. A Voronoff-operáció hatása a gyapjútermelésre. [Effect of the Voronoff operation on the wool production of sheep.]** [German summary.] *Kisérletügyi Közlemények* 33(1): 88-93. 1930.—The production of clean wool of 3 4-year-old rams in 1928 was determined accurately. After shearing the Voronoff operation was performed. In the following year (1929) no favorable effect on wool production was evident.—*Authors' summary (transl. by W. E. Joseph).*

4769. **ROBERTS, E. J. Some observations on the secondary sex ratio in a group of Dairy Shorthorn and Welsh Black cattle.** *Jour. Agric. Sci.* 20(3): 359-363. 1930.—In the 18 herds, the highest ratio in any herd was 139.1, and the lowest 76.3. The ratio for 2087 Dairy Shorthorns was 97.1, and 100.1 for 2825 Welsh. The effect of season is seen in a ratio of 94.8 for March-August calves, and 106.0 for September-February calves. The effect of age is more difficult to ascertain owing to an increasing tendency of cows to calve in spring as they get older.—*E. J. Roberts.*

4770. **SCHANDL, JÓZSEF. A benöttség értékelése a merinóknál. [Correlation of the extent of wool covering of fine wool Merinos and fineness of wool and density of fleeces.]** [German summary.] *Kisérletügyi Közlemények* 33(1): 93-99. 1930.—The Royal Hungarian Agricultural Institute for wool grading has accurately determined the degree of wool covering of 60 fine wool Merino sheep that were differently covered, and has compared the data with the weight of clean wool obtained from 100 sq. cm. of body surface (side) which had a length of staple of 1 cm. The results show no relation between the amount of wool covering and the density of the wool fibers. Likewise, there was no correlation between wool covering and the fineness of fiber in the fine wool Merino type of sheep. It would also be incorrect to ascribe a greater significance to covering than to the value of parts of the fleece shorn from the better covered extremities or the better covered head. A high degree of wool covering cannot be considered as a measure of the density of fleeces or fineness of wool fiber.—*Author's summary (transl. by W. E. Joseph).*

4771. **SCHMIDT, J., und H. VOGEL. Fütterungsversuche mit rohen Kartoffeln bei Milchkühen.** [English summary.] *Tierernährung* 2(6): 449-466. 1931.—In a normal ration of beet-roots, hay, straw, and a mixture of concentrates, fed to dairy cows yielding various amounts of milk, it was possible to replace the beet-roots completely by an amount of fresh, cut potatoes, containing the equivalent of starch values. At the most, 50 kgm. of beet-roots in the daily ration were replaced by 18.8 kgm. of potatoes. The av. utilization of the feeds, based on the quantity of starch-values, required for the production of 100 kgm. of milk was with potatoes about 20% less, and the average quantity of milk about 5% less, than with beet-roots. The feeding of potatoes had no significant effect on the quantity of milk-fat produced, nor on live weight. Though in this test the feeding of potatoes resulted in a lowered av. utilization of the feeds and a decrease of milk-yield, the feeding of potatoes is recommended in all cases of an unprofitable potato market.—*Authors' summary.*

4772. **SCHOLZ, ROBERT. Untersuchungen an Saugkälbern über die Ausnützung des Milcheiweisses bei Zufütterung von Kohlenhydraten.** *Tierernährung* 1(5/6): 502-538. 1 fig. 1930.—In a preliminary trial with 7 calves, potato flakes (chips) produced 92 gm. greater daily gains. By increasing or at least maintaining these gains in the future they also give promise of a better development of the calves. No impairment in quality of meat could be detected after butchering. The addition of potato chips to the ration reduced the cost of raising calves by 0.03 mk. for every 100 gm. increase in live weight, and by 0.11 mk. after substituting dry malt for the expensive diastase preparation. Feeding potato flakes was accompanied by about 10% less protein decomposition with a correspondingly greater protein retention. After the age of 12-14 days supplementary feeding of potato flakes is recommended especially since the method of feeding is very simple, but diastase should be added, which may perhaps also be replaced by somewhat larger amounts of dry malt.—*Author's summary (transl. by A. H. Kuhlman).*

4773. **SPENCER, J. B. Sheep husbandry in Canada.** 6th ed. *Canada Dept. Agric. Bull.* 75. 1-111. 59 fig. 1928.—A revised edition of Bull. No. 41 N. S. 1928.

4774. **URQUHART, J. C. The composition of the milk of British breeds of goats.** *British Goat Soc. Year Book* 1930: 115-123. 2 pl. 1930.—The average fat content of the milk of all goats in the milking trials at British Shows, 1919-1929, was: a. m. 4.00%; p. m. 4.51%. The average yield per day in the same period was 8.72 lb., showing an increase in average yield from 4.74 lb. in 1919 to 9.81 lb. in 1929. Figures are given showing the average composition and yield, and the variations from year to year for the different breeds. There is some indication that there has been a reduction of fat content accompanying the increase of yield, but that such reduction is slight. Some evidence is given as to the effect of change of conditions, such as removal to a show, on the fat content of the milk.—*From author's summary.*

4776. **WHITEHOUSE, F. Feeding pigs on rough rice. An experiment at Hawkesbury Agricultural College.** *Agric. Gaz. New So. Wales* 41(7): 535-542. 1 fig. 1930.—The small number of pigs (19) and the abnormal weather conditions do not allow of generalisations. Rice was profitably utilised as a grain supplement with a small amount of meat meal fed with it. Gains were proportionate to the total digestible nutrients of the rations. More time was required to prepare wheat than rice, but the same amount of labor in feeding both rations. The pigs relished both rations with avidity. The wheat ration induced a greater desire for cinders than the

rice ration. No evidence of indigestion, digestive derangement or depraved appetite was noted with either ration. The pigs on the wheat ration appeared more contented; those on rice ration more active. The need for increasing rations in accordance with increasing weights was indicated on 2 occasions.—*From author's conclusions.*

4777. **WHITTET, J. N. The importance of pasture improvement to fat lamb production.** *Agric. Gaz. New So. Wales* 40(9): 635-644. 10 fig. 1929.—Statistics showing that the production of fat lambs might profitably be increased in N. S. Wales; and advice for a greater use of top-dressing and more planting of grass and of legumes to improve and enlarge the pasturage.—*M. H. Keith.*

Pr. $2.00—Includes general information on rabbit and cavy breeding and culture, and short articles on different phases of the subject by various authors.

POULTRY

4780. **ATWOOD, H. A study of the time factor in egg production.** *West Virginia Agric. Exp. Sta. Bull.* 223. 11p. 1 fig. 1929.—A study was made of egg laying cycles and the relative time intervals of laying and the effect on the size of the egg. Data with correlation and deviations for egg cycles from 2 to 8 or more eggs showed that the longer the cycle, the shorter are the intervals between the laying of successive eggs. The greatest interval in a given cycle is usually between the last 2 eggs of a cycle, and the shortest intervals are about the middle. Shorter intervals of the cycle as a whole were usually associated with prolific layers and the intervals tend to lengthen as the bird ages. The first egg of each cycle was generally the heaviest with a gradual decline in weight of each succeeding egg until the last of the cycle. This study was based on the premises that when a bird lays for several days in succession, the 1st egg of the cycle or clutch generally is relatively early in the forenoon. The remainder of the eggs are laid later and later on succeeding days, the last egg of the cycle being laid late in the afternoon. Then the bird ceases to lay for 1 or more days, and when a new cycle is started, the 1st egg is again laid early in the forenoon, and so on. The author cites the practical application of the fact that the high degree of regularity with which birds lay later and later in the day on succeeding days affords a means by which trap nest records may be checked with a high degree of accuracy when the time of laying is recorded for each day.—*D. C. Kennard.*

4781. **BLAKE, R. C., and RALPH STOUTAMIRE. Ducks and geese in Florida.** *Dept. Agric. Florida Bull.* 38. 5-24. 8 fig. 1930.

4782. **BLAKE, R. C., and RALPH STOUTAMIRE. Turkey raising in Florida.** *Dept. Agric. Florida Bull.* 41. 5-23. 8 fig. 1930.

4783. **BUCKNER, G. DAVIS, J. HOLMES MARTIN, and W. M. INSKO, Jr. The calcium and phosphorus requirements of growing chicks.** *Proc. 21st Ann. Meet. Poultry Sci. Assoc. 1929.* [In: *Bull. Alabama Polytech. Inst.* 25(1): 27-28. 1930.]—Raw bone meal proved equally good, if not better, than raw bone meal and limestone when fed as supplements to a yellow corn meal, wheat middlings and skimmilk to growing White Leghorn chicks.

4784. **CRUM, J. H. The crumalow back-yard poultry system.** 91p. 2 pl., 9 fig. Walton Book Co.: New York, 1928.

4785. **FAWKES, A. K. Record of seven Busra hens sent to the national egg laying test, England, by the U. P. Poultry Association, Lucknow.** *Jour. Central Bur. Animal Husb. and Dairying in India* 4(4): 161. 1930.—Preliminary report of a test to be continued.

4786. **GRAHAM, W. R., J. B. SMITH, and W. D. McFARLANE. Results of a three years study of certain poultry rations as they affect the hatching power of hen eggs as well as the number of eggs laid.** *Ontario Dept. Agric. Bull.* 362. 3-11. 1 fig. 1931.—In feeding value, for egg production, fish meal, powdered buttermilk, beef scrap and tankage, ranked in the order named. Cod liver oil added to a combination of milk and fish scrap, of milk and beef scrap, or of milk and tankage, increased the hatching power of the eggs set and the number of eggs produced. With a grain ration such as this, plus alfalfa meal, the addition of direct sunshine or sunshine substitutes (a good grade of cod liver oil or ultraviolet light) is the most important factor in producing good hatching eggs for the rations tested. Vitamin D appears to be an important factor in hatchability. Birds housed in these feeding trials did not get the necessary amount until there was at least 200 hrs. of sunshine per month. Milk in combination with beef scrap or fish scrap together with cod liver oil appeared to be the most satisfactory feed used, when hatching power of eggs, number of eggs produced and pounds of feed required to produce a dozen eggs are considered.—*Authors' conclusions.*

4787. **JULL, M. A. Good farm feeding practice profitable to farmers, packers, consumers. Growth controlled by amount of feed consumed—a good frame essential to successful finish feeding.** *U. S. Egg & Poultry Mag.* 37(4): 28-31, 66, 69. 7 fig. 1931.—From a series of experiments with pens of cockerels and pullets, respectively, fed specific amounts of feed from hatching time to 24 weeks of age, it was determined that growth in both sexes is controlled by the amount of feed consumed and is irrespective of age.—*M. A. Jull.*

4788. **JULL, MORLEY A. Poultry husbandry.** ix+639p. 229 fig. McGraw-Hill Book Co., Inc.: New York, 1930.—This book presents fundamental scientific principles in their relation to practical methods of husbandry. Introductory chapters deal with the poultry industry and its products, and the origin, breeds and anatomy of chickens. Breeding, incubation, brooding, housing, judging and diseases are discussed. Three chapters are devoted to marketing and economic phases of production. There is an extended bibliography of practical and scientific poultry literature.—*L. W. Taylor.*

4789. **KNANDEL, H. C. The confinement method of poultry management.** *Proc. 21st Ann. Meet. Poultry Sci. Assoc. 1929.* [In: *Bull. Alabama Polytech. Inst.* 25(1): 32-34. 1930.]—Results on over 10,000 individuals show that Single Comb White Leghorn pullets at 19 weeks of age averaged 3.02 pounds and Barred Plymouth Rock pullets 3.73 lbs. Eggs from fowls reared and maintained in confinement hatch very satisfactorily. The chicks make uniformly good growth; mortality is low. All confined fowls possess deep yellow pigmentation throughout the rearing period and at maturity. Confinement brooding does not prevent coccidiosis. No tapeworm or round worm infestations have been observed; some isolated cases of cecal worms have been observed. The flesh of fowls is of excellent table quality. The confinement method is not advocated except where poultrymen have great difficulty in rearing chicks on range, owing to round worm and tapeworm infestations.—*H. C. Knandel.*

4791. **LAMON, HARRY M., and JOS. WM. KINGHORNE. Practical poultry production.** Rev. ed. 438p. 323 fig. Webb Book Publ. Co.: St. Paul, Minn., 1930.

4792. **LEARMONTH, R. Milk in the feeding of poults.** *Jour. Amer. Vet. Med. Assoc.* 32(2): 206-209. 1931.—The addition of 30% of dry skimmed milk, in a representative mash mixture fed to poults under 2 weeks of age, increased growth and vitality. The author further concludes from his experiments that the value from dried skim milk was due more to the increase of protein than to the increase of vitamin B. Therefore, a mash mixture high in animal protein seems to be important for growing poults.

4793. **NORRIS, L. C., G. F. HEUSER, and H. S. WILGUS, Jr. Is the chief value of milk for feeding poultry due to the presence of a new vitamin?** *Proc. 21st Ann. Meet. Poultry Sci. Assoc. 1929* [In: *Bull. Alabama Polytech. Inst.* 25(1): 43-44. 1930.]—The authors conclude from their results that milk contains a hitherto unrecognized factor, vitamin in nature, which is essential for the prevention of a peculiar type of paralysis in poultry involving the legs and feet, and which is only indirectly growth-promoting. The probability that the effects obtained from this factor have previously been credited to vitamin B is also suggested.—*Authors' conclusions.*

4794. **PORTER, FARLEY. First to last in poultry.** 86p. Illus. Publ. by the author: Maple Ave. Farms, Solus, New York, 1930.—Contains practical suggestions on rearing and feeding chicks, feeding and the management of laying stock, and housing poultry.

4796. **SHARP, PAUL F., and GEORGE F. STEWART. Carbon dioxide and the keeping quality of eggs. The effect of the addition of carbon dioxide to the air in a cold storage room on the keeping quality of eggs.** *U. S. Egg & Poultry Mag.* 37(6): 30-32, 63, 65-66, 68. 2 pl. 1931.—Eggs were kept over 14 months at 29-30° F. in a series of jars containing 0, 1, 5, 15, 30, and 100% CO_2. Eggs stored in air containing no CO_2 were off in odor and flavor, while those stored in the atmospheres containing CO_2 were scored as flat. Eggs stored in a commercial cold storage room (0.5-0.6% of CO_2) were better than those stored under ordinary conditions in the following respects: odor, condition of the thick white, standing up of the yolk, viscosity of the yolk, taste, and in color of white.

4797. **STOUTAMIRE, RALPH. Florida poultry farming.** *Dept. Agric. Florida Bull. 34.* 5-71. 23 fig. 1930.—A comprehensive guidebook dealing with all phases of the industry, including hatching, incubation, feeding, housing, culling, diseases and insect pests.

4798. **WARREN, D. C. The effect of disturbances upon the rhythm of egg production.** *Proc. 21st Ann. Meet. Poultry Sci. Assoc. 1929* [In: *Bull. Alabama Polytech. Inst.* 25(1): 50-51. 1930].—The author concludes that disturbances that are sufficient to cause a decrease in the daily production of a group of White Leghorn pullets affect the rhythm of egg production. Much of the decrease is due to some birds entirely stopping egg production for a period, but there is also a slight lengthening of the average interval between eggs. This effect is not sufficient to cause any very conspicuous changes in the bird's characteristic rhythm.—*Author's summary.*

4799. **VOITELLIER, CH. Possibilities with regard to introducing various kinds of periodical testing of egg production in place of permanent testing.** *World's Poultry Congress* 4(Sect. A): 12-18; résumé sect., 3. 1930.—The author studied methods of testing covering 48 weeks: (1) One day a week over a period of 48 weeks; (2) 2 consecutive days a week over a period of 48 weeks; and (3) 1 whole week in every 4 weeks. A comparison of the theoretical with the average actual production of the 50 hens showed differences of −0.04 and −0.30 for testing 1 day a week, and −0.36 for 2 consecutive days. Although these figures favor the adoption of periodical testing, in the case of some of the hens the individual variations were sometimes very high.—*From author's summary*

4800. **ARNY, A. C., T. E. STOA, C. McKEE, and A. C. DILLMAN. Flax cropping in mixture with wheat, oats and barley.** *U. S. Dept. Agric., Tech. Bull. 133.* 47p. 10 fig. 1929.—These experiments were designed to determine the advantages and disadvantages of growing flax in combination with wheat, oats, or barley. Where weather conditions were favorable mixtures of flax and cereals gave higher yields than where the 2 crops were grown separately. Under dry-land conditions, mixed cropping gave no appreciable increase in yield. The percentage of flax in the harvested crops was less than in the mixture sown, whereas the percentage of wheat or oats was greater than in that sown. Mixed cropping was very effective in checking the growth of weeds. The prevalence of diseases such as flax wilt and stem rust of wheat was not appreciably affected by mixed cropping.—*J. A. Bizzell.*

4804. **BROWN, B. A. Effect of time of cutting on the elimination of bushes in pastures.** *Jour. Amer. Soc. Agron.* 22(7): 603-605. 3 fig. 1930.—Plats of former woodland (mixed gray birch, soft maple, etc.) were mowed at various times during the year. Plats mowed in April and May and during the winter remained covered by brush and species undesirable for forage. September cutting reduced bushes and weeds slightly. Cutting in June, July and August gave best results.

4805. **CARRE, GEORGES. L'augmentation des rendements en blé par la sélection généalogique. [Increase**

of wheat production through genealogical selection.] 39p. 31 fig. Librairie Delagrave: Paris, 1929.

4806. CLAYTON, E. S. Mallee farming. *Agric. Gaz. New S. Wales* 41(7): 481-489. 2 fig. 1930.—Introductory statement to a series on the possibilities of growing wheat, etc., on the infertile areas known as mallee country, "mallee" referring to stunted eucalypts. Types of mallee and soil analyses are discussed.

4807. DENAIFFE, et COLLE. La résistance des céréales pendant l'hiver 1928-29 dans les Ardennes. *Compt. Rend. Acad. Agric. France* 15(14): 559-566. 1929. —No fields remained in good condition until the destructive freezes of February and March. Study of 22 types of wheat showed that the time of sowing and character of the soil were most important, i.e., there is a culture optimum for each variety. For eastern France, resistant varieties should be sown early; non-resistant varieties later. An entire series of hybrids between winter and spring barley was completely destroyed.

4808. EICHINGER. Die Beeinflussung der Länge der Winterroggenähren und der Zahl der Ährchen durch Düngung und Aussaatzeit. Eine Methode zur Unterscheidung von Winter- und Sommersaatgut. *Angewandte Bot.* 10(1): 66-79. 6 fig. 1928.—Winter grains sown in the spring give about twice as many tillers as summer grains, but the former do not shoot and head while the latter do. Winter rye sown at 10 day periods from September 15 to October 15 show a decrease in number of tillers per plant on November 5. The spikelets differentiate on the spike primordia of summer grains much earlier than on winter grains. Grains sown August 1 show distinct spikelet primordia in summer grains by November 15 but none in winter grains. On light sandy soil the type of fertilizer and time of application have a marked effect on the number of spikelets formed in the following ascending order: no fertilizer, fall application of N, spring application of N, and spring application of complete fertilizer. Headlength, spikelet number and grain yield are similarly affected.—*W. Crocker.*

4809. FAULKNER, O. T., and J. R. MACKIE. Field experiments in West Africa. *Gold Coast Dept. Agric. Bull. 20.* (2nd Conf. W. African Agric. Officers vol. 2.) 18-24. 1930.—The authors conclude that in West Africa, the methods generally used on English experimental farms are unsuitable, except for very special purposes and in exceptional circumstances.

4810. GAINEY, P. L., and M. C. SEWELL. Indications that available nitrogen may be a limiting factor in hard winter wheat production. *Jour. Amer. Soc. Agron.* 22(7): 639-641. 1930.—The small, well-defined areas of taller and darker green plants, often seen in spring in pastured grain fields, are attributed to deposits of urine. Chemical analysis of soil and of winter wheat from such spots shows that in the spots, N is higher than in surrounding areas. "Plants from the spots . . . made 2.6 times the total growth, contained 1.8 times as much N per unit wt., and had actually assimilated 4.68 times as much N per plant as those from the field at large." There was no deficiency of total N in surrounding soil. Distribution and activity of nitrifying bacteria do not account for the difference, and P is not the determining factor. Evidently available N (but not necessarily total N) is higher in the spots.

4815. JANSSEN, GEO., C. K. McCLELLAND, and W. H. METZGER. Sap extraction of sorghum and the localization of juice and sugars in internodes of the plant. *Jour. Amer. Soc. Agron.* 22(7): 627-638. 1930.—The percentage juice and the total sugars of juice extracted from sorghum plants in the process of crushing for syrup manufacture were determined on plants given the following treatments: (a) Cut without stripping leaves at time of crushing; (b) cut with stripping leaves at time of crushing; (c) stripped, cut, and left to lie in a pile for various intervals before crushing; and (d) unstripped and left to lie in piles before crushing. It is clearly shown that there is a proper time for harvesting sorghum in order to obtain high percentage of juice and of total sugar. The highest total sugar was obtained from October 1 and October 4 cuttings; less from the September 25 cutting and later dates in October. There is some difference in the value of internodes from different parts of the sorghum stalks, the central having the highest, the lower ones an intermediate, and the uppermost the least value. Heavy pressure during the processes of crushing the sorghum stalks usually gave the higher amounts of sugar and juice. By repeating the crushings 3 times and by increasing the pressure of the rollers in each case, the respective crushings yielded total sugars in ratio of 2.71: 2.4: 1.26, or in percentage, approximately 43: 40: 17. Stripping of leaves from the plant 3-4 days previous to cutting and crushing caused a slight depression in amounts of total sugars obtained on various dates. Allowing the stalks to remain in piles several days after cutting increased the sugar content of the juice probably due to evaporation, thereby making the sap more concentrated, and hydrolyses of starch and dextrins to sugars. Allowing leaves to remain on stalks in each instance reduced the percentage of juice and the total amount of sugars.—*Authors' summary.*

4816. JENKIN, T. J. New varieties and strains from the Welsh Plant Breeding Station. No. 1. Pure lines of Hen Gymro wheat. *Univ. Coll. Wales, Aberystwyth Leafl. Ser. S.* 1: 7-16, 3 pl. 1928.—The general policy followed with new varieties and strains produced at the Station is outlined. "Hen Gymro" wheat is an old variety of unknown origin which has remained in cultivation in certain Welsh counties. Growers contend that over a number of seasons it gives more satisfactory results than modern English varieties. The grain is typically red, rather small and hard; the straw long, slender and rather weak. The ear is lax in all cases, but it may be bearded or beardless; the glumes may be red or white and either smooth or rough. Intermediate ear types also occur. A total of 265 ears was selected from crops grown from seed obtained from various farmers. By ear-row tests, segregating lines, and some others of little promise, were rejected. Rod-row trials gradually eliminated the less promising lines, but even then the 5-yr. average for the Hen Gymro selections was no better than that for Standard Red, the check variety. In the same period, however, the 5 best Hen Gymro selections averaged 2-14% better than Standard Red. In 1928 these lots in replicated 100th-acre plots showed an advantage of 14-31%. In seasons favorable to grain development in both Standard Red

and the Hen Gymro selections, the grain is decidedly larger in the former than in the latter, but, in poor ripening seasons, grain development in the Hen Gymro lines is better than in Standard Red, despite a greater tendency to lodge.—*T. J. Jenkin.*

4819. **KEEN, BERNARD A., et al. Studies in soil cultivation. 5. Rotary cultivation.** *Jour. Agric. Sci.* 20(3): 364-389. 4 fig. 1930.—Experiments extending over 4 yrs., 1926-9 inclusive, were conducted on a heavy and stony loam soil to compare rotary cultivation with customary methods for the production of a seed-bed. The work was confined to spring-sown crops—swedes and barley—and to spring cultivation. Rotary cultivation gave earlier and better germination of seed, followed by better early growth. In every experiment, however, the final yield was either no better, or significantly less than that obtained from plots cultivated in the usual way. Barley gave equally good yields under the various cultivation treatments. Although there was better germination under rotary cultivation, the plants on other plots, apparently having greater root range, produced more tillers and leveled up the yield. The swede crop did not do so well under rotary cultivation, in spite of better early growth. In the 1926 experiments this was due in part to an extensive hardening or "capping" of the soil on the rotary cultivation plots, but although this effect was absent in the 1928 experiments, a reduced yield was still obtained. In addition to records of yield, measurements were made of the amount of soil pulverisation or comminution produced by the various implements. Soil samples were taken for mechanical analysis before and after cultivation. Rotary cultivation is most effective on soil in poor physical condition, e.g., after a wet and open winter, as it leaves a smaller proportion of large lumps. It does not produce an appreciably finer tilth than the usual implements, but it leaves the soil in a much looser condition, and thus encourages the early germination of seeds. The looser tilth becomes more compact with time, and the initial advantage of rotary cultivation then disappears. If a ridging body is attached behind the rotary cultivator, a further comminution of the soil is produced. The operation of ridging is itself effective in breaking up land in poor physical condition. Ploughing does not necessarily produce any comminuting action unless the soil is well supplied with humus.—*From authors' summary.*

4820. **LAIRD, A. S. A study of root systems of some important sod-forming grasses.** *Florida Agric. Exp. Sta. Bull.* 211. 28 p. 6 fig. 1930.—Root systems of centipede grass (*Eremochloa ophiuroides* (Munro) Hack.), Bahia grass (*Paspalum notatum* Fluegge), Dallis grass (*P. dilatatum* Poir.), blue couch grass (*Digitaria didactyla* Willd.), Bermuda grass (*Capriola dactylon* (L.) Kuntze), St. Lucie grass (*C. d.* var. *st. lucie* (L.) Ktze.), and St. Augustine grass (*Stenotaphrum secundatum* (Walt.) Ktze.) were studied under pasture, lawn, and putting green conditions. When several of the grasses were grown in competition on Fellowship sandy loam under pasture conditions, centipede grass produced the best top growth and second best root growth, and Bahia grass had the best root system. Centipede and Bahia grasses similarly excelled on Norfolk sand under lawn conditions. The other grasses, except Bermuda, protion produced better developed root systems than when not mowed. However, this tendency was not so pronounced with St. Augustine grass. A 3-in. top-dressing of clay on Norfolk sand resulted in better root systems with Bermuda, St. Lucie, and centipede grasses than did the Norfolk sand alone without ammonium phosphate. When ammonium phosphate was applied the growth of the roots on both soils was about the same. A clay top-dressing and an application of ammonium phosphate increased decidedly the concentration of the root systems of all the grasses in the 8 in. of surface soil.—*H. M. Steece* (*courtesy Exp. Sta. Rec.*).

4821. **[LEVENSSON, EVGENIĬ.] ЛЕВЕНСОНЪ, ЕВГЕНИЙ. Овесътъ въ Брѣзнишко. Приносъ къмъ проучване овеса въ България. [Oats of the Bresnik district.]** [German summary.] Годишникъ на Софийския Университетъ, Агрон. Факулт. (*Ann. Univ. Sofia, Agric. Div.*) 6: 211-238. 1927/1928(1928).—The uniform distribution of rain and soils unsuitable for other crops account for the wide cultivation of oats in the Bresnik district (western Bulgaria). The variety grown has open heads, most of the outer kernels are without chaff, each spikelet has 2 kernels, the chaff amounts to 32.2%. Seed purity is low, averaging 89.14%, with *Lolium temulentum* often present.—*I. Kovachevsky.*

4822. **LORD, L. Report by the Economic Botanist on a visit to Malaya, Indo-China, Sumatra and Java. Part 1. The improvement of rice cultivation in Malaya, Indo-China and Java.** *Trop. Agric.* [*Ceylon*] 73(4): 195-221. 16 fig. 1929.—A description of the methods adopted by the Agricultural Departments in the countries visited to improve the cultivation of rice. The Java system of rotating sugar with rice is described. It is concluded that the work being carried out in Ceylon is on similar lines to that in the countries visited but certain improvements are suggested.—*L. Lord.*

4823. **McKEE, ROLAND. Plantas tropicales para cultivos de cobertura y abonos verdes. [Tropical plants used as cover crops and green manure.]** *Bol. Compañia Admin. Guano* 6(9): 479-512. 18 fig. 1930; also: *Bol. Union Panamericana* 64(4): 378-389; (5): 535-553. 24 fig. 1930.—This is a discussion of a large number of leguminous plants used for green manuring in the tropics. This practice is most common in India and the East Indies, where it is frequently employed in the cultivation of rubber, coffee, tea, sugar, rice and tobacco. The rationale and value of green manure and cover crops are discussed with special reference to the tropics, and a classification of suitable crops is given, among which are: *Cajanus indicus, Cracca candida, Sesbania aculeata, Erythina lithosperma, Canavalia ensiformis, Indigofera endecaphylla, Calopogonium mucunoides, Dolichos hoseii, Phaseolus aureus,* and *Vigna sinesis.*—*R. 4826. **MENDIOLA, NEMESIO B. Natural crossing in rice and its relation to rice improvement.** *Proc. Third Pan-Pacific Sci. Congr.* [*Tokyo*] 1: 1171-1179. 1926 (1928).—Natural crossing is suggested as the principal cause of the thousands of rice varieties in the world. Making allowance for the beneficial effect of heterosis, natural crossing which results in genetic and mechanical mixtures in varieties causes economic losses to the rice growers. Data are given on opening of the rice flower and the distribution of pollen grains in Los Baños, Philippine Is., which show that rice pollen grains may be transported by wind a distance of 1-2 m. Planting of varieties no closer than 2 m., and the use of pure lines are suggested for the prevention of natural crossing. —*N. B. Mendiola.*

leads to greater economy. The practice of intensive fertilization and management is usually dependent on the selling price of the product.—*Author's summary (transl. by O. C. Magistad).*

4828. **NOGUER, J. POCH. Formulario práctico de agricultura y sus industrias. II. Explotaciones agrícolas en pleno campo. Colección de procedimientos, reglas y fórmulas para la práctica de la agricultura y sus industrias, sin previos conocimientos técnicos y sin emplear aparatos especiales ni complicados.** [Practical handbook for agriculture and its industries. II. Agricultural field practices.] 269p. Bailly-Baillière, S. A.: Madrid, 1929.—This is a compendium of general information on farm practice, the broad scope of which is indicated by the principal chapter headings: Weather and soils, with directions for the use of the common meteorological instruments; Preparation of the soil; Crop production, with a discussion of the source and use of fertilizers, methods of planting and grafting; Plant diseases and pests, with control measures; Pruning; Culture of cereals, legumes, vegetables and root crops, with suggested rotations; Culture of feed, industrial and tropical crops; Fruit culture; Gardening and floriculture; and Agricultural mechanics. Fertilizer formulas are given for use with the different crops discussed.—*E. V. Abbott.*

4829. **PENDLETON, RAY A. Nitrate fertilizers for oats in Iowa.** *Jour. Amer. Soc. Agron.* 22(7): 663-668. 1930.—2 series of nitrate fertilization experiments with oats were conducted, one on Shelby loam in greenhouse pots, the other on Carrington loam in the field. The results of both series indicate that sodium nitrate may appreciably increase the yield of oats. Early applications were more effective in producing an increase in yield than late applications. In both series an increase in the N content of the grain was obtained from both early and late applications of sodium nitrate, the late applications being more effective than the early. The use of superphosphate without nitrate had little effect. Applications of sodium nitrate at the rate of 200 lb. per acre, particularly if applied late, tended to produce a late growth of straw and delayed maturity. However, the field results indicated that this amount might be used to advantage if applied in connection with superphosphate.—*Author's summary and conclusions.*

4830. **PETRI, L. "Ginocchiatura" del culmo del grano.** [Bending of the stem of wheat.] *Boll. R. Staz. Patol. Veg.* [*Firenze*] 10(1): 113-115. 1930.—The author describes a bending of the 2nd, 3d, and 4th internodes of the culms of some early varieties of wheat. This phenomenon is attributed to lowering of temp. following a long period of rain in the spring of 1930. The rapid elongation of the internodes and the small content of mineral substances in the young heads (due to lessened transpiration) cause weak turgor and, as a result, a bending of the culm in the zone of least resistance.—*L. Petri (transl. by B. F. Lutman).*

4831. **REYNOLDS, MARK H. Maize and sorghum trials, 1929-1930. A summary of the outstanding results in the Northern District.** *Agric. Gazette N. S. Wales* 41(12): 883-885. 1930.—Successful results were obtained at Singleton by sowing short season grain varieties in early September. Long season varieties sown in mid-September also proved satisfactory. Of the mid-season varieties, Funk's Yellow Dent, sown at Singleton during the 3rd week in September, yielded 16 bu. per acre more than the earlier maturing varieties under test. In a maize fertilizer trial a nitrogen applied with superphosphate was beneficial. In the sorghum green fodder and fertilizer trials, Collier gave better yields than Saccaline. Sumac, a short season variety, was low in yield and would appear more suitable for districts cooler than Singleton, where Saccaline and other long season varieties may be sown as late as early February and still mature before damaged by frost. The water-holding capacity of the alluvial soils on which the trials were sown was shown to be deficient, as in 9 instances crops showed evident moisture need within a few weeks of sowing, despite precipitation of 4-31 inches on the fallow.

Economics and technic of culture.] Журнал Опытной Агрономии Юго-Востока. (*Jour. Exp. Landw. Südost. Eur.-Russl.*) 6(1): 53-69. 1928.—In 1927 the Economics Division of Saratov Experiment Station conducted a survey on the culture and economic importance of sunflowers in the lower Volga region. Of 2,000 questionnaires submitted to farmers 250 were answered. Since the revolution the sunflower crop has increased in acreage and has spread into new regions. As a whole the crop is profitable, since it requires little care, grows on poor soils, fits well into rotation as a fallow crop, kills weeds and is resistant to drought. The cultural methods are still somewhat primitive. Selection of the better types has not received sufficient attention. There is also a need for better machinery for the cultivation and utilization of the product. The crop is disposed of mostly for oil production. It is expected that the sunflower will occupy a more prominent place in the agriculture of this region, depending on the available acreage, introduction of machinery, and the competition with forage crops.—*G. Valley.*

4841. **[VVEDENSKII, D. I.]** ВВЕДЕНСКИЙ, Д. И.

К методике и ближайшим задачам селекции конопли на волокно. **[Methods and actual problems of fibre hemp breeding.]** [English summary.] Труды по Прикладной Ботанике, Генетике и Селекции, Прил. (*Bull. Appl. Bot., Genet., and Plant Breeding, Suppl.*) 35: 355-406. 17 fig. 1929.—In breeding hemp in Russia 3 lines must be considered,—for seed and fiber, for fiber only, and for seed only. Individual and mass selection, the method of "halves" with diallel crossing in selection in the ♂ line, and inter-racial crossing are used. Special "kriazhes" or geographical forms are tested in different parts of Russia. Most American and Italian varieties of hemp have too long a vegetative period for the shorter season in Russia. A study of the different characters of the hemp plant has shown a wide range of variation as well as a fair heredity of the majority of characters. Studies are conducted on the morphology of the plant and the quality of the fiber resulting from cutting off the inflorescences, as practiced in the region of the River Desna, and by growing chiefly ♂ plants as practiced in eastern regions. Improvements are needed in the standardization of hemp fiber and also in methods of plant breeding as applied to hemp.—*L. H. Dewey.*

4842. **[VVEDENSKIĬ, D. I.]** ВВЕДЕНСКИЙ, Д. И. Изменчивость и корреляция признаков конопляного стебля. **[Variation and correlation in the Russian hemp stem.]** [English summary.] Труды по Прикладной Ботанике, Генетике и Селекции, Прил. [*Bull. Appl. Bot., Genet., and Plant Breed., Suppl.*] 35: 453-473. 1929.—This paper is based on a biometric study of pistillate hemp plants from the region of Trubchevsko where the best hemp in Russia is grown. A high positive correlation is shown by the combinations: total height and height to 1st branches; total height and diam.; height to 1st branches and diam.; % of height to 1st branches and diam. A high negative correlation is shown by the combinations: total height and relation of height to 1st branches to diam.; total height and % of height to branches; average diam. and % of height to branches. A feebler negative correlation is shown by: height to branches and the relation of this height to diam.; height to branches and the % of this height. The regression coefficients show that the diam. of the stem, measured midway between the ground and 1st branches, increases more rapidly than the total height; and the total height increases at a greater rate than the height to branches, therefore in estimating the yield of fiber on the basis of morphological characters it is necessary to consider not one character only but a complex of characters. The hemp of the Desna valley represents valuable material for plant breeding under the conditions of the Russian hemp growing area.—*L. H. Dewey.*

4843. **WEIGERT, J., und F. FÜRST. Kombinierte Sorten- und Düngungsversuche.** *Blät. Pflanzenbau u. Pflanzenzücht.* 8(2/3): 29-35. 1930.—The farmer should value each variety according to its yield under the conditions of development at his command. Based on experimentation with winter rye, winter wheat, summer barley, and oats, examples are given to show varietal fluctuations according to variations in fertilization.—*J. Weigert (transl. by M. C. Sewell).*

4844. **WILLARD, C. J. Root reserves of alfalfa with special reference to time of cutting and yield.** *Jour. Amer. Soc. Agron.* 22(7): 595-602. 1930.—Any extensive reduction of root reserves of alfalfa as measured by total weight of roots per acre consistently resulted in a reduction in yield and vigor of growth. Severe winter-killing from heaving followed extreme reduction in reserves, but the loss in vigor occurred without this. Up to the 1st cutting for hay, young alfalfa gained in root reserves regularly and consistently, both in the fall of the seeding year and in late April, May, and early June of the next year. Under Columbus, Ohio, conditions, alfalfa did not in 4 yr. show a gain in root reserves in August when the 2nd cutting was allowed to stand from full bloom to seed stage. During the same period in June, gains took place in some years and not in others. This failure to store root reserves after full bloom was associated with yellowed and diseased leaves and does not indicate that gains during this stage would not take place in a region where the leaves remained healthy. The loss in root reserves in recovery after cutting, as an average of 35 observations, was 177 lb. per acre. This was accompanied by an average loss of 0.17 % N (air-dry basis). Recovery after cutting was almost uniformly accompanied by a decrease in the percentage of dry matter in the green roots, averaging 4.9% in 23 comparisons. At Columbus the most uniformly important period of root storage is in October, when the last cutting of the season has been taken off early enough so that a considerable top growth has been produced by October 1. The most favorable condition for storage of root reserves seems to be the combination of a large amount of healthy leaf area and drier weather than normal. While Grimm and other variegated varieties of alfalfa are more winterhardy than common alfalfas under all cutting treatments, there is no evidence that this difference is due to or associated with differences in the amount of root reserves stored. The effect of cutting on different dates at Columbus is determined nearly as much by the activities of the potato leafhopper as by root reserves, but at present the former are to a large extent unpredictable.—*Author's summary.*

4845. **WISHART, J., and WINIFRED A. MACKENZIE. Studies in crop variation. 7. The influence of rainfall on the yield of barley at Rothamsted.** *Jour. Agric. Sci.* 20(3): 417-439. 7 fig. 1930.—Daily records for a 68-yr. period were examined to determine the influence of amount and distribution of rainfall on the yield of barley grown continuously on the same plots under a wide variety of manurial treatments. It was found that (1) excess of rain is beneficial during a short period in summer, and in the case of plots treated with nitrogen, but no phosphate, during the autumn and winter period; (2) rainfall during the 6 months when the ground is not occupied by barley has an important effect on subsequent yield; (3) excess of winter rain reduces the yield of plots receiving phosphate but no alkali salts; (4) excess of rain at sowing time is harmful in all cases; (5) the yields of plots receiving nitrogen are more affected by rain than those of plots without such dressing; (6) the indication of benefit from excess summer rain is not inconsistent with the conclusions of Hooker in a previous study; (7) the farmyard manure plot shows a pronounced loss from excess winter rain, and benefit from summer rain is earlier than for the others. Probable causes are discussed.—*J. Wishart.*

4846. **YAMAGUTI, YASUKE. Genetics in relation to the improvement of rice.** *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 1: 1187-1191. 1926(1928).

4847. **ANONYMOUS. Hybridization of talahib and sugar cane showed wonderful results.** *Sugar News [Manila]* 10(8): 536. 1929.

4848. **ANONYMOUS. Indian (Sunn or Sann) hemp.** *Empire Marketing Board as E. M. B.* 25. 40p. Illus. 1930.—The name "hemp" was first given to the plant *Cannabis sativa.* Several other fibers are called hemp, but the nearest to the true hemp is sunn, also called Indian Hemp and Bombay Hemp. This is a bast fiber obtained from the slender stalks of *Crotalaria juncea.* This plant is useful as a soil renovator, cover crop, and a crop to smother weeds. Stock sometimes eat it but the leaves are bitter; the leaves are eaten better after they have fallen and dried. Sunn is not recommended as a forage crop. Experiments have demonstrated that fiber from plants with seeds nearly mature is as good as that from plants in the early flowering stage, and also that removing the stalks after most of the leaves have fallen does not materially reduce the value of the crop as a soil renovator. A fairly light well drained soil produces the best plants for fiber. Good crops yield up to 1200 lb. of fiber per acre, the average ranging from 500-800 lb. There are several grades of Sunn fiber under the classes Benares, Bengal, Jubblepore and Bombay,

ranging in price from £17-50 per ton. The difference in value is due to greater or less care in the preparation of the fiber. Seed from nearly all districts grown at the Sibpur Botanic Gardens near Calcutta, produced plants yielding fiber in which there was no material difference. In tests conducted by the Imperial Institute, London, sunn fiber, though somewhat weaker than Italian or Russian hemp, deteriorated less from 90 day immersion in either salt or fresh water.—*L. H. Dewey.*

SOIL SCIENCE (EDAPHOLOGY)

4849. **AARNIO, B. Onko maan reaktio muuttamaton suure? [Is the soil reaction constant?]** *Suomen. Maataloustieteellinen Seura. Maataloustieteellinen Aikakouskirja* 1(1/2): 18-25. 1 fig. 1929.—The reaction of the soil varies during artificial drying just as it does upon drying in the field. In different soils the change in reaction may vary from 0 to more than 1 pH, heavy soils showing the greatest change. The change in reaction is very rapid when the drying temp. is 100°C. The amount of change in 24 hr. is about the same as in air drying (0.09 to 1.4 pH). At still higher temp. the change is much more rapid, requiring only 1-2 hr. The reaction of a neutral clay is lowered up to ca. 400°C., then increases, becoming slightly alkaline at 800-1000°. An acid clay remains unchanged up to 400°, then increases and becomes neutral at 1000°. The change in reaction is probably due to reduction of the internal surface by drying, with accompanying lowering of buffer action. Through drying, electrolytes are also released, which increase the acidity, especially those which cause hydrolysis. The soil reaction is thus not of definite magnitude.—*Author's summary (transl. by F. Weiss).*

4850. **AGAFONOFF, M. V. Sur quelques sols rouges en Bienhoa de l'Indochine (Suite et fin).** *Rev. Bot. Appl. et Agric. Coloniale* 9(90): 120-126. 4 pl. 1929.—This paper deals with a study of the cause of infertility. Analyses of 5 soils show that the lack of fertility is not due to deficiency of N, P_2O_5 and K_2O. The suggestion is made that the changes in structure brought about by clearing the forest are responsible. Analyses of soils for their basic exchange (according to Gedroitz) show the absorbing complex of some soils higher in Ca and Mg than others. Analyses of the SiO_2 and Al_2O_3 dissolved by 5% NaOH showed an excess of Al_2O_3 over the proportion 2 SiO_2: 1 Al_2O_3 and indicated a relation between the free Al_2O_3 and the saturation of the absorbing complex by Ca and Mg. In general, the soils low in Ca and Mg have poor structures, with consequent defective water and air circulation.—*E. P. Deatrick.*

Sci.* 20(3): 399-406. 1930.—A method is shown for estimating the yield of a missing plot by the analysis of variance, using the yields of all the other plots. The calculation is given for (a) a Randomised Block experiment, and (b) a Latin Square arrangement.—*F. E. Allan and J. Wishart.*

4852. **BARNES, S., and E. S. HOPKINS. Soil moisture and crop production.** *Canada Dept. Agric. Div. Field Husbandry Bull.* 130. 1-46. 4 pl., 9 fig. 1930.—The storage of moisture in the soil and its utilization by crops has been studied in Western Canada under an average annual precipitation of 15 inches. Snowfall, averaging 30 inches annually, did not appreciably influence the amount of moisture stored in soil. Summer-fallow, the most common practice for moisture conservation, has an efficiency of approximately 35%. Weeds can utilize all moisture entering soil from rainfall. Because of competition for soil moisture by weeds grain crops may be reduced 50% in yield. Grass and clover crops are difficult to grow when seeded with nurse crops on account of competition for moisture. The water requirements of crops are doubled when grown with deficient supplies of moisture.—*S. Barnes.*

4853. **BARNETTE, R. M., and J. B. HESTER. Effect of burning upon the accumulation of organic matter in forest soils.** *Soil Sci.* 29(4): 281-284. 1930.—Analyses are reported of samples from comparable soil (Norfolk Medium Fine Sand, deep phase) on the Florida Mainland (burned over nearly annually for the past 42 yrs.) and in virgin pine forest from an island off the coast (not burned over within the past 42 yrs.). Leaf mold was absent, and N and organic matter were depleted in the burned-over land, and exchangeable lime and hygroscopic moisture was much lower in it.

4854. **FRASER, GEORGE K. The soil and the forest: Soil classification and description.** *Scottish Forestry Jour.* 43(1): 19-33. 1 pl. 1929.—A brief review of knowledge of soil profile structure from the historical standpoint, with descriptions of examples occurring in forests of Scotland.—*A. P. Kelley.*

4855. **HISSINK, D. J., und JAC. van der SPEK. Ueber Titrationskurven von Humusböden. [Titration curves of humus soils.]** *Proc. 2nd Comm. Internat. Soc. Soil Sci. Vol. A, Groningen,* 1926. 72-93. 1926.—Preliminary experiments show that mixtures of humus soil and solutions of strong bases require long periods to reach equilibrium, and for accurate results should be allowed to stand at least 24 and preferably 72 hours, with intermittent rotation. A concentration of 5 gm. of organic matter to 200 cc. of liquid proved most satisfactory. Ca and Ba hydroxides produce almost identical changes in reaction, but Na hydroxide yields somewhat different results. A series of soils with widely differing humus contents were treated with various amounts of these reagents and the pH values attained plotted against gm. CaO per 100 gm. humus. The points at which the curves obtained in the Ca hydroxide treatments cut the line of pH 7.0 are taken to express the theoretical lime-requirements of the respective soils. In practice, however, larger amounts of CaO must be added.—*E. T. Wherry.*

4856. **SHAW, CHARLES F. Potent factors in soil formation.** *Ecology* 11(2): 239-245. 1930.—The character of the soil is determined by the composition of the parent material, climatic and vegetative influences, the intensity and time during which they have operated and any modification by erosion or deposition. Soil classifications which do not evaluate each of these facts are applicable only in a very general way or in local restricted areas where the ignored factors may be fairly uniform. The influence of each of these factors must be considered in any widely applicable scheme of soil classification.—*W. W. Weir.*

4857. **SPURWAY, C. H. A test for water-soluble phosphorus. Studies on water-soluble phosphorus in field soils.** *Michigan Agric. Exp. Sta. Tech. Bull.* 101. 25p. 1929.—A microchemical method for the estimation of the water-soluble phosphate content of soils was developed on the basis of the reaction of Deniges—the interaction of orthophosphate and ammonium molybdate in the presence of nitric acid followed, in the original procedure, by the addition of stannous chloride to produce the blue reduction-derivative of the phosphomolybdate. Applying this method to a number of Michigan soils the author concludes that when the soil showed 0.5 parts per million or less of P, phosphatic fertilizers produced crop increases.—*H. C. Waterman (courtesy Exp. Sta. Rec.).*

4858. **STEVENSON, W. H., P. E. BROWN, and J. L. BOATMAN. The management of peat and alkali soils in Iowa.** *Iowa Agric. Exp. Sta. Bull.* 266. 81-100. 8 fig. 1930.—The first requirement of peat soils was adequate tile drainage, then exposure to frost, snow, and rains by means of fall plowing, which hastened their decomposition. In the shallower parts deep plowing had the advantage of enriching the soil and improving its physical condition by the admixture of the heavy clay subsoil. Frequent cultivation is of value both in opening peat soils and in encouraging their decomposition and in controlling weed growth. The choice of crops for newly drained peats is discussed. These peat soils were found to have a high lime content and to need no additional supplies. They were also rich not only in

organic matter but in nitrogen, and the use of much manure was deemed inadvisable. For corn and small grains, grown after 2-3 yr. of pasture or cropping to vegetables, following drainage, 200-lb. per acre of superphosphate, potassium chloride, or both, was often profitable. Drainage and manuring to rid the soil of excessive soluble salts and plowing under straw and green manure crops, of which sweet clover was one of the most valuable, were the most useful preliminary treatments for "alkali" spots. KCl at 200 lb. per acre often proved effective, and superphosphate occasionally so.—*H. C. Waterman (courtesy Exp. Sta. Rec.).*

The seedlings prefer an acid soil, a moist, shady situation and must not be checked in growth.—*C. G. Bowers.*

4860. BECKER, J. Handbuch des Hackfruchtbaues und Handelspflanzenbaues. [Manual of vegetable and truck crop culture.] 506p. 116 fig. Paul Parey: Berlin, 1928. Pr. 24 M.

4861. BEMELMANS, J. Systématique du genre Coffea Linn. Terres à café du Brésil. *Ann. Gembloux* 36(4): 128-138. 1 fig. 1930.—The author discusses briefly the species of *Coffea,* lists the varieties of each, and describes the coffee soils of Brazil as to type and location.

4862. BLAIR, A. W., and A. L. PRINCE. The influence of lime in vegetable growing. *New Jersey Agric. Exp. Sta. Bull.* 498. 16p. 5 fig. 1930.—Soil fertility plats of which some had received no lime during 20 yr. whereas others had been limed regularly at 5-yr. intervals were used in a study of the growth of various vegetable crops. "In every case the yields were much increased where lime was used. Beets and carrots were a failure on the unlimed plat. The failure in this case was due in part to the fact that the acid soil had a very depressing effect on germination. "For the type of soil and the crops under consideration, a soil reaction represented by medium acidity (slightly above pH 6) seems to be preferable to one that is more acid than medium (below pH 6). Reactions of pH 7, or even slightly higher appear to have no detrimental effect. The important indirect effect of lime in encouraging the growth of soil-improving crops is also noted and attention is drawn to the fact that "strongly acid soils may contain soluble Al compounds which are toxic to certain crop plants. Lime possesses the property of putting these compounds out of action. Heavy applications of superphosphate will do the same, but lime is more economical." In moderate applications, there was little choice as between Ca and Mg limestones.—*H. C. Waterman (courtesy Exp. Sta. Rec.).*

4863. CHADWICK, L. C. Thuja propagation. *Florists' Rev.* 66(1693): 25-26. 2 fig. 1930.—All varieties of thujas do not react the same when propagated in different media. The greatest root growth usually occurs in peat moss. The percentage of rooting in peat depends on its moisture content, which should be relatively low for rooting thuja cuttings. Sand is a good medium for most varieties of *T. occidentalis.* The rooting of *Thuja plicata* is influenced by the acidity of the medium.

4864. CROCE, FRANCISCO M. Elección de las variedades de brotación tardía en la lucha contra las heladas de primavera. [Selection of varieties for late budding as control against early frosts.] *Rev. Mens. B. A. P.* [*Buenos Aires*] 13(153): 46-48. 1930.—The periods of budding and flowering of more than 100 varieties of grapes grown in Mendoza are listed.

4865. CURTIS, K. M., and T. RIGG. Peach culture. Spraying and manurial experiments in the Nelson district. 1. Four years' control of brown rot in New Zealand. 2. Manurial experiments. *New Zealand Dept. Sci. & Indust. Res. Bull.* 15. 1-22. 4 pl. 1929.—1. For 4 consecutive seasons, in some of which climatic conditions were adverse, brown rot has been kept under control on 3 peach varieties in a commercial orchard at Umukuri by eliminating as far as possible the sources of initial infection each spring; cutting out after blossoming time all laterals bearing diseased flowers; and applying adequate sprays (bud-movement, pink to blossom, petal-fall, and immediate pre-maturity), together with an adjustable interpolated series between petal-fall and pre-maturity. Bordeaux mixture and lime sulphur were used. 2. Experiments, conducted over a period of years on several varieties of peaches on the 2 chief peach soils of the Nelson district have demonstrated the importance of manure for peaches on these soils. On the Motueka soil, which is well supplied with available phosphate and lime, nitrogenous fertilizers used at the rate of 3 lb. per tree increased the average annual yield by 1 bushel per tree. There was little benefit from the use of phosphates and potash on this soil. On the Stoke soil, use of a complete fertilizer supplying 2 lb. of superphosphate, 1 lb. K_2SO_4, 1 lb. $(NH_4)_2SO_4$, and 2 lb. $NaNO_3$ per tree gave an increase of about ½ bushel of fruit per tree. In both experiments the increased yield was profitable. The value of fertilizing peaches with phosphates and potash is not so clear. The fertile sand of Umukuri is well supplied with phosphate, and should require little phosphatic manure. The results obtained do not suggest that potassium fertilizers have been very beneficial on the Umukuri sand, although the supply of available potash in the soil is below normal. Growers are advised to use at least 1 lb. of K_2SO_4 per tree. The Stoke soil is typical of many average soils used for peach-culture throughout New Zealand. Undoubtedly the liberal use of nitrogenous manures at the rate of 3 lb. per tree is essential for the maintenance of high yield. Owing to a more restricted root-range on such soils, it is highly desirable to maintain the humus supply of the soil by ploughing in green crops, and to use both phosphate and potash in the manuring of the trees. A dressing of 2-3 lb. of superphosphate, 1 lb. K_2SO_4, 1 lb. $(NH_4)_2SO_4$, and 1 lb. of dried blood per tree is recommended for use early in September. About the middle of November a further top-dressing of 1 lb. per tree of either $NaNO_3$ or $(NH_4)_2SO_4$ should be given. The use of iron sulphate for peaches in the Umukuri district has not improved the yield of fruit or the control of die-back.—*From authors' summary.*

4866. DARNELL, A. W. Illustrations and descriptions of beautiful and interesting plants suitable for outdoor culture in the British Isles. *Hardy & Half-hardy Plants* 2(2): 22-42. 21 pl. (1 col.). 1930.—Illustrations and descriptions of *Campanula lasiocarpa*, Cryptogramma stelleri*, Cypripedium guttatum* var. *yatabeanum*, Dendromecon rigidum* Dimorphotheca calendulacea* Douglasia laevigata*, D. vitaliana*, Hesperoyucca whipplei*, Iris lupina*, Landolphia capensis*, Meconopsis integrifolia*, Nierembergia filicaulis*, Nolana prostrata*, Primula marginata*, Romneya coulteri*, Styrax hemsleyanum*, Syringa persica*, Thunbergia alata*, Trachelospermum jasminoides*, Tumion californicum*,* and *Volvulus sylvaticus*.*

4867. DRÖMER, H. Die Grundlage des holländischen Gartenbaus. *Gartenbauwiss.* 1(5): 517-523. 1929.—The historical development and present status of the pro-

duction and marketing of vegetables and fruits in Holland are briefly discussed.—*A. E. Murneek.*

4868. FOTHERINGHAM, N. Manuring citrus trees at the Berri experimental orchard. *Dept. Agric. S. Australia Bull.* 238. p. 71-74. 1930.—Both in the superphosphate and potash plots the trees are yellow in appearance, especially those receiving potash. Those given mixed manure and bonedust generally appear healthy. The trees in the plot receiving 5 cwt. sulphate of ammonia are in fine condition, while those receiving potash and superphosphate appear incapable of bearing another crop. So convincing are the failures of superphosphate over a period of 8 yr. that a new line of experiments has been laid down.—*From author's conclusions.*

4869. GIOELLI, FELICE. Sopra la "maturazione" dei tralci della vite. [Maturation of grape canes.] *Ann. R. Accad. Agric. Torino* 71: 3-19. 1928(1929).—The author outlines his plans for a comprehensive study of the "ripening" of the canes of the grape vine. Complete maturity is reached by the middle of February in Italy. Generally speaking, maturation is a phenomenon of perfecting the secondary structure, with a storing of nutritive reserves common to all woody plants.—*F. Gioelli (transl. by H. S. Wolfe).*

4870. [HEINTZ, G. W.] ГЕЙНЦ, Г. В. Состояние культуры инжира в разных странах мира. Мировое производство и потребление. **[Fig culture; world production and consumption.]** [English summary.] Бюллетень Государственного Никитского Опытного Ботанического Сада. (*Bull. Gov. Bot. Gard. Nikita, Yalta, Crimea*) 7. 7-69. 6 fig. 1930.—The author discusses the quality of figs grown in different regions and describes the varietal diversity of this crop in different countries. He also deals with the export, the methods of cultivation, harvesting, drying, grading and packing of the fruit and presents statistics of consumption. The following countries are included: U. S. A. (California), Turkey (region of Smyrna), Italy, Spain, Algeria, Portugal, Greece, France, Tunis, Morocco, Chile and Australia. The author concludes that much attention should be devoted to the wide development of commercial fig growing in the USSR, in order that importation of figs may be checked. Since the fig has been grown in different regions of the USSR (Crimea, Caucasus, Turkestan), for centuries, the author thinks that its cultivation may become of commercial importance within a few years, but recommends great care in the selection of appropriate areas. The most favorable combination of climate, soil and cultural characters has nowhere been ascertained; therefore a thorough comparative study of the climatic microregions of commercial fig growing is of great importance.—*From the English summary.*

(*Jour. Gov. Bot. Gard., Nikita, Yalta, Crimea*) 12(4): 213-250. 19 fig. 1930.—A description of the history of development of this industry, as well as the methods of cultivation used in California, including the technique of drying, grading, cleaning and packing of the raisin.—*From the English summary.*

4872. HOFMANN, FRED W. Effects of nitrogen, phosphoric acid, and potash applications on yields and circumference growth in ensembled data from cultivated apple orchards. *Proc. Amer. Soc. Hort. Sci.* 26: 145-148. 1929(1930).—On the whole over the entire limestone apple sections studied, there are significant gains in yield and trunk increase when some combination of N with either P or K, or both, is applied in cultivated apple orchards. The odds are generally more in favor of a complete combination.

4873. HOFMANN, FRED W. Profitable application of certain fertilizers to apple orchards in the Hagerstown soil series. *Proc. Amer. Soc. Hort. Sci.* 26: 153-157. 1929 (1930).

4874. JAMES, D. M. The fruit and vegetable supply for fifteen cities. *Bull. Pennsylvania Dept. Agric.* 13(8): 1-82. 3 fig. 1930.

4875. JONES, H. A. Spacing, time-of-planting and size-of-seedling studies with California Early Red onion. *Proc. Amer. Soc. Hort. Sci.* 26: 114-118. 1929 (1930).—As the distance between onion plants in the row was increased from 3 to 12 inches, there was a delay in time of maturity, an increase in the size of the bulbs and a decrease in the yield per acre. When seedlings were graded for size at time of transplanting the large seedlings produced a higher yield of bulbs and the average size of the bulbs was larger. Early planting gave the highest yields and there was a decrease in yield and size of bulbs as the time of transplanting was delayed.—*H. A. Jones.*

4876. KORTLEVE, IR. A. Kieming van oliepalmzaden. *De Bergcultures* 4(28): 729-730. 1930.—The sprouting beds are best made by placing sand from low land in beds ± 5 cm. deep, upon which the seed is sown. Then the seed is covered with 3-4 cm. of sand. When exposed to full sunlight, the seed should be watered 1-2 times a day. No method of germinating fresh seed has been devised; therefore it is advised that preliminary treatment be given the seed immediately following harvest. If the seed cannot be planted out directly, it is treated for 2 days with 1% hydrochloric acid (29 parts of water to 1 of hydrochloric acid), washed 2 days in flowing water, and planted. The plants must not remain too long on the beds because they become yellow through lack of nourishment.—*R. H. Westveld (transl.)*

4877. [KOSTOV, DONCHO]. КОСТОВЪ, ДОНЧО. Биология на калуса. **[Biology of the callus.]** [English summary.] Годишник на Софийская Университетъ, Агр. Факул. (*Yearbook Univ. Sofia, Fac. Agron.*) 8: 297-316. 4 pl. 1929/1930.—The morphology, physiology, histology, and cytology of the interspecific and intergeneric graft unions of certain solanaceous plants were studied and attention given to certain similar conditions in *Pyrus* and *Malus*. The scions, depending on the species and genus, manifested a tendency to form small roots, tumorous outgrowths, thin leaves, fasciated shoots, etc., immediately above the callus plane. In the interspecific and intergeneric graft unions the pigment was usually unable to pass through the callus plane. In certain intergeneric grafts flowers were produced with abortive pollen grains and with pollen grains containing an increased number of chromosomes. After selfing such flowers, aberrant and mutant plants were obtained. In the interspecific and intervarietal grafts the scion grew better when it was grafted on to stocks with a better root system than that of the plant from which the scion was taken. This was not true in the case of the intergeneric grafts. By means of the nephelometer and by the "Dialyzing-Ninhydin" colorimetric method, the presence of acquired lysins and precipitins was determined in the scions and stocks not only in the intergeneric and interspecific graft unions but even in the grafts between hybrids and their parent plants. The tissue joining the scion and stock was the product of the stock. An accumulation of starch, silica, and sometimes tannin was found in the scion above the callus plane. The malformation of the scion immediately above the callus plane is due in most cases to the new physiological conditions of the components and rarely to *Bacterium tumefaciens*. In certain grafts an agglutination of the chloroplasts was observed in the callus region. The parenchyma cells of the pith in the callus region had secondary thickening in the older calluses. The cells near the callus plane were rich in cytoplasm and contained many small vacuoles. The appearance of the vacuoles in these cells is apparently chiefly the result of precipitation in vivo and the storage of the foreign substances diffusing into the cells. An increase of cytoplasmic viscosity was observed in the callus region. Cell division is retarded by this increased cytoplasmic viscosity and a number of abnormal conditions appear in this region, e.g., irregular somatic cell division, multinucleate cells, polyploid so-

matic cells, and cells with contracted chromosomes. In the older intergeneric grafts the nuclei of the cells located near the callus plane at first became hypertrophied and later were dissolved. The nucleoli in the hypertrophied nuclei were more numerous and often larger than in normal cells. Sometimes very small ones appeared as though they might be fragmented. They are considered as possibly being catabolic products.—*D. Kostoff.*

[The fruits and oils of the varieties of oil palms.]** *Bull. Matières Grasses (Inst. Colonial Marseille)* 1930(4): 97-104. 1930.

4886. **MITRA, S. K., and P. C. KHONGWIR. Orange cultivation in Assam.** *Dept. Agric. Assam. (India) Bull. 2.* 1-19. 1928.—An attempt to make an approximate estimate of the area and distribution of orange cultivation in Assam with special reference to picking, packing and marketing.—*S. K. Mitra.*

4887. **OPPENHEIM, D. J., and L. WINIK. The determination of the sugar content and the pH value of the Jaffa orange.** [Text in Hebrew and English.] *Hadar [Jaffa]* 3(7/8): 170-173; Hebrew, separately paged sect.: 169-171. 1930.—The acidity of the fruit gradually increases until about mid-August. Thenceforth until January it remains stationary, then decreases. The percentage of sugar increases until about the 1st of January. At that date a certain fall occurs, after which a gradual increase commences once more until the end of the season. There are no differences between the value of pH in light and heavy soils. There are very slight differences in sugar. No relation was determined between meteorological factors and variations in the pH value and sugar content.—*Authors' conclusions.*

4888. **REINECKE, O. S. H. Survey of fruit orchards of the Western Cape Province.** (*Univ. Stellenbosch-Elsenburg Coll. Agric. Sci. Bull. 3*) *Union So. Africa, Dept. Agric. Sci. Bull.* 77. 1-110. (4p. of text and 106 of tables). 1929.—The Western Cape Province produces practically all the deciduous fruit exported from the Union annually, as well as the wines, raisins and other products of the vine. A brief outline of the early development of the fruit industry in South Africa is given and the annual export of fruit compared with that of other agricultural products. A graph indicates the growth of fruit export during the period 1899-1928 and the very rapid expansion of this trade during recent years. Based upon the number of trees planted and the quantities of fruit shipped in the past, an effort is made to forecast the quantities of fruit which may be expected for shipment in 10 yr. Tables indicate the acreage and distribution of fruit farms and vineyards (other than for wine or raisins) in the different districts; the proposed extension for the period 1927-1929; the total number, according to age, of apple, pear, apricot, plum, prune and peach trees in the different fruit growing districts. The varieties grown in each district are treated in detail. Meteorological data are given for the different districts.—*P. A. van der Byl.*

4890. **SAND, AUSTIN W. W.** A study of Pogoniris varieties. *Cornell Agric. Exp. Sta. Mem.* 100. 159p. 3 pl., 52 fig. 1926.—There have existed perhaps 2,500 named varieties of bearded iris. By checking and comparison more than a thousand were reduced to less than 700 distinct varieties. To this group new sorts have been added and the collection in the Cornell plantation embraces more than 1,200 varieties. The multiplicity of varietal names has been due to the fact that blooms are not identical season after season. Climatic conditions, particularly frost, seem to effect color intensity, and flowers produced on young plants may be slightly different from those produced after the plant has become well established. The history of bearded iris is traced, and directions are given for handling iris, including cut flowers for the trade. Based mainly upon the work of W. R. Dykes, the genus *Iris* is divided into 12 sections with a 13th indicated for hybrids: Juno, Xiphium, Reticulata, Gynandriris, Nepalensis, Evansia, Pogoniris, Pseudoregelia, Oncocyclus, Regelia, Pardanthopsis and Apogon. Each section is again divided into groups. The three most important sections commercially are Apogon, Pogoniris and Xiphium. The subgenus *Apogon* is the largest and most widely distributed. It extends throughout the temperate belt of the northern hemisphere. The second largest subgenus is *Pogoniris*, horticulturally the most important. It is found cultivated in central and southern Europe, northern Africa and eastward to China and northwestern India; no members are indigenous to America. The analytical key to subdivisions of the genus *Iris* is based primarily on the rootstock, whether it be bulbous or non-bulbous. Keys are also presented to the 12 sections or subgenera, the section *Pogoniris* being divided, according to Dykes, into 7 major groups with 35 spp. A description of 172 varieties of the *Pogoniris* section completes the publication.—*T. H. McHatton.*

Forstw.* 17(5): 401-422. 10 pl., 13 fig. 1929.—The influence of the various soil types mentioned in Rothe's "Geology of the Lower Elbe Marshes," on fruit tree culture, and the influence of climate and cultural practices upon soil types are discussed. Trees grew best on an alkaline sandy clay soil and on a strongly acid, sand free, clay soil high in Fe. Inasmuch as the acidifying effect of the former, or the neutralization of the latter caused damage to trees, it is concluded that soil aeration is of greater importance than soil reaction.—*H. Wartenberg (transl. by W. B. Albert).*

4902. **BOURGUET.** Formules pour le cubage des arbres sur pied. *Bull. Trimest. Soc. Forest. de Franche-Comté* 19(1): 16-23, 1931.—Formulae applicable in the region of the Vosges and Alps of eastern France are compared with existing volume tables. If V=stem volume in cu.m., h=height in m., D=diam. at breast height in m., then for oak, beech, and other deciduous trees not over 10 m. high, $V=6D^2(h/10)+1/30[6D^2(h/10)]$. For heights of 11 to 18 m., this becomes $V=5D^2(h/10)+2/30[5D^2(h/10)]$. For heights of 18-20 m. $V=10D^2$, and for heights over 20 m., $V=5D^2(h/10)-2/30[5D^2(h/10)]$. For conifers with average form factor=0.80 (i.e., ratio of diam. at middle height to diam. at breast height), $V=2D(2D+0.1)h/10$, and with factor 0.70, $V=2D(2D-0.1)h/10$. The latter formula is applicable to young isolated trees, or to those grown in thinned stands or to trees more than 0.60 m. in diam.—*J. Kittredge, Jr.*

4905. CHALK, L. The formation of spring and summer wood in ash and Douglas fir. Oxford Forestry Memoirs No. 10. 48 p. 3 pl. Clarendon Press: Oxford, 1930. Pr. $2.00. —The trees studied were growing in Bagley Wood near Oxford, England. The 1st part of the memoir deals with the development of the annual ring. Inception, rate, and duration of growth are compared in different parts of the same tree and between individuals growing under different conditions. The results of various investigators are compared. In Douglas fir, growth started first in open-grown trees; the upper parts of the stem started 10-14 days before the lower. In ash, growth commenced at the same time in the upper and lower parts of the stem. In ash, individual vessels developed more rapidly in a tangential than in a radial direction. Growth ceased after 5-6 weeks. Part 2 deals with the effect of climatic conditions on the growth of Douglas fir. The areas and volumes of spring and summer wood varied independently of each other from yr. to yr. The highest correlation coefficients obtained with meteorological data were between: (a) spring wood volume and May-June mean temp.; (b) summer wood volume and June-July-August rainfall. Part 3 deals with the effect of crown size on growth of Douglas fir. From 1924 to 1927 the annual increment of the dominant tree increased; in the intermediate trees it remained constant; and in the suppressed tree it fell steadily. In all the trees the cross-sectional area of each ring was greatest just below the living crown and decreased both upward in the crown and downward in the stem. The decrease in area from the base of the crown to the base of the stem was more marked in the suppressed than in the dominant tree, and in the spring wood than in the summer wood. The weight of wood produced varied between 1.5 and 2.5 gm. per gm. of total needles. The weight of the old needles appeared to be more closely related to the weight of wood produced than that of the new needles. An extensive bibliography on tree growth is given.—*D. A. Kribs.*

4911. FRANCIS, W. D. The buttresses of rain-forest trees. *Kew Bull. Misc. Inform.* 1931(1): 24-26. 1 pl. 1931.—Discusses briefly the various theories put forward to account for buttresses. In Queensland, buttresses are well developed on comparatively young trees and long before they become exposed to strong winds. Formation of buttresses may be due to soil conditions. In Australian rain-forests the dense ground cover of organic matter prevents efficient aeration of the soil. As buttresses are best developed in trees growing in moist or wet soils they may be related to deficient aeration of the soil.—*V. S. Summerhayes.*

Stanford University Press, 1930.—Information of general interest about *Sequoia gigantea.* Chapters are devoted to their significance, early history (fossil history omitted), need for saving, age, size, growth, seedling development, cone and seed production, cone pigment, foliage, bark and root system, and death. A table gives the location, number of trees and general remarks for each of the 71 groves of big trees in the Sierra Mts. of California.—*W. C. Muenscher.*

4914. GIACOBBE, ANDREA. L'abete bianco (Abies alba Mill.). *L'Alpe, Riv. Forest. Italiana* 18(1): 77-86. 9 fig. 1931.—General notes on characteristics and productivity of *A. alba* in the Apennines.

4915. GRAHAM, SAMUEL A. The effect of defoliation on tamarack. *Jour. Forestry* 29: 199-206. 1931.—Four sets of 10 trees each were defoliated for 4 successive yr. and left undefoliated the 5th yr. The experiments demonstrated that: (1) Defoliation causes a reduction in the size of needles in subsequent years and its effects may be localized in the parts defoliated; (2) complete defoliation usually killed after 3 successive yr. (although 2 trees showed signs of life after 4 defoliations), whereas 75% defoliation failed to kill; (3) complete defoliation affected roots as well as tops, but partial defoliation showed little or no effect; (4) increment of wood is reduced in direct proportion to the amount of defoliation; (5) partial defoliation results in gradual reduction, whereas complete defoliation results first in an increased growth followed by a sharp falling off in rate of increment; (6) certain individual trees failed to react like the majority—usually individuals which were suffering from competition with their neighbors. The results are discussed in connection with larch sawfly attack.—*S. A. Graham.*

4924. JENSEN, C. F. Generationsveksel i skoven. [Crop rotation in the forest.] *Skogen* 18(3): 52-54. 1931.—Further evidence that in nature one species alternates with another on the same area is given in the succession of *Vaccinium vitis idaea* after *Calluna vulgaris* on heaths, the failure of successive generations of *Sorbus* or other trees of the same family in the same nursery bed, and the deterioration of successive timber crops of one species on a given site. Poisonous excretions from the roots may be the cause. Frequently infections with root rot make a change of species advisable. Underplanting, retention of advance growth, mixed stands and selection cutting all tend to correct the evils of soil deterioration and infection.—*H. I. Baldwin.*

4925. JONSON, TOR. Methods and aids in tree form investigations and in the calculation of volume, yield of various products and growth. *Proc. Internat. Congress Plant Sciences, Ithaca, N. Y. 1926* 1: 729-739. Geo. Banta Publishing Co.: Menasha, Wisconsin. 1929.—An exposition of the "form class" method of estimating timber, and its usefulness in commercial and in scientific work, together with the author's method of calculating current volume growth, growth of different sortiments and annual value increment. The form class method facilitates the construction of general volume tables, and the calculation of sortiments and of the supply of wood over a certain minimum dimension, and makes possible, without new measurements, new calculations which will be in harmony with changing utilization standards. The paper mentions a promising new dendrometer devised by the Swedish forester Liljenström.—*F. I. Righter.*

4926. KEITHLEY, E. S. Colorado evergreens turn deciduous. *Jour. Forest.* 29(4): 614-615. 1931.—Severe freezes and unseasonable thaws, and late spring frosts, during 1930, prevented new growth during the following summer on Douglas fir, Engelmann spruce, and Colorado blue spruce above 7,500 ft. on the Pike National Forest, Colorado, and as a result the trees, though still alive and with new buds, entered the winter of 1930-31 in a leafless condition.—*P. C. Wakeley.*

4927. KLIKA, JAROMÍR. Dendrologie. [In Czech.] *Publ. Min. Zemedelství RCS.* 1930(79): 327p. 149 fig. 1930.—A handbook of dendrology systematically arranged, and including descriptions.

4928. LARUE, P. Eclaircie dans les peupliers. *Bull. Trimest. Soc. Forest. de Franche-Comté* 19(1): 37-39. 1931.—A plantation of *Populus* on a low, moist, poor quality site originally spaced 5 × 5 m., thinned at 34 yr. to a spacing of 5 × 10 m., and at 37 yr. to 10 × 10 m., gave current annual growth per tree of 0.07 cu. m. after the 1st thinning and 0.14 cu. m. after the 2nd thinning. The trees on the south side were largest, those in the center, intermediate, and those on the north, the smallest.—*J. Kittredge, Jr.*

4929. LEDOUX, PAUL. Documents et études de drymologie et de phytotechnologie. (To be cont.) *Bull. Soc. Cent. Forest. Belgique* 36(5/6): 232-250. 5 pl. 1929.—This instalment is devoted to "some problems of floristic phytogeography in relation to drymology." Many references are listed.—*H. T. Gisborne.*

4930. LENT. Düngungsversuche in der Preussischen Staatsoberförsterei Willenberg. *Zeitschr. Forst.- u. Jagdw.* 62(12): 839-846. 5 fig. 1930.—An account of results with commercial fertilizers in experiments started between 1908 and 1914. Potassium phosphate tests with "Kainit" and "Thomasmehl" showed that a single application of fertilizer is sufficient to produce an appreciable stimulation in the growth of pine for many years on the poorest sand soils. Fifteen to 17 yr. after fertilizing with various magnesium compounds the basal area growth of the treated stands was 30-163% above that of an untreated stand.—*J. Roeser, Jr.*

4931. LUNCZ, G. The importance of acidity in forest soil. *Internat. Rev. Agric. Pt. 1. Monthly Bull. Agric. Sci. & Pract.* [Rome] 21(11): 431-438. 1930.—The author summarizes the work done by a number of experimenters under the following heads: soil layers, classification of soils in relation to acidity, influence of acidity on the physical and mechanical properties of the soil, nitrogen metabolism, microbiology of the soil, influence of soil acidity on growth, influence of plants on the soil and methods of improvement. A 2-page bibliography is appended.

4932. LUNCZ, G. The problem of the choice of seeds in forestry. *Monthly Bull. Agric. Sci. & Pract.* [Rome] 22(1): 31-35. 1931.—A review of some preliminary work done in different countries, with a suggestion for an international agreement on forest seed control.

4933. MATTOON, WILBUR R., and R. B. MILLER. Forest trees of Illinois. How to know them. A pocket manual describing their most important characteristics. 5th ed. 93p. 93 fig. Schnepp & Barnes: Springfield, Illinois, 1930.

4934. MOREY, H. F. A test of hypsometers on short trees. *Jour. Forest.* 29(2): 233-237. 1931.—For trees up to 50 ft. in height the U. S. Forest Service hypsometer and the Abney hand level proved superior to the Faustmann and Klaussner hypsometers.—*P. C. Wakeley.*

4935. OLBERG. Zapfenertrag und Samenbedarf. *Zeitschr. Forst.- u. Jagdw.* 62(10): 726-728. 1930.—In a good pine seed year (1928), the yield of cones from felled trees was 2.35 liters per cu. m. of timber cut (0.86-6.06 liters for different compartments). In a poor seed year (1929), the yield was 0.05-1.63 liters (aver. 0.53 l. per cu. m.). Based on a yield of 1 kgm. of seed from 100 liters of cones, and a cut of 250 cu. m. per ha., 5.88 kgm. of seed per ha. are available under favorable conditions, and 1.33 kgm. when conditions are unfavorable. The seed needed for sowing and nursery production for the Prussian state forests is 1.44 kgm. per ha. of land to be restocked. Under any conditions the seed required can be supplied from felled trees, provided care in collecting, sowing, and nursery practise is exercised.—*J. Roeser, Jr.*

4936. PATTERSON, C. F., and A. C. BUNCE. Rapid methods of determining the percentages of fertility and sterility in seeds of the genus Betula. *Scientific Agric.* 11(10): 704-708. 6 fig. 1931.—Successful germination tests were made proving the reliability of 2 methods employed. In one, transmitted light below the objectives of a medium power binocular microscope was used. The seeds to be examined were spread thinly over a glass plate and placed on the stage. In a simpler method seeds were spread over a sheet of paper placed between the eye and a strong light.

4937. PAVARI, ALDO. Il pino nero o larício (Pinus nigra Arn.) *L'Alpe, Riv. Forest. Italiana* 18(1): 25-38. 1 pl., 12 fig. 1931.—Notes on its distribution in Italy.

4938. PAVARI, ALDO. Il pino silvestre (Pinus silvestris L.) *L'Alpe, Riv. Forest. Italiana* 18(1): 41-45. 1 pl., 4 fig. 1931.—Notes on *P. silvestris* in Italy.

4939. PETRINI, SVEN. Resebilder från några franska skogsområden. [Travel pictures from some French forest regions.] *Skogen* 18(3): 55-56; (6): 143-146. 9 fig. 1931. —The forests of the Jura consist of *Picea excelsa* at the higher elevations and *Abies pectinata* at the lower, the dividing line being about 1200-1400 m. In the Noirmont forest the rotation for spruce is 150 yr., and the increment 6 cu. m. per year. Biolley's "methode due contrôle" is practiced, as well as cutting in narrow bands parallel with the slope. In the French Alps *Larix europea* is the commonest tree in the subalpine zone; lower down *Pinus silvestris* and *P. cembra* occur, as well as spruce and fir. Larch reproduction is best in the paths of avalanches. Management is usually by the "quartier bleu" system.—*H. I. Baldwin.*

4940. PETTERSON, H., et al. Redogörelse från kommittén för flytbarhetsundersökningar. [Report of the committee on buoyancy investigations.] *Skogsvårdsför. Tidskr.* 28(4): 496-519. 13 fig. 1930.—Wood properly piled on the landings usually dries sufficiently in the spring before driving. There is little danger of fungus damage, although some of checking. Wood cut in September or October and completely barked dries well, and runs no risk of blue stain or checking, but some snow mould may develop. When the green crown is left on the tree after felling the top and center logs do not dry more than ordinary cut logs, although the butt logs of rapidly grown trees dry more when cut by this method. If sufficient drying can take place on the landings in the spring, broad-ringed trees may be cut in the fall or winter; if not, cutting during moist weather in August, leaving the crown attached, is recommended.—*H. I. Baldwin.*

4941. PILLOW, M. Y. Compression wood records hurricane. *Jour. Forest.* 29(4): 575-578. 2 fig. 1931.—The formation of compression wood in 35-yr.-old longleaf pines in Florida is traced to a hurricane near the end of the 1926 growing season.—*P. C. Wakeley.*

4942. POLHAMUS, LOREN G. Experimental tapping of Hevea rubber trees at Bayeux, Haiti, 1924-25. *U. S. Dept. Agric. Tech. Bull.* 65. 1-32 2 fig. 1928.—Plot and individual yields of 95 *H. brasiliensis* trees over a period of 9 months are reported, the average total yield of dry rubber per tree being 3.4 lb. The best tree produced 6.7 lb. in 9 months. A small proportion of the trees produced a large proportion of the latex. The product-moment correlation method was used in studying the relation between the tree yields in the different months. Since low-yielding trees in one month were normally low-yielding in another month, total yields could be determined with a fair degree of accuracy. The use of the regression equation is discussed in connection with production control. The correlation between yield and tree growth was 0.66 ± 0.68; between yield and bark thickness, 0.030 ± 0.070. There was only a slight correlation between latex yield and rubber content. Bark consumption amounted to a mean of 9.3 inches of bark from about ½ of the circumference of the tree. The bark renewal was good, the thickness for 9-months old bark being 4-7 mm. Weather conditions were normal over the period the trees were studied.

4943. RENDLE, B. J., et al. The timber of Corsican pine (Pinus laricio Poiret). *Great Britain Dept. Sci. & Indust. Res., Forest Prod. Res. Bull.* 6. 1-40. 4 pl. 1930.—This bulletin consists of the following reports: I. The structure of Corsican pine, by B. J. RENDLE; II. The seasoning of Corsican pine, by S. T. C. STILLWELL; III. Mechanical and physical properties of Corsican pine, by C. J. CHAPLIN; IV. The antiseptic treatment of Corsican pine; V. The utilization of Corsican pine, by J. R. COSGROVE; and an appendix: Details of woodworking tests, by E. D. van REST, J. A. BUCHANAN, and W. E. WILSON.

4945. ROCHESTER, G. H. The strength of telephone poles. Eastern cedar, red pine and jack pine. *Canada Dept. Interior, Forest Serv. Circ. 31.* 1-16. 4 pl. 1931.

4946. SALA, GIOVANNI. Il larice (Larix decidua Mill.). *L'Alpe, Riv. Forest Italiana* 18(1): 54-64. 10 fig. 1931.—General notes on the cultivation and biological characters of the larch in Italy.

4947. SCHANTZ-HANSEN, T. Some results of thinning 27-year old jack pine. *Jour. Forest.* 29(4): 544-550. 3 fig. 1931.—A lightly thinned (approximately 6 x 6 ft. spacing) and a heavily thinned plot (approximately 8 x 8 ft.), were laid out in dense 27-yr.-old *Pinus banksiana* on light, deep sand at Cloquet, Minnesota. After 5 yr., the lightly thinned plot showed approximately the same periodic increment % as the unthinned check, but 120 cu. ft. less volume increment, whereas on the heavily thinned plot the volume increment was approximately the same as on the check plot, but the increment per cent was 30% greater, laid on by trees of superior quality and size.—*P. C. Wakeley.*

4948. SCHUBERT, J. Grundlagen der allgemeinen und forstlichen Klimakunde. Die Sonnenstrahlung und der Wärmeumsatz an der Bodenoberfläche. [Solar radiation and heat exchange at the soil surface.] *Zeitschr. Forst.- u. Jagdw.* 62(10): 689-705. 1930.—The principal characteristics that distinguish the climate within forests are protection against radiation, the peculiar character of heat circulation, and the manner in which it is modified. —*J. Roeser, Jr.*

4949. SHIRLEY, HARDY L. Does light burning stimulate aspen suckers? *Jour. Forest.* 29(4): 524-525. 1931. —Light burning late in the fall on 10 ft. sq. quadrats on plots in a 43 yr. old aspen stand on the Chippewa National Forest (Minnesota) stimulated the growth of aspen root suckers, apparently because of the increased heat absorption of the blackened surface.—*P. C. Wakeley.*

4950. SOUZA PINTO, G. de. A carnaúbeira a arvore da vida. [The carnauba, the tree of life.] 21p. 2 pl., 7 fig. Typ. Moderda F. Carneiro: Fortaleza, Brazil.—1928.—*Copernica cerifera* is valued economically for its leaves and wood useful in building, its roots used for medicinal purposes, and especially for the wax which it yields.

4951. STÅLFELT, M. G. Die physiologisch-ökologischen Bedingungen der Kronenreinigung, Schaftreinigung und der natürlichen Bestandesreinigung der Fichte. *Skogsvårdsför. Tidskr.* 29(1): 1-44, 8 fig. 1931.—The dying off of branches begins with the failure of new shoots to appear. After a time the needles fall off and the branch withers. Growth usually stops first on branches of higher order, then affects branches of the 2nd order, and finally the terminal bud. Light intensity measured by Wiesner's method was E_s 0.03 where formation of new internodes ceased. This is the same value as that found for spruce needles where assimilation just balances respiration. Death of side branches is thus due to failure to manufacture adequate food. Self-thinning of stands results from the same causes.—*H. I. Baldwin.*

4952. STASSEN. Bodenbearbeitung mit dem "Lindwurm." *Zeitschr. Forst.- u. Jagdw.* 62(11): 791-793. 1930. —Use of this machine greatly facilitated natural reproduction in beech stands, especially on impoverished soils on stand borders.—*J. Roeser, Jr.*

4953. STREYFFERT, TH. Europas virkesförsörjning. [Europe's wood supply.] *Skogsvårdsför. Tidskr.* 28(4): 460-495. 9 fig. 1930.—In 1925-27 Europe produced a surplus of 11 million cu. m. of wood above imports. A possible sustained yield of 185 million cu. m. is estimated for all Europe. The cut averaged 177 million cu. m. for the years studied. Increment amounting to 27 million cu. m. in Russia was mostly balanced by decay. Thus an excess of 19 million cu. m. of cut over growth is indicated, which probably increased to 24 and 22 million cu. m. for 1928 and 1929.—*H. I. Baldwin.*

4954. TELLA, G. di. L'abete rosso (Picea excelsa Lk.). *L'Alpe, Riv. Forest. Italiana* 18(1): 65-76. Map. 13 fig. 1931.—Notes on *P. excelsa* in Italy.

4955. **TRABUT, L.** Tamarix articulata Vahl. *Bull. Stat. Forest. Nord de l'Afrique* 1(8): 336-349. 8 fig. 1926.—The distribution, development, taxonomy, anatomy, insect parasites, history, methods, and status of the culture of the species in north Africa are described.—*J. Kittredge, Jr.*

4956. **WAKELEY, PHILIP C.** Successful storage of longleaf pine seed. *Jour. Forest.* 29(3): 424-425. 1931.—Seed was kept viable for 1 and 2 yrs. by storing at temp. slightly above freezing.—*P. C. Wakeley.*

4957. **WALLMO, UNO.** Individ-vård. [Individual tree selection.] *Skogen* 18(4): 82-89; (5): 117-122. 15 fig. 1931.—The yield of the Högsjö forest in Sweden has constantly increased under individual tree selection until it is now 250% greater than in 1900. The most important factor is the spacing of each tree for optimum use of the site at every stage of development. If properly spaced, individual trees instead of stands can indicate the site quality by their current annual increment. When this sinks more than 25% below its peak, reproduction should be commenced. Different species should be alternated on the same spot; pine and birch can be reproduced after spruce by making heavier reproduction cuttings.—*H. I. Baldwin.*

4958. **WIEDEMANN, EILHARD.** Die Versuche über den Einfluss der Herkunft des Kiefernsamens. *Zeitschr. Forst.- u. Jagdw.* 62(7/8): 498-522; (12): 809-836. 6 fig. 1930.—This is a comprehensive résumé of the results of an international experiment proposed by Schwappach at the 1906 meeting of the International Union of Forest Experiment Stations. *Pinus silvestris* seed from 12 climatic regions was assembled and distributed to the various cooperators in 1907. The plantations constituting the basis of study are now 15-20 yr. old. The latest results indicate that a large number of local pine races exist within the range of the species in Europe and that these exhibit definite heritable characters involving form, growth and susceptibility to certain enemies. Many of these races are adaptable to a wide range of climatic conditions without appreciable change of original characters. However, within the wide range of the species' distribution, climatic variations are so great that careless introduction of a climatic race into a new habitat may result disastrously. The Belgian and East Prussian races have proved to be elite strains, whose introduction into regions considerably removed from their natural range may be recommended. More intensive studies are needed to establish a scale of strains suitable for cultivation in various "normal" localities in central Europe. More information is needed on the desirability of various races for localities with peculiar local climatic conditions. Meanwhile procedure should be cautious and only seed of certain origin should be used.—*J. Roeser, Jr.*

4959. **ANONYMOUS. RHODESIA DIVISION OF FORESTRY.** Establishing pines. Preliminary observations on the effects of soil inoculation. *Rhodesia Agric. Jour.* 28(2): 185-187. 1931.—Inoculation of soil giving poor growth with soil containing mycorrhizas from satisfactory plantations afforded favorable results.

4960. **ANONYMOUS.** West Virginia forests and forest products. *West Virginia Dept. Agric. Bull.* 74. 1-48. Illus. 1928.

4961. **ANONYMOUS.** Zusammenstellung der im Jahre 1929 in den Preuss. Staatsforsten vorgekommenen Waldbrände. *Zeitschr. Forst.- u. Jagdw.* 62(12): 866-867, 1930.—A total of 670 fires occurred, of which 41% were of unknown origin and only 3% were attributable to lightning. They burned over 4,666 acres or 57% of the area burned in 1928. Most of the fires occurred in May and April. Data for 1927 and 1928 are also included.—*J. Roeser, Jr.*

PHARMACOGNOSY AND PHARMACEUTICAL BOTANY

HEBER W. YOUNGKEN, *Editor*

(See also in B. A. 6(1): Entries 54, 58, 655, 1176, 1404, 1429, 1554, 1624, 2120, 2123, 2126, 2134; and in this issue 3024, 3231, 4061, 4073, 4075, 4277, 4321 4507, 4737, 4885, 4950, 5180, 5217, 5455)

4962. **AMES, OAKES.** Rhus verniciflua and Japanese damascene ware. *Jour. Arnold Arboretum* 12(1): 1-3. 1 pl. 1931.—In Japanese damascene ware which caused *Rhus* dermatitis or lacquer poisoning, the black background was found to be non-metallic and to consist of lacquer, the prepared latex of *Rhus verniciflua*, dyed black. This product should be called lacquer-damascene to avoid confusion with the genuine entirely metallic article.—*A. Rehder.*

4963. **BRIDEL, M., et J. RABATÉ.** Sur la présence du picéoside dans l'écorce de saule noir. *Jour. Pharmacie et Chim.* 11(12): 561-571. 1930.—The bark of the black willow is one of the common commercial drugs. In 1900, Jowett isolated from it a glucoside which he named salinigrin. The authors repeated Jowett's work and showed that the glucoside is a combination of glucose with p-hydroxy acetophenone, and is identical with piceoside, which was first prepared by Tanret from *Picea excelsa*. Therefore, the name Salinigrin should give way to piceoside which has priority.—*O. F. Black.*

4964. **CLARK, E. P.** Tephrosin. I. The composition of tephrosin and its relation to deguelin. *Jour. Amer. Chem. Soc.* 53(2): 729-732. 1931.—Deguelin, m. p. 171°, and a compound melting at 198°, were isolated from the leaves of *Cracca vogelii*, derris root and the roots of *Lonchocarpus nicou* (Cubé root). These 2 substances form a mixture which is difficult to separate by fractional crystallization and which appears to be the material designated by Hanriot as tephrosin. It is proposed that the name tephrosin should be retained for the compound with the melting point of 198°. Tephrosin is a dimethoxy lactone, $C_{23}H_{22}O_7$, which, under the influence of certain dehydrating agents, loses one molecule of water, forming dehydrodeguelin. It is suggested that tephrosin is a hydroxydeguelin. The action of potassium permanganate upon tephrosin results in the formation of a dicarboxylic acid, $C_2H_{20}O_{11}$.—*Author's summary.*

4965. **FINNEMORE, HORACE, and CHARLES BERTRAM COX.** Cyanogenetic glucosides in Australian plants. Part II. A.-Eremophila maculata. The native fuchsia. *Jour. & Proc. Roy. Soc. N. S. Wales* 63: 172-178. 1929(1930).—Leaves of *E. maculata* (but not those of *E. goodwinii*) treated with sweet almonds, gave a strong positive test for HCN, but were found almost free of the corresponding enzyme. The glucoside was isolated and identified with prunasin. The glucoside amounted to nearly 10% of the dry wt. of the leaves. Procedures of isolation and analysis are reported in detail.

4966. **FINNEMORE, H., C. B. COX, and SUZANNE KATE REICHARD.** Cyanogenetic glucosides in Australian plants. Part II. B. The presence of enzymes in fodder plants as a factor in the poisoning of stock. *Jour. & Proc. Roy. Soc. N. S. Wales* 63: 179-182. 1929(1930).—*Heterodendron oleaefolium*, and dried plants of *Eremophila maculata*, although containing cyanogenetic glucosides, are harmless to stock because the enzymes capable of decomposing them are absent or insufficient in amount; hence, a study of various plants was carried out as to their containing β enzymes, since these latter, capable of decomposing prunasin and sambunigrin but not amygdalin, are widely distributed in plants. To 2 gm. portions of minced fresh plants were added 4 cc. of solutions of amygdalin, prunasin, or sambunigrin; the material was incubated at 40°-42°; and color change of picrate paper was taken as indicating hydrolysis. Pods of *Acacia suaveolens* hydrolyzed prunasin; this may explain the poisoning of stock after eating pods of *A. georgina.*

4967. GLASER, ERHARD. Über das unter den Namen B Methyläsculetin, Scopoletin, Gelseminsäure, Chrysatropasäure in verschiedenen Pflanzen vorkommende 4-Oxy-5-Methoxykumarin und das Glukosid desselben. [The 4-Oxy-5-Methyoxycumarin and its glucoside which occurs in different plants under the names: B methylaesculetin, scopoletin, gelseminic acid and chrysatropic acid.] *Arch. Pharm. u. Ber. Deutsch. Pharm. Ges.* 1928 (8): (1-10). 1928.—Confusion exists in the nomenclature of certain plant products which are notable for their property of fluorescence. By experimental work he assigns them to a proper relationship to each other, and also determines their relative fluorescence. A practical side to this lies in the recent use of such fluorescing compounds as a protection to the skin in the practise of ultra violet-ray therapy. A paste containing preparations of this nature has been employed for the purpose.—*O. F. Black.*

4968. HADI, ALI, und WALTHER BAIER. Über histologische Untersuchungen medizinischer Organpräparate. *Deutsche Tierärz. Wochenschr.* 38(22): 337-340. 5 fig. 1930.—The authors' study appears to show that, with the requisite histological knowledge, it is possible to determine by microscopical examination the origin and trueness to declaration of commercial organ preparations (e.g., ovarian, thyroid, testicle, prostate, liver, etc., preparations).

4969. HIMMELBAUER, WOLFGANG, und EMMY ZWILLINGER. Biologisch-chemische Formenkreise in der Gattung Digitalis L. Eine pharmakognostisch-botanische Studie. *Biol. Generalis* 3(5/8): 595-688. 31 fig. 1927.—Recent investigations have shown that *Digitalis purpurea* is not the only glucosidal drug of importance in this genus,—that other spp., e.g., *D. lanata* Ehrh., can be used with advantage. The authors studied the value of *Digitalis* spp. from the standpoint of glucosidal content. Material was obtained from the herbarium and garden of the Vienna Botanical Garden and Natural History Museum, and from other sources. *D. lanata* had 3 times the glucosidal content of *D. purpurea;* the authors therefore used the content of *D. purpurea* as unity, and designated its content as +, and that of *D. lanata* as +++. The genus is peculiar to the Mediterranean region, with 2 centers of distribution, one in the east, and one in the west. They describe each of the 25 species studied in great detail, both morphologically and anatomically, illustrating most of them. As to glucosidal content, they find the following species with less content than *D. purpurea: D. sceptrum, isabelliana, laevigata,* and *eriostachya.* As strong as *purpurea: canariensis, ambigua, gigantea, parviflora, purpurascens,* and *ferruginea.* Most species lie between *purpurea* and *lanata* in glucosidal strength, viz.: *laciniata, amandiana, lutea, guelli, viridiflora, leucophaea, athoa, longebracteata, nervosa, ciliata, sibirica.* Some are as strong as *lanata* (*obscura* and *thapsi*), a few even stronger (*dubia, mariana,* and *orientalis*). In the special part, each species is again treated in great detail, followed by groupings of species. This is done in various ways, according to leaf shape, according to kind of leaf margin, according to pubescence, shape of leaf in transverse section, shape of epidermal cells, size of epidermal cells, size of stomata, size of palisade cells, comparison of width of palisade tissue to that of the spongy tissue, and according to glucosidal content. The western or Iberian species are stronger in glucosides than the eastern or oriental species; the northern species are comparatively weak in this respect. The authors thus get various group-forms, a *laciniata*-group, a *purpurea*-group, a *lutea*-group, etc. *Isoplexis* appears as a subgenus, not as a section. It is so different that it might be considered a genus. The origin of the genus *Digitalis* may well be sought here, and next in *Digitalis laciniata* and *D. obscura.* From these western forms migrations probably took place, gradually spreading over the Mediterranean region, from which, later, developed 2 centers of distribution.—*C. C. Plitt.*

4970. KAFUKU, KINZO, and RYO KATO. On the essential oil of Taiwania cedar. *Bull. Chem. Soc. Japan* 6(3): 65-74. 1 fig. 1931.—The wood chips of *Taiwania cryptomerioides* Hayata give, on steam distillation, 0.23% of an oil, consisting chiefly of sesquiterpene and sesquiterpene alcohol. The sesquiterpenes in the oil are chiefly cadinene, with a little humulene and caryophyllene. From the cadinene, a new oxidation product $C_{12}H_{22}O_2$ (m. p.=142°-143°) was obtained. The sesquiterpene alcohol in the oil, for which the authors suggest the name "taiwanol," closely resembles cadinol of Semmler and Jonas. From cadinol no crystalline phenyl urethane could be obtained, but in case of taiwanol, it affords a crystalline phenyl urethane melting at 134°-135°, and furthermore, it gives a neutral oxidation product (m. p. 170°) if oxidized with permanganate in acetone solution.—*Authors' summary.*

4971. KLEIN, GUSTAV, und FELIX SCHUSTA. Der mikrochemische Nachweis der Alkaloide in der Pflanze. XV. Der Nachweis von Echinopsin. *Österreich. Bot. Zeitschr.* 79(3): 231-248. 2 fig. 1930.—This alkaloid, found by Greshoff in the seeds of *Echinops ritro* L. and other spp. of *Echinops,* Fam. *Compositae,* is very soluble in ethyl alcohol and in chloroform, almost insoluble in ether, very slightly so in benzol, or in petroleum ether, soluble in distilled water, in methyl alcohol, in amyl alcohol, in 3% H_2SO_4, and in 5% HCl. Of the various microchemical reagents, I and the iodides were the most delicate in its detection. The alkaloid was obtained by pulverizing 0.2 gm. of the dried plant material, and extracting it with 10 cc. of 96% alcohol for 1 hr. in a Klein and Tauböck microextraction apparatus. The alcoholic extract was evaporated almost to dryness over a water bath, dissolved in 2 cc. distilled water, filtered and precipitated with basic lead acetate, filtered, and the filtrate treated with H_2S until free of Pb, and again filtered. With aqueous extracts, thus partly purified, the authors found that the seeds of all *Echinops* spp. examined contain echinopsine, and in the same amounts; the protecting scales of the fruits contained almost none; all seedlings contain the alkaloid, and the alkaloidal content remains fairly constant in all young plants. In plants several yrs. old, material examined in the fall showed that the alkaloidal content was high in the fruit and the uppermost youngest stem parts, and least in the old stem. In spring collected material, all spp. are richer in alkaloid than in the fall.—*C. C. Plitt.*

4972. PENFOLD, A. R., and F. R. MORRISON. The occurrence of a number of varieties of Eucalyptus dives as determined by chemical analyses of the essential oils. Part III. *Jour. & Proc. Roy. Soc. N. S. Wales* 63: 79-84. 1929(1930).

4973. PENFOLD, A. R., and F. R. MORRISON. The essential oils of Melaleuca decora (Salisbury) Druce, and M. nodosa var. tenuifolia (De Candolle), from the Port Jackson District. Part I. *Jour. & Proc. Roy. Soc. N. S. Wales* 63: 102-110. 3 pl. 1929(1930).—Chemical study.

4974. SCHMOLKE, A. Die mikroskopische Prüfung der Digitalis und ihre Verfälschungen. *Heil- u. Gewürz-Pflanzen* 12(4): 142-145. 1 pl. 1930.—The author gives a careful description of the leaf of *Digitalis,* and of microscopical sections of the leaf with illustrations. The action of a few common reagents as KOH, Kl and con. H_2SO_4 on the sections is treated. The common adulterants as *Verbascum, Inula conyza, Symphytum* etc., are then considered, and their characteristics which differentiate them from *Digitalis* described.—*O. F. Black.*

4975. SMITH, SYDNEY. Digitalis glucosides. Part III. Glucosides of Digitalis lanata. *Jour. Chem. Soc.* [*London*] 1931(Jan.): 23-25. 1931.—Gitoxin, hitherto found only in leaves of *D. purpurea,* is reported in leaves of *D. lanata.* Chemical studies on its extraction and properties are reported.

4977. **ALLEN, G. O.** Charophyte notes from Saharanpur, U. P. *Jour. Indian Bot. Soc.* 7(2): 49-69. 6 pl., 13 fig. 1928.—Saharanpur District, India, lies 30°N. and 78°E. Rainfall averages 39 in., maximum shade temp. rarely rises above 105° F., and severe frost is uncommon. Photographs, distinguishing characters, time of appearance, habitat, and distribution are given for 11 spp. of *Nitella*, 1 of *Tolypella*, and 10 of *Chara*. The charophyte flora of the district is regarded as rich, the number of species being half the total number recorded for all of India. Number of species and abundance are greatest during the cold season.—*W. Dudgeon.*

4978. **BACHRACH, EUDOXIE, et M. LEFÈVRE.** Disparition de la carapace sileuse chez les Diatomées. *Compt. Rend. Soc. Biol.* 98(17): 1510-1511. 1928.—Several marine diatoms and one fresh water form (*Nitzschia palea*) reproduced rapidly on sterilized solid media, giving rise to forms of irregular outline, with no siliceous frustule and what seemed to be merely a hyaline membrane. On culturing such forms on solid media containing silica, the abnormality persisted.

4979. **BHARADWAJA, YAJNAVALKYA.** Scytonema malaviyaensis, sp. nov. *Rev. Algologique* [*Paris*] 5(2): 223-227. 1 pl. 1930.—An epiphyte* growing among mosses on the bark of *Mangifera indica* in Benares, India.—*W. C. Muenscher.*

4980. **BORGE, O.** Beiträge zur Algenflora von Schweden. 4. Die Algenflora am Grövelsee. *Ark. Bot.* [*Stockholm*] 23A(1, paper 2): 1-64. 2 pl., 9 fig. 1930.—This is a list of algae, including an especially large number of desmids, from a high mountain lake and vicinity in southern Sweden. *Cosmarium* inclusum* (p. 37) is described.—*F. Drouet.*

4981. **BUDDE, HERMANN.** Die mesohaloben und halophilen Diatomeen der Lippe in Westfalen. *Ber. Deutsch. Bot. Ges.* 48(9): 415-419. 1930.—An annotated list of 34 spp., each designated as mesohalobe (m) or halophile (h). Of the 34, 15 were halophile, 15 mesohalobe, 3 halophile-mesohalobe, and 1 doubtfully halophile. Only slight periodicity, with perhaps maxima in spring or autumn, was observed. Seven associations are designated, based on the degree of salinity of their environment.

4982. **CHODAT, R.** La mutation généralisée et les mutations chez le Chlorella rubescens Chod. *Compt. Rend. Soc. Phys. et Hist. Nat., Genève* 46(1): 31-38. 1929. (*Suppl.* to: *Arch. Sci. Phys. et Nat.* 11(Jan./Fév.) 1929.)—Author's summary indicates that the asexual *Chlorella rubescens*, in pure culture since 1907 and showing in pure line a remarkable colonial stability, furnished in 1927 as a result of the cultivation of several hundred isolated cells on same standardized medium a series of mutants, some scarcely different from original type and others sufficiently different to justify distinguishing names. The theory of generalized mutation says that the general fact is not constancy but micromutation. —*M. A. Howe.*

4983. **CYRUS, BOHUMIL.** Étude monographique du genre Cymatopleura W. Smith. L'histoire et la phylogénie des Bacillariales. *Acta Bot. Bohemica* 8: 129-146. 1929.—The author divides the genus into 3 spp.: *C. solea, C. regular,* and *C. elliptica,* with varieties in the 1st and 3rd. The genus is cosmopolitan. *C. solea* varies greatly in length. Many stations with associated diatoms are listed.—*J. P. Young.*

4984. **DEFLANDRE, GEORGES.** Sur une algue rare Bernardinella bipyramidata Chod. nouvelle pour la flore française. *Arch. Botanique* 1(Bull. Mens. 11): 220-223. 1 fig. 1927.—The alga,* found in an association of blue-green algae, flagellates, diatoms, green algae and desmids, in Haute Savoie, is described in detail.

4985. **De WILDEMAN, E.** Morphologie du Zygnema ericetorum (Kuetz.) Hansg. *Acad. Roy. Belgique Bull. Cl. Sci.* 16: 422-426. 1930.—The author gives some figures of the above named species, especially of the branching and the formation of the zygospores, and concludes that *Zygogonium* and *Zygnema* cannot be considered distinct.—*E. de Wildeman* (*transl. by Sister Mary Ellen O'Hanlon*).

4986. **FRÉMY, P.** Petite contribution à la flore des Myxophycées de l'Inde meridionale. *Arch. Botanique* 1(Bull. Mens. 3): 46-47. 1927.—List of 9 spp. found in the Madura district of India.

4987. **FRÉMY, P.** Une Stigonémacée nouvelle: Hyphomorpha perrieri. *Arch. Botanique* 1(Bull. Mens. 4): 63-64. 2 fig. 1927.—The genus is described, as well as the n. sp.,* from Madagascar.

4988. **FRÉMY, P.** Note sur le Phormidium luridum (Kuetz.) Gom. *Arch. Botanique* 2(Bull. Mens. 3): 53-54. 1928.—Gomont's description of the species is emended and the forms violacescens and nigrescens are added.

4989. **FRÉMY, P., et R. MESLIN.** Trois Oscillariées nouvelles pour la flore française. *Arch. Botanique* 2(Bull. Mens. 5): 73-78. 2 fig. 1928.—Detailed descriptions of *Schizothrix fuscescens** Kütz., *Microcoleus sociatus** W. et G. S. West, and *Lyngbya martensiana** Menegh.

4990. **GUERRERO, PEDRO GONZÁLEZ.** El género Spelaeopogon Borzi en España. (Cyanophyceae.) *Mem. R. Soc. Españ. Hist. Nat.* 15(1): 437-439. 13 fig. 1929.—*Spelaeopogon* (Scytonemaceae) is reported for the first time from Spain as represented by *S.* populi (p. 437), from Madrid, in cavities of *Populus*. Reproduction in *S. populi* is by isolated, spherical spores which grow into adult filaments, or by hormogonia which lack heterocysts. Taxonomic citations important to the genus are listed.—*H. C. Bold.*

4991. **HANDA, M. R.** Akinetes in a species of Oedogonium. *Jour. Indian Bot. Soc.* 7(1): 15-16. 4 fig. 1928. —An undetermined sp. from the Southern Shan States (Burma) at an alt. of 4675 ft. showed 1 or 2 rounded or elongated akinetes in the vegetative cells, due, it is thought, to low temp.—*W. Dudgeon.*

4992. **HOFFMANN, WM. E., and JOSEPHINE E. TILDEN.** Basicladia, a new genus of Cladophoraceae. *Bot. Gaz.* 89(4): 374-384. 22 fig. 1930.—The authors call attention to the green algae growing on the backs of turtles, and describe **BASICLADIA** (p. 380), related to *Chaetomorpha* and *Cladophora*, type *B.* crassa* (p. 382), Minnesota, from shell of a common snapping turtle, *Chelydra serpentina*. *Chaetomorpha chelonum* Collins is redescribed; *Basicladia* chelonum (*Chaetomorpha c.* Collins) (p. 382) is reported from Michigan, Massachusetts and Iowa.—*J. E. Tilden.*

4993. **[HÜBBENET, E. R., and T. V. VOBLIKOVA.]** ГЮББЕНЕТ, Е. Р., и Т. В. ВОБЛИКОВА. Заметка об ассимиляции красных водорослей, утративших фикоэритрин. **[Photosynthesis of red algae which have lost their phycoerythrin.** (German summary.)] Известия Научного Института имени П. Ф. Лесгафта. (*Bull. Inst. Sci. Lesshaft*) 14(1/2): 43-47. 1928.—The greening of red algae in consequence of loss of phycoerythrin begins in the Polar Sea (Murman Biological Station) towards the end of June and continues until the beginning of Oct. It is correlated with the increased intensity of light and heat. The dark-red and brown-red colors are resumed towards Nov. Photosynthesis and, to a less extent, respiration are suppressed in the green plants. The chlorophyll also gradually disappears. In spite of the usually fresh appearance and normal reproduction of the plants, the greening must be looked upon as pathological. The rôle of phycoerythrin in the assimilation of CO_2 needs further investigation.—*M. A. Howe.*

4994. **HUSTEDT, FRIEDRICH.** Untersuchungen über den Bau der Diatomeen. IX. Zur Morphologie und

Zellteilungsfolge von Eunotia didyma Grun. *Ber. Deutsch. Bot. Ges.* 47: (59)-(69). 5 fig. 1929.—Studies on *Eunotia didyma,* similar to former ones on *Melosira arenaria* Moore by O. Müller, are presented, but in greater detail, and with some differences of opinion concerning relation of the valves, cell membrane, and inner and outer girdle bands during cell division. Diagrams are given of the relationship of these parts through a series of generations of vegetative reproduction. Discussion of the function of elasticity of the cell membrane during division is a new contribution.—*P. S. Conger.*

4995. **HUSTEDT, FRIEDRICH. Die Kieselalgen Deutschlands, Österreichs und der Schweiz mit Berücksichtigung der übrigen Länder Europas sowie der angrenzenden Meeresgebiete.** In: **L. RABENHORSTS. Kryptogamen-Flora von Deutschland, Österreich und der Schweiz.** Band 7. Lief. 3. 465-608. 3 pl. 90 fig. Akademische Verlaggesellschaft: Leipzig. 1929.—A continuation, from a taxonomic standpoint, of parts 1 and 2 of the same series. The genus *Planktoniella* is continued and 19 other genera are discussed, including a total of 66 species. The author makes the n. comb., *Auliscus reticulatus* var. **schmidtii** (*A. s.* Gründl.), and includes *A. ralfsii* W. Sm., *A. sparsus* Ratt., *A. crassus* Van Huerck and *A. tenellus* Bréb. under *Actinocyclus* as *Actinocyclus chrenbergi* vars. **ralfsii*** (p. 528), **sparsa** (p. 528), **crassa*** (p. 529) and **tenella*** (p. 530). Descriptions, figures, classification, synonymy, distribution and literature citations are given, as well as identification keys.—*P. S. Conger.*

4996. **HYLANDER, CLARENCE JOHN. The Algae of Connecticut.** *Connecticut State Geol. Nat. Hist. Surv. Bull. 42.* (*Public Document* No. 47) 245 p. 28 pl. 1928.—This work deals with the species of fresh and salt water algae of Connecticut with keys for their identification and illustrations of many of them. For each species there is noted the citation of the original description, the characteristic environment and the towns in the state in which the species have been collected. The author gives a brief description of the Algae, which he treats under 4 groups: Myxophyceae, Chlorophyceae, Heterokontae, Phaeophyceae and Rhodophyceae. He speaks briefly of the distribution of the Connecticut Algae, classifying them as Subaerial Flora, Submerged Limnophyceae (4 types), and Submerged Halophyceae (6 types), listing the Connecticut genera for each type. The paper includes a short history of Connecticut phycology and an index.—*H. T. C.*

4997. **INOH, SHUMPEI. Embryological studies on Sargassum.** *Sci. Rept. Tôhoku Imp. Univ. 4th Ser. Biol.* 5(3): 423-438. 13 fig. 1930.—*Sargassum hemiphyllum* Ag., *S. kjellmanianum* Yendo, *S. confusum* Ag., *S. patens* Ag., *S. piluliferum* Ag., *S. enerve* Ag., *S. ringgoldianum* Harv., *S. serratifolium* Ag., *S. tortile* Ag., *S. nigrifolium* Yendo, *S. micracanthum* (Kütz.) and *S. horneri* Ag. were studied. Collections were made of egg-discharging plants from March 16 to July 7. The time of fruiting was found to be correlated with the spring tide. Living material was taken to the laboratory, where development of the embryos was studied. The 1st segmentation of the zygote is transverse, as in the 2nd, which cuts off a small rhizoid-cell in the lower portion of the embryo. Subsequent divisions of the rhizoid-cell are distinctive and characteristic for each species. Three types of rhizoid-formation were observed: (1) Species with small eggs develop embryos in which the rhizoid-cell becomes cut into 8 irregularly arranged cells, from which as many rhizoids grow; (2) species with somewhat larger eggs form 16 irregularly arranged rhizoid-cells, giving rise to 16 rhizoids; (3) species with still larger eggs and embryos with 8 radially arranged cells and 8 additional rhizoids arising from the cells adjacent to and behind the rhizoid-initials. The author points out that the genus *Cystophyllum* with relatively much larger eggs has 32 rhizoid-cells in the embryo and suggests that species of *Sargassum* with the larger eggs are higher taxonomically.—*G. W. Prescott.*

4998. **KOL, E. Adatok a Tátrai Desmidiaceák kocsonyakiválasztással történö helyváltoztásához. [Movement with slime formation of Desmidiaceae from the High Tatra Mts.]** *Folia Cryptogamica* [*Szeged*] 1(5): 435-442. 2 pl. [German summary] 1927.—The paper treats of the slime forming Desmid species, living under various ecological conditions in the Hohen-Tatra (Czechoslovakia) and in the moors along the base. The speed of their movement depends on light, temperature, and other external factors.—*E. Kol* (*transl. by H. J. Brown*).

4999. **KYLIN, HARALD. Some physiological remarks on the relationship of the Bangiales.** *Bot. Notiser* 1930(6): 417-420. 1930.—From analysis of the several types of phycoerythrin, phycocyanin and xanthophyll differently distributed in the Myxophyceae, Bangiales, Florideae, and the Chlorophyceae (especially *Prasiola*), and with regard to the types of gametes produced, the author confirms his stand that the Bangiales are more closely related to the Florideae than to the Myxophyceae, and are not at all related to the Chlorophyceae. —*W. R. Taylor.*

5000. **OKAMURA, KINTARÔ. On the distribution of marine algae in Japan.** *Proc. Third Pan-Pacific Sci. Congress Tokyo* 1: 958-963. Map. 1926(1928).—The course of the warm Japan current (Kurosiwo) and that of the cold Kurile current are described. In Japan there are 3 distinct algal floras, viz., subarctic, temperate, and subtropical. The author distinguishes 5 regions in the Pacific coast for algal distribution: (1) subarctic, extending from Syumushu Isl. to Kinkwazan, the Ochotsk flora predominating, such as *Thalassiophyllum, Arthrothamnus,* etc.; (2) extending from Kinkwazan to Hyuga-Ôshima on the eastern coast of Kyusyu, rich in temperate flora, with *Undaria, Acanthopeltis,* etc., abundant; (3) the southern part of Kyusyu from Hyuga-Ôshima to Cape Noma on the western coast of the province Satuma, and also Ryukyu, Formosa and Bonin, with *Halicoryne wrightii,* the only indigenous alga, the others being those common to Australia, Red Sea, Indian Ocean, etc.; (4) from Cape Noma to Tugaru Strait along the coast of the Japan Sea, with a floral aspect quite similar to that of the 3rd region; (5) from the Tugaru Str. to Nemuro through the Soya Strait; this has the temperate feature, and may be considered as the continuation of the 4th region with some Ochotsk species.—*K. Okamura.*

5001. **OKAMURA, KINTARÔ. On the evolution of classification of the Rhodophyceae.** [In Japanese.] *Bot. Mag.* [*Tokyo*] 44: 61-69. 1930.—The word Florideae was created in 1813 by Lamoureux, though his so-called Florideae contained besides the red algae in the modern sense many other plants. The foundation of the modern classification of red algae was laid by Bornet and Thuret, who first recognized the female nature of the carpogonium. J. Agardh's classification was long prevalent. Schmitz published in 1883 his system of the Florideae (except the Bangiales), which included Nemalioninae, Gigartininae, Rhodymeninae and Cryptomeninae. Oltmanns (1904) distinguished 5 groups, viz., Nemalionales, Cryptonemiales, Ceramiales, Gigartinales and Rhodymeniales, though later the order of these groups was changed. Kylin (1928) has separated certain forms from Nemalionales and created a new group, Gelidiales.—*K. Okamura.*

5002. **OKAMURA, KINTARÔ. Icones of Japanese algae.** (In Japanese and English.) 6(3): 19-28. 5 pl. (4 col.); 6(4): 29-38. 5 col. pl. (p. 21); *Herposiphonia tenella** (C. Ag.) Naeg.; *H. insidiosa** (Grev.) Falk.; *Taenioma perpusillum** J. Ag.; *Scinaia moniliformis** J. Ag. 6(4): *Halymenia agardhii** De Toni; *Erythrymenia obovata* Schmitz; *Rhodymenia* **intricata** (*Phyllophora i.* Okam.) (p. 23); **PLUMARIELLA** (p. 24), Ceramiaceae, near *Euptilota* and *Plumaria,* with *P.* **yoshikawai*** (p. 26); *Ceramium* **crassum*** (p. 26); *Erythrymenia,* which was put by Mazza in *Rhodymenia,* belongs to Grateloupiaceae; *Ceramium*

hypnaeoides (*Campylaephora h.* J. Ag.) (p. 27); *Griffithsia* japonica* (p. 28).—*K. Okamura.*

5003. PASCHER, A. Über zwei spezialisierte epiphytische Algen. (Der Beiträge zur Morphologie und Biologie epiphytischer Algen 2. Teil.) *Beih. Bot. Centralbl. 1 Abt.* 47(2): 271-281. 5 fig. 1930.—Chrysophyceae: *Lagynion* cystodinii* (p. 280), epiphytic on *Cystodinium* sp., and EPICYSTIS (p. 281), resembling *Epichrysis*, based on *Epicystis* peridinearum* (p. 281), epiphytic on an undetermined Peridiniae, both from Czechoslovakia.

5004. PETERSEN, JOHS. BOYE. Beiträge zur Kenntnis der Flagellatengeisseln. *Bot. Tidsskr.* [*Copenhagen*] 40(5): 373-389. 1 pl. 1929.—Fischer's modification of Löffler's method for demonstrating the flagella of bacteria is used to bring out the finer modifications of the flagella of the Euflagellata. Five structural types are demonstrable, though many preparations fail in demonstrating these finer structures. (1) The whip flagellum is found in Volvocales, Bodonaceae, and in the smaller flagellum in *Synura*. It has a thickened basal section abruptly contracting distally into a shorter, delicate lash-like terminal thread. The basal part is more rigid, the distal one easily broken off, and more flexible. (2) The one-sided "Flimmer" flagellum of the Euglenaceae is somewhat rigid, swings in the surface of a cone without wavelike contractions. It bears along one side only from the base to the tip a single row of obliquely set, fine cilia. Their movement has not been proved. (3) The flagellum of the Chrysomonadinae and the Monadaceae is undulant, thinner, and more flexible than that of the Euglenaceae, and bears fine, obliquely set cilia on all sides. (4) The axial flagellum of the Craspedomonadaceae is of the whip type with a thick, rigid basal, and a thin, undulant terminal region. The thickened, more rigid section bears on 2 (or all?) sides fine cilia set at right angles to the shaft. The collar is resolved into a row of radial fibrils. (5) The smaller flagellum in the Monadaceae and in some Chrysomonadinae are simple threads throughout, without differentiated regions and without cilia. The finer structure of the flagella has a diagnostic value in differentiating the subdivisions of the Mastigophora.—*C. A. Kofoid.*

5005. SCHWARTZ, W. Studien über die "Blattformen" von Caulerpa prolifera. ["Leaf" forms of C. prolifera.] *Flora* 24(4): 479-490. 3 fig. 1930.—The leaves with cordate tips more often proliferate than those with rounded tips, giving rise to about 84% of the proliferations. The kind of proliferation and its position on the leaf is influenced by the type and age of the leaf from which it grows and its original position on the rhizome. Proliferation experiments with the two types of various ages, and from apical and basal portions of the rhizome, showed varying results depending upon the time of year, thus showing a seasonal factor. The effect of the seasonal factor varies in that toward the end of the period of development of the plant, a basal displacement of the proliferation on the leaf occurs almost independent of the effect of the form of leaf or its position.—*T. C. Frye.*

5006. SECKT, HANS. Algenforschung in Argentinien. II. *Ber. Deutsch. Bot. Ges.* 48(9): 420-427. 1930.—An extensive bibliography of articles dealing with Argentine algae.

5007. TAYLOR, FREDERICK B. Notes on diatoms. An introduction to the study of the Diatomaceae. 269 p. 5 pl. Publ. by the author's estate: 2A Montague Rd., Bournemouth, England, 1929. Pr. $5.—This book professes no original contributions to diatom research, but is, as the name indicates, a collection of "notes on diatoms" or gleanings of salient facts about them compiled for the author's own use from a large and comprehensive library and later organized into book form as a guide for students. The first 4 chapters discuss the nature and substance of diatoms, their discovery and early investigators, their occurrence and distribution both recent and fossil, and the manner of growth and development in the various groups. Chapter 5 discusses in great detail the structure and markings of diatoms, citing instances of the many forms of specific peculiarity, and the opinions of various workers concerning the outer membrane, shell layers, primary and secondary markings, the rhaphe, septae, craticular plates, etc. This is followed by a short statement of the theories of the much disputed question of diatom movement. Chapter 7 discusses the geological age of diatoms, mentioning the important deposits and giving a table of fossiliferous strata with typical organisms. Chapter 8 deals with the numerous uses of diatoms both individually and as diatomaceous earth including recent applications. Chapter 9 on reproduction describes the method of fission and auxospore formation, sporulation, and rest spores. Chapter 10 gives the classifications of leading authorities to genera with comments and comparisons. Chapter 11 is devoted to specific distinctions and diatom species relationships. In chapter 12 diatom literature is discussed somewhat chronologically, giving the periods in which various diatomists worked and their writings and particular original contributions. There is a 1½ page list of monographs of various genera, a list of books of diatom floras of countries and localities, and a list of dealers in diatom books. Chapter 13 describes the various methods of cleaning, preparation and study of diatoms and gives, as an aid to identification, a list of magnifications of illustrations used by different authors. Chapter 14 concerns the time, place, and manner of collecting diatoms. In chapter 15 the author discusses rules of nomenclature and has assembled a complete list giving derivations of diatom generic names from the Latin and Greek. The gathering together of this analytical list, not heretofore done, to facilitate understanding of diatom nomenclature has the aspect of a new contribution to the science. Chapter 16 gives a complete list of diatom genera with the name of the author of each, date of publication, habitat, position in the classified list, and references to other sections of this book, and to other standard works. This chapter of 108 pages is practically a generic catalogue. An appendix is subdivided into chapter headings corresponding to the foregoing chapter subjects, giving under each references to the literature on that subject. The 4 plates of line drawings and 1 plate of photographs are representative illustrations of the various groups.—*P. S. Conger.*

5008. TORKA, V. Gomphonema augur Ehrbg. und Gomphonema parvulum Ktg. *Hedwigia* 70(1/2): 133-136. 5 fig. 1930.—A study of the course of frustule change from the macrotheca to the microtheca in both species indicates that the microtheca constitutes the name form. The form of *Gomphonema augur* Ehrbg., known as var. *gautieri* V. H., is the mesotheca and needs no name.—*V. Torka* (*transl. by F. O. Grover*).

5009. WEBER, (Mme.) A. Sur un nouveau genre de Floridés. *Ann. Cryptogamie Exotique* 2(3/4): 255-261. 8 fig. 1929.—PERIPHYKON (p. 255) with *P.* beckeri* (p. 256), Java, is reported as a "parasite" (but is in reality an epiphyte) on the branches of *Laurencia ceylanica* J. Ag., forming a thin, encrusting stratum composed of 3 layers of different kinds of cells, with marginal growth, attached by occasional groups of rhizoids not penetrating the host, and giving rise on the dorsal surface to short erect protuberances bearing the reproductive cells. The genus is allied with the family Rhodomelaceae.—*N. L. Gardner.*

5010. WERTEBNAJA, P. I. Über eine relikte Algenflora in den Seeablagerungen Mittelrusslands. *Arch. Hydrobiol.* 20(1): 124-133. 1929.—In the post-glacial deposits of Bolschoji Medweschje Lake in the vicinity of Moscow the diatom *Melosira baicalensis* (Meyer) Wislouch is the characteristic plankton form. It occurs very frequently at a depth of 10 m., and again between 4 and 5 m., in the deposits. In between these plankton maxima is a very dense mass of epiphytic and soil inhabiting forms, indicating a dryer period in the lake's history. Kudrjaschew's discovery of ancient beach ridges bears out this theory and his study of the pollen found in these deposits indicates that the first (lower) plankton maximum fell in the period dominated by the birch,

at the beginning of the wet, Atlantic period, and that the second maximum coincided with that of the alder, at the beginning of the dry, subboreal period. *M. baicalensis* appears today in a very impoverished flora. *M. binderana* Ktzg. var. limnetica (p. 130) is new.—*D. G. Doubt.*

5011. YAMADA, YUKIO. Notes on some Japanese Algae 1. *Jour. Fac. Sci. Hokkaido Imp. Univ. Ser. V Bot.* 1(1): 27-36. 5 pl., 2 fig. 1930.—Notes on the following: *Cladophora rhizoplea* Kjell. erroneously included in Japanese flora; *Enantiocladia* okamurai* (p. 27); *Delisea pulchra* Mont. (*D. japonica* Okam.); *Peyssonnelia* distenta (*Galaxaura d.* Harv., of which *Peyssonnelia involvens* Okam. is a synonym) (p. 30); *Callophyllis* palmata* (p. 30); *Acrosorium* flabellatum* (p. 31); *Pseudophycodrys* pacifica* (p. 32); *Acrosorium* yendoi* (p. 33); *Heteronema* japonica* (p. 34); *Hypoglossum* nipponicum* (p. 35).

FUNGI

5012. ASHBY, S. F. Further note on the production of sexual organs in paired cultures of species and strains of Phytophthora. *Trans. British Mycol. Soc.* 14(3/4): 254-260. 2 fig. 1929.—The author examined isolations of *Phytophthora arecae* (Colem.) Pethybridge and of 3 strains of *P. meadii* McRae. *P. arecae* formed no oospores on any medium tried, nor did cultures of the later isolations of the 3 strains of *P. meadii* when grown either singly or in pairs on maize meal agar at 23° C. When, however, each of the 3 strains of *P. meadii* were grown with *P. arecae,* sexual organs developed in 4-5 days, first in the zone of contact of the 2 mycelia, and later throughout most of the growth of *P. meadii,* but not in the *P. arecae* zone. The author concludes, both from the distribution and size of the sexual organs and oospores in the paired cultures, that they belong to *P. meadii,* and that *P. meadii* and *P. arecae* are one species, separable by their behaviour in paired cultures into 2 groups of strains, the "Arecae" and "Meadii" groups, comparable with the "cacao" and "rubber" groups of *P. palmivora.* He also records in more detail the development of sexual organs and oospores in paired cultures of *P. cryptogea* Pethyb. and Lafferty with *P. cinnamomi* Rands, mentioned in an earlier paper. These 2 spp. were also grown in paired cultures with *P. richardiae* Buis. He concludes that the essential similarities, apart from mere differences in the size of the conidia (sporangia) and sexual organs of *P. cryptogea* and *P. richardiae,* do not justify a distinction of species, but that the differences are sufficiently recognised by recording the latter as a variety, namely *P. cryptogea* var. richardiae (*P. r.* Buis) (p. 259) *P. cinnamomi* did not produce sexual organs in pure cultures, but these developed in a paired culture with a strain of *P. parasitica* and showed amphigynous antheridia and oospores of similar sizes to those of *P. richardiae. P. cinnamomi* produced on solid media peculiar vesicles (called chlamydospores by Rands) closely resembling similar bodies formed on the same media by *Blepharospora cambivora,* but sexual organs have not been obtained in paired cultures of these 2 fungi. The proliferation of the pedicel with the production of new sporangia within those which have discharged zoospores, as well as other characters, indicates a close relationship of these 4 forms, but *P. cinnamomi* appears to be nearer to *B. cambivora* than to *P. cryptogea.*—*A. W. Bartlett.*

5013. ASHBY, S. F. The production of sexual organs in pure cultures of Phytophthora cinnamomi Rands and Blepharospora cambivora Petri. *Trans. British Mycol. Soc.* 14(3/4): 260-263. 2 fig. 1929.—The author reports the discovery of sexual organs of *P. cinnamomi* and *B. cambivora* in pure cultures in tubes of sloped maize meal agar. *P. cinnamomi* possesses large amphigynous antheridia, and the sexual organs appear to be borne on separate hyphae. The sexual organs of *B. cambivora* were likewise of the amphigynous type. Petri, however, reported the finding of paragynous antheridia in the tissues of chestnut seedlings attacked by this fungus. The variation in the dominant type of sexual apparatus in the tissues of the host, and in maize meal, respectively, may possibly be explained by the difference in the habitat. The production of similar sexual organs in pure culture strengthens the view as to the close relationship between the 2 spp.—*A. W. Bartlett.*

5014. BOSS, ADOLF. Über Färbung von Fadenpilzen in Kulturen. *Dermatol. Wochenschr.* 90(14): 482-485. 1930.—A loop of fungus is treated for 2 min. on a slide with 10 parts of 25% antiformin and 1 part 1% NaOH, fixed with heat, then stained with Unna's modification of the Unna-Pappenheim stain.

5015. BRODIE, H. J. The oidia of Coprinus lagopus and their relation with insects. *Ann. Botany* 45(178): 315-344. 1 pl., 24 fig. 1931.—The oidia of *C. lagopus* are produced on oidiophores which project away from the substratum into the air, and they are developed in, and are set free into, a drop of adhesive liquid which is of importance in dissemination. The oidia are produced only on haploid mycelia. On a mycelium derived from a spore, oidia are produced only aerially or on the surface of the nutrient medium. When many spores of diverse sex are sown together, the haploid mycelia, in the first few days of their growth, produce oidiophores and oidia in abundance but do not fuse with one another. Then mycelia of opposite sex fuse with one another and mutually diploidize one another with the result that the production of oidiophores and oidia ceases. Oidia are formed from the oidial branches at the apex of the oidiophore by: (1) the division of the protoplasm of the branch into 2-3 separate masses; (2) the shrinking or condensation of these masses with the formation of short water-filled gaps or spaces between them and at the base of the oidial branch; (3) the development of a wall at each end of each shrunken mass of protoplasm; and (4) the dissolution of the wall of the oidial hypha around the water-filled spaces. Under suitable conditions oidia germinate readily. Their germ-tubes, in culture media, develop into a mycelium which soon produces numerous oidiophores and oidia. By sowing oidia, 12 successive generations of oidia were obtained. The mycelium developed from an oidium, as compared with a mycelium derived from a basidiospore, has thinner hyphae, produces more oidial fructifications per unit of surface, develops no aerial hyphae except oidiophores, grows more slowly, and remains sterile so far as ordinary fruit-bodies and fruit-body rudiments are concerned. Haploid mycelia derived from basidiospores, when grown separately on sterilized horse-dung, usually produce haploid fruit-bodies in 10-14 days, whereas a mycelium derived from oidia grew on sterilized horse dung for 3 months without any sign of fruit-bodies. Oidial fructifications of *C. lagopus,* associated with ordinary fruit-bodies of *C. lagopus,* were found on unsterilized horse-dung on 4 occasions. Thus, possibly for the first time, the oidia of a hymenomycetous fungus have been ob-

served and recognized as such under natural conditions. The oidia of *C. lagopus* are not transported by the wind; they may be scattered to a limited extent by rain, but they are mainly disseminated by coprophilous insects and, in particular, by flies. Flies feed on the oidial drops on the oidiophores. They carry away oidia on their feet and bodies, and deposit them in a viable condition in their excreta. From the mycelia of *C. lagopus* flies carry away oidial fluid and oidia only. It has been proved experimentally for *C. lagopus* that, when flies walk on a (+) mycelium and then on a (−) mycelium, they transfer (+) oidia to the (−) mycelium and (−) oidia to the (+) mycelium, with the result that both the (+) mycelium and the (−) mycelium become converted into diploid mycelia. The diploidization of haploid mycelia through the agency of flies took place when 2 mycelia were 3.5 ft. apart. The oidia of *C. lagopus* very closely resemble the pycniospores of the Uredineae in their early appearance on haploid mycelia, in their being immersed in a fluid which is attractive to flies, in their transportation by flies from one mycelium to another, and in their ability to bring about the diploidization of mycelia of basidiosporous origin and of opposite sex.—*Author's summary.*

5016. CEJP, K. Neue Beiträge zur Kenntnis der resupinaten Arten der Hydnaceen in Böhmen. [New contributions on the resupinate Hydnaceae in Bohemia.] *Ann. Mycologici* 28(3/4): 287-290. 1930.—An annotated list. *Odontia pallida* is new for Bohemia.

5017. CHILD, MARION. Preliminary studies in the genus Daldinia. *Ann. Missouri Bot. Gard.* 16(4): 411-486. 3 pl. 1929.—Factors influencing the germination of ascospores and the development of mycelium of *D. concentrica, D. vernicosa,* and 2 unnamed spp., *Daldinia X* and *Daldinia Y,* were studied comparatively in pure culture. In most cases ascospores over 1 yr. old failed to germinate either because of age or as a result of treatment with fumigants. In experiments devised to determine the effects of O, 3 sources were used: O produced by the photosynthetic process of *Pleurococcus;* H_2O_2; and compressed O. Germination of ascospores of *D. concentrica,* both frozen and unfrozen, was stimulated by O from the first and last source, but those of *D. vernicosa* appeared to germinate better in the absence of O artificially supplied. In both spp., when germination occurred, growth of the germ-tubes appeared to be stimulated. Ascospores of *Daldinia X* were indifferent to the O treatment. Ascospores of *D. concentrica* and of *D. vernicosa* failed to germinate in .1-10% pepsin solutions. Ultra-violet rays (578-289 $m\mu$) stimulated germination of both frozen and unfrozen ascospores of *D. concentrica.* Maximum germination of *D. vernicosa* (4%) was secured from unrayed but frozen ascospores; raying slightly favored germination of unfrozen ascospores. Frozen and unfrozen ascospores of *Daldinia X* were adversely affected by raying. Ascospores of *D. vernicosa* and *Daldinia X* frozen for 3 mo. at −5° C. were stimulated to increased germination; with *D. concentrica,* the opposite effect resulted. Ascospore germination of *D. vernicosa* was markedly stimulated by short exposures to high temp. previous to inoculation; although the % of germination decreased as the temp. increased, even at 100° C. more germination was obtained than in the controls. Similar treatment of ascospores of *D. concentrica* resulted in a decrease in germination. In both spp., short exposures at 90° C. seem to have about the same effect as lower temp. (70-75° C.). Ascospores of *D. concentrica,* kept at 38° C. for 24 hrs., failed to germinate, or germinated poorly; but when changed to 25° C. they recovered from partial plasmolysis or increased in percentage of germination. In maltose solutions the maximum germination of month-old and of 1-yr.-old ascospores of *D. concentrica* was obtained in 10% concentration, the minimum in .05-.06%. Year-old ascospores of *D. vernicosa* gave a maximum germination of 17.3% (in a 3% maltose solution); month-old ascospores gave 4% germination in 10% solution. Ascospores of *Daldinia X* 2 mo. old did not germinate in any of the concentrations. After 48 hrs. on a medium of pH 5.6, ascospores of *D. concentrica* gave 70% germination and a minimum of 23% at pH 2.4; the optimum range was pH 4.8-6.0. Conidia occurred at 10 different hydrogen ion concentrations, while in *D. vernicosa* they occurred at only 5. Maximum germination, 17%, occurred at pH 4.8; minimum, 4%, at pH 2.4; the optimum occurred between pH 4.8 and 6.4. For the effect of light and darkness on growth of mycelium, oatmeal agar gave more abundant growth than Pfeffer agar. In both cases, darkness was more conducive than light to rapid and abundant aerial growth. Only slight color changes of *D. concentrica* occurred in darkness, while in the light decided changes were noted. A red secretion appeared both in *D. vernicosa* and *Daldinia Y,* of which the mycelia closely resemble each other in pure culture. Pfeffer's agar was the best for germination and for rapid growth of *D. concentrica, D. vernicosa,* and *Daldinia Y,* but oatmeal agar induced much more abundant mycelium. 32° C. was the most favorable temp. for *D. vernicosa* and *Daldinia Y,* while 23° C. was best for *D. concentrica.* More conidia were found on media rich in carbohydrates. Neither zoning nor the presence of conidia was dependent on differences of exposure to light. The pH range 6.2-6.6 produced the most abundant growth of mycelium of *D. concentrica;* the most rapid growth (3.5 mm. per day) occurred at pH 6.6. The most abundant growth of mycelium of *D. vernicosa* occurred in the range of pH 5.4, 5.8, and 6.2, but the fastest rate of growth (7.11 mm. per day) occurred at pH 5.0. The range of most abundant growth of mycelium of *Daldinia X* was pH 6.6-7.4; the most rapid rate (6.2 mm. per day) occurred at pH 5.4. Although the ascocarp and ascospores of *Daldinia X* closely resemble those of *D. vernicosa,* its behavior in pure culture, as regards mycelium and conidia, is very similar to that of *D. concentrica.* These experiments indicate that the physiological reactions of fungi are correlated with their morphological characters.—*From author's summary.*

5018. COTNER, F. B. The development of the zoöspores in the Oömycetes at optimum temperatures and the cytology of their active stages. *Amer. Jour. Bot.* 17(6): 511-546. 4 pl. 1930.—A low temp. chamber for observation of the development of hanging drop cultures is described. Some improvements are noted in the technique of staining zoospores over that previously described. The optimum conditions are pointed out for the production of zoospores in plants belonging to 12 spp. of 8 representative genera from 4 orders of the Oomycetes: *Allomyces arbuscula, Apodachlya brachynema, Rhipidium europaeum, Saprolegnia monoica* var. *glomerata, Isoachlya paradoxa, Achlya conspicua, Aphanomyces euteiches, Phytophthora cactorum, P. erythroseptica, P. palmivora, P. terrestris,* and *Phytophthora* sp. The details of the cell structure and the typical number, arrangement, and development of the cilia of these spores formed under optimum conditions are shown. The number of cilia is constant for a species when the zoospores are formed under optimum conditions. Zoospores formed under unfavorable temp. and poorly aerated conditions are likely to be atypical, resulting from incomplete cleavage in the sporangium. Each species requires a certain definite set of conditions under which it is capable of forming perfect zoospores, typical of the species. The zoospores of the spp. studied all have a definite basal granule (blepharoplast) at the insertion of each cilium. This granule is connected with the nucleus by a definite strand (rhizoplast). The cilia develop as outgrowths from the region of a basal granule which has reached a position near the plasma membrane, as a result of nuclear activity. The basal apparatus is always of nuclear origin and seems to be composed of several chromatic bodies, one of which forms the basal granule proper (blepharoplast). The remaining granules of the basal apparatus are normally retained or drawn back into the nucleus, and usually form the tip or beak-like part of that organ during zoospore activity. When

the zoospores come to rest after the first swimming stage, the basal granule (or granules) migrates back to the nucleus and apparently becomes part of that organ. The chromatin of the nucleus in the mature active zoospores is arranged in irregular masses in the peripheral region. In some spores a large central mass of chromatin could be distinguished near the center of the nucleus. The cytoplasm of the zoospores studied is finely granular, usually more dense in the central region of the spore. From a few to numerous highly stained granules are usually found variously distributed in the cytoplasm of the stained zoospores.—*F. B. Cotner.*

5019. CRAEGER, DON B. Reproduction in Cyathus stercoreus (Schw.) DeToni. *Proc. Iowa Acad. Sci.* 36: 121-124. 1929(1931).—The author failed to get germination of spores, but had abundant mycelium from peridioles or even from single hyphae of the peridiole wall. He believes the spores have degenerated so as to be unable to germinate, and the reproductive function has been taken over by the peridiole.—*H. S. Conard.*

5020. CUMMINS, GEORGE B. Heterothallism in corn rust and effect of filtering the pycnial exudate. *Phytopathology* 21(7): 751-753. 1931.—*Puccinia sorghi* is heterothallic and the formation of aecia cannot be explained on the basis of an enzymic stimulation, as the pycnial exudate, freed from pycniospores without inactivating its enzymes, lost its stimulatory action.—*W. A. Whitney.*

5021. CUNNINGHAM, G. H. Terminology of the spore forms and associated structures of the rust fungi. *New Zealand Jour. Sci. & Technol.* 12(2): 123-128. 1930.—An historical account of the origin of terms, and of the changes, since Persoon, in terminology of the structures in the life cycle of the rusts, is given. The author advocates the use of a standardized and consistent terminology; and suggests that the following terms, retained, should be adequate, all others being abandoned: pycniosorus, pycniospore, aecidiosorus, aecidiospore, caeomosorus, caeomospore, uredosorus, uredospore, teleutosorus, teleutospore, basidium, and basidiospore.

5022. DEARNESS, JOHN, and G. B. SANFORD. A new species of Plenodomus. *Ann. Mycologici* 28(3/4): 324-325. 1930.—*P.* **meliloti** (p. 324), parasitic on living roots of *Melilotus, Medicago,* and *Trifolium,* and, apparently, on dead roots of *Axyris, Chenopodium* and *Amaranthus.*

5023. DIETEL, P. Über einige neue Puccinia-Arten aus Asien. *Ann. Mycologici* 28(3/4): 273-277. 1930.—*P.* **johreniae** I, III (p. 274), on *Johrenia fungosa* Boiss., Cappadocia; *P.* **johreniae alpinae** I, III (p. 274), on *J. alpina* Fenzl., Cilicia; *P. stauntoniae* Tranzsch. et Diet., III, on *Stauntonia hexaphylla* Decsne., Japan; *P.* **adenophorae** III (p. 276), on *Adenophora remotiflora* Miq., Japan and Manchuria.

5024. GRÄFLINGER, TRUDE. Zur Kenntnis der Kleinarten von Uromyces scillarum. *Ann. Mycologici* 28(3/4): 321-323. 1930.—Schneider's discovery that the *U. scillarum* from *Muscari racemosum* is pathologically distinct, and incapable of passing over to other spp. of *Muscari* or to *Hyacinthus* or *Scilla* spp., led the author to make precise measurements of spore length and spore diameter (about 500 spores from each host) of *U. scillarum* from *M. racemosum, M. neglectum, M. comosum, Scilla bifolia,* and *Hyacinthus ciliatus.* Biometrical study of the limits of variability of these quantities, and of their quotient, are reported. Slight differences were found.

5025. GUBA, E. F. Monograph of the genus Pestalotia de Notaris. Part 1. *Phytopathology* 19(3): 191-232. 1 pl., 7 fig. 1929.—The history, morphology, and relationship of the genus is discussed. Sections Sexloculatae Klebahn (for *P. pezizoides* de Not.) and Quinqueloculatae Klebahn (type, *P. guepini* Desm.) are recognized.—In the latter are: *P.* **vaccinii*** (*P. guepini* v. *vaccinii* Shear) (p. 201); *P. funerea** Desm. (=*P. conigena* Lev.); *P.* **glandicola*** (*Robillarda g.* Castagne) (p. 206); *P.* **sphaerelloides*** Ellis and Langl. (p. 206), from *Carya aquatica; P. palmarum** Cke. (=*P. phoenicis* Vize, *P. brevipes* Prill. et Delacr.); *P.* **rhododendri*** (*P. versicolor* v. *rhododendri* D. Sacc.) (p. 215); *P. clavata** Cke. & Ellis (=*P. grandis* B. & C.). Descriptions are given, with synonymy, hosts, and distribution, of 30 spp., with a key, a host index, and a bibliography of 90 titles.

5026. GWYNNE-VAUGHAN, HELEN. Sex and nutrition in the fungi. *Brit. Assoc. Advancem. Sci. Rept. 96th Meeting.* [*Glasgow*] 1928: 185-199. 1929.—The author reviews the work that has been done on sexual reproduction in the fungi and on the nutritive conditions which determine the appearance of ♂ or ♀ organs or of fruiting bodies. In her opinion it is unfortunate that the mycelial fusions in the Basidiomycetes have been designated as sexual by Kniep, Bensaude, and others, for sexual organs, the ordinary criteria of sex, are wholly lacking. She suggests that heterothallism might better be explained on the basis of the hereditary ability of different strains of the same fungus to extract different nutritive substances necessary for fructification from the substratum. In *Humaria granulata* oogonia give rise to ascogenous hyphae without the intervention of antheridia. The mycelium from single spore cultures are of 2 kinds and when properly paired ascocarps develop only along the line of junction. Both (+) and (−) strains bear well grown oogonia but these produce ascogenous hyphae only where the 2 strains have met. It is difficult to think of this as a difference due to sex when both strains bear ♀ reproductive organs.—*L. Dosdall.*

5027. GWYNNE-VAUGHAN, HELEN, and [Mrs.] H. S. WILLIAMSON. A contribution to the study of nutritive heterothallism. *Proc. Linnean Soc. London* No. 142. 22-23. 1929/30(1931).—Abstract of a lecture. *Humaria granulata* produces globose oogonia, which are multinucleate from their origin. There are no antheridia. Nuclei in the oogonium fuse in pairs, before passing into the ascogenous hyphae. Subsequent nuclear divisions are simultaneous in all ascogenous hyphae and in the oogonium. The spores are incapable of germination till 5 months after they are shed; they remain viable for a yr. or more. Single-spore cultures produce normal archicarps, but these fail to form ascogenous hyphae, nor is any sheath developed around them. In about 50% of cases fruits develop where 2 monothallic strains meet. The strains are of 2 kinds, + and −. Since each produces oogonia, the difference between them cannot be sexual. Mycelial fusions are common; when they take place between + and − strains, the oogonia in the neighbourhood form ascogenous hyphae and develop into fruits. Their asci contain both + and − spores, showing that fusion of + and − nuclei takes place. Not only the oogonium and its branches, but the sheath hyphae developed from the lower cells of the archicarp are affected by the association of + and − strains.

5028. HADDOW, W. R. Studies in Ganoderma. *Jour. Arnold Arboretum* 12(1): 25-46. 2 pl., 1 fig. 1931.—The history of the genus is briefly reviewed and 4 American spp., *lucidum, sessile, curtisii* and *oregonense,* are fully described and discussed. It is shown that there is no host specificity in this genus. The 2 plates represent sporophores and anatomical details.—*A. Rehder.*

5029. HANNA, W. F., and W. POPP. Relationship of the oat smuts. *Nature* [*London*] 126(3187): 843-844. 1930.—Inoculations of oats with cultures of *Ustilago avenae* and *U. levis* indicate that the sporidia of both are of 2 kinds, mating without difficulty with the sexually opposite sporidia of the opposite species. The spp. are genetically distinct with respect to the characters by which they are differentiated, but the ease of crossing suggests close relationship.

5030. HIRATSUKA, NAOHIDE. Über einige interessante oder für Japan neue Rostpilze. *Ann. Mycologici* 28(3/4): 278-280. 1930.—An annotated list. *Phragmidium* **miyabeanum** S. Itô et Hiratsuka f., III (p. 279), on leaves of *Geum pentapetalum* Mak., S. Saghalien, and *P.* **alpinum** Hirat. f., III (p. 280), on leaves of *Rubus pedatus,* Japan. The following are new for Japan: *Puccinia anthemidis* Syd., *P. tranzschelii* Diet., *P. adoxae* Hedw., *P. clintonii* Peck, *P. veronicarum* DC., *P. epilobii* DC.,

P. parkerae Diet. et Holw., *P. rumicis-scutati* (DC.) Wint., *P. fusispora* Syd., *P. liliacearum* Duby, and *Phragmidium papillatum* Diet. *Puccinia haleniae* Arth. et Holw. is reported on *Swertia tetrapetala* Pall., a new genus of hosts for this species. *P. majanthemi* Diet. is reported on *Convallaria majalis* L., *Disporum smilacinum* A. Gray, *Smilacina japonica* A. Gray, and *Trillium kamtschaticum* Pall., these representing 4 new host genera for this rust. *Phragmidium rubi-japonici* Kasai, II, described for the first time.

5031. **JOSLYN, M. A., and W. V. CRUESS.** A comparative investigation of certain film-forming fungi. *Hilgardia* 4(9): 201-240. 5 fig. 1929.—Some of the morphological and physiological properties of 16 strains of *Mycoderma*, 1 of *Torula* and 4 of molds from food storage brines are presented. The Mycodermas resemble each other fairly closely in macroscopic appearance but differ in their microscopic appearance and in their acid and salt tolerance. In synthetic nutrient media, acids are formed by these organisms from sucrose, dextrose, maltose, lactose, mannite and glycerin. These organisms also oxidize acetic, citric, lactic, malic, oxalic and tartaric acids. The *Mycoderma* strains and the molds are remarkably tolerant to acids and NaCl; the concentration of salt necessary to inhibit growth depending upon the composition of the medium, especially its pH value, the manner of inoculating and the previous history of the culture. They are strongly aerobic; their growth and activity are easily checked by limiting their oxygen supply; their action is limited principally to the surface. Their growth is inhibited by exposure to direct sunlight, or by use of various antiseptics; Na benzoate, sulphurous acid, and hydrofluoric acid being more efficient. The concentration of Na benzoate necessary to inhibit growth varies with the pH and salt concentration. The effect of pH and salt on the death temp. of certain of these organisms is presented.—*M. A. Joslyn.*

5032. **KAUFFMAN, CALVIN H.** A study of the fungous flora of the Lake Superior Region of Michigan with some new species. *Papers Michigan Acad. Sci.* 9: 169-218. 22 fig. 1928.—A local list of the spp. collected near the mouth of Rock River, on Shelter Bay, on the southern shore of Lake Superior, in Michigan in the late summer of 1927, composed of Myxomycetes, 20; Myxobacteria, 1; Phycomycetes, 7; Ascomycetes, 92; Fungi Imperfecti, 20; and Basidiomycetes, 128. The new spp. are the following: *Cyathicula* **alni*** Kauff. & Kanouse on decaying leaves of *Alnus incana* (p. 175); *Lachnum* **thujinum** on decorticated wood of *Thuja occidentalis* (p. 177); *Mollisia benesuada* v. **borealis*** on decorticated wood of *Pinus, Betula,* etc. (p. 179); *Mollisia benesuada* v. **polyspora*** on rotten pine wood (p. 181); *Ocellaria aurea* v. **cornicola*** Kauff. & Kanouse on *Cornus alternifolia* (p. 183); *Schizoxylon* **bipartitum*** on decorticated log of *Picea* (probably *nigra*) (p. 184); *Pleospora* **alnea*** on decorticated dead branches of *Alnus incana* (p. 190); *Lophionema* **cylindrosporum*** on *Eupatorium purpureum* (p. 191); *Lophiostoma* (*Lophiotrema*) **thalictri*** on *Thalictrum polygamum* (p. 192); *Libertella betulina* Desm. var. **amelanchieris** on bark of *Amelanchier* sp. (p. 198); *Oospora* **poricola*** on pore-surface of what is apparently *Trametes sepium,* which has the size and shape of *Fomes scutellatus* on *Alnus incana* (p. 199), *Collybia* **papilliformis** on *Sphagnum* in sphagnous bogs (p. 203), *Pistillaria* **thujicola** on bark of *Thuja occidentalis* (p. 207). The following new combinations are reported: *Rutstroemia* **nebulosa** (*Peziza n.* Cke.) (p. 178), *Lophiotricha* **viridicoma*** (*Sphaeria v.* C. & P.) on decorticated wood of *Alnus incana,* emended description (p. 187). *Synchytrium vaccinii* Thomas on living leaves of *Gaultheria procumbens* is transferred to *Synchytrium vaccinii* Halsted, the name of the fungus having been merely suggested to Halsted in a letter by Thomas, whose identity has apparently been lost.—*L. E. Miles.*

5033. **LOHWAG, HEINRICH.** Das Oogon als Wesensbestandteil der Geschlechtsorgane im Pilzreich. *Biol. Generalis* 2(5/8): 699-772. 51 fig. 1927.—With the published data of various authors as a basis, the homologies of reproductive organs of Ascomycetes, Basidiomycetes, and Phycomycetes are discussed. In Ascomycetes the archicarp consists of a more or less spirally wound chain of ascogonia, one or more of which is fertile. The terminal portion (trichogyne) and the basal cell are suppressed ascogonia. In the primitive condition the ♂ and ♀ organs are wound spirally about each other; but in some reduced forms the antheridium is straight, and in the archicarp the spiral is reduced to a slightly eccentric placement of the trichogyne. Spermatia are merely reduced antheridia. In several spp. of Ascomycetes the vegetative mycelium is multinucleate but the ascogonia are uninucleate. In other spp. all cells of the carpogonial chain (suppressed ascogonia) are uninucleate, while in still others the reduction is carried further and all vegetative cells are uninucleate. All such uninucleate cells, including conidia, are potential or suppressed ascogonia. Where true paraphyses are present they arise from the basal cell of the archicarp (a suppressed ascogonium) and are, therefore, homologous with the ascogenous hyphae. A homolog of the trichogyne is found in the Zygomycete genera *Syncephalis* and *Basidiobolus,* and of paraphyses in the enveloping hyphae, arising from the suspensor cells in several Phycomycetes. In Basidiomycetes the binucleate phase is homologous with and strikingly similar to the ascogenous hyphae of Ascomycetes. In the haplophase each uninucleate cell is a potential or suppressed oogonium as in the Ascomycetes. Here the oogonia and antheridia are very much reduced and simplified.—*B. B. Higgins.*

5034. **McKENNY, MARGARET.** Mushrooms of field and wood. 193p. 50 fig. 2 col. pl. John Day Co.: New York, 1929.—Following the introductory explanation of terms and an illustrated key to the classes of fungi discussed, brief descriptions of genera and spp. are given, many illustrated by photographs. The fungi treated are chiefly agarics, though a few of the more common and conspicuous forms of other hymenomycetes and discomycetes are included.—*E. K. Cash.*

5035. **MARTIN, G. W.** Notes on Iowa Fungi—1928. *Proc. Iowa Acad. Sci.* 36: 127-130. 1 pl. 1929(1931).—The Iowa species of *Mutinus* are described: *M. elegans, M. ravenelii,* and *M. caninus.* The synonymy is discussed. *Stypella minor* Moeller is noted for the first time outside of Brazil. *Roesleria pallida* (Pers.) Sacc. was found in Johnson county in 1928. *Ustilago sieglingiae* Ricker, previously reported only from Florida, was collected in Louisa county.—*H. S. Conard.*

5036. **MARTINEZ, J. BENITO, y E. GUINEA.** Nueva aportacion a la micoflora española. [Fungi new to Spain.] *Bol. R. Soc. Espan. Hist. Nat.* 31(3): 211-220. 4 fig. 1931.—Annotated list of: Myxomycetes (2); Phycomycetes (1); Ascomycetes (5); Basidiomycetes (13), including *Pleurotus atro-coeruleus* f. **nigrescens** (p. 217); Fungi Imperfecti (5) including *Isaria guignardi* f. **major*** (p. 219).

5037. **SAKSENA, KANHAIYA LAL.** Fungus flora of Allahabad. Uromyces andropogonis-annulati Syd. et Butl. nov. spec. on a new host, Andropogon pertusus Willd. *Allahabad Univ. Studies* 4: 193-213. 3 pl. 1928; **MITTER, J. H., and R. N. TANDON.** The fungus flora of Allahabad. Part II. *Allahabad Univ. Studies* (*Sci. Sect.*) 6(2): 241-249. 1930.—*Uromyces andropogonis-annulati** Syd. and Butl. reported on *Andropogon pertusus,* a new host, is described. The grass is considerably injured. A brief list of Phycomycetes, Ascomycetes, Uredineae, Ustilagineae, Basidiomycetes proper, and Fungi Imperfecti is given, with hosts, habitats, etc., locality, and dates.

5038. **SATINA, SOPHIA, and A. F. BLAKESLEE.** Imperfect sexual reactions in homothallic and heterothallic Mucors. *Bot. Gaz.* 90(3): 299-311. 16 fig. 1930.—Imperfect sexual reactions were tested between homothallic species (including both homogamic and heterogamic forms) and (+) and (−) races of heterothallic species. Among the heterogamic hermaphrodites there are 2 sexual groups: (1) those with a (−) sexual tendency (*Absidia spinosa, Dicranophora, Zygorhynchus*

moelleri, Z. vuillemini, Zygorhynchus sp.); these show strong reactions with (+) races and weak or no reactions with (−) races; and (2) those with a (+) tendency (*Z. heterogamus*). These show strong reactions with (−) races and weak or no reactions with (+) races. So far as investigated, all the races of a given species have the same sexual tendency. The terminal and lateral zygophoric hyphae of the hermaphrodites investigated are bisexual. The terminal hyphae take part more actively in imperfect sexual reactions than do the lateral branches. In the group of hermaphrodites with a (−) tendency, the large gametangium is shown to be (+) from its reactions with (−) races and the small gametangium is shown to be (−) from the reaction with (+) races. In the group with a (+) tendency, represented by *Z. heterogamus*, however, the large gametangium is shown to be (−) in reaction and the small gametangium to be (+). Representative hermaphrodites of these groups when grown together have given imperfect reactions. A small gametangium of the one group reacts with a small gametangium from the representative of the other group, or less frequently 2 large gametangia, one from each group, show a mutual reaction.—*Authors' summary.*

5039. **SAWADA, KANEYOSHI.** Descriptive catalogue of the Formosan fungi. Part 4. [Japanese.] *Rept. Bot. Agric. Gov. Res. Inst. Formosa* 33. 123p. 4 pl. 1928.—148 spp. are described in Japanese, including the following: *Sorosporium* **formosanum** (*Ustilago formosana* Saw.) (p. 29); *Helicobasidium* **albicans*** on *Citrus unshu* (p. 84); *Verticillium* **agaricicolum*** on *Agaricus* sp. (p. 101); *Dactylaria* **panici-repentis** (*D. panici-paludosi* Saw.) (p. 102); *Dactylium* **alpiniae*** on *Alpinia speciosa* (p. 102); *Cercospora* **acaciae-confusae*** on *Acacia confusa* (p. 105); *C.* **alternantherae-nodiflorae*** on *Alternanthera nodiflora* (p. 106); *C.* **jussiaeae-repentis*** on *Jussiaea repens* (p. 108); *C.* **kusanoi*** (*Clasterosporium mori* Syd.) (p. 109); *Gibellula* **araneae*** on spiders (p. 114); **MULTIPATINA** (sterile mycelia), based on *M.* **citricola*** on *Citrus* spp. (p. 121). Fungi and hosts are indexed under Latin as well as Japanese names.—*E. K. Cash.*

5040. **SINGER, R.** Eine neue Russula-Art: Russula mairei nov. spec. *Arch. Protistenk.* 65(3): 306-320. 1 pl., 1 fig. 1929.—*R.* **mairei*** (p. 306), Austria, is compared with related forms with special reference to chemical reactions of the genus. A detailed description of *Pleurotus nidulans* (Pers.) Fr. is given, including chemical reactions, with critical discussion of general taxonomic problems involved.—*G. W. Martin.*

5041. **SPRAGUE, RODERICK.** Host range and life-history studies of some leguminous Ascochytae. *Phytopathology* 19(10): 917-932. 3 pl. 1929.—Life histories and physiological characteristics of various forms and spp. of *Ascochyta* on leguminous plants, as well as their morphological features, are given. Most of the No. Amer. collections of *Vicia* spp. were shown to be similar or identical with *A. pisi* (of which an emended description (p. 927-928) is given), as it occurs on peas. A form on *V. faba* resembles *A. fabae*. Its difference from *A. pisi* on other vetches was shown to be due to host reaction. No ascigerous stage was found with any form of *A. pisi*. Inoculation studies show *Mycosphaerella pinodes* to be pathogenic on a wide range of hosts, a fact not borne out by field and herbarium study. The writer has found this organism only on *Pisum* spp., *Lathyrus odoratus*, and *L. tingitanus*. Stone's material on vetches was not examined. It is suggested that the occurrence of *M. pinodes* on vetches may be limited to late season. A study of *A. pinodella* shows it to be common and widespread on peas in America and under greenhouse conditions able to attack many hosts not as yet found under field conditions. *A. lathyri* is the common sp. on *L. odoratus* in America; *A. imperfecta* on alfalfa was shown to be distinct from *A. medicaginis* on *Medicago lupulina* and, while variable in the field, is clearly 1 sp. as far as leaf-spot symptoms go. *A. phaseolorum* is reported in America on *Phaseolus lunatus*. As a result of a study of *A. boltshauseri* pycnidia in culture and on the host, the genus *Stagonosporopsis* is untenable. *Diplodina* is probably a polymorphic form of *Ascochyta*, inoculation of leaf and stem with *A. imperfecta* yielding *Ascochyta* pycnidia on the former and *Diplodina* on the stem.—*From author's summary.*

5042. **STEVENS, F. L.** Parasitic fungi from Panama. *Ann. Mycologici* 28(3/4): 281-286. 6 fig. 1930.—An annotated list of Phycomycetes, Ascomycetes, Gastromycetes and Fungi Imperfecti. Ascomycetes: *Phyllachora* **davillae*** (p. 282), on *Davilla rugosa; P. guazumae* P. Henn., described; *Dictyochora* **paspali** (p. 283), on *Paspalum saccharoides; Mycosphaerella* **erythrinae** (p. 285), on *Erythrina* sp., *Pseudothis pulchella** (Speg.) Theiss., described. Gasteromycetes: *Staheliomyces cinctus* Fisch.

5043. **STEVENS, F. L.** Parasitic fungi of Peru and Ecuador. *Ann. Mycologici* 29(1/2): 102-106. 3 fig. 1931.—An annotated list of 5 Phycomycetes, 2 Archimycetes, 22 Ascomycetes, and 1 Imperfecti. *Catacauma* **galactiae** (p. 102), on *Galactia speciosa*, Peru; **PHAEOPHRAGMOCAUMA** (p. 103), Dothideaceae, Scirrhineae, near *Phragmocauma*, based on *P.* **buddleyae*** (p. 103), on *Buddleya incana*, Peru; *Phyllachora* **buettneriae** (p. 104), on *Buettneria brevipes*, Ecuador; *Phyllachora* **distichlidis** (p. 104), on *Distichlis thlassica*, Peru; *Didymella* **clibadii** (p. 105), on *Clibadium* spp., Peru and Ecuador; and *Hendersonia* **fungicola** (p. 106), in locules of *Phyllachora minutissima* on *Pennisetum tristachyum*, Peru.

5044. **THAXTER, ROLAND.** Contribution towards a monograph of the Laboulbeniaceae—V. *Mem. Amer. Acad. Arts & Sci.* 16(1): 1-435. 60 pl., 1 fig. 1931.—All published genera in the Laboulbeniaceae and Ceratomycetineae except *Laboulbenia* (to be dealt with later) are treated. For reference, the known spp. are enumerated, many with notes. Numerous known spp. are illustrated for the first time; among these, attention is called especially to the aquatic genus *Thaumasiomyces* (pl. 54-5), the anomalous *Dipodomyces*, and to the very remarkable trichogynes on pl. 19. The extensive list of spp. includes many from Borneo (here abbreviated as Bor.), Cameroons (Cam.), Grenada Island (Gren.), Guatemala (Guat.), Luzon (Luz.), Madagascar (Mad.), Sumatra (Sum.), and Trinidad (Trin.). *Mimeomyces* **quedionuchi*** (*Sphaleromyces q.* Thaxt.) (p. 8); *M.* **andinus*** (*S. a.* Speg.) (p. 8); *M.* **valdivianus*** (*Corethromyces v.* Thaxt.), *M.* **atropurpureus** (*Sphaleromyces a.* Thaxt.), *M.* **brachyderi** (*S. b.* Thaxter), *M.* **chiriquensis** (*S. c.* Thaxt.), and *M.* **latonae** (*Corethromyces l.* Thaxt.) (p. 9); *Diandromyces chilenus* is described and figured; *Dichomyces* **arimensis*** (p. 11), Trin.; *D.* **bicolor*** (p. 12), Bor. and Luz., in *Philonthus borneensis; D.* **eulyssi*** (p. 12), Trin. (type) and Gren.; *D.* **fumosus*** (p. 13), Sum.; *D.* **lepidus*** and *D.* **pallidus*** (p. 14), Luz.; *D.* **pretiosus*** (p. 15) and *D.* **staphylini*** (p. 15), Sum.; *D.* **thyreocephali*** (p. 16), Venezuela; *Peyritschiella* **clivinae*** (p. 18), Kansas; *P.* **lampropygi*** (p. 18), Panama; *P.* **trichodomiae*** (p. 19), *P.* **xyricola*** (p. 19), and *Cantharomyces* **exiguus*** (p. 23), Cam.; *C.* **haytiensis*** (p. 23), Haiti; *C.* **denigratus*** (p. 27), England; *C.* **flagellatus*** (p. 28), Trin.; *C.* **aquaticus*** (p. 30), Maine; *Kleidiomyces* **hoplandriae*** (p. 33), Trin. (type) and Gren.; *K.* **venezolanus*** (p. 33), Trin.; *Monoicomyces* **asymmetricus*** (p. 36), Sum.; *M.* **athetae*** (p. 36), England; *M.* **barberi*** (p. 37), Maryland; *M.* **californicus** (*Eumonoicomyces c.* Thaxt.) (p. 38); *M. caloderae* Thaxt. (=*M. ocaleae* Speg.); *M.* **diestotae*** (p. 39), Sum.; *M.* **doryloniae*** (p. 39) and *M.* **dorylonillae*** (p. 40), Cam.; *M.* **eleusinus*** (p. 41), Venezuela; *M.* **falagriae*** (p. 41), Cam.; *M.* **furcatus*** (p. 41), Jamaica (type), Haiti, and Guat.; *M.* **gibbosus*** (p. 42), Sum.; *M. invisibilis* (=*Eumonoicocymes i.* Thaxt., *M. affinis* Speg., *Eucom. argentinensis* Speg.); *M.* **javanus*** (p. 44), Java; *M.* **kamerunensis*** (p. 44) and *M.* **osorianus*** (p. 46), Cam.; *M.* **plagiusae*** (p. 47) and *M.* **ramosus*** (p. 47), Sum.; *M.* **singularis*** (p. 49), Cam.; *M.* **trypetae*** (p. 50) and *Eumonoicomyces* **platystethi*** (p. 52), Sum.; as an addendum to the genus *Rickia*, the author refers to the 4th part of the present monograph, where 4 forms of this genus were placed under "species excludendae,"

and gives here notes on the genus and lists the 4 spp. which were omitted from his revision of *Rickia: R. melanophthalmae**, *R. platensis**, *R. perpusilla**, and *R. pumila**. *Amorphomyces* **biformis*** (p. 55), Sum.; *A.* **minisculus*** (p. 56), Guat. (type) and Sum.; *A.* **pronomaeae*** (p. 58), Sum.; *A.* **schistogeniae*** (p. 58), Bor.; *A.* **stipitatus*** (p. 58), Sum.; *A.* **stenusae*** (p. 59), Bor.; **RHIZOPODOMYCES** (p. 60), resembles *Amorphomyces*, type *R.* **merragatae*** (p. 60), Guat.; *Dioicomyces anthici* (=*D. formicillae* var. *anthicicola* Spegg.); *D.* **endogaeus** Picard, on *Anillus coccus*, is the only sp. known to occur on this family of beetles; *D.* **formicomi*** (p. 63), Luz.; *D.* **guatemalensis*** (p. 64), Guat.; *D.* **inclinatus*** (p. 64) and *D.* **indentatus*** (p. 65), Luz.; *D.* **notosci*** (p. 66) and *D.* **prominens*** (p. 67), Guat.; *D.* **trinitatis*** (p. 69), Trin.; **TRIANDROMYCES** (p. 69), type *T.* **bottegoi*** (p. 70), *T.* **arcuatus*** (p. 71), and *T.* **pallescens*** (p. 71), Cam.; **DICRANDROMYCES** (p. 72), similar to *Triandromyces*, type *D.* **terminalis*** (p. 72), Luz.; *Tetrandromyces brachidae**; **APOROMYCES** (p. 74), type *A.* **uniflagellatus*** (p. 75), Cam. (type), Sum., and Luz.; *A.* **trinitatis*** (p. 75), Trin.; *A.* **subulatus*** (p. 76), Luz.; **NANOMYCES** (p. 76), type *N.* **forficulinus** (p. 76); *N.* **fijianus*** (p. 76), Fiji Isls.; *N.* **appendiculatus*** (p. 77), Solomon I.; *N.* **perpendicularis*** (p. 77), Sum. (type) and Java; **APATOMYCES** (p. 78), resembling *Laboulbenia*, type *A.* **laboulbenioides*** (p. 78), Luz.; *Herpomyces* **amazonicus*** (p. 80), Natal and Brazil; *H.* **appendiculatus*** (p. 81), New So. Wales; *H.* **gracilis*** (p. 83), Luz.; *H.* **grenadinus*** (p. 83), Gren.; *H.* **lobopterae*** (p. 84), Argentina; *H.* **panchlorae*** (p. 85), Trin.; *H.* **leurolestis*** (p. 87), Brit. Guiana (type) and Trin.; *H.* **supellae*** (p. 87), Trin.; *Autophagomyces platensis** emend. descr.; *A.* **guatemalensis*** (p. 90), Guat.; *A.* **kamerunensis*** (p. 91), Cam.; *A.* **longicaulis*** (p. 91), Guat.; *A.* **subfuscatus*** (p. 92), Cam.; *A.* **gracilis*** (p. 93), Sum. 5045. **WATERHOUSE, W. L.** Australian rust studies. II. Biometrical studies of the morphology of spore forms. *Proc. Linnean Soc. N. S. Wales* 55(2): 159-178. 1 pl. 1930.—Spore measurements have been made of aecidiospores, uredospores, and teleutospores of physiologic forms of varieties of *Puccinia graminis* and of uredospores of *P. triticina.* Aecidiospores of 2 physiologic forms of *P. graminis tritici* are significantly shorter, and are probably also significantly narrower than those of a form of *P. graminis avenae.* Uredospores of 13 physiologic forms of *P. graminis tritici* were compared. When produced under uniform conditions, the spores of certain forms showed marked and significant morphologic differences. Of the naturally-occurring Australian forms, similarities in length, width, and shape exist between Forms 43, 44, and 54, which, as a group, show rather marked physiologic similarities. In the same way, the Forms 45, 46, and 55 fall into a group showing affinities between physiologic and morphologic characteristics. That parallelism between morphology and physiology does not necessarily exist was shown by the fact that Form 34, the other naturally-occurring form, which physiologically is quite unlike the first group of 3 forms, gave dimensions similar to those of members of this group. Uredospores of the so-called "New Form," which was produced on a barberry as a hybrid form, were unique in their dimensions. Uredospores of 5 physiologic forms of *P. graminis avenae* were compared; significant differences were shown in the dimensions of certain of them, but there was not necessarily any parallelism between the parasitism and morphology. A comparison between the totals of the dimensions of uredospores of the forms of *P. graminis tritici* and those of *P. graminis avenae* revealed that those of the former were the longer and that there was no difference in the widths. Of the 2 forms of *P. triticina,* the uredospores of Form 2 are significantly longer and narrower than those of Form 1. Teleutospore measurements were also made, and showed that in this stage also, morphologic differences are to be found between physiologic forms. Such differences are not correlated with those found between the uredospores of these forms.—*Author's summary.*

5046. **WESTON, WM. H. Jr.** Pharmacien Frechou and the germination of Sclerospora oospores. *Phytopath.* 21(4): 441-443. 1931.—A note calling attention to Prillieux's reference (1884) to the observations of a M. Frechou on the germination of the oospores of *S. graminicola.* Further information on M. Frechou is requested. See this issue: Entry 3416.—*W. A. Whitney.*

5047. **WOLLENWEBER, H. W.** Pyrenomyzetenstudien III sectio Willkommiotes generis Nectriae. *Proc. Internat. Congress Plant Sci., Ithaca, New York, 1926* 2: 1612-1617. 1929.—In pure culture as well as in nature, the *Nectria* spp. of the section *Willkommiotes,* and related fungi studied, develop spore forms with a similar absolute and average fluctuation in size. As a result of these comparative studies the limits of some spp. such as *Nectria coccinea* could be easily fixed. The limits of other spp. such as *N. galligena* have been restricted to strains averaging from 14.9-17.2 × 5-7.2μ in the spore size. These will include most of the apple canker producing Nectrias. The *Fraxinus* canker *Nectria* with spores averaging 18-19 × 6.5-7.2μ, *N. galligena* var. *major,* seems to be absent on *Pirus* but present on *Salix. N. galligena* has been found on *Pirus, Sorbus* and *Populus,* rarely on *Fraxinus* and exceptionally on *Fagus.* Some of the canker producing Nectrias seem to be more specialized than others. An analytic key has been worked out to facilitate the determination of the 14 *Nectria* spp. belonging to the section *Willkommiotes* of the subgenus *Coryneconnectria.*—*Author's summary.*

5048. **YOUNG, ELAINE M.** Physiological studies in relation to the taxonomy of Monascus spp. *Trans. Wisconsin Acad. Sci. Arts & Lett.* 25: 227-244. 2 pl. 1930.—Constant morphological characters are used as the basis for regarding *M. ruber* van Tieghem as a single species comprising a number of strains differing under cultivation in gross color, extent of growth, tolerance to acids and temp. One strain causes destruction of maize starch blocks (So. Africa) previously soaked in 1% SO_2 water, and drying at a temp. ranging from 30°-40° C. Optimum development of fungus occurs between 30°-35° C. and only in those blocks containing an excessive proportion of protein. Another strain from moldy silage (Australia) grows in 3.5% lactic acid and forms perithecia in 1% lactic acid, conductivity water, besides a large variety of the media, particularly those containing carbohydrates. *Monascus heterosporous* (Harz) Schröter is placed in definite synonymy with *Monascus ruber.* Five clearly defined spp. of *Monascus* (*M. purpureus* Went, *M. barkeri* Dangeard, *M. olei* Pied., *M. mucoroides* van Tieghem and *M. ruber* van Tieghem) are recognised, and in those studied in detail, vigor can be retained over a period of yrs. only when the material can be kept dry.—*E. M. Young.*

LICHENES

5049. **ERICHSEN, C. F. E.** Lichenologische Beiträge. *Hedwigia* 70(3/4): 216-233. 1 fig. 1930.—An annotated list, giving distributional data. *Lecidea* (*Biatora*) **lauenburgensis** (p. 216); *Buellia* **subatra** (p. 218), and form **perlimitata** (p. 219); *Caloplaca pyracea* ssp. **latericola** (p. 219); *Graphis* **neglecta*** (p. 221); *Bacidia* (*Weitenwebera*) **abscondita** (p. 222); *Verrucaria* **frisiaca** (p. 224), all from Germany. Key is given to the crustaceous lichens of the northern lowlands of Germany.

(p. 255); and *B.* **substigmatea** Fink (p. 255); the algal host, in each case, being a Protococcoid. The types are in Herb. of Univ. of Michigan.

5051. **JAAG, OTTO.** Recherches expérimentales sur les gonidies des lichens appartenant aux genres Parmelia et Cladonia. 128p. 6 pl., 5 fig. Thèse No. 804. Université de Genève; also published by Imprimerie Jent: Geneva, 1929.—This research is concerned with gonidia of *Cystococcus,* and with special reference to differences of form, of dimensions, general aspect, among these gonidia, (1) in the different genera of lichens, (2) in the different spp. of the same genus, (3) in different specimens of the same sp. collected in different localities, (4) in different regions of the same thallus. A study of the gonidia in situ shows that there is a difference in the dimensions of gonidia belonging to different spp. of lichens. Using the Janse and Peterfi micromanipulator the author transferred thousands of gonidia to artificial media of various compositions and concentrations. Concentrations of around 2% glucose in Detmer's solution gave better development of gonidia than more dilute media. Intense light prevented development of the gonidia in media with weak concentrations whether of salt or sugar; but in media with an abundance of these nutritives, it caused a more intense growth than was obtained either in darkness or in diffuse light. Gonidia from 2 thalli of *Parmelia caperata,* one from the trunk of an oak and the other from the trunk of an apple tree 20 m. distant, proved distinct, and are described as *Cystococcus parmeliae* ssp. **minor*** (p. 109) and *C. p.* ssp. **major*** (p. 110) respectively. Comparison of these with gonidia of *Cladonia* was made. After 4½ mo., all the cultures in darkness grew vigorous colonies. At once 2 groups were noted: one composed of the 2 *Parmelia* gonidia; and one composed of the *Cladonia* gonidia, with one quite unique, the colony formed from *Cystococcus cohaerens.* The differences between the gonidia belonging to the same genus of lichens was less than those which existed between 2 spp. belonging to different genera. All the gonidia of *Cladonia* grow more quickly than those of *Parmelia,* and they can endure as much as 10% glucose. Compared in culture, gonidia of different spp. of *Parmelia* can be distinguished without difficulty. Grouping the colonies according to their resemblances, he obtained as many groups as had furnished the gonidia; hence, each sp. of lichen possesses its specific gonidium. Individuals of the same sp. of lichen may contain specific gonidia according to the region where they have been collected. All the gonidia for spp. of *Parmelia* formed a group sharply distinct from those taken from spp. of *Cladonia,* indicating a specificity of a higher order between the gonidia of the 2 genera. Gonidia from the same thallus were practically identical. To determine whether gonidia develop less actively in summer than in winter, lots of young cultures were kept at 29°, 23°, 5° and 1° C. Those at low temp. grew better than those at high. Gonidia multiplied, first by autospores (the most prevalent form of reproduction), the contents of a cell rounding off into 4, 16, 32, etc., spores (the author has counted up to 120), which escape by the breaking of the cell wall. After leaving the mother cell, the autospores can separate, or they may remain attached. Reproduction by zoospores was also observed. Different forms of zoospores were noted. The more common forms were fusiform, drawn out on one side, and rounded on the opposite side. Two cilia of equal size and 1/5 longer than the body of the zoospore were inserted on the pointed end. They were 2 or 3 times as long as broad. There were others 6-7 times as long as broad. Low temp. favored the formation of zoospores. Besides the zoospores, *Cystococcus parmeliae* ssp. *minor,* and also *major,* produced gametes, isogametes and heterogametes. To study the differences in behavior of the gonidia in their assimilation of N, the author prepared 8 series of media, of which 3 contained N in an organic form, 4

contained it in inorganic form and 1 contained none. The *Cladonia* gonidia thrived well in the media with organic N and also in the medium with $(NH_4)_2SO_4$; the *Parmelia* gonidia remained small. In the remaining 3 inorganic media the differences were less pronounced. Although the gonidia of *Parmelia* gave small colonies, those of *Cladonia* gave growth of fine dimensions in the medium without N. The N was probably obtained from the agar. Following are the spp. of gonidia studied: *Cystococcus parmeliae* ssp. *minor*; *C. p.* ssp. *major*; *C.* **chodati** (*Parmeliae*)* (p. 110), from *Parmelia caperata* L., collected on an ash; *C.* **juratensis** (*Parmeliae*)* (p. 111) from *Parmelia sulcata* Tayl. collected from a fir tree; *C.* **valdensis** (*Parmeliae*)* (p. 111) from *Parmelia saxatilis* L. growing on a beech; *C.* **beringensis** (*Parmeliae*)* (p. 112) from *Parmelia scortea* Ach. on a pear tree; *C.* **lemanensis** (*Parmeliae*)* (p. 113) from *Parmelia acetabulum* Neck., on a fir tree; *C.* **genevensis** (*Parmeliae*)* (p. 113) from *Parmelia saxatilis* L., on an oak; *C.* **scaphusensis** (*Parmeliae*)* (p. 114) from *Parmelia caperata* L. collected on a cherry tree all from Switzerland.—*C. C. Plitt.*

5052. **NILSSON, GUNNAR. Bemerkungen über Cyphelium notarisii (Tul.) Blomb. et Forss. und C. tigillare Ach.** *Bot. Notiser* 1930(2): 105-128. 1930.—The author has examined representatives of these spp. in university herbaria and private collections in Sweden and discusses the taxonomic history. Though treated as variations of a single sp. by many authors, the 2 may be clearly differentiated by the spores which in *tigillare* are constantly 2-celled, in *notarisii* 2-8-celled, with great variation in arrangement of septa. Extremes of variations may be found in the same apothecium. Differences in size of apothecia, thickness of thallus, and size of spermatia are unreliable for identification; geographic distribution, however, is distinct. Whereas *tigillare* is a northern plant occurring through most of the Scandinavian peninsula, *notarisii* is a lowland sp., in Sweden confined to the south. A general account of the range of *notarisii* in Europe and a detailed account with distributional maps showing occurrence in Scandinavia are included.—*H. K. Svenson.*

5053. **ROBBINS, C. A. The identity of Cladonia lepidota Fries.** *Rhodora* 31(366): 101-106. 1 pl. 1929.—*C. piedmontensis* Merrill (*C. lepidota* Fries, in part), ranging from Massachusetts to So. Carolina, Alabama, and "Mexico," is discussed and described, and a key given to the following forms (all on p. 104): f. **epiphylla**, f. **obconica***, f. **intermedia***, f. **squamulosa***, f. **phyllocoma***, f. **lepidifera*** (Wain.) n. comb., f. **squamosissima***. *Cladonia* **simulata** (p. 105), a related sp. from Massachusetts and No. Carolina, is described.—*S. F. Blake.*

5054. **WERNER, R. G. Recherches biologiques et expérimentales sur les Ascomycetes.** (Thèse Fac. des Sc. Paris.). pp. vi-78. 8 pl., 19 fig. Mulhouse et Cie, Paris, 1927.—The paper begins with an historical account of the experimental work already carried on in an attempt to study the nature of lichens. The author's main work consisted in carrying in pure culture the fungi from the foliose and fruticose lichens; their development is compared with that of the crustose lichens, which was similar to the results of Möller (1887). The technique employed in the culture of the algae, the culture of the fungi and the attempts at synthesis, are discussed. The author concludes that there exists a regressive evolution of the organs of reproduction in the lichens. The projection of the spores is limited to the latter part of winter and spring. The spores mature from March to June according to the genera; the development of the fungi of the different lichens studied is identical up to the age of 3 months, and differentiation begins at that time, each fungus taking on the special characters of the corresponding lichen. Organs of multiplication exist, which are made up of aerial hyphae which sometimes cut off definite conidia. There is also multiplication by stolons. The aerial hyphae are capable of establishing contact with the algal cells, but the fungus, unaccustomed to an existence with the gonidia, exerts a destructive action upon them. That they are capable of a saprophytic existence is proved by the pure cultures. To accomplish this it is necessary to observe the time of spore maturity.—*J. Beauverie* (*transl. by C. W. Waters*).

BRYOPHYTA

A. LEROY ANDREWS, *Editor*

(See also in this issue Entries 3066, 3190, 3222)

5055. **CHALAUD, G. Sur la place en systématique de Fossombronia fleischeri Osterw.** *Verhandl. Bot. Ver. Prov. Brandenburg* 72(1): 69-75. 1 pl. 1930.—*Fossombronia incurva* Lindb. is more suitably called *Simodon incurvus* Lindb., because of its terminal perianth, axillary antheridia and other distinctive characters. *Fossombronia fleischeri* Osterw. was reported from the same locality as the above, and resembles it very closely, according to the original description. Upon examination of material furnished by Loeske, however, the latter species was found to be a true *Fossombronia*, closely related to *F. crozalsii* Corbière. The original diagnosis is completed by a number of important additions.—*W. C. Steere.*

5056. **DENING, KARL. Entwicklungsgeschichtliche Untersuchungen am Gametophyten von Buxbaumia aphylla (L.).** *Verhandl. Naturhist. Ver. Preuss. Rheinlande u. Westfalens* 85: 306-444. 52 fig., 1 map., 1 pl. 1928(1929).—In nature spore-germination and protonemal development occur during summer. Apparently gametophores may rarely be formed on these protonemata during the same summer, and may, by September of the same year, give rise to sporophytes. In general, the protonemata developed one year produce gametophores during the following March and April; these give rise during the summer to sporophytes whose spores ripen in late April or early May. Ripening may be hastened by placing plants under a bell jar in a warm room.—Protonemal development was followed in agar cultures. Particularly noticed were anastomosis resulting when the apical cell of a protonema comes in contact with a cell of another filament; and the hitherto unrecorded breaking up of protonemal filaments into brood cells. These cells become rounded and thick-walled; in presence of sufficient water, each may develop into a protonema.—The development of gametophores is described in detail. Both the single leaf and the single antheridium of a ♂ gametophore develop for a time by means of apical cells with 2 cutting faces. The apical cell of the antheridium is finally divided by a periclinal wall into a fertile inner cell and a sterile wall cell; this represents a deviation from the history characteristic of the antheridia of Bryales. Another deviation lies in the failure of the earlier segments to elongate in the direction of the axis of the antheridium, and the consequent spherical form of this organ. One ♂ gametophore was observed bearing 2 antheridia; another, bearing 2 leaves. Ordinarily a ♀ gametophore bears 10-15 leaves; the highest number found was 24. The development of these leaves is similar to that of the leaf of the ♂ gametophore. Older ♀ gametophores develop numerous rhizoid-like filaments from their lower stem segments. Archegonial development is substantially as in other Bryales. Gametophores may bear 3, 4, or 5 archegonia. Among these are 3 or 4 paraphyses, each a filament of 6-8 cells. From a successful attempt to grow the moss on silica jelly with inorganic nutrients, it is concluded

that *Buxbaumia* is capable of purely autotrophic nutrition.—*C. E. Allen.*

5057. DIXON, H. N. Muscineae. *Jour. Bot.* [*London*] *Suppl.* 64: 137-138. 1926.—Annotated list of mosses, 5 from Java, 4 from Timor, and 8 from Sumatra, including *Dicranoloma brevisetum* (Doz. & Molk) Par and *Aerobryopsis leptosigmata* (C. M.) Fleisch., new to Sumatra.

5061. LITARDIÈRE, R. de. Notes sur quelques bryophytes de la Corse. *Arch. Botanique* 1(Bull. Mens. 12): 248-250. 1927.—*Madotheca thuja, Dichodontium pellucidum* and *Fissidens osmundoides* from Corsica are considered from standpoint of their phytogeographical interest.

5062. POTIER de la VARDE, R. Hookeriopsis mittenii nom. mutat. *Arch. Botanique* 1(Bull. Mens. 7): 138-139. 1927.—*H.* **mittenii** (*Lepidopilum versicolor* Mitt. not Schp.).

5063. POTIER de la VARDE, R. Additions aux mousses de l'Oubangui. *Arch. Botanique* 3(Bull. Mens. 1): 1-9. 3 fig. 1929.—*Fissidens grandifolius,* known previously only from Gabon and incompletely described, is here given a full description. Among the other forms listed, the following are new: *F.* **herpetineuron*** (Bryoidium) Broth. et P. de La V. (p. 2), *F. tisserantii* v. **sublaevifolius** (p. 3), *F.* (*Semilimbidium*) **perlimbatus*** Broth. et P. de La V. with f. **albinervis** (p. 3), *F.* (*Aloma*) **rivicola*** Broth. et P. de La V. (p. 3), *F.* (*Crenularia*) **crispifolius*** Broth. et P. de La V. (p. 6), *Moenkemeyera* **flexipes*** (p. 6), *Didymodon*(?) **tisserantii*** (p. 7), *Bryum coronatum* v. **latifolium** Broth. et P. de La V. (p. 8), *Rhacopilum büttneri* f. **brevirostre** Thér. et P. de La V. (p. 9), *Stereophyllum*(?) **laxirete*** Broth. et P. de La V. (p. 9), *Sematophyllum laetevirens* v. **homomallum** (p. 9). The authority is P. de La V. where not otherwise indicated.

5064. SCHWEIZER, G. Physiologisch-morphologische Studien über Funaria hygrometrica L. in Reinkultur. *Ber. Deutsch. Bot. Ges.* 48(3): 75-84. 1 fig. 1930.—*Funaria hygrometrica* was grown in pure culture on agar or sea-sand containing Detmer's solution, brought to the proper acidity by the addition of phosphoric, citric, or huminic acids, or mixtures of them. The spores endure pH 1.55 without impairment of germination. The protonema develops equally richly with high or low acidity, and shows remarkable resistance to the influence of chemical or osmotic agents. The leafy plants are produced several days later in the very acid media than in the less acid media. The protonema is strongly positively phototropic and bears leafy plants not only in the water on the surface of the medium, but on the walls of the flask, and in the air. The young moss plants are produced equally densely in all cultures, regardless of high or low acidity, or absence or presence of huminic acid. In the cultures with huminic acid, the plants produced considerably more antheridia and archegonia, and consequently more capsules than in the cultures lacking huminic acid. This is not directly due to the acidity, however, but to the actual utilization of the huminic acid, since the black color of the medium entirely disappears during the growth of the cultures.—*W. C. Steere.*

5065. THÉRIOT, I. Un nouveau genre de mousses: Maireola (Dicranaceae). *Arch. Botanique* 1(Bull. Mens. 3): 47-48. 1 fig. 1927.—The new genus is based on *M.* **atlantica*** Thér. et Trab. (p. 47), Morocco.

5066. THÉRIOT, I. Deux mousses nouvelles. *Arch. Botanique* 1(Bull. Mens. 4): 66-69. 2 fig. 1927.—*Fontinalis* **utahensis*** (p. 67), Utah, and *Lyellia* **platycarpa*** (p. 67), Yunnan; Card. et Thér. authority for both.

5067. THÉRIOT, I. Étude sur Campylopus concolor (Hook.) Mitt. et C. jamesoni (Hook.) Jaeg. *Arch. Bot.* 2(10): 185-188. 1 fig. 1928.—Critical notes in which it is shown that the species are distinct; the important characters distinguishing *C. jamesoni* from *C. concolor* are given *C.* (*Pseudocampylopus*) **apollinairei*** (p. 187), Colombia, is described.

5068. THÉRIOT, I., et [L.] TRABUT. Quelques mousses inédites de l'Afrique du Nord. [Algeria & Morocco.] *Bull. Soc. Hist. Nat. Afrique du Nord* 21(3): 28-31. 1930.—*Encalypta* **litardierei** (sect. *Diplolepsis*) (p. 28); *Tortella* **elkantarensis** (p. 29); *Pleurochaete squarrosa* v. **brevifolia** (p. 29); *Hyophila* **perpusilla** (p. 29); *Grimmia* (*Rhabdogrimmia*) **verticillatula** (p. 29); *Bryum* **mairei** (p. 30); *B.* (*Apalodictyon*) **trabutii** Thér (p. 30); *Mnium marginatum* v. **aristatum** (p. 31); *Orthotrichum anomalum* v. **algeriense** (p. 31); *Homalothecium philippeanum* v. **maroccanum** (p. 31).

GENERAL

5076. **BAILEY, L. H.** Statements on the systematic study of variables. *Proc. Internat. Congress Plant Sci. Ithaca, N. Y., 1926.* 2: 1427-1433. 1929. Also in reprint, with correction.—The greatest quest or concern in biology is to discover origins; precedent to the quest is accurate identification and adequate record of the forms of life. The importance of these systematic studies is therefore primary and fundamental. The more perplexing and variable the forms, the greater is the necessity for diligent research in their identities; and yet we are wont to confine our attention to invariables or "good species." Four main considerations in the study of variables are discussed: (1) the variables tempt the worker into unrestraint in systematic treatment; (2) they lure one into the swamps of hybridity, whereby anything not understood may be unscientifically disposed of by assuming it to be a hybrid; (3) necessity for a better kind of collecting and field work; (4) the study of variables should eventually throw new light on phylogeny. The assumption that "like produces like," in its common acceptance, is challenged. In biology the variables are in many ways the most significant objects and most in need of painstaking study.—*L. H. Bailey.*

5077. **HILL, A. W.** Index kewensis plantarum Phanerogamarum. Supplement 6: 1916-1920. 222p. 1926. Pr. $23.50. Supplement 7: 1921-1925. 260p. 1929. Oxford University Press American Branch, New York.—These supplements of this well known work include citation of publication for all species of flowering plants published as new to science for the periods indicated in the title.

5078. **REHDER, ALFRED.** Neuere und seltene Gehölze. *Mitteil. Deutsch. Dendrolog. Ges.* 1927: 34-47. 1927.—A description is given of little known species of *Thuja, Juniperus, Abies, Picea, Populus, Celtis, Berberis, Deutzia, Spiraea, Pentactina, Evodia, Buxus, Abeliophyllum, Forsythia, Buddlea* and *Lonicera,* most being of Asiatic origin.—*J. C. Th. Uphof.*

GYMNOSPERMAE

5079. **FASSETT, NORMAN C.** Preliminary reports on the flora of Wisconsin. V. Coniferales. *Transl. Wisconsin Acad. Sci. Arts and Lett.* 25: 177-182. 12 maps. 1930.—In this paper are incorporated many field data collected by L. S. Cheney in 1897-98. Notes on ecological and geographical distribution, with maps, are given for 14 forms.

5080. **[FOMIN, A.]** ФОМІН, А. Голонасінньові Кавказу та Криму. [Gymnosperms of the Caucasus and of the Crimea.] [In German and Latin, with Ukrainian summary.] Всеукраінська Академія Наук, Труди Фізично-Математичного Відділу. (*Acad. Sci. Ukraine, Mém. Cl. Sci. Phys. et Math.*) 11(1): 3-62. 1928.—A monographic treatment in Latin and German. Tables are provided showing altitudinal and geographic distribution within the area. *Taxus baccata* v. **caucasica** (p. 12), Cis- and Transcaucasia; *Pinus sylvestris* v. **subalpina** (*P. s.* ssp. *hamata* v. *subalpina* Fom.) (p. 22); *P.* **hamata** (*P. silvestris* var. *hamata* Stev.) (p. 23); *P. h.* var. **kochiana** (*P. k.* Klotzsch) (p. 25), with f. **frutescens** (p. 26), Transcaucasia; *P. armena* f. **obtusa** (p. 27), Ciscaucasia; *P. a.* var. **parvifolia** (p. 27), Kars. Armenia; *Juniperus communis* var. **typica** (p. 37); *J. c.* proles **transcaucasica** (p. 38), Transcaucasia; *J. c.* f. **compacta** (p. 39), Armenia; *J. oxycedrus* ssp. *rufescens* f. **compacta** (p. 43), Taurida, Crimea; *J. o.* ssp. *rufescens* × *communis* (p. 43); n. hybr. *Ephedra distachya* f. **caspia** (p. 54), Transcaucasia.

5081. **KURDIANI, S.** [Pinus silvestris and its mutative forms in a region in Georgia [Caucasus].] [In Georgian, with German summary.] *Bull. Mus. Géorgie* [*Tiflis*] 3:

81-88. 2 fig. 1926(1927).—In a gorge (some 40 hectares in extent, descending 600 m. from a height of 1200 m.), 2 new forms of *Pinus silvestris* occur; one has the cones borne at the middle of the branch (not at the end as is usual in the species); the other bears many cones (instead of 2-3) in a fruiting branch. Nearly ⅓ of the trees in the area belong to these forms, which are referred to 2 growth types: pyramidal, *P. s.* var. **pyramidalis**; and compact, *P. s.* var. **compacta**. The richness of the forms in this small area is perhaps due to hybridization of these 2 types, but the new forms are so distinct from the normal pines as to suggest that they may be mutants. They may be of use as ornamentals.

5082. TRABUT, L. Le sapin du Maroc. Abies maroccana Trab. (Soc. Bot. Fr., 1906). *Bull. Soc. Bot. France* 75(9/10): 898-902. 1 fig. 1928.—The author discusses the 6 Mediterranean spp. of *Abies* and their relationship. In the histological characters of the leaf *A. maroccana* is very close to *A. pinsapo*, while in the shape of the cone-scales it resembles most *A. numidica*. The figure represents cone-scales of the 4 western spp.—*A. Rehder.*

ANGIOSPERMAE (MIXED)

5083. BLACK, J. M. Additions to the flora of South Australia. No. 27. *Trans. and Proc. Roy. Soc. S. Australia* 53: 261-263. 1929.—Gramineae: *Danthonia* **geniculata** (p. 261); *D.* **auriculata** (p. 261). Cyperaceae: *Cladium* **monocarpum** (*Schoenus monocarpus* Black) (p. 261); *C.* **gracile** (p. 261). Leguminosae: *Acacia microcarpa* var. **linearis** (p. 262). Rutaceae: *Correa* **calycina** (p. 262). Compositae: *Helichrysum ambiguum* var. **paucisetum** (p. 262), S., Cent., & W. Austr.; *Helichrysum basedowii* Black (=*Leptorrhynchus tetrachaetus* var. *penicillatus* Black); *Athrixia tenella* v. **horripes** (p. 263); *Myriocephalus rhizocephalus* v. **pluriflora** (p. 263); *Sonchus* **megalocarpus** (*S. asper* var. *m.* Hook.) (p. 263). There is also a note on the rare *Acacia peuce*.

5084. CASTELLANOS, ALBERTO. Bromeliáceas y Cactáceas de los alrededores de Buenos Aires y de la Isla Martín García. [Bromeliaceae and Cactaceae of the environs of Buenos Aires and of Martin Garcia Isl., Argentina.] *Physis [Buenos Aires]* 10(35): 85-98. 3 pl. 1930.—Only those spp. are discussed which are represented in herbaria. Five forms of *Tillandsia* (Bromeliaceae) and 7 of the genera *Cereus, Echinopsis, Opuntia*, and *Rhipsalis* (Cactaceae) are discussed, with synonymies, descriptions, and distributional records. There is a key to the 4 genera of Cactaceae.

5085. CAUM, EDWARD L. New Hawaiian plants. *Bernice P. Bishop Mus. Occ. Papers* 9(5): 1-30. 15 pl., 2 fig. 1930.—*Gunnera* **kauaiensis*** Rock (p. 3); *Hibiscus brackenridgei* vars. **molokaiana*** Rock (p. 4) and **kauaiana*** (p. 5); *H. kokio* v. **pukoonis*** (p. 7); *Phyllostegia* **longiflora*** (p. 9); *Straussia* **grandiflora*** (p. 9); *Pritchardia* **kamapuaana*** (p. 10); *P.* **macdanielsi*** (p. 11); *P.* **donata*** (p. 12); *P.* **kahukuensis*** (p. 13); *P. kaalae* v. **minima*** (p. 13); *P.* **elliptica*** Rock and Caum (p. 14).

5086. HONDA, M. Nuntia ad floram Japoniae III. *Bot. Mag. [Tokyo]* 43(510): 291-294. 1929.—*Carex* **pseudo-wrightii** (p. 291); *Sakakia ochnacea* v. **contracta** (p. 292); *Agropyron* **yezoense** (p. 292), Yezo; *Trisetum* **homochlamys** (p. 293), Yezo; *Parabenzoin praecox* v. **pubescens** (p. 293); *Ischaemum* **sakaguchii** (p. 293); *Glyceria* **viridis** (p. 294). Unless otherwise stated, all are from Hondo.

5087. MACBRIDE, J. FRANCIS. Spermatophytes, mostly Peruvian—2. *Field Mus. Nat. Hist. Publ.* (278.) *Bot. Ser.* 8(2): 77-130. 1930.—Under the caption (1) "New species of various families" (pp. 77-84) the following are described. (a) Araceae by K. KRAUSE: *Anthurium* **schunkei** (p. 77); *A.* **gracilipedunculatum** (p. 78); *A.* **siccisilvarum** (p. 78); *A.* **macbridei** (p. 79). (b) Iridaceae by L. DIELS: *Sisyrinchium* **palustre** (p. 79). (c) Cruciferae by O. E. SCHULZ: *Weberbauera spathulifolia* v. **integrifolia** (p. 80); *Sisymbrium oleraceum*, emended descriptions; *S.* **weberbaueri** (p. 80); *Cremolobus* **paysonii** (p. 80); *Descurainia* **macbridei** (p. 81). (d) Lauraceae by O. C. SCHMIDT: *Nectandra* **macbridei** (p. 81). (e) Meliaceae by H. HARMS: *Cedrela* **weberbaueri** (p. 82). (f) A. WEBERBAUER "Ueber die Rhamnaceen Gattung Scypharia Miers" makes the following n. combs.: *Scutia* **spicata** (*Colletia s.* Willd.) (p. 83), *S.* **guayaquilensis** (*Rhamnus g.* HBK.) (p. 83), *S.* **pauciflora** (*Discaria p.* Hook f.) (p. 84), *Citharexylon spinosum* HBK. (=*Scypharia tetragona* Miers). Thus, with its species all allocated elsewhere, *Scypharia* is stricken.—Under the heading (2) "Leguminosae, especially of the genera *Parosela* and *Psoralea*," specific characters are discussed in the former, and generic and specific limits in the latter. Included are: *Psoralea lasiostachys* v. **potens** (*P. p.* Macbr.=*Hoita versicolor* Rusby) (p. 88); *P.* **timorata** (p. 89), Bolivia; *Calliandra* **tumbeziana** (p. 89); *Acacia* **huarango** Ruiz., in herb. (p. 90); *Mimosa* **dichoneuta** (p. 90); *M. albida* v. **erratica** (p. 91); *Cassia* **helveola** (p. 91); *C.* **weberbaueri** (p. 92); *C.* **andina** Rose (p. 93); *Hoffmannseggia viscosa* v. **egena** (p. 93); *Crotalaria nitens* v. **trichina** (p. 94); *Lupinus* **fieldii** Rose, in herb. (p. 94); *L.* **andinus** Rose (p. 95); *L.* **huaronensis** (p. 95) and v. **pascoensis** (p. 96); *L.* **visoensis** (p. 97); *L. microphyllus* v. **chavanillensis** (p. 97); *Medicago sativa* f. **salaverryensis** (p. 97); *Coursetia* **tumbezensis** (p. 97); *Astragalus* **dillinghami** (p. 98); *A. richii* Gray (=*A. macrorrhynchus* Ulbr.); *A. garbancillo* v. **varus** (p. 99); *A. g.* v. **mandoni** (*A. m.* Rusby) (p. 100); *Adesmia* **augusti** (p. 100); *Aeschynomene* **tumbezensis** (p. 101); *Desmodium* **distortum** (*Hedysarum d.* Aubl) (p. 101); *D.* **micranthum** (*Meibomia micrantha* Schindl.) (p. 120); *Tetrapteris crispa* v. **punicans** (p. 121); *T.* **triopteris** n. n. (p. 121) (*T. crispa* ssp. *pseudotriopterys* Ndz.); *Vochysia* **leguiana** (p. 121); *Mauria* **denticulata** (p. 122); *Ilex* **caniensis** (p. 122); *Hippocratea* **opacifolia** (p. 123); *Cormonema spinosum* v. **peruvianum** (p. 124); *Cuphea* **carthagenensis** (*Lythrum carthagenense* Jacq.)

(p. 124); *Laguncularia racemosa* f. **longifolia** (p. 125); *Niphogeton* **dissecta** (*Petroselinum dissectum* Benth.) (p. 125); *N. d.* v. **aspera** (*Oreosciadium dissectum* v. *asperum* Wedd.) (p. 125); *N.* **weberbaueri** (*Apium w.* Wolff) (p. 126); *N.* **magna** (p. 126); *N.* **glaucescens** (*Apium g.* HBK) (p. 126); *Clavija* **euerganea** (p. 126); *Geissanthus* **abditus** (p. 127); *Rapanea dependens* v. **saxatilis** (p. 127); *Symplocos* **scabra** (p. 128); *Styrax* **ferax** (p. 128); *Cordia* **lucayana** (*Varronia l.* Millsp.) (p. 129).—Under the heading (5) "An Illinois Variety of Shooting Star" are reported: *Dodecatheon meadia* v. *frenchii* Vasey and *D. m.* f. **alba** (p. 129), Illinois. All the forms new to science are from Peru except when stated otherwise.

5088. MARQUAND, C. V. B. The botanical collection made by Captain F. Kingdon Ward in the Eastern Himalaya and Tibet in 1924-25. *Jour. Linn. Soc. London, Bot.* 48(321): 149-229. 1929.—An historical account of botanical exploration in the area, and of publications on the Tibetan and Himalayan flora, introduces an enumeration of the plants now collected. The following novelties are, unless otherwise stated, from southeastern Tibet and proposed jointly by Marquand and Shaw: *Thalictrum* **diffusiflorum** (p. 153); *Anemone demissa* v. **grandiflora** (p. 154); *A. rupestris* vars. **villosa** (p. 154) and **pilosa** (p. 154); *A.* **wardii** (p. 155); *Ranunculus* **oreionannos** (p. 155); *Delphinium* **gyalanum** (p. 156); *D.* **wardii** (p. 157); *Aconitum soongaricum* v. **lasiocarpum** (p. 158); *A.* **tangense** (p. 158); *Corydalis* **chrysosphaera** (p. 160); *C.* **lupinoides** (p. 160); *C.* **wardii** (p. 161); *Iberidella* **tibetica** (p. 163), *Lychnis* **atsaensis** Marquand (p. 163); *L.* **namlaensis** Marquand (p. 164); *L.* **rubricalyx** Marquand (p. 164); *L.* **wardii** Marquand (p. 165); =*Myricaria* **wardii** Marquand (p. 166); *Impatiens* **fragicolor** (p. 167); *I.* **nyimana** (p. 167); *Euonymus* **rongchuensis** (p. 168); *Piptanthus* **bombycinus** Marquand (p. 169); *Caragana* **crassispina** Marquand (p. 170); *Astragalus* **tumbatsica** (p. 171); *Potentilla eriocarpa* v. **dissecta** (p. 174); *P. fruticosa* v. **grandiflora** Marquand (p. 175); *Rosa sweginozowii* v. **inermis** (p. 175); *Saxifraga* **bergenioides** Marquand (p. 176); *S.* **gyalana** (p. 177); *S.* **heterotricha** (p. 177); *S. hookeri* v. **aequifolia** (p. 178); *S.* **kingdonii** Marquand (p. 179); *S.* **megalantha** Marquand (p. 179); *Saxifraga montana* v. **subdioica** (Hook. f.) Marquand (p. 180); *S.* **muricola** (p. 180), with vars. **brachypetala** and **quinquenervis** (p. 180); *S.* **pasumensis** (p. 181), with f. **gracilis** (p. 181); *S.* **signatella** Marquand (p. 182); *S. stella-aurea* v. **ciliata** (p. 182); *S.* **taraktophylla** (p. 182); *S. umbellulata* f. **pectinata** (p. 183); *Hydrangea heteromalla* v. **parviflora** (p. 183); *Sedum rotundatum* v. **oblongatum** (p. 184); *Schefflera* **wardii** (p. 186); *Lonicera cyanocarpa* v. **porphyrantha** (p. 187); *L. ovalis* v. **subcoriacea** (p. 188); *Anaphalis adnata* v. **petiolata** (p. 190); *Tanacetum myrianthum* v. **wardii** (p. 190); *Senecio* **drukensis** (p. 191); *S. paucinervis* v. **brachylepis** (p. 192); *Saussurea* **rohmooana** (p. 192); *Crepis glomerata* v. **porphyrea** (p. 194); *Cyananthus* **wardii** Marquand (p. 196); *Campanula aristata* v. **longisepala** (p. 196); *C.* **pasumensis** Marquand (p. 196); *Agapetes* **praeclara** Marquand (p. 197); *Gaultheria* **wardii** (p. 198); *Cassiope* **wardii** Marquand (p. 199); *Androsace strigillosa* v. **canescens** Marquand (p. 201); *Buddleia tibetica* v. **grandiflora** (p. 202); *B.* **tsetangensis** Marquand (p. 202); *B.* **wardii** Marquand (p. 203); *Crawfurdia* **wardii** Marquand (p. 203); *Gentiana* **namlaensis** Marquand (p. 205); *G. prostrata* vars. **crenulatotruncata** Marquand and **bilobata** (p. 205); *G. tubiflora* v. **namlaensis** Marquand (p. 206); *Lomatogonium* **deltoideum** (*Pleurogyne deltoidea* Burk.) (p. 207); *L.* **oreocharis** (*P. o.* Diels) (p. 207); **KINGDON-WARDIA** (p. 207), between *Gentiana* and *Swertia*, based on *K. w.* **codonopsidioides** Marquand (p. 207); *Swertia hispidicalyx* f. **subglabra** Marquand (p. 208); *S.* **wardii** Marquand (p. 208); *Pedicularis* **aschistorrhyncha** Marquand (p. 210); *P. bella* v. **holophylla** (p. 211), with f. **rosea** (p. 211); *P.* **cryptantha** (p. 211); *P.* **mychophila** (p. 212); *P. roylei* v. **cinerascens** (p. 213); *Plectranthus* **wardii** (p. 216); *Micromeria* **wardii** (p. 216); *Phlomis* **tibetica** (p. 218), Eastern Himalaya; *P. t.* var. **wardii** (p. 219); *Salix* **annulifera** (p. 222) with var. **macriula** (p. 222); *Populus ciliata* v. **aurea** (p. 223); *Fritillaria cirrhosa* v. **brachyantha** (p. 227); *Lloydia serotina* f. **parva** (p. 228); *Arisaema* **wardii** (p. 228); *Pegaeophyton* **scapiflorum** (*Cochlearia scapiflora* Hook. f. & Thoms.) (p. 229).

5089. POLE EVANS, I. B. [Ed.] The flowering plants of South Africa 10(40): pl. 391-400. 1930.—The following species are described, each with hand-colored plate: *Faurea speciosa**, figured for the first time; *Stapelia asterias* var. *lucida**; *Mesembryanthemum marianae**; *M. longifolium**; *Cotyledon schäferiana**; *Stapelia variegata**; *Cotyledon* **pygmaea*** W. F. Barker (pl. 396), Cape Province; *Strumaria watermeyeri**; *Monsonia multifida**; *Conophytum minutum**.

5090. POLE EVANS, I. B. [Ed.] The flowering plants of South Africa 11(41): pl. 401-410. 1931.—The following plants are described, each with hand-colored plate: *Lachenalia ovatifolia**; *L.* **longibracteata*** Phillips (pl. 405), Cape Province; *Dolichos gibbosus**; *Crassula* **lettyae*** Phillips (pl. 403), S. Africa; *Hessea* **mathewsii*** Barker (pl. 404), Cape Province; *Mundulea suberosa**; *Stapelia* **clavicorona*** Verdoorn (pl. 407), Transvaal; *Asclepias dregeana* v. *calseolus**; *Asparagus suaveolens**; *Parapodium costatum**.

5091. ST. JOHN, HAROLD. New and noteworthy northwestern plants. Part 4. *Proc. Biol. Soc. Washington* 44: 29-36. 1931.—Notes on various species, including: (Juncaceae) *Juncus drummondii* v. **longifructus** (p. 29), Brit. Columbia and Washington (type), with f. **davisonii** (p. 30); (Liliaceae) *Allium* **equicaeleste** (p. 31); (Portulacaceae) *Lewisia exarticulata* St. John (=*L. pygmaea* v. *aridorum* Bartlett); (Cruciferae) *Chorispora tenella* DC., a Eurasian plant, adventive to Washington; (Scrophulariaceae) *Penstemon* **pickettii** (p. 33); (Orobanchaceae) *Orobanche* **columbiana** St. John & English (p. 34); (Compositae) *Arnica amplexicaulis* v. **piperi** St. John & Warren (p. 36). All are from Washington.

5092. STAPF, O. Plants from the Royal Botanic Gardens, Kew. *Curtis's Bot. Mag.* 154(1): Tab. 9205-9215. (col.): (2): 9216-9226. (col.) 1928(1930).—Descriptions by author unless otherwise specified, with hand-colored plates, of: *Lilium formosanum** Wallace; *Maxillaria elatior** Reichb.; *Rhododendron albrechtii** Maxim.; *Codonopsis ovata** Benth.; *Ligustrum quihoui** Carr.; *Primula sikkimensis* **microdonta*** (*P. m.* Franch.) (tab. 9210); *Osmanthus fragrans* v. *aurantiacus** Makino; *Arisaema purpureogaleatum** Engl.; *Leontopodium haplophylloides** Handel-Mazz.; *Acacia elata** Cunningham, described by V. S. SUMMERHAYES; *Veronica teucrium* ssp. *thracica** Velenovský, by W. B. TURRILL; *Cymbidiella humblotii** Rolfe, by Summerhayes; *Rhododendrum didymum** Balf. & Forrest; *Primula anglenia-na** Balf. & Forrest; *Caryopteris mongolica** Bunge; *Iris winogradowii** Fomin; *Rhododendron amesiae** Rehder & Wilson; *Epigaea asiatica** Maxim.; *Aster farreri** W. W. Smith & J. F. Jeffrey; *Tremacron forrestii** Craib; *Kniphofia insignis** Rendle; *Papaver macrostomum** Boiss., by Turrill.

MONOCOTYLEDONES

5093. BOJKO, HUGO. Heleocharis vierhapperi nov. spec. Eine neue Sippe aus den Dolomiten. *Verhandl. Zool.-Bot. Ges. Wien* 79(2/4): 300-307. 10 fig. 1929 (1930).—*Heleocharis* **vierhapperi*** (p. 300), Italy.

5094. BRAUN-BLANQUET, J. Poa granitica, nouvelle Graminée de l'Europe centrale. *Arch. Botanique* 3(Bull. Mens. 3): 46-48. 1929.—*Poa* **granitica**, Tatra.

5095. BURRET, M. Palmae cubenses et domingenses a Cl. E. L. Ekman 1914-1928 lectae. *Kgl. Svenska Vetenskapsakad. Handl.* 6(7): 1-28. 14 pl. 1929.—Records the entire collection, including: *Copernicia* **gigas*** Ekman Ms. (p. 3); *C.* **ekmannii** (p. 5), Haiti; *C.* **oxycalyx** (p. 6); *C.* **yarey** (p. 7); *C.* **ramosissima** (p. 8); *C.* **pauciflora** (p. 8); *Hemithrinax* **ekmaniana*** (p. 9); *Coccothrinax* **ekmanii*** (p. 11), Haiti; *C.* **pauciramosa** (p. 12); *C.* **concolor** (p. 14) and *C.* **gracilis** (p. 14), Haiti; *C.* **fragrans** (p. 16), Cuba (type) and Haiti;

C. **montana** (p. 17), Santo Domingo; *C. crinita** Becc. and *C. anomala** Becc., emend. descr.; *Pseudophoenix sargenti* H. Wendl. (=*P. linearis* O. F. Cook,=*P. saonae* O. F. Cook); *P.* **ekmanii*** (p. 19), Santo Domingo; *P. vinifera* (Mart.) Becc. (=*P. insignis* O. F. Cook); *Attalea* **crassispatha** (*Maximiliana c.* Mart.) (p. 23); *Bactris* **cubensis** (p. 25); *Thrinax* **ekmanii** (p. 27) and *Pseudophoenix* **navassana** Ekman Ms. (p. 27), Navassa Isl.; *P.* gracilis Ekm. Ms. (p. 28), Haiti. Unless otherwise stated, the locality is Cuba. Many previously known species are included in this systematic list, with locality records or taxonomic remarks.

5096. CHEVALIER, C. Monographie des Broméliacées-Tillandsiées (Étude botanico-horticole). *Bull. Mens. Soc. Nation. Hort. France* 3(Juillet): 337-367. 1930.—Brief notes on the morphology of the Bromeliaceae are followed by synoptic tables of the genera and subgenera of the Tribe Tillandsieae after Baker and Mez. He gives a summary of the principal cultivated spp. of *Vriesea, Tillandsia* and *Guzmania* according to the classification of Mez. One chapter deals with the numerous hybrids of *Vriesea*. Hybrids of *Tillandsia* are rare and bigeneric hybrids still more so. The author obtained *Vriesea-Tillandsia* hybrids, but they have not yet flowered. He concludes that the power of character transmission is a quality of the individual whether it operates as the male or as the female element.—*C. Chevalier* (*transl. by L. B. Smith*).

5097. FASSETT, NORMAN C. Preliminary reports on the flora of Wisconsin. VI. Pandanales. *Trans. Wisconsin Acad. Sci. Arts and Lett.* 25: 183-187. 6 maps. 1930.—Three forms of Typhaceae and 8 of Sparganiaceae are discussed, with maps and notes on ecological and geographical distribution. A key to the 3 Typhaceae is given.

5098. HITCHCOCK, A. S. Four new grasses. *Jour. Washington Acad. Sci.* 20(15): 381-384. 1930.—*Agrostis* **hendersonii** (p. 381), Oregon; *Calamagrostis* **stipitata** (p. 382), Chile; *Stipa* **smithii** (p. 382) and *Panicum* **killipii** (p. 383), Peru.

5099. HOEHNE, F. C. Contribuições para o conhecimento da flora orchidologica brasilica. [Contribution to a knowledge of the orchid flora of Brazil.] *Arch. Inst. Biol.* [*S. Paulo*] 2: 5-52. 10 pl. 1929.—An enumeration of the species of Orchidaceae of the genera *Pleurothallis* and *Octomeria* which, up to August 1928, have been added to the herbarium of the "Secção de Botanica e Agronomia" of the "Instituto Biologico de Defesa Agricola e Animal," with critical notes on every species, showing its affinity with other species or giving characters not mentioned in the original descriptions. *Pleurothallis muscosa* v. **parviflora*** (p. 12); *P.* **duartei*** (p. 12); *P.* **heliconiscapa*; *P.* altoserrana*** (p. 20); *P. josephensis* vars. **integripetala, subcrenulata,** and **papillifera** (p. 22); *P.* **jordanensis*** (p. 23); *P.* **puttemansii*** (p. 24); *P.* **sonderanoides*** (p. 30); *P.* **unguiculata*** (p. 32); *P.* **ornithorrhyncha*** (p. 34); *P.* **montipelladensis*** (p. 36); *P.* **anomala*** (p. 43); *P.* **brachiloba*** (p. 44); *Octomeria* **recchiana*** (p. 48); *O.* **caldensis*** (p. 50). The following redescriptions and synonymy occur: *Pleurothallis caespitosa* Barb. Rdr. (=*P. subcordifolia* Cgn. =*P. platycaulis* Reichb. f.); *P. mentigera** Kraenzl.; *P. paranaensis** Schltr.; *P. parvifolia* Ldl. (=*P. succedanea* Hoehne & Schltr.); *P. grobyi* Ldl., regarded as distinct from *Lepanthes marmorata* Fl. Br.; *P. caldensis** Hoehne & Schltr.; *P. smithiana* Ldl. (=*P. riograndensis* Barb. Rdr.); *P. glaziovii* Cgn. (=*P. alexandri* Schltr=*P. vitellina* Porsch.); *P. heterophylla* Cgn., notes; *P. densiflora* Cgn., emended description; *P. macrophyta* Barb. Rdr. (=*P. loefgrenii* Cgn.); *P. depauperata* Cgn. (=*P. sororcula* Schltr.); *P. bradei* Schltr., placed in the *mouraei* group of the Lepanthiformes, is undoubtedly a hybrid species; *Octomeria serrana** Hoehne, redescribed; *O. wilsoniana** Hoehne, redescribed, the name being a correction from *O. wilsoniae* Hoehne.

5100. KRÄNZLIN, F. Catasetum gongoroides spec. nov. aus Colombia. *Rep. Spec. Nov. Reg. Veg.* 27 (741/750; paper 25): 254. 1930.—This new orchid belonging to § *Myanthus* bloomed at the Hamburg Bot. Gard. in 1929.—*H. K. Svenson.*

5101. KRÄNZLIN, FR. Pleurothallis rhodosticta spec. nov. *Rep. Spec. Nov. Reg. Veg.* 27(741/750; paper 26): 255. 1930.—This new orchid of unknown origin bloomed in the Hamburg Bot. Gard. in Dec., 1929.—*H. K. Svenson.*

K. Svenson.*

5109. SMALL, JOHN K. Palms of the continental United States. *Sci. Month.* 32(3): 240-255. 1 pl., 17 fig. 1931.—While palms were much more widely distributed in past ages, about 1200 spp. still exist. Tropical America and tropical Asia are now the main centers of distribution. They occur between latitudes 38° N. and 37° S., in regions with an average temp. of 60° F. or more. The distribution and uses of the 17 spp. occurring in the U. S. A. are given. They are confined mainly to the Atlantic and Gulf Coastal Plains, their distribution being almost identical with that of the flowering epiphytes. Birds are considered probable agents in extending the range of some spp. northward along the Atlantic Coast. On the other hand, *Roystonea regia* has retreated from central to southern Florida. This state contains nearly all spp. of both palms and flowering epiphytes occurring in the U. S. A. Two genera, *Serenoa* and *Rhapidophyllum,* are endemic in the U. S., six others are apparently Antillean in origin, and *Washingtonia* of California is related to Mexican and Pacific forms. Botanists were slow in recognizing the native palms.

5110. SMITH, J. J. Icones Orchidacearum Malayensium I. *Bull. Jardin Bot.* [*Buitenzorg*] *Súppl.* 2(1/2): (1-100). 50 pl. 1930.—The first instalment of analytic figures is published of the species treated in the series "Neue Orchideen des malaiischen Archipels" and "Orchidaceae novae malayenses."

5111. STENT, SYDNEY M. South African Gramineae. Some new species of Digitaria. *Bothalia* 3(1): 147-156. 1930.—*Digitaria* **pentzii** (p. 147), Cape Province (type), Orange Free State, Transvaal; *D. p.* var. **minor** (*D. eriantha* v. *stolonifera* Stapf.) (p. 148), Transvaal; *D.* **valida** (p. 148), Transvaal (type), Orange Free State,

and Cape Province; *D. v.* var. **glauca** (p. 149), Transvaal; *D.* **polevansii** (p. 149), Cape Province; *D.* **decumbens** (p. 150), Transvaal; *D.* **swazilandensis** (p. 150), Swaziland; *D.* **rigida** (p. 151), Transvaal; *D.* **glauca** (p. 151), Transvaal, Orange Free State, Cape Province; *D. g.* var. **bechuanica** (p. 152), Cape Province; *D.* **natalensis** (p. 152), Natal; *D.* **littoralis** (p. 153), Cape Province; *D. l.* var. **prostrata** (p. 153), Cape Province; *D.* **geniculata** (p. 154), Cape Province (type) and Orange Free State; *D.* **foliosa** (p. 154), Cape Province; *D.* **trichopodia** (p. 155), Cape Province; *D.* **apiculata** (p. 155), Swaziland (type), Transvaal.

5112. **WARBURG, O. Heimat und Geschichte der Lilie (Lilium candidum).** *Rep. Spec. Nov. Reg. Veg. Beihefte* 56: 167-204. 2 pl. 1929.—A critical examination of the literature discloses that earlier reports of *Lilium candidum* in Palestine were erroneous. In June, 1925, specimens of this lily were found for the first time growing wild in Palestine, and it is believed that the species is a native of this region. In the more western regions wherever *L. candidum* is found, it grows in the vicinity of old ruins, villages or churches, indicating that it has found its way thither as an ornamental plant. The author concludes that it is a forest plant which became established in Syria and Palestine during the rainy period of early times when these regions were largely forested. With the subsequent change in climate came the replacement of forest by the maquis and the disappearance of the lily from all but the most favorable habitats, where it has managed to persist. Its ornamental and decorative value has probably further restricted its distribution. —*P. D. Strausbaugh.*

DICOTYLEDONES

5113. **ACEVEDO, REBECA. Sobre el género Lathyrus L., en Chile. [The genus Lathyrus in Chile.]** *Rev. Chilena Hist. Nat. Pura y Aplicada* 31: 123-126. 1927(1928).—The author places under *L. multiceps* 2 plants previously considered distinct: *L. m.* var. **setiger** (*L. s.* Ph.) (p. 126), with f. **eurypetalus** (*L. setiger* Ph. var. *e.*) (p. 126). The distinguishing characteristics of these plants are discussed.

5114. **AELLEN, PAUL. Ein neues Chenopodium von St. Helena.** *Rep. Spec. Nov. Reg. Veg.* 27(741-750; paper 35): 335-336. 1930.—*C.* (sect. *Chenopodiastrum*) **helenense** (p. 335). This new apparently endemic species has not been collected for over 100 years, and may have been exterminated.—*H. K. Svenson.*

5115. **ANDERSON, R. H. A revision of certain Australian Chenopodiaceae.** *Proc. Linn. Soc. N. S. Wales* 51(3): 382-386. 3 pl. 1926.—In revising the Australian spp. of *Bassia, B. tricornis* (Benth.) F. v M. and *B. enchylaenoides* F. v M. were excluded. The former now becomes **MALACOCERA** (p. 383), **tricornis*** (*Bassia t.* Benth.). The latter is transferred to *Kochia* as *K.* **crassiloba** (*Enchylaena villosa* F. v M., *Chenolea enchylaenoides* F. v M.), while another plant that had been confused with it is described as *K.* **pentagona*** (p. 385) from S. Australia, Victoria and N. S. Wales.—*G. T. Hastings.*

5116. **BENOIST, R. Une Lauracée nouvelle de la Guyane française.** *Arch. Botanique* 3(Bull. Mens. 1): 10. 1929.—*Ocotea* **subglabra.**

5117. **BENOIST, R. Une Acanthacée de la Nouvelle-Calédonie.** *Arch. Botanique* 3(Bull. Mens. 4): 63-64. 1929.—*Pseuderanthemum* **incisum.**

5118. **BLACKBURN, KATHLEEN B. A new rose from Northumberland [England].** *Proc. Univ. Durham Phil. Soc.* 8(2): 101-103. 1 pl. 1928-1929[1929].—*Rosa* **berniciensis*** "var. nova" (p. 101). The text states that it belongs to *R. glauca* ssp. *subcanina,* under which it is apparently to be considered as a "micro-species" or "variety."

5119. **BLATTER, E. The Indian species of Terminalia L.** *Jour. Indian Bot. Soc.* 8(4): 245-264. 1929.—20 species are listed with short descriptions and synonymy, and complete key. Geographical considerations are included. *Terminalia chebula* f. **tomentella** (*T. t.* Kurz), f. **tomentosa** (p. 254), and f. **villosa** (p. 255) appear to be new. —*E. Blatter.*

5120. **BLATTER, E. A proposed revision of the flora of British India.** *Jour. Indian Bot. Soc.* 9(2/3): 140-150. 1930.—Urges the need of a revision of Hooker's "Flora of British India," and, as an illustration of method, presents a revision of the Indian Malpighiaceae, with keys to genera and spp. Includes *Brachylophon curtisii* v. scortechinii (*B. s.* King) (p. 150).—*E. Blatter.*

5121. **BONATI, G. Sur trois espèces nouvelles du genre Pedicularis.** *Arch. Botanique* 1(Bull. Mens. 11): 217-219. 1927.—*P.* **koueytchensis** (p. 217), *P.* **gagnepainiana** (p. 218), and *P.* **rigidiformis**, all from China.

5122. **BONATI, G. Scrofulariacees de Madagascar. (Collections Perrier de la Bathie, Decary, Waterlot, Viguier et Humbert, d'Alleizette.)** *Bull. Soc. Bot. France* 74(1/2): 86-101. 1927.—A list of species (none indicated as new) of Scrophulariaceae determined from the above Madagascan collections.—*J. P. Poole.*

5123. **BOUCHON, A., et G. MALVESIN-FABRE. Note sur "Thlaspi alliaceum" L., crucifère nouvelle pour la Gironde [France].** *Actes. Soc. Linn. Bordeaux, Proc.-Verb.* 80: 54-57. 1928.

5124. **BRIQUET, JOHN. L'organisation florale des Cynaroïdees dites monadelphes.** *Beibl. Vierteljahrsschr. Naturforsch. Ges. Zürich* 73(15): 719-743. 1928.—The genera *Silybum, Tyrimnus,* and *Galactites* were thought by Cassini to have monadelphous filaments and were on this account grouped by Lessing in one division, *Silybeae;* but Baillon decided that the filaments were not concrescent. The problem has been investigated anew. The filaments are fastened together by a glutinous secretion so as to form a sheath, but at the base they are distinct. The group should not be united with *Carduus* as proposed by Baillon. The relationships of these 3 genera to the rest of the Cynaroideae are yet to be determined and the group *Silybeae* can only be considered as a convenient means of isolating these 3 genera. There follow revised Latin diagnoses of the 3 genera.—*J. P. Young.*

5125. **CHOUX, M. P. Nouvelles observations sur les Sapindacées de Madagascar.** *Ann. Mus. Hist. Nat. Marseille* 22(2): 5-17. 10 pl. 1929.—This report is based upon material collected by MM. Perrier de la Bathie and Decary in 1923-27. Emended descriptions are given of *Manongarivea perrieri**, *Eriandrostachys chapelieri** Baillon, *Omalocarpus macrophyllus**, *Molinaea arborea** Gmelin, *Cardiophyllarium apetalum**, and *Majidea zanguebarica** Kirk. *Macphersonia gracilis* O. Hoffm. (=*M. hildebrandtii* O. Hoffm.). *Tina* **tsaratananensis*** (p. 42). Some of the above-mentioned species are recorded from parts of Madagascar where they were unknown previously.

5126. **CUFODONTIS, GEORG. Die Namen Senecio integrifolius und helenitis in ihrer richtigen Verwendung.** *Verhandl. Zool.-Bot. Ges. Wien* 79(2/4): 297-299. 1929(1930).—The correct name of the first sp. is *S. integrifolius* (L.) Clairv., of which *campestris* Retz. is a synonym. *S. helenitis* (L.) Schz. & Thell. (=*Cineraria spathulaefolia* Gmelin).

5127. **DAVIDSON, A. Horsfordia alata Gray, a new record for U. S.** *Bull. Southern California Acad. Sci* 29 (2): 100. 1930.—Found in the Colorado Desert, California.

5128. **DENIS, M. Observations sur les Uapaca malgaches et diagnoses d'espèces nouvelles.** *Arch. Botanique* 1(Bull. Mens. 11): 223-231. 1927.—Among the 12 species recognized are *U.* **amplifolia** (p. 224) (with keys to distinguish it from *U. clusioides* and *U. ferruginea,* related Madagascar species), *U.* **rivularis** (p. 225), *U.* **sambiranensis** (p. 226), *U.* **angustifolia** (p. 227), *U.* **perrieri** (p. 228), *U.* **littoralis** (p. 228), and *U.* **louveli** (p. 230), which was confused under the name of *U. thouarsii* Baillon which latter species is here emended. *U. densifolia* Baker (=*U. myricaefolia* Baker); *U. bojeri* Baillon (=*U. clusiacea* Baker).

5129. **FASSETT, NORMAN C. Preliminary reports on the flora of Wisconsin. VIII. Aceraceae.** *Trans. Wisconsin Acad. Sci. Arts and Lett.* 25: 195-197. 6 maps. 1930.

—Five spp. and several varieties of *Acer* are discussed, with maps and distributional data, the latter furnished chiefly by L. S. Cheney.

5130. FRITSCH, KARL. Zur Kenntnis der Camelina rumelica Velenovský. *Akad. Wiss. Wien, Math.-Naturwiss. Kl. 1. Abt.* 138(7): 347-370. 1929.—*C. rumelica*, while an independent sp., is not sharply delimited from other spp., especially *C. microcarpa*. *C. rumelica* Vel. (=*C. albiflora* Kotschy). *C. rumelica* occurs in southern and southeastern Europe and southwestern Asia. It is a variable plant; hairiness is its most dependable characteristic. Intermediate forms (not hybrids) are present but not abundant. *Camelina* **transcaspica** (p. 365), Transcaspian regions and Persia. There are intermediate forms which link these species. Forms of *C. microcarpa*, which approach *C. rumelica* by their abundant, long-bristly hairs, occur also in southern Switzerland and in Germany.—*K. Fritsch (transl. by P. A. Young).*

5131. FURRER, ERNST. Abruzzesische Hieracien. [Hieraciums of Abruzzi, Italy.] *Vierteljahrsschr. Naturforsch. Ges. Zürich* 74(3/4): 225-233. 1929.—An annotated list of 25 species collected by the author in 1922-28, with locality and habitat records, including: *Hieracium bupleuroides* ssp. *breviflorum* v. **aprutiorum** (p. 227); *H. arrectum* ssp. **furreri** Zahn (p. 227); *H. scorzonerifolium* ssp. **croceoglossum** (p. 228); *H. murorum* ssp. *tenuiflorum* a *genuinum* f. **bifidiceps** (p. 229); *H. dentatum* ssp. **xanthostylophorum** (p. 229); *H. wiesbaurianum* ssp. *wiesbaurianum* v. **sigilloanum** (p. 230); *H. cotteti* ssp. **brachycaulodes** (p. 230); *H. kerneri* ssp. **amoenohastatum** (p. 231); *H. prenanthoides* ssp. **lissocorium** (p. 232); *H. racemosum* ssp. *alismatifolium* v. **subbarbatum** (p. 233); *H. racemosum* ssp. *barbatum* a *genuinum* b *glabrescens* 3 **italiciforme** (p. 233). All are by Furrer and Zahn except the 2nd.

5132. Green, M. L. Lagoseris Marsch.-Bieb. and Lagoseris Hoffmgg. & Link. *Kew. Bull. Misc. Inform.* 1929 (2): 54-56. 1929.—In the past, *Lagoseris* Marsch.-Bieb. (type *L. crepoides* Marsch.-Bieb.) and *Lagoseris* Hoffmgg. & Link (type *Pterotheca nemausensis* Cass.) have been confused. A detailed synonymy and a list of species referable to each genus are given.—*M. L. Green.*

5133. GUȘULEAC, M. Note critice asupra speciei Pulmonaria rubra Schott. [Critical notes on P. rubra.] [With French summary.] *Bul. Fac. Stiinte Cernăuți* 3 (1/2): 321-336. 1 pl. 1929.—The plant on which Schott based his diagnosis of *Pulmonaria rubra* is not a new species, but *P. rubra* × *P. officinalis*. There are 2 varieties: *P. rubra* v. *transsilvanica*, of Macedonia to Bukowina, and *P. rubra* v. **filarszkyana** (*P. f.* Jávorka) (p. 330), of Poland, Czechoslovakia, and Bukowina. *P. rubra* f. **indurata** (p. 331); *P. r.* f. **stenophylla** (p. 331); *P. r.* f. **baumgarteni** (p. 331); *P. r.* monstr. **marmorata** (p. 331). The synonymy and distribution of the 2 varietes of *P. rubra* are given in detail.

5134. HALL, HARVEY M. The genus Haplopappus. A phylogenetic study in the Compositae. *Carnegie Inst. Washington Publ.* 389. 1-391. 16 pl. 1928.—The monograph illustrates the application of the principles of phylogeny to the classification of a complex and highly specialized group of plants. The studies were made both in the field and in the herbarium, and in some instances plants were transplanted from diverse habitats to a uniform environment in order to test the stability of their differentiating characters. Numerous illustrations and charts are included. A discussion of the relationships of the N. Amer. spp. of *Haplopappus* to those of S. Amer. is given. The N. Amer. spp. of *Haplopappus* are divided into 16 sections, the S. Amer. spp. into 5 sections. A list of spp. and vars. which have received names under *Haplopappus*, but which are now excluded from the genus, is given. New spp. and subspp.: *H.* **occidentalis*** (p. 214), California; *H.* **rosulatus*** (p. 329), Chile; *H. phyllocephalus* **primitivus*** (p. 56), Mexico; *H. suffruticosus* **tenuis** (p. 190), California; *H. bloomeri* **compactus*** (p. 199), Nevada; *H. squarrosus* **stenolepis** (p. 253) and *H. palmeri* **pachylepis*** (p. 267), California. New combinations: *H. phyllocephalus* **typicus** (*H. p.* DC.) (p. 58); *H. p.* **annuus*** (*Sideranthus a.* Rydb.) (p. 58); *H. p.* **megacephalus** (*Eriocarpum megacephalum* Nash) (p. 59); *H.* **stenolobus*** (*E. stenolobum* Greene) (p. 65); *H. spinulosus* **scabrellus** (*E. scabrellum* Greene) (p. 74); *H. s.* **gooddingi*** (*Sideranthus g.* Nels.) (p. 75); *H. s.* **incisifolius*** (*H. arenarius* var. *i.* Johnston) (p. 75); *H. s.* **typicus*** (*Amellus s. t.* Pursh) (p. 76); *H. s.* **australis** (*Eriocarpum australe* Greene) (p. 77); *H. s.* **cotula** (*Sideranthus cotula* Small) (p. 77); *H. s.* **glaberrimus** (*S. g.* Rydb.) (p. 77); *H. s.* **laevis** (*S. l.* Wooton & Small) (p. 78); *H. fremonti* **typicus** (*Pyrrocoma foliosa* Gray) (p. 87); *H. f.* **monocephalus** (*Oonopsis m.* Nels.) (p. 87); *H. f.* **wardi*** (*H. f.* var. *w.* Gray) (p. 88); *H.* **engelmanni*** (*Bigelovia e.* Gray) (p. 94); *H. croceus* ssp. **typicus*** (*H. c.* Gray) (p. 98); *H. c.* ssp. **genuflexus** (*Pyrrocoma genuflexa* Greene) (p. 99); *H. carthamoides* ssp. **maximus** (*H. c.* var. *m.* Gray) (p. 103); *H. c.* **typicus*** (*Pyrrocoma c.* Hook.) (p. 103); *H. c.* **rigidus** (*P. rigida* Rydb.) (p. 103); *H. c.* **cusicki*** (*H. c.* var. *c.* Gray) (p. 104); *H. c.* **subsquarrosus** (*Pyrrocoma subsquarrosa* Greene) (p. 104); *H. c.* **erythropappus** (*P. erythropappa* Rydb.) (p. 105); *H. integrifolius* **typicus*** (*H. i.* Gray) (p. 110); *H. i.* **insecticruris** (*H. insecticruris* Hend.) (p. 111); *H. i.* **liatriformis** (*Pyrrocoma l.* Greene) (p. 111); *H. i.* **scaberulus** (*Pyrrocoma scaberula* Greene) (p. 111); *H. lanceolatus* **typicus** (*Donia lanceolata* Hook.) (p. 115); *H. l.* **subviscosus** (*Pyrrocoma subviscosa* Greene) (p. 117); *H. l.* **vaseyi** (*H. l.* var. *v.* Parry) (p. 117); *H. l.* **solidagineus** (*Pyrrocoma solidaginea* Greene) (p. 118); *H. l.* **tenuicaulis** (*H. t.* D. C. Eaton) (p. 118); *H. hirtus* **typicus*** (*H. h.* Gray) (p. 124); *H. h.* **sonchifolius** (*Pyrrocoma sonchifolia* Greene) (p. 125); *H. h.* **lanulosus*** (*P. lanulosa* Greene) (p. 125); *H. racemosus* **typicus*** (*Homopappus r.* Nutt.) (p. 128); *H. r.* **congestus*** (*Pyrrocoma congesta* Greene) (p. 128); *H. r.* **duriusculus** (*P. duriuscula* Greene) (p. 129); *H. r.* **longifolius*** (*P. longifolia* Greene) (p. 130); *H. r.* **prionophyllus*** (*P. prionophylla* Greene) (p. 131); *H. r.* **glomeratus*** (*Homopappus g.* Nutt.) (p. 134); *H. r.* **brachycephalus*** (*Pyrrocoma brachycephala* Nels.) (p. 135); *H. r.* **sessiliflorus*** (*P. sessiliflora* Greene) (p. 136); *H. r.* **halophilus** (*P. halophila* Greene) (p. 136); *H. uniflorus* **typicus*** (*Donia uniflora* Hook.) (p. 148); *H. u.* **howelli** (*H. h.* Gray) (p. 150); *H. u.* **gossypinus** (*Pyrrocoma gossypina* Greene) (p. 151); *H. linearifolius* **typicus*** (*H. l.* DC.) (p. 156); *H. l.* **interior** (*H. i.* Coville) (p. 158); *H. acaulis* **typicus*** (*Chrysopsis a.* Nutt.) (p. 166); *H. a.* **glabratus** (*H. a.* var. *g.* D. C. Eaton) (p. 166); *H. lanuginosus* **typicus** (*H. l.* Gray) (p. 172); *H. l.* **andersoni** (*Stenotus a.* Rydb.) (p. 172); *H.* **aberrans*** (*Macronema a.* Nels.) (p. 185); *H. suffruticosus* **typicus*** (*Macronema suffruticosum* Nutt.) (p. 190); *H. greenei* **typicus*** (*H. g.* Gray) (p. 194); *H. g.* **mollis*** (*H. m.* Gray) (p. 195); *H. bloomeri* **typicus** (*H. b.* Gray) (p. 198); *H. b.* **angustatus** (*H. b.* var. *a.* Gray) (p. 198); *H. b.* **sonnei** (*H. b.* var. *s.* Greene) (p. 199); *H. macronema* **typicus** (*Macronema discoideum* Nutt.) (p. 204); *H. m.* **linearis** (*M. lineare* Rydb.) (p. 206); *H. venetus* **typicus** (*Baccharis veneta* HBK) (p. 224); *H. v.* **vernonioides** (*Isocoma vernonoides* Nutt.) (p. 224); *H. v.* **tridentatus** (*Bigelovia tridentata* Greene) (p. 225); *H. v.* **oxyphyllus** (*Isocoma oxyphylla* Greene) (p. 225); *H. v.* **furfuraceus** (*Bigelovia furfuracea* Greene) (p. 226); *H. acradenius* **typicus** (*B. acradenia* Greene) (p. 223); *H. a.* **eremophilus** (*Isocoma eremophila* Greene) (p. 233); *H. a.* **bracteosus** (*I. bracteosa* Greene) (p 233); *H.* **pluriflorus** (*Linosyris pluriflora* Torr. et Gray) (p. 238); *H. squarrosus* **typicus*** (H. s. Hook. et Arn.) (p. 251); *H. s.* **obtusus*** (*Hazardia obtusa* Greene) (p. 253); *H. palmeri* **typicus*** (*H. p.* Gray) (p. 267); *H.* **cooperi*** (*Bigelovia c.* Gray) (p. 276); *H.* **philippi** (*Aster p.* O. Kuntze) (p. 325); *H.* **punctatus** (*Conyza punctata* Willd.) (p. 339); *H.* **integerrimus** (*Diplopappus i.* Hook. et Arn.) (p. 340); *H.* **pristiphyllus** (*Pyrrocoma pristiphylla* Remy) (p. 351). New names: *H.* **contractus*** (*Pyrrocoma acuminata* Rydb., not *H. acuminatus* DC.) (p. 155); *H.* **eastwoodae*** (*Chrysoma fasciculata* Eastw.,

not *H. fasciculatus* Vasey & Rose) (p. 258); *H.* **reicheanus** (*H. vernicosus* Reiche, not Brandegee) (p. 324); *H.* **rotundifolius** (*Diplopappus ilicifolius* Hook. & Arn.) (p. 347). New sections: **POLYPHYLLA** (p. 302); **XYLOLEPIS** (p. 302). Trinomial names are to be read as subspecies, rather than as varieties.—*Minna F. Koch.*

5135. **HANDEL-MAZZETTI, HEINRICH. Ein bisher unbekanntes Vorkommen nordischer Taraxaca in den Alpen.** *Verhandl. Zool.-Bot. Ges. Wien* 79(2/4): 307-308. 1929(1930).—*Taraxacum reichenbachii* and *T. ceratophorum* in Tyrol, Austria.

5136. **HICKEN, CRUSTÓBAL. La planta cruel "El Tasi" (Araujoa sericifera Brot.).** *Darwiniana* 2(1): 24-29. 1928.—Review of literature concerning this sp. of Asclepiadaceae presents the history of the generic name with its variant spellings, the distribution over southern Brazil, Uruguay and northern Argentina, and both from the botanical and entomological sides the curious ability of the plant to imprison in its flowers and to kill certain insects (Lepidoptera and Hymenoptera).

5137. **HOLZFUSS, E. Neuheiten aus der Rosenflora Pommerns.** *Rep. Spec. Nov. Reg. Veg.* 27(734/740; paper 21): 230-233. 1929. *Rep. Europ. et Mediter.* 3 (paper 6): 38-41. 1929.—The following varieties collected and worked out by B. Matsson and the author are different from any northern varieties: *Rosa mollis* vars. **arrectans, systema,** and **intensifrons** (all p. 230), **intensicolor** (p. 231); *R. omissa* vars. **cyanopsis** and **labenziensis** (p. 231); *R. tomentosa* vars. **pleonazans** and **corchemeropsis** (p. 231), **pomeranica, radekowiensis** (with f. **curtifrons**), and **baeotorne** (p. 232); *R. canina* vars. **gyrizans** (p. 232), **fatuans** (p. 233), *R. coriifolia* v. **schlawensis** (p. 233). The authors of new varieties are Holzf. and Matsson.—*H. K. Svenson.*

5138. **KELSO, LEON. A new Castilleja from Colorado.** *Madroño, Jour. California Bot. Soc.* 1(16): 241-242. 1929.—*Castilleja* **flavoviridis** (p. 241).

5139. **KILLIP, ELLSWORTH P., and A. C. SMITH. The South American species of Viburnum.** *Bull. Torrey Bot. Club* 57(4): 245-258. 1930.—Since the authors' account of the species of *Viburnum* in northwestern S. Amer. (*Ibid.* 56: 265-274. 1929), they have examined all the Andean material at Kew and at the Bot. Mus., Berlin, and now present a single account; for the species treated in the earlier paper detailed diagnoses are not repeated, though specimens examined are listed. A key is provided to the 29 spp., which include: *V.* **undulatum** (*Oreinotinus undulatus* Oerst.) (p. 248); *V.* **jamesonii** (*O. j.* Oerst.) (p. 249); *V.* **goudotii** (*O. furcatus* Oerst., not *V. furcatum* Blume) (p. 249); *V.* **tridentatum** (p. 251), Peru; *V.* **halli** (*O. h.* Oerst.) (p. 251); *V. triphyllum* forms **macrophyllum** (*O. triphyllus macrophyllus* Oerst.) (p. 252), **lanceolatum** (p. 252), Peru, and **microphyllum** (p. 252), Peru; *V.* **mathewsii** (*O. m.* Oerst.) (p. 253); *V. tinoides* f. **venezuelense** (*V. leptophyllum* f. *v.* Killip & Smith) (p. 254); *V.* **antioquiense** (p. 256) and *V.* **subsessile** (p. 256), Colombia; *V. seemenii* forms **bolivianum** (*V. b.* Gandoger) (p. 258) and **minus** (p. 258), Bolivia. With the exception of *V. roraimense* K. & S. from Brit. Guiana, all are confined to the Andes of western Venezuela, Colombia, Ecuador, Peru and Bolivia.

5140. **KILLIP, ELLSWORTH P. Ten new species of Passiflora, mainly from Colombia and Peru.** *Jour. Washington Acad. Sci.* 20(15): 374-381. 1930.—*Passiflora* **dolichocarpa** (p. 374), Guatemala; *P.* **tenella** (p. 375), Peru; *P.* **dawei** (p. 375), *P.* **bucaramangensis** (p. 376) and *P.* **popayanensis** (p. 377), Colombia; *P.* **lyra** Planch. & Linden (p. 377), Venezuela; *P.* **smithii** (p. 378), Colombia; *P.* **cuzcoensis** (p. 379), *P.* **spectabilis** (p. 379) and *P.* **crassifolia** (p. 380), Peru.

5141. **KRAJINA, VLADIMIR. New Hawaiian species of Pipturus.** *Bernice P. Bishop Mus. Occ. Papers* 9(3): 3-6. 2 pl. 1930.—*Pipturus* **skottsbergii*** (p. 3); *P.* **forbesii*** (p. 6).

5142. **LECOMTE, HENRI. Le genre Viscum à Madagascar.** *Notulae Systematicae* 4(3): 65-83. 1 pl. 1927.—This study is based on the extensive collections in the Museum of Paris. The Madagascar species are listed, and brief notes on specimens collected, range, and distinguishing features are given. The following are new: *Viscum* **debile** (p. 68); *V.* **erectum** (p. 68); *V.* **granarium** (p. 69); *V.* **apiculatum** (p. 70); *V.* **conicum** (p. 71); *V.* **decaryi** (p. 72); *V.* **demissum** and var. **mahafalense** (p. 73); *V.* **farafanganense** (p. 73); *V.* **humbertii** (p. 75); *V.* **multiflorum** (p. 76); *V.* **multipedunculatum** (p. 77); *V.* **papillosum** (p. 78); *V.* **parvifolium** (p. 78); *V.* **pedicellatum** (p. 78); *V.* **perrieri*** (p. 79); *V.* **semialatum** (p. 80); *V.* **tsaratananense** (p. 80). The following n. spp. and n. combs. are based by the author on what he considers as nomina nuda of Van Tieghem: *V.* **bakeri** van Tiegh. (p. 71); *V.* **comorense** (*Ploionixus c.* van Tiegh.) (p. 71); *V.* **pervillei** (*Alepidixia p.* van Tiegh.) (p. 69); *V.* **grandidieri** (*Aspidixia g.* van Tiegh.) (p. 74); *V.* **spathulatum** (*Tetrixus s.* van Tiegh.) (p. 80). (Of these, the first two lack Latin diagnoses). An emended description is given of *V. multicostatum*. A key to spp. of sect. *Ploionixia* is provided.

5153. SASAKI, SYUN'ITI. Miscellaneous contributions to the Flora of Formosa, VI, VII. *Trans. Nat. Hist. Soc. Formosa* 19(105): 479-485. 1929; 20(108): 163-170. 1930.—Notes on various species, including: *Corydalis formosana* v. **microphylla** (p. 482); *Pedicularis* **ikomai** (p. 164); *Anaphalis* **transnokoensis** (p. 166); *Buddleja curviflora* Hook. et Arn., new to Formosa.

5154. SCALA, AUGUSTO C. La validez del género "Magallana" Cav. y su rehabilitación. [The validity of the genus Magallana Cav.] *Rev. Mus. de la Plata* 32: 23-39. 1 pl., 21 fig. 1930.—The author defends the validity of *Magallana** as distinct from *Tropaeolum**, and points out that the proper specific name is *porifolia*, not *porrifolia*, as used by most authors. However, since the meaning of this name does not accord with the facts, he proposes a new name, *M.* **cavanillesii** (p. 25), to replace *M. porifolia* Cav. A detailed description of the plant is given.

5155. SKÄRMAN, J. A. O. Ännu ett växtställe for Viola silvestris Rchb. i Västergötland. [Another locality for V. silvestris in Västergötland, Sweden.] *Bot. Notiser* 1930(5): 408-409. 1930.

5156. SYLVEN, NILS. Quercus sessiliflora Salisb. funnen i Lurö skärgård i Värmland. [Q. sessiliflora found in the Lurö islands in Värmland, Sweden.] *Bot. Notiser* 1930(3/4): 305-307. 1930.—A brief résumé is given of its occurrence in other parts of Sweden. It is found on comparatively few of the islands and in small numbers, together with a hybrid between *Quercus sessiliflora* and *Q. robur*. The author contrasts its appearance with that of *Q. robur* and states that the hybrid has somewhat the appearance of a back-cross between an F_1 hybrid and the parent form. *Q. s.* is new to the province of Värmland and thus shows a considerable northward extension in range.—*H. K. Svenson.*

5157. VERDOORN, I. C. A revision of the Crotalarias of south and south-east-tropical Africa. *Bothalia* 2(2): 371-420. 1 map. 1928.—The area covered includes the Union of South Africa, Rhodesia, Nyassaland, and Portuguese East Africa. There is a key to the 123 recognized species but no generic sections are designated. There is an index to the species and synonyms. The following appear: *Crotalaria* **athroophylla** (p. 390), Rhodesia; *C.* **doidgeae** (p. 392), Transvaal; *C.* **ceciliae** (p. 393), Portuguese E. Africa; *C.* **friesii** (p. 405) and *C.* **shamyaensis** (p. 405), Rhodesia; *C.* **allenii** (p. 417), S. Rhodesia; *C. lachnocarpoides* var. **valida** (*C. l.* ssp. *valida* Bak. f.) (p. 395). Descriptions of the following new species and varieties are taken from the manuscript of the Transvaal flora by J. Burtt-Davy, which is ready for press: *C.* **longidens** (p. 390); *C. monteiroi* v. **galpinii** (p. 391); *C.* **cinerea** (p. 411); *C.* **brachycarpa** (*C. globifera* v. *b.* Benth.) (p. 412); *C.* **orientalis** (p. 417).—*T. D. Howe.*

5158. VESTERGREN, T. Über den Verwandtschaftskreis der Myosotis versicolor (Pers.) J. E. Sm. *Svensk Bot. Tidskr.* 24(3): 449-467. 2 fig. 1930.—The group as a whole is characterized and a note given on seed-distribution (principally by animals). Of the 5 divisions recognized, 4 are found in France, 3 in Great Britain, 2 in Sweden, 1 in Spain. The range extends easterly and southerly to Austria, the Atlas Mts., the North Balkan area, Ukrainia, Turkey and the Caucasus, and, by adventive plants, to N. and S. Amer. *M. lutea* (Cav.) Hoffmannsegg & Link. and *M. balbisiana* Jord. are redescribed. Under *M. versicolor* (Pers.) J. E. Sm. are the following subspecies: **longicalyx*** (p. 456); **fallacina*** (*M. f.* Jord.) (p. 459); **dubia*** (*M. d.* Arrondeau) (p. 463).—*J. W. Gillespie.*

5159. WORSDELL, W. C. Hybrid poppies. *Gard. Chron.* [*London*] 88(2292): 452. 1930.—A brief historical account of hybrid poppies is given, including *Papaver* **ashfordense**, a spontaneous hybrid of *P. somniferum*, and *P. rhoeas*, which was seen in 1929 in a garden (but not in 1930) in Kent, England. This is the first record of a hybrid of these spp.

5160. YAMAMOTO, YOSHIMATSU. Contributiones ad floram Formosanam. *Trans. Nat. Hist. Soc. Formosa* 19: 104-107. 1929.—*Alsophila acaulis* Makino, *Crawfurdia* **cordifolia**, *Viburnum* **yamadai** Bartlett & Yamamoto, *Patrinia glabrifolia* Yamamoto & Sasaki and *Lobelia trigone* Roxburgh are discussed.—*Author* (*courtesy Japanese Jour. Bot.*).

5161. YAMAMOTO, YOSHIMATSU. Contributiones ad floram Formosanam, III. *Trans. Nat. Hist. Soc. Formosa* 20(107): 97-105. 1930.—The 7 species listed include: *Equisetum ramossissimum* v. **taikankoense** (p. 97); *Aconitum* **bartlettii** (p. 98); *Clematis* **bartlettii** (p. 101); *Euphrasia* **matsudae** (p. 102); and *E.* **nankotaizanensis** (p. 104).

5162. ZAHN, KARL HERMANN. Hieracium 2. Lieferung 118/119 of: Synopsis der Mitteleuropäischen Flora, by PAUL ASCHERSON und PAUL GRAEBNER, fortgesetzt von P. GRAEBNER Sen. und PAUL GRAEBNER Fil. 12(2): 1-160. 1930.—This installment is devoted wholly to a treatment of part of the genus *Hieracium*. A key is given to the sections of the subgenus *Euhieracium*, and the entire systematic list of forms is arranged under the subdivisions of a general key. The treatment of each form includes synonymy, diagnosis, and distribution. The category in which each form below the rank of species belongs—whether subspecies, variety, subvariety, etc.—is not made clear. No new forms, combinations, or synonyms seem to be designated. Many hybrids are treated.

FLORISTICS AND PLANT DISTRIBUTION

5163. BALDACCI, ANTONIO. Le fonti della flora Albanese. [Sources of the Albanian flora.] *Boll. Soc. Adriatica Sci. Nat. Trieste* 29: 27-48. 1926(1927).—A study has been made of the reports of all the botanical explorations in Albania, from Pouqueville to Markgraf; their significance for a proposed flora of Albania is considered. The phytogeographical importance of such a flora is stressed and von Degen of Budapest suggested as the logical compiler.—*A. Baldacci* (*transl. by H. S. Wolfe*).

5164. DUTHIE, A. V. List of vascular cryptogams and flowering plants of the Stellenbosch Flats [Cape of Good Hope]. *Ann. Univ. Stellenbosch, Sect. A* 8(4): 5-52. 2 col. pl. 1930.—An annotated list including also 16 Pteridophyta and 2 Gymnospermae. Colored plates of *Gladiolus alatus* L. and *Microloma tenuifolium* K. Schum. are given.

5165. GAVIOLI, ORAZIO. Note sulla flora Lucana, Monte Serranetta e suoi contrafforti a sud-est di Potenza. [On the flora of Lucana, Mount Serranetta and its foot-hills southeast of Potenza, Italy.] *Arch. Bot. Sist., Fitogeog. e Gen.* 4(3/4): 186-201. 1928.—An annotated list of flowering plants, including *Linum gallicum* v. pusillum (p. 190).

5166. ISSLER, E. Contributions à la flore haut-rhinoise. 2. [Contribution to the flora of the department of Haut-Rhin, France.] *Bull. Assoc. Philomathique Alsace et Lorraine* 7(2): 113-120. 1926(1927).—Eleven species of lichens are listed. Notes are given on about 35 ferns and flowering plants.

5167. JACOT, ARTHUR PAUL. Contributions from the herbarium of the Shantung Christian University. *Jour. N. China Branch Roy. Asiatic Soc.* 61: 127-155. 2 pl. 1930.—III. Spring flowers of the Tsinan plain. Popular descriptions and ecological notes of 46 species.—IV. The Shantung dandelions. *Taraxacum mongolicum* vars. **caninum*** and **laeve*** (p. 141), and *T.* **dupex*** (p. 142), all Tsinan.—V. The violets of northeast China. Based on Becker's papers, descriptions, keys and notes on 10 spp. besides a few extra limital are given, including *Viola* **cheelooi** (p. 155). Mts. Tsinan.—*A. P. Jacot.*

5168. [KOTOV, M.] КОТОВ, М. Ботанические экскурсии в Купянский округ Харьковской губ. и в Артемовский—Донецкой губ. **[Botanical excursion into Kupiansk district, Kharkov province, and in Artemovsk district, Donets province, U. S. S. R.]** [English summary.] Журнал Русского Ботанического Общества. (*Jour. Soc. Bot. Russie*) 14(2): 175-179. 1929.—A description of some forests in this region, with lists of the vascular plants observed.

5169. [KOTOV, M.] КОТОВ, М. Ботаникогеографический очерк лесов окрестностей сл. Уразово Валуйского уезда Воронежской губ. **(Botanical and geographical notice about the woods in the environs of Urasovo village, Valouiky district, Voronezh Province, U. S. S. R.)** [English summary.] Журнал Русского Ботанического Общества (*Jour. Soc. Bot. Russie*) 14 (2): 181-186. 1929.—These small forests lie in ravines on the right sides of the Oskol and Urasovo rivers. *Quercus pedunculata* Ehrh. is prevalent, also *Corylus avellana* L. shrubbery; where the forest has been cut down *Salix caprea* L. grows. The forest borders are rich in steppe-plants, e.g., *Clematis integrifolia* L., *Anemone silvestris* L., *Vinca herbacea* W. K., *Adonis vernalis* L., *A. wolgensis* Stev., *Geranium sanguineum* L., etc. In the thickets *Lithospermum purpureo-coeruleum* L., *Viola elatior* Fr., *Aristolochia clematitis* L., etc., are common. *Cephalaria tatarica* Schrad., *Gymnadenia conopsea* R. Br., *Platanthera bifolia* Rich., etc., occur rarely. Here and there along the forest edges on the ravine slopes are chalk outcrops where grow *Clematis pseudoflammula* Schm., *Matthiola fragrans* DC., etc. The forests are in deplorable condition due to ruthless cutting.

5170. POWERS, W. H. Flora of the Upper Missouri Valley. *Proc. South Dakota Acad. Sci.* 11(7): 85-100.—From the collection of early explorers, Lewis and Clark, Bradbury and Nuttall, as studied by the last and by Pursh, there has been compiled an alphabetical list of 260 species of spermatophytes. The identifications have been revised, both by the authors and Arthur T. Evans. Each entry gives the collector's statement of the plant's occurrence.

5171. ST. JOHN, HAROLD, and EDITH HARDIN.

Flora of Mt. Baker. *Mazama* 11(12): 52-102. 3 pl., 20 fig. 1929; also a corrected reprint, C. S. English, 1586 Chatham St., Portland, Oregon.—Mt. Baker, 10,750 feet in height, is a western spur of the Cascade Mts. in Washington. It is within 13 miles of the Canadian boundary. There is given, in non-technical language, an account of the vegetational areas on the mountain: the lower forest, the upper forest, the mountain meadows, and the alpine region. Earlier collectors on the mountain were M. W. Gorman and G. W. Turesson. Complete keys are included, as well as descriptions, habitats, and abundance for the 334 species of pteridophytes and spermatophytes. These include: *Agrostis hyemalis* v. geminata St. John (*A. g.* Trin.) (p. 63); *Poa* englishii (p. 64), Mt. Baker; *Anemone occidentalis* v. subpilosa Hardin (p. 73), Mt. Baker; *Saxifraga ferruginea* f. vreelandii St. John & Thayer (*Spatularia* v. Small) (p. 77); *S. mertensiana* v. glandipilosa (p. 77), Washington (type), Idaho, and Oregon; *Lomatium* angustatum St. John (*Peucedanum martindalei* var. *a.* C. &. R.) (p. 83); *Mimulus lewisii* f. leuceruthrus Hardin (p. 88), Mt. Baker; *Penstemon diffusus* f. albiflorus Hardin (p. 89), Mt. Baker; *Antennaria* gormannii St. John (p. 92), Mt. Baker; *Aster* bakerensis St. John (p. 93), Mt. Baker; *Senecio triangularis* v. trichophyllus (p. 95), Washington (type) and British Columbia.—*H. St. John.*

5172. **STECKI, K., i K. ZALESKI. Parietaria officinalis L., Geranium sibiricum L. i inne rośliny, jako pozostałości dawnego Botanicznego Ogrodu Licealnego w Krzemieńcu. [P. officinalis L., G. sibiricum L., and other plants as relicts of the earlier Lyceum Garden in Krzemieniec, Poland.]** [With German summary.] *Kosmos* [*Lwów*] 53(4): 680-684. 1 fig. 1928(1929).

5173. **SVENSON, HENRY K. Report on a botanical exploration trip to the Galapagos Islands.** *Brooklyn Bot. Gard. Rec.* 19(6): 269-284. 6 fig. 1930.—This is the administrative report of the botanist of the Astor Expedition to the Galapagos Islands, March 23–May 2, 1930. Herbarium specimens with duplicates were collected to the amount of about 500 members of flowering plants and ferns, collected chiefly on Indefatigable and Cocos Islands, "including at least fifty species that have not previously been reported from these islands."—*C. S. Gager.*

5174. **TORO, RAFAEL A. Una contribucion a nuestro conocimiento de la flora silvestre y cultivada de San Andrés. [A contribution to our knowledge of the wild and cultivated flora of San Andrés, Caribbean Sea.]** *Rev. Soc. Colombiana Cienc. Nat.* 4(103): 201-207. 1929. —This island has few indigenous species, and most of them resemble those of the Antilles; 96 angiosperms are listed.

MORPHOLOGY AND ANATOMY OF VASCULAR PLANTS

ARTHUR J. EAMES, *Editor*

(See also in this issue Entries 3050, 3065, 3066, 3170, 3172, 3183, 3185, 3189, 3200, 3211, 3218, 3228, 3236, 3478, 4738, 4905, 4911, 4926, 4941, 4943, 4969, 5221, 5244)

5175. **BUCHHOLZ, JOHN T. The dissection, staining, and mounting of styles in the study of pollen-tube distribution.** *Stain Tech.* 6(1): 13-24. 8 fig. 1931.—The methods here outlined, given in general in previous publications, are summarized with special reference to *Datura* styles. Pistils, artificially pollinated and kept at 18-22° C., are slit along 2 sides, scalded ½-2 min. in water at 70-75° C., and killed by immersing several hours in 50% alcohol containing 6% formalin. Within 12 hours of killing, they are dissected with needles and forceps under a wide-field binocular microscope, removing the cortex from style and stigma. The strand of conducting tissue thus separated is stained within 24 hours of dissection in a watch-glass containing a mixture of 8 parts 1% aqueous acid fuchsin and 2 parts 1% aqueous or alcoholic light green. Staining requires 3-6 hours, and may be continued over night if stain is not too concentrated. The strand of tissue is cleared several hours or overnight in 80% lactic acid, carefully spread out on a slide, and mounted in lactic acid. After a few days the preparations are sealed around the edges of the cover-glasses with damar in xylol or paraffin which has gum mastic added to it.—*Author* (*courtesy Wistar Bibl. Serv.*).

5176. **CHANDLER, CLYDE. A method for staining pollen-tubes within the pistil.** *Stain Tech.* 6(1): 25-26. 1931.—Pistils are collected after pollination and immediately killed (6 to 7 cc. formalin in 100 cc. 70% alcohol), and may be examined promptly or stored. For pistils with a central canal: Place entire style on glass slide and split longitudinally with needles along one side to the central canal. Spread cut surfaces apart. Place a drop of aceto-carmin (saturated solution in warm 45% acetic acid) on exposed surface. After a few seconds, add a drop of saturated aqueous magenta. Remove excess stain with blotting-paper. Destain by passing absolute alcohol over the style and absorbing it at the basal end with blotting-paper. For solid pistils: If the style is short and thick, free-hand sections may be made and placed on the slide. In some cases (*Brassica* and *Convallaria*) the entire pistil may be thus sectioned and stained. If tissue differentiation is difficult, a drop of anilin blue may be added just before the magenta.—*Author* (*courtesy Wistar Bibl. Serv.*).

5177. **CHIARUGI, A. Osservazioni embriologiche sulla partenocarpia in Zizyphus sativa Gaertn.** *Atti Soc. Ital. Progr. Sci. 18ª riunione, Firenze, Settembre,* 1928; **Partenocarpia in Zizyphus sativa Gaertn.** *Nuovo Gior. Bot. Ital.* 37: 287-312. 21 fig. 1930.—Author describes parthenocarpy in *Z. sativa* of Chinese origin, which showed distinct dimorphism of mature drupes, small sterile ones and large drupes with embryos in the seeds. It was found in lesser degree in native *Z. sativa* and in *Z. lotus.* Ovules of parthenocarpic *Z. sativa* were sterile due to absence of fertilization and not because of embryo abortion. This is believed to be the first contribution to cytology and embryology of the Rhamnaceae with ♀ gametophyte developing according to *Scilla* type. Parthenocarpy in *Zizyphus* may be considered an hereditary character, revealed when environmental conditions impede sexual functioning.—*H. D. Hill.*

5178. **CHUTE, HETTIE M. The morphology and anatomy of the achene.** *Amer. Jour. Bot.* 17(8): 703-723. 3 pl. 1930.—The achene (studied in numerous species of Ranunculaceae and Rosaceae) has been derived from the follicle by reduction. The morphological changes are a marked decrease in the size of the carpel and in the number of ovules per carpel, the multiovular carpel becoming uniovular. In some forms ovular traces to suppressed ovules occur; in other forms abortive ovules without vascular tissue; and in still others, rudimentary ovules. The anatomical changes involve the reduction of the vascular tissue both in the number of traces which a carpel receives and in the traces themselves within the carpel. All stages of reduction from the typical 3-trace follicle to the most simple 1-trace achene are shown in a series of pistils in the Ranunculaceae and Rosaceae. Reduction of the vascular tissue has accompanied reduction in number of ovules, and in size of carpel.—*H. M. Chute.*

5179. **COLLINS, J. F. On changing the direction of sap conducting tissues.** *Rhodora* 32(380): 145-146. 1930. —Report of experiments on chestnut trees in which (1) zigzag grains were produced in the wood by removing portions of the bark; (2) spiral conduction was induced and spiral grain in wood resulted from cutting a spiral groove around the trunk; (3) the grain of newly formed

wood and bark was turned as much as 50-87° from the perpendicular by cutting grooves through the bark.—*S. F. Blake.*

5180. CZAPLA, KARL. Seltene Erdmetalle im Dienste der Pflanzenaschendiagnostik. 1. Aschenpräparation von Zellstoffen der Papierindustrie mittels Lösungen seltener Erdmetalle. *Faserforschung* 8(4): 238-254. 2 pl. 1930.—A method for impregnating plant fiber materials, especially celluloses used in the paper industry, incorporates small amounts of the rare earth metals, cerium and thorium. The mineral skeleton yields on ashing an ash picture useful for identification of the celluloses. Animal fibers, resisting impregnation, can be distinguished from plant fibers in textiles. Old paper, because of fillers and deformations resulting from grinding, yields no usable ash picture. An identification key for celluloses can be made by associating, with the ashing, measurement of width of tracheids and fibers in the ash.—*N. E. Pfeiffer.*

5181. ELFORD, F. G. The palisade cells of the seed coat of Albizzia lophantha. *Proc. Roy. Soc. Victoria* 42(2): 92-98. 3 fig. 1930.—The seed coat can be successfully sectioned after soaking at least 1 week in HF, and by transferring quickly through the alcohols and chloroform to paraffin. Safranin and light green in combination are suitable stains to differentiate the structure of the testa. One layer of palisade cells forms the epidermis. In the cavity of each palisade cell is a highly transparent globule of a waxy nature. These globules appear to be arranged in a distinct line across the cells. They dissolve slowly in wax solvents, are stained on the exterior by fat stains, and have a high melting point. A layer of hour-glass cells separates the epidermal layer from the inner layers of the integument.—*Author's summary.*

5182. EVANS, A. T., and I. H. CROWELL. Cutting microscopic sections of wood without previous treatment in hydrofluoric acid. *Stain Tech.* 5(4): 149-150. 1930.—A review of a paper by Kisser proposing softening of wood by steam is followed by a description of a similar method worked out independently by the junior author. Water is boiled slowly in an Erlenmeyer flask, from which the vapor is led to the microtome through a small copper tube in which there are a few coils. A Bunsen burner beneath the coils vaporizes the water before it leaves the tube. The steam flows over the piece of wood to be sectioned; up to 500 sections of very hard wood have been cut with a single sharpening of the razor. A possible improvement in using tubing of aluminum or monel metal instead of copper is suggested. —*Authors (courtesy Wistar Bibl. Serv.).*

5183. FUNKE, G. L. On the biology and anatomy of some tropical leaf joints II. *Ann. Jard. Bot. Buitenzorg* 41(1): 33-62. 10 pl. 1930.—One or more well developed leaf joints are typical of tropical plants, both trees and lianas. Most families and genera are characterised by the arrangement and structure of these joints. As to location and number, at least 15 types can be distinguished. Anatomy shows 4 distinct types, which can be distinguished by the arrangement of the vascular bundles. When there are more joints per leaf than 1, their anatomy is mostly the same. When outwardly the type is very complicated, the anatomy need not therefore also be complicated. Though outwardly the joints are often hardly visible, there are certain constant general structural characteristics: pericycle absent, starch sheath present, vessels narrow, probably higher osmotic pressure. Idioblasts and crystals occur frequently, but by no means generally. Probably the joints are of the utmost importance for the light position of the leaves.—*Author's summary.*

5184. GOURLEY, J. H. Basic fuchsin for staining vascular bundles. *Stain Tech.* 5(3): 99-100. 1930.—Plants are removed from the soil, their roots washed and immersed for 24-48 hrs. in a basic fuchsin solution prepared by dissolving 50 mgm. of the dye in 2 cc. 95% alcohol and diluting with 100 cc. tap-water. After removing, wash with water and (1) dissect under a binocular microscope after boiling in water or a very dilute KOH solution, or (2) clear (10-12 hrs.) by running through alcohols and then mixtures of alcohol and xylol into pure xylol.—*Author (courtesy Wistar Bibl. Serv.).*

5185. HORTLEDER, ALMA. Some anatomical features of Sorbopyrus auricularis. *Trans. Kansas Acad. Sci.* 33: 29-30. 1930.—An anatomical description of this generic hybrid (*Sorbus aria* × *Pyrus communis*) followed by detailed comparisons with each parent and statements of differences from both parents.—*F. C. Gates.*

5186. KOCH, MINNA F. Studies in the anatomy and morphology of the composite flower I. The corolla. II. The corollas of the Heliantheae and Mutisieae. *Amer. Jour. Bot.* 17(9): 938-954; (10): 995-1010. 4 pl., 5 fig. 1930.—I. A primitive gamopetalous corolla of 5 petals usually has a vascular supply of 15 bundles (10 lateral, 5 median). The venation in a primitive corolla of a disk floret of the Compositae consists of 10 bundles (5 fused lateral, 5 median). Reduction from this primitive condition (15 bundles) to a type having 5 bundles can be traced. Venation types in the ray corollas are termed "Aster," "Heliantheae," and "Bilabiate." The "Aster" type usually has 4 bundles; the "Heliantheae" type 8 or 9, and 2 or 3 other prominent large bundles which differ from the first group; the "Bilabiate" type, found in the Mutisieae, has the venation of a disk corolla supplying a strap-shaped lobe and 2 shorter lips which spread laterally. *Aster laevis* is used as an example of the anatomy of the floret. 5 to 10 strands given off from the floral stele in the base of the disk floret furnish the vascular supply of the floret. This is also the situation in the ray corolla. The reduction of the bundle system of the floret is traced in *Aster* and *Senecio*. It is shown that the split in the ray corolla takes place at a point where a fused lateral bundle has aborted or divided. The ray corolla is a modification of the disk corolla and shows the same fundamental structure as found in the latter.—II. The ray "corolla" of the Heliantheae constitutes a structure which consists of a typical composite corolla plus part of a reduced calyx, 2 or 3 appressed bundles. The calyx and corolla have apparently become fused and the vascular supply of these floral whorls united in part. *Bidens cernua* is used as an example in the Heliantheae to show the presence of these appressed bundles on the dorsal surface of the ray corolla. The bilabiate corolla of the Mutisieae is believed not to be the intermediate form from which the ray corolla has been derived, as indicated by: (1) the tip lobing of the ray corolla; (2) division of the lobes of the corolla of *Centaurea;* (3) variation of the corollas of the Mutisieae; (4) vascular anatomy of the ray corolla.—*M. F. Koch.*

5187. KUMAZAWA, MASAO. Studies on the structure of Japanese species of Ranunculus. *Jour. Fac. Sci. Imp. Univ. Tokyo. Sect. 3. Bot.* 2(3): 297-343. 2 pl., 18 fig. 1930.—16 species of Japanese *Ranunculus* (½ endemic to Japan) were studied anatomically. The course of the vascular bundles of the stem was traced in many species. The vigorous species are rather complicated in this respect because of the large number of leaf trace strands. The vascular arrangement does not suggest phyletic relationship in this group. Two types of leaf trace strands were found: (A) those running from the petiole down without fusing, as a rule, with any stem strand, at least in the 1st internode; (B) those fusing with stem strands immediately below their entrance into the stem. The strands of these 2 categories were examined in each species and their behavior and significance are discussed. The ontogeny of these strands was studied, and 2 nodal conditions were found: in the seedlings of most species, each of the 3 traces of a leaf forms a gap of its own, while in *R. zuccarini* the 3 strands depart from a common gap. It seems that in this genus the trilacunar and unilacunar conditions of the node are closely related; one condition may change readily to the other, even in the same plant, by the dislocation of the point of exit of the leaf trace strands, the partial fusion of the leaf trace strands with the stem strands, and by the appearance of new leaf gaps. The vascular supply of

the floral organs was also traced. Stem bundles are, in some species, entirely surrounded by mechanical sheaths, so that cambial activity is greatly restricted. Such a sheath is not common in dicotyledons, but is prevalent among monocotyledons. It is called the *Ranunculus* type. *R. sceleratus* and other species do not possess such sheaths, and show no tendency to develop them. These bundles, rather rare in *Ranunculus*, are called the *Anemone* type. This type is probably more primitive than the former in this genus. Probably environmental conditions, particularly humidity of the substratum, exert the greatest influence upon the appearance of structural divergences. If phylogenetically considered from various points of view, *R. sceleratus* may be regarded as probably one of the most primitive representatives of the genus.—*M. Kumazawa.*

5188. **LEANDRI, JACQUES. Recherches anatomiques sur les Thyméléacées.** *Ann. Sci. Nat. Bot.* 12(1): 125-237. 26 fig. 1930.—Some abnormal characters of the conducting tissues were studied. Sieve-tubes are described and compared in normal phloem and in medullary and interxylary strands. The sieve-tubes of the anomalous phloem show by their structure that they conduct elaborated sap. Differentiation of these strands is not uniform, but they do not arise from pith cells. Interxylary strands constitute the continuation of the phloem of the leaves, and show different characters in Aquilarioideae and Thymelaeoideae. Structural anomaly in some subterranean stems was also studied. None of these anomalies seems to be pathologic in nature, nor are they dependent upon climatic conditions. Anatomy of flowers and buds demonstrates the petaloid nature of the throat scales; the fact that the flower tube is formed by united appendages and not by intussusception of axis; and the presence of an articulation in the pedicel in most cases. It shows clearly the remoteness of the Octolepidoideae, and the relationship of other members of the Thymelaeaceae to the Elaeagnaceae and some groups of the Rosaceae. The Thymelaeaceae are not related to the Lythraceae, Lauraceae, and Combretaceae.—*J. Leandri.*

5190. **MAHESHWARI, PANCHANAN, and UDAI BHAN SINGH. The development of the female gametophyte of Asphodelus tenuifolius.** *Jour. Indian Bot. Soc.* 9(1): 31-39. 3 pl., 3 fig. 1930.—The plant is a common winter weed in N. India. The archesporial cell cuts off a primary wall cell, which divides by anticlinal walls. Walls are formed after each division in meiosis; the innermost megaspore functions, in the usual way. The embryo sac is broad. The polar nuclei fuse in the upper part of the sac, but the fusion nucleus migrates to the chalazal end. The synergids degenerate early. The wall cells disappear at about the 4-nucleate stage of the embryo sac, which then comes into contact with the epidermis. The primary endosperm nucleus divides before the egg, and forms a free-nuclear endosperm. The embryo is of the usual *Lilium* type. The aril, or 3rd integument, begins to develop from the chalazal end of the nucellus at the 4-nucleate stage, and completely surrounds the ovule after fertilization. Degeneration in the embryo sac from the 4-nucleate stage onward was observed in a small percentage of flowers.—*W. Dudgeon.*

5191. **MANN, C. E. T. Studies in the root and shoot growth of the strawberry. V. The origin, development, and function of the roots of the cultivated strawberry (Fragaria virginiana × chiloensis).** *Ann. Bot.* [*London*] 44(173): 55-86. 4 pl., 7 fig. 1930.—Development of the runner and the root system is described. Adventitious roots arise from small groups of meristematic cells within the stele, alternating with the primary vascular strands and between the outer pericycle tissue and the medullary tissues of the center of the stele. These groups are observed in greatest number in the region of departure of the leaf-trace bundles. Differentiation of the apical meristem of the root occurs before the differentiation of the secondary vascular cambium of the stem in the majority of cases, differing in this respect from that recorded in other plants. The initiation of root meristems in the stem occurs during periods of vigorous growth, characterized by the absence of excess carbohydrates and a low dry matter content of the tissues. Further development of the roots follows on a period of carbohydrate accumulation as indicated by deposition of starch in the storage parenchyma of the plant as a whole, and a marked increase in dry matter content. When vigorous growth of the shoot occurs simultaneously with a readily available supply of carbohydrate materials, as in the case of the young "runner" plant, further development of root meristems follows closely on their initiation. The development of a specialized polyderm forms a very characteristic feature of the older main roots, which continue to develop secondary tissues and function little as absorbing organs after their first season's growth. No polyderm development was observed on the majority of the lateral roots and they became largely functionless with the formation of new adventitious roots in the later summer and autumn. In the primary condition of the root, starch accumulates in the cortex; in roots showing secondary developments of phellogen and vascular tissues, the phelloid cells of the polyderm form the chief region of starch deposition. Accumulation occurs as the dormant season is approached, and again during the month of June and in early July. Depletion takes place in the spring and in late July, during periods of vigorous new root development.—*G. M. Darrow.*

5192. **MONOYER, A. Les variations vasculaires dues à la manière d'être des feuilles et l'établissement des types de structure.** *Bull. Soc. Roy. Bot. Belgique* 62(1): 69-72. 1929(1930).—A review and critique.

5193. **NEBEL, B. R. Xenia and metaxenia in apples.** *New York State* [*Geneva*] *Agric. Exp. Sta. Tech. Bull.* 170. 16p. 5 fig. 1930.—It is shown that 2 apples on the same tree originating from different kinds of equally efficient pollen are not strictly alike. The dissimilarities were found in several characters of the apple, such as height, breadth, color, weight, and seed length, and it is assumed that they may extend to all remaining characters of the apple, which, however, will be very difficult to prove. The dissimilarities are very slight and can be detected only with refined methods of measurements on series of individuals.—*B. R. Nebel.*

5194. **NEBEL, B. R. Lacmoid-martius-yellow for staining pollen-tubes in the style.** *Stain Tech.* 6(1): 27-29. 2 fig. 1931.—Material collected in small vials is kept from drying out by the addition of a drop of water. Slender styles and ovaries are crushed between 2 slides; larger ones are first sectioned longitudinally by hand. The material is stained in 5 mgm. lacmoid and 5 mgm. martius yellow dissolved in 10-15 cc. water, with reaction adjusted to pH 8 by adding a few drops of 1% solution of ammonia (making staining fluid deep olive-green). After 2-5 minutes, the material is mounted in the stain or else in water of same reaction. To make permanent mounts the following procedure may be followed: (1) Crush, dissect, or otherwise prepare fresh material; (2) fix material in Carnoy's solution; (3) transfer via 70% alcohol to alkaline water; (4) wash thoroughly in tap-water to remove all acid or excessive alkali; (5) transfer to stain for 1-5 minutes; (6) Dehydrate rapidly in alcohols containing lacmoid in solution in its blue modification (pH 8); (7) mount in balsam via xylol or in cedar oil. The latter mount should be sealed.—*Author* (*courtesy Wistar Bibl. Serv.*).

5195. **NOACK, KONRAD L. Untersuchungen an Pelargonium zonale "Freak of nature."** *Zeitschr. Bot.* 23: 309-327. 4 fig. 1930.—Leaves of this race have a white center and green border of varying width, with veins and petioles mostly colorless. There is no periclinal or sectorial arrangement of the green and colorless portions. The variegation is inherited through the egg cells as well as the pollen. In crosses with other races, spotted seedlings occur which cannot be distinguished from spotted forms in crosses of white-coated forms. From this it is concluded that the origin of the variega-

tion of the parent plant and the colored seedlings can be explained not through variously colored independent plastids but through physiological peculiarities.—*K. L. Noack (transl. by H. D. Hill).*

5196. PARKIN, JOHN. The structure of the starch layer in the glossy petal of Ranunculus. *Ann. Bot. [London]* 45(177): 201-205. 9 fig. 1931.—The cells composing the starch layer in the glossy petal of the 4 spp. of *Ranunculus* investigated take an unexpected oblique course, thus presenting in transverse section the appearance of a layer 2-3 cells deep, though in reality only 1 cell thick. The development of the layer in the petal of *R. ficaria* has been followed in detail. The direction of the slope of the starch cells in *R. acris, R. bulbosus,* and *R. repens* runs in the opposite direction to that in *R. ficaria.* There may, therefore, be considerable variety in the structure of the starch layer in the genus, perhaps useful in working out a phylogenetic scheme for the genus.—*Author's summary.*

5197. PETCH, T. Buttress roots. *Ceylon Jour. Sci. Sect. A. Bot., Ann. Roy. Bot. Gard. Peradeniya* 11(3): 277-285. 4 pl. 1930.—From observations on *Poinciana, Ficus, Canarinum, Cedrela, Tarrietia, Weinmannia* and *Ceriops,* the hypothesis is advanced that the presence of buttressed roots is associated with a deficient tap root and the formation of the buttresses is due to the restriction of the food and water currents to limited narrow regions of the stem continuous with the lateral roots.—*J. E. Cribbs.*

5198. RITTER, GEO. J. Wood fibers. *Jour. Forest.* 28(4): 533-541. 12 fig. 1930.—The location of 2 forms of lignin in woody tissues is described and figured, together with the several layers into which the cell wall of a wood fiber can be separated by treatments with NaOH and phosphoric and sulphuric acids. The individual layers can in turn be separated into fibrils and the fibrils into regularly shaped, fusiform bodies. The physical reactions and optical properties of these various parts are described and discussed.—*P. C. Wakeley.*

5204. SMITH, FRANK H. The corm and contractile roots of Brodiaea lactea. *Amer. Jour. Bot.* 17(9): 916-927. 3 pl. 1930.—The general structure and seasonal development of the corm are described. A new corm is produced each year from the terminal bud of the old corm. Also in Sept. or Oct. axillary buds appear at the nodes of the old corm, forming offsets. Each offset develops a single contractile root which draws the cormlet downward and away from the parent corm. The next year adventitious nutritive roots are produced by this offset but never another contractile root. The contractile roots, 4-15 cm. long, may contract 75% of the original length. Lateral roots do not appear. The contraction proceeds as follows: (1) The cortical cells decrease in length and increase in radial and tangential measurements; (2) a collapse of cells begins in certain portions of the cortex and a distortion of the stele than results from the turgor of the remaining cells. The distribution of the collapsed cells is irregular. (3) This collapse continues until there are only 2 or 3 rows of turgid cells separated by wide bands of collapsed tissue. The turgid cells tend to become rounded as the pressure of the surrounding tissue is relieved. The cause of the changes in the relative diameters of the cells and of the irregular collapse of tissue was not determined. The only functions of the contractile roots of *B. lactea* are absorption and the anchoring and lowering of the offset into the soil.—*F. H. Smith.*

5205. SNELL, K., und J. Fr. PFUHL. Beitrag zur Morphologie und Systematik der Weizensorten. *Mitteil. Biol. Reichsanst. Land- u. Forstw.* 39. 5-37. 3 fig. 1930. —Among the varieties of *Triticum vulgare* the young plants present types of growth from the recumbent to the upright Japhet type. Among the older plants, the gray waxy layer of culm, blade and ear separates certain varieties. Among the characters of the ears are the awns, density, form, hairiness and color. An important character is the form of the tooth and the margin of the empty glume. The tooth is either straight or bent and the margin is either horizontal or oblique. Taxonomic features are the natural color of grain and the color after a phenol solution treatment. One classification is based on the color of the grains; a second, on characteristics of ears and color of non-treated grains.—*K. Snell (transl. by J. M. Haber).*

5206. SNELL, K. Vorarbeiten zu einer Sortenkunde der Futterrüben. *Mitteil. Biol. Reichsanstalt Land- u. Forstw.* 39. 63-79. 2 pl., 1 fig. 1930.—Form and color of *Beta vulgaris* are most important features. The shape may be rod, olive, cylindrical, globose or oblate. The underground portion is orange-yellow, dark red or white. In general the leaves are green, but produce varietal differences in the yellow or red color of the costa or the petiole. The green sprouts are red-spotted or striped. The seeds and fruits are similar in all varieties, but the color varies from green to yellow-green, orange-green, orange-red, rose, light bluish red, vermilion to dark bluish red. The varieties are arranged in 11 groups based on above characteristics; 90 varieties are listed as to breeders and regions.—*K. Snell (transl. by J. M. Haber).*

5207. STOKEY, ALMA G. Prothallia of the Cyatheaceae. *Bot. Gaz.* 90(1): 1-45. 186 fig. 1930.—Under favorable conditions the plate stage follows very quickly after germination; there is ordinarily no filament left at the base of the prothallium. The mature prothallium usually is longer and the cushion heavier than in the Polypodiaceae. Forking of the cushion of the prothallium occurs frequently in old cultures, and in certain species may occur in relatively young prothallia. Multicellular hairs developed more or less abundantly on mature prothallia of all species of *Alsophila, Hemitelia,* and *Cyathea,* and rarely on *Lophosoria.* None were found on *Thyrsopteris, Culcita, Cibotium,* or *Dicksonia.* The multicellular hair arises from a special initial, a wedge-shaped cell cut from the anterior face of a superficial cell near the apical meristem. The hairs are found on both dorsal and ventral surfaces, on or near the cushion, but not on the margin. The hairs may reach a length of 2 mm. The wall of the antheridium typically consists of 5 cells: an oblique basal cell, a lower ring cell with a "binding wall" on one side, an upper ring cell, an opercular cell, and a crescent-shaped cell formed by the division of the cap cell. Many variations from this type occur. The antheridia of *Lophosoria* are larger and less symmetrical than those of *Alsophila, Hemitelia,* and *Cyathea.* Those of *Thyrsopteris* are the largest and

least symmetrical of the family, ordinarily not conforming to the type just given. The antheridia of the Dicksonieae are usually larger than those of the Cyatheae. The necks of the archegonia in the Cyatheae are straight or slightly curved; they have more cells in the neck and are longer than those of the Polypodiaceae. Those in the Dicksonieae and *Thyrsopteris* are longer than those of the Cyatheae, and are more apt to be recurved. The walls of the neck cells are more or less cutinized. The neck contains 2 neck canal nuclei not separated by a wall. Archegonia with 4 neck canal nuclei were found in all species. Apogamous growths were found in *Lophosoria quadripinnata, Alsophila excelsa, A. armata; Hemitelia parvula, Cyathea medullaris, C. dealbata, Thyrsopteris elegans, Dicksonia squarrosa, Cibotium barometz,* and *C. schiedii.* The evidence from the gametophyte indicates that the family Cyatheaceae, in the broader sense, is not a natural group, but is of polyphyletic origin.—*Author's summary.*

5208. VEH, ROBERT von. Untersuchungen und Betrachtungen zum Blattstellungsproblem. *Flora* 25(1): 83-154. 23 fig. 1930.—The author considers that the causal standpoint, introduced into phyllotaxis by Hofmeister, has given negative results, as witnessed by our inability to recognize the internal factors determining the emergence of successive leaf initials. He follows instead the methods of formal morphology which, in Goebel's recent interpretations of whorled leaves, led the author to the view that all monocotyledon leaf positions could be derived from a 2-ranked, all dicotyledons from a 4-ranked, decussate, phyllotaxis. Veh confirms Goebel's views as the result especially of intensive studies of species of *Costus,* which have apparently a 1-ranked spiral arrangement, but which he shows, by study of seedlings and young lateral shoots, derives from an originally 2-ranked system. Veh argues that the shoot has an autonomous tendency to develop, either along straight (orthodrome tendency) or spirally curved (spirodrome tendency) lines. He concludes that the original monocotyledon half system or dicotyledon decussate system may be modified by the operation of the following factors: (1) A primary factor determining the number of leaves arising simultaneously at the apex (in the monocotyledon 1, in the dicotyledon, 2); (2) the orthodrome, or spirodrome, tendency; (3) a secondary whorl formation as the result of the interpolation of internodes by longitudinal extension.—*J. H. Priestley (from abst. by R. v. Veh).*

5209. VOSS, JOHN. Die Untersuchung der Keimpflanzen als Hilfsmittel der Sortenfeststellung beim Weizen. *Mitteil. Biol. Reichsanst. Land- u. Forstw.* 39: 39-62. 6 fig. 1930.—Coloration of coleoptile and cotyledon, hairiness and type of growth including position and attachment of first foliage leaves, showed varietal differences. The first 2 of these characters can best be observed in seedlings grown in the greenhouse, the others in plants grown in the field. The characters are useful in varietal determination when the plants are grown under definite and not too extreme conditions. Summer and winter varieties of *Triticum vulgare* were divided on the basis of seedling coloration. Two groups with further subdivisions were made on the basis of degree of anthocyanin development; 3 groups were formed on the basis of hairiness, and 3 on the basis of development of the first leaves.—*From author's summary (transl. by H. D. Hill).*

5210. WEATHERWAX, PAUL. The ontogeny of the maize plant. *Bull. Torrey Bot. Club.* 57(4): 211-219. 1930.—This paper is chiefly a résumé of work previously published by various authors. The new material presented has since been published, with illustrations, in *Amer. Journ. Bot.* 17: 371-380. 1930.—*P. Weatherwax.*

5211. WEISS, F. E. Note on the Crataegomespili of Saujon. *Mem. & Proc. Manchester Lit. and Phil. Soc.* 74: 89-95. 1 fig. 1930.—After examination of *Crataegomespilus bruni* and *C. bonnieri,* graft hybrids between hawthorn and medlar, the author concludes that, as in the case of the Crataegomespili of Bronvaux described by Haberlandt, these cannot be considered as pure periclinal chimaeras, since the epidermal cells are intermediate between those of the two parents instead of like those of the medlar.—*A. M. Taylor.*

5212. WEISSE, ARTHUR. Der morphologische Aufbau von Corchorus und Corchoropsis. *Jahrb. Wiss. Bot.* 70 (2): 163-180. 10 fig. 1929.—The central stem of the inflorescence in *Corchorus* is a sympodium. The primary axis of the plant bears the cotyledons and a number of foliage leaves arranged in a spiral with a single flower at the end. This flower is pushed aside by the growth of a branch in the axil of the preceding leaf so that it appears to be opposite this leaf. This branch bears a scale leaf, a foliage leaf, and 3 bracts arranged in a spiral, and terminates in the 2nd flower of the inflorescence. It is also pushed aside by the growth of a branch from the axil of the foliage leaf. This process continues during the growth period. The branches developing in the axils of the lower leaves are like the axillary branches in the inflorescence except that there are several foliage leaves. In *Corchoropsis* both the main floral axis and the lateral vegetative branches are monopodia. The flowers are solitary in the axils of the foliage leaves with 3 whorled bracts on the peduncles. In *Corchorus* the petals are cochlear or quincuncial in the bud while in *Corchoropsis* they are contorted. Thus the view that it is better to place *Corchoropsis* in the Sterculiaceae rather than in the Tiliaceae seems to be well founded.—*A. Weisse (transl. by T. D. Howe).*

5213. WEISSE, ARTHUR. Blattstellungsstudien an Sämlingen abnorm keimender Dikotylen. *Beitr. Biol. Pflanzen* 18(1): 17-80. 2 pl. 1930.—In some pseudomonocotyledons the single cotyledon surrounds the 1st foliage leaf and scale leaf by a broad sheathing base, hence the phyllotaxy is alternate. In *Cyclamen* the broad base is almost opposite the 1st leaf, which is not a belated 2nd cotyledon. In acotyledonous dicotyledons small scaly leaves appear in spiral arrangement, the first 2 of which form belated cotyledons. In heterocotyledonous seedlings no definite relationship between size of cotyledons and phyllotaxy is evident. Unilateral fusion of cotyledons occurs as a monstrosity in which the 1st leaf is opposite the bicotyledon, while the 2nd is over the cotyledon. Cotyledons may be fused along basal margins to form a cupule. Cleavage of cotyledons is characteristic as well as abnormal. When normal the cleavage takes place simultaneously. In monstrosities, when cotyledons are slightly lobed, there is no effect on phyllotaxy; when decidedly cleft, the first 2 leaves are forced over toward the entire cotyledons. In tricotyledonous seedlings in which 2 cotyledons are perfect, the first 2 leaves appear in the larger intervening spaces. Where spiral phyllotaxy prevails, the 3rd leaf comes between the nearest cotyledons; in decussate plants there is no relationship. In seedlings with 4 cotyledons, 4 large dissimilar leaves form among the cotyledons, the larger ones in the larger gaps between the cotyledons.—*J. M. Haber.*

5214. WENT, F. A. F. C. Morphological and histological peculiarities of the Podostemonaceae. *Proc. Internat. Congress Plant Sci. Ithaca, N. Y. 1926* 1: 351-358. Geo. Banta Publishing Co.: Menasha, Wisconsin, 1929. —The following species growing in direct sunlight in swift waters of falls and rapids in Coppenam and Surinam Rivers, Dutch Guiana, were studied: *Oenone staheliana, O. richardiana, O. marowynensis, Mourera fluviatilis, Tristicha hypnoides, Apinagia perpusilla, A. flabellifera, A. nana.* Stems are reduced so that the leaves seem to grow out from each other or from the roots. The leaves of most species have outgrowths, various in shape and point of origin, which are extremely hairy although submerged. The chloroplasts are restricted to the inner faces of the epidermal cells of leaves and roots. No stomata are present. Phloem can be detected and xylem, if present, is represented by a few annular vessels; mechanical tissues are collenchyma, which becomes sclerenchyma at time of flowering. Roots are attached to the substratum by the root hairs, which secrete a sticky substance which makes them adhere

to rock or tree trunks in swift water. A great mass of reserve food is stored in the developing inflorescence. When the water becomes shallow the flowers and seeds are produced in a few days. Embryo sac is minute in all species, composed of 2 synergids, an egg cell, 1 polar nucleus; no trace of endosperm. All species have a milky sap in multinucleate tubes. The above species are compared with African species.—*A. R. Bechtel.*

5215. **WILCZEK, E.** Anomalies florales. *Bull. Soc. Vaudoise Sci. Nat.* 57(224): 113-114. 1930.—The following, among others, are described: *Gymnadenia conopea* R. Br., with anomalous flowers and stems; and bracteomania ("wheat ear") of carnation.

5216. **WILD, G. V., and V. D. ZOTOV.** Notes on sexual expression in certain species of New Zealand Coprosmas. *Trans. & Proc. New Zealand Inst.* 60(4): 547-556. 3 pl. 1930.—Of 15 spp. of *Coprosma* examined, 11 exhibited more or less abnormality in either the ♂ or the ♀ flower, or in both. In 9 spp. the ♂ plant had some pistillate flowers; in 8 spp. the ♀ plant had some staminate flowers. One plant of *C. lucida* and 6 of *C. rhamnoides* were definitely polygamous. In 4 spp. ripe fruit was found on a ♂ plant. Every plant of *C. lucida* examined, and nearly every ♂ plant of *C. robusta,* was abnormal in its floral parts.—*G. V. Wild.*

5217. **WOLKOFF, A.** Indisches Flachsstroh. *Faserforschung* 8(4): 282. 1 fig. 1930.—Note on morphological characters distinguishing Indian flax straw.

PALEOBOTANY

EDWARD W. BERRY, *Editor*

(See also in this issue Entries 3308, 5250, 5251, 5254, 5255, 5262, 5263, 5264, 5265, 5269, 5275, 5276, 5277)

5218. **BALL, OSCAR M.** A partial revision of fossil forms of Artocarpus. *Bot. Gaz.* 90(3): 312-325. 17 fig. 1930.—From fossil beds of Indio formation (Eocene) in Bastrop County, Texas, a large number of specimens of *Artocarpus* have been secured. After thorough study of this widely varying material and comparison with earlier specimens from different sections of the U. S. A., the author concludes that the specimens previously classed by Knowlton and others in 5 spp. (*A. lessigiana, pungens, dubia, similis,* and *dissecta*) are all variants of one, *A. lessigiana* (having priority). Among the figures are those of 2 new, and much larger forms. A table indicates the occurrence of the 5 types in other sections of the U. S. A. —*A. M. Taylor.*

5219. **BERTRAND, P., et P. CORSIN.** Observation sur le Neuropteris scheuchzeri Hoffmann. *Ann. Soc. Geol. du Nord* 52: 155-159. 1927.—Detailed description of this species of the group Rachivestiteae Bertr. & Corsin (Paripinneaes Gothan).—*W. Berry.*

5220. **CARPENTIER, ALFRED.** La flore Wealdienne de Féron-Glageon (Nord). *Mém. Soc. Geol. du Nord* 10(1): 1-151. Map. 25 pl. 42 fig. 1927.—This flora from northern France comprises 93 different plants, among which are listed 41 ferns, including FERONIA (p. 27) (Matoniaceae), type *F.* sewardi* (p. 27), *Laccopteris* ? tenuinervis* (p. 28), *Cladophlebis* feronensis* (p. 29), *C.* stricta* (p. 45), *Gleichenites* gosseleti* (p. 32), *G.* boulayi* (p. 37); 6 cycads, including *Nilssonia* cf. *orientalis* stenophylla* (p. 60); 1 ginkgo; 35 conifers, including *Brachyphyllum* ? milloti* (p. 74), *Elatocladus* longifolia* (p. 75), *Pityostrobus* ? feronensis* (p. 80), *Dadoxylon* (*Araucarioxylon*) feronense* (p. 87); 5 angiosperms and 5 plant fossils of uncertain affinities.—*W. Berry.*

5221. **CARPENTIER, ALFRED.** Note sur des péridermes d'âge Wealdien trouvés à Féron-Glageon (Nord). *Ann. Soc. Geol. du Nord* 55: 145-147. 1 pl. 1 fig. 1930. —The author describes a piece of silicified coniferous wood both macro- and microscopically, from the Wealden of northern France. This fragment is referred to Cycadeoidea.—*W. Berry.*

5222. **CORSIN, P.** Sur la position systématique du Zeilleria avoldensis Stur. *Ann. Soc. Geol. du Nord* 52: 28-36. 2 pl. 2 fig. 1927.—*Z. avoldensis** of the Carboniferous of northern France belongs to the family Pecopterideae, probably close to *Pecopteris miltoni,* possibly analogous to *Psaronius.*—*W. Berry.*

5223. **CORSIN, PAUL.** Sur les fructifications et la position systématique de Sphenopteris zamioïdes P. Bertrand. *Ann. Soc. Geol. du Nord* 53: 222-230. 4 pl. 4 fig. 1928.—Both ♂ and ♀ fructifications of *S. zamioïdes* from the upper Westphalian (Carboniferous) from Bethune Mine (Bully-Grenay), France, are described and figured. Based on the fructifications this species is placed among the pteridosperms or cycadales in the genus PTERIDOZAMITES, with *P. zamioides** (*Sphenopteris z.* P. Bertrand) (p. 230).—*W. Berry.*

5224. **CORSIN, P., et G. MATHIEU.** Note sur un Lepidophloïos du bassin houiller de Langeac (Haute-Loire). *Ann. Soc. Geol. du Nord* 54: 82-87. 1 pl. 1929.—Associated with some 8 spp. of fossil plants is *L. laricinus* v. verticillatus* (p. 83), Stephanian.—*W. Berry.*

5225. **DEPAPE, G.** Plantes fossiles des Iles Baleares; gisement burdigalien de Majorque. *Ann. Soc. Géol. du Nord* 53: 13-19. 1 pl. 1928.—The Burdigalian from the Isl. of Majorca comprises 1 gymnosperm, several fragments of monocotyledons, and 7 dicotyledons including *Phyllites* balearica* (p. 18).—*W. Berry.*

5226. **DEPAPE, GEORGE.** La flore landénienne des environs d'Arras. Etude paléobotanique. *Ann. Soc. Geol. du Nord* 54: 16-19. 1 pl. 1929.—Concerns 2 spp. of fossil plants including *Musaphyllum* eocenicum* (p. 17), from the Eocene of northern France.—*W. Berry.*

5227. **DUTERTRE, A.** Sur l'identification des "Aroides." *Ann. Soc. Geol. du Nord* 53: 78-80. 1928.—Aroides belong to the Dasycladacea and probably those described from the English Bathonian are close to *Goniolina cylindrica* J. Pia.—*W. Berry.*

5228. **GERBER, ED.** Eine neue Poiretia aus dem untersten kohleführenden Horizont der Emmentaler Molasse. *Eclogae Geol. Helvetiae* 21(2): 427-433. 1 fig. 1928.—*P.* (*Pseudoleacina*) bernensis* (p. 431), Tortonian. —*W. Berry.*

5229. **GOTHAN, W.** Über einige pflanzenführende Geschiebe Norddeutschlands. [Plant-containing boulders of northern Germany.] *Zeitschr. Geschiebeforsch.* 4(1): 1-8. 3 fig. 1928.

5230. **HALLE, T. G.** Fossil plants from South-western China. *Palaeontologia Sinica. Ser. A.* 1(2): 1-26. 5 pl. 1927.—New specimens of old forms as well as: the Permian *Sigillaria* acutangula* (p. 5), and *Ptychocarpus* tingi* (p. 10), and some unidentified species.

5231. **KOOPMANS, R. G.** Researches on the flora of the coal-balls from the "Finefrau-Nebenbank" horizon in the province of Limburg (The Netherlands). *Geol. Bur. Nederlandsche Mijngebied. Holland. Flora en Fauna van het Nederlandsche Karboon* 1. 1-53. 18 pl., 3 fig. 1928.

5232. **LAURENT, L., et P. MARTY.** Flore Pliocène des Cinérites des Hautes Vallées de la Petite-Rhue et de la Véronne (Cantal). *Ann. Mus. Hist. Nat. Marseille* 21: 1-132. 23 pl. 1927.—Before an enumeration of the flora the authors summarize the stratigraphy and paleontology of the volcanic massif of Cantal and place the new plant bearing beds in the Plaisancian. The flora consists of 49 spp., of which 34% are herbaceous. The flora is mainly dicotyledonous.—*E. W. Berry.*

5233. **Le MAÎTRE, Mlle. D.** Observations sur les algues et les foraminifères des calcaires dévoniens. *Ann. Soc. Geol. du Nord* 55: 42-50. 1930.—In Part I, Algae in the middle Devonian of Avesnois (northern France), are described 3 spp. of *Sphaerocodium* and 1 of *Calcisphaere.* In part II, Foraminifera and *Cidaris* in the Devonian limestone of Bartin (Turkey), are recorded

4 genera of arenaceous Foraminifera and a *Cidaris* fragment.—*W. Berry.*

5234. **LEMOINE, [Mme.] PAUL. Les Solenopora du Jurassique de France.** *Bull. Soc. Géol. France* 27(6/9): 405-417. 2 pl., 7 fig. 1927.—The *Solenopora*, marine calcareous algae, became widespread during the Paleozoic, being found in considerable numbers in the Silurian rocks of N. Amer., Scotland, England, Norway, and the Baltic provinces. Towards the close of the Paleozoic only 1 species is found in the German Devonian and 1 from the English Carboniferous. In the Mesozoic the genus appears at Timor (Pacific Ocean) and the last representatives are found in the Great Oolite and the Coral Rag of England. The author claims that the fossils from the 2 English localities represent the same species. One known species is described from the Bartonian of the Ardennes. From the Argovian of the Ardennes are described 1 known species and 1 new variety, *Solenopora jurassica* v. **delepinei*** (p. 416). No difference is found between the fossils of the Argovian and the Coral Rag. Between the *Solenopora* of the Argovian and those of the Bartonian there is a slight difference as exemplified by the variety *delepinei* which the author considers as a "simple variation and not as a stock." Mention is made of the unnamed *Solenopora* in the Paleontology coll. of the École des Mines.—*E. W. Berry.*

5235. **LIESEGANG, RAPHAEL ED. Pseudomorphosen und verkieselte Hölzer.** *Natur u. Mus.* 61(3): 137-143. 2 fig. 1931.—A popular discussion of the physics and colloid chemistry of the formation by fossils by the infiltration of Si compounds and the replacement of the original material, molecule by molecule, with the Si compound.

5236. **MATHIEU, GILBERT. La flora Stéphanienne du bassin houiller de Langeac (Haute-Loire).** *Ann. Soc. Geol. du Nord* 55: 75-85. 1 pl. 3 fig. 1930.—After discussing the stratigraphy, 43 fossil plants are described, including *Carpolithes* **crassicostus*** (p. 81).—*W. Berry.*

5237. **NĚMEJC, F. Příspěvek k floristice východního cípu kamenouhelného revíru kladensko-rakovnického.** *Rozpravy České Akad. Věd a Umění* 35(No. 35): 1-8. 2 pl. 1926.—The author describes plant impressions found in the road-cut leading from Blevice (near Kralup, the Carboniferous coal district of Kladno and Rakovník, Bohemia) toward the west. The locality is that of the hanging sandstone series ("arkosa") with interlayers of sandy till clayey shales above the upper Radnice coal-measure (the so-called main Kladno coal-measure). The impressions are from a bed of clay-shales (about 2 m.) containing a thin layer of shaly coal. The impressions are fragmentary, consisting often of only isolated parts of fern pinnules, single leaves of Sphenophyllum, etc.; the specimens are variously broken, the Cordaites leaves are often torn. The author did not collect large trunks (Lepidodendron or Stigmaria), therefore he considers the plant remains as well as the thin interlayer of coal as allochton, i.e., deposed by the water from the surroundings. The flora is rather poor. Specimens of *Cordaites palmaeformis* Goepp., *Cordaianthus* sp., *Calamites* sp., *Asterophyllites equisetiformis* (Schl.) Bgt., *Sphenophyllum emarginatum* Bgt., *Pecopteris plumosa* Artis, *P. plückeneti* Schl., *P.* aff. *crenulata* Bgt., *P. miltoni* Artis, and *Schizopteris lactuca* Presl., were collected.—*F. Němejc.*

5238. **NĚMEJC, F. Paleobotanický výzkum travertinového masivu kolem vesničky Lůček u Ružomberka na Slovensku.** *Rozpravy České Akad. Věd a Umění Tř. 2.* 37(paper 35): 1-17. 1 pl., 4 fig. 1928; also published as: Palaeobotanical investigation in the travertine-complex around the village of Lůčky near Růžomberok in Slovakia. *Acad. Tchèque Sci. Bull. Internat. Rés. Trav. Présentés Cl. Sci. Mat., Nat. et Méd.* 29: 183-201. 1 pl., 4 fig. 1928.—Two complexes of travertine sediments were found near the village of Lůčky; nonconformably deposed along the brook in the Holocene valley sediments containing remains of broad-leaf trees and *Picea excelsa,* but no *Fagus,* and at either side of this first sediment there are complexes of Pleistocene travertines situated higher above the brook-level. These contain at the base a *Pinus-Betula* vegetation, above broad-leaf trees with numerous remains of *Corylus avellana, Acer pseudoplatanus, Fraxinus, Picea,* but no *Fagus;* here appear also *Cotinus coggygria* and *Carpinus betulus.*—*F. Němejc.*

5239. **NĚMEJC, F. Některé zajímavější nálezy rostlinných otisků ze středočeských pánví kamenouhelných.** *Rozpravy České Akad. Věd a Umění, Tř. 2.* 37(paper 46): 1-9. 2 pl., 1 fig. 1928; also published as: Some new interesting discoveries of plant impressions in the coal basins of Central Bohemia. *Acad. Tchèque Sci. Bull. Internat. Rés. Trav. Présentés Cl. Sci. Mat., Nat. et Méd.* 29: 355-363. 2 pl., 1 fig. 1928.—The author describes the following plant remains of the Carboniferous of central Bohemia: *Zeilleria hymenophylloides* (new for Bohemia) from Strádonice, the "Schleifsteine" shales horizon; *Zeilleria* **haidingeri** (*Sphenopteris h.* Ettingsh.), fructifications from Strádonice, the "Schleifsteine" horizon; a *Calymotheca* fructification, from the same loc. and horizon, related to *C. acutum* Carp.; and some *Taeniopteris* remains of the shales in the carboniferous sandstone quarry near Třemošná (at Plzeň).—*F. Němejc.*

5240. **[NEUBURG, M. F.] НЕЙБУРГ, М. Ф. К стратиграфии и возрасту угленосных отложений Кузнецкого бассейна в Сибири. [Stratigraphy and age of coal deposits in the Kuznetsk Basin in Siberia.]** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1929(14): 337-342. 1929.—Discovery by the expedition of the Geol. Mus. of the Acad. of Sciences of 30 forms of plant fossils in the region of the village Protopopova and middle Tom river proves the presence of Mesozoic deposits in the coal deposits of the Kuznetsk Basin. The presence of *Clathropteris meniscioides* and *Marattiopsis muensteri* shows that the flora of the basin is probably Lr. Jurassic. Also the discovery in the middle Tom river region of *Lepidophloios* sp. and *Knorria,* sporadic for the region, shows the difficulty of classifying coal deposits of the region by lithology. Fossils characteristic of the 2 main horizons of the Kuznetsk Basin are listed.

5241. **NEUWEILER, E. Liste der Pflanzenreste aus dem Kälberhügel Vindonissa. Mitteilungen aus dem Botanischen Museum der Universität Zürich (CXXIII). [Plant remains from the Kälberhügel Vindonissa.]** *Vierteljahresschr. Naturforsch. Ges. Zürich* 72(3/4): 326-331. 1927.

5242. **OSBORNE, FRELEIGH FITZ. A possibly biogenic structure in Grenville limestone in Hastings County, Ontario.** *Canadian Jour. Res.* 4(6): 570-573. 1 pl. 1931.—These elliptical structures, possibly of algal origin but regarded by the author as more probably non-biogenic, are associated with *"Eozoön"* and resemble *Collenia* and *Cryptozoön.*

5244. **SAHNI, B. On Asterochlaenopsis, a new genus of zygopterid tree-ferns from western Siberia.** *Phil. Trans. Roy. Soc. London B* 218(460): 447-471. 3 pl., 4 fig. 1930.—**ASTEROCHLAENOPSIS** (p. 461) (Zygopterideae, probably Permian), type *A.* **kirgisica*** (*Asterochlaena* (*Clepsydropsis*) *k.* Stenzel) (p. 461), and including *Rachiopteris ludwigii* Schenk; combines a *Clepsydropsis*-like petiolar strand with a leaf-trace sequence resembling *Asterochlaena,* while the stem stele is intermediate between the latter and *Ankyropteris.* The leaf-trace at its point of origin, structurally closely resembles the Permian osmundaceous ferns *Zalesskya* and *Thamnopteris.* The *Clepsydropsis* type of rachis bundle is no guide to generic, and perhaps not to family, affinity.—*W. N. Edwards.*

5245. **ZALESSKIJ, M., et H. ČIRKOVA. Observations sur deux végétaux nouveaux du dévonien supérieur du bassin du Donetz.** Известия Академии Наук СССР., Отделение Физико-Математических Наук. (*Bull. Acad. Sci. URSS., Cl. Sci. Phys.-Math.*) 1930(10): 1009-1016.

1 pl. 1930.—**CARACUBOXYLEAE** (p. 1010), near the Pityeae in Cordaitales, based on **CARACUBOXYLON** (p. 1010), with 2 species, *C.* **bakhasuense*** (p. 1011), and *C.* **arnoldi*** (p. 1013), both found in yellow schist.

5246. ZALESSKIJ, M. Végétaux nouveaux du dévonien supérieur du bassin du Donetz. Известия Академии Наук СССР., Отделение Математических и Естественных Наук. (*Bull. Acad. Sci. URSS., Cl. Sci. Math. et Nat.*) 1931(4): 557-588. 8 pl. 1931.—The author reports a group of new lepidophytes chiefly of sigillarian type, which are described and compared with related forms. *Heleniella* may be ancestral to both *Sigillaria* and *Lepidodendron*. The following are from the Up. Devonian unless otherwise stated. **HELENIA** (p. 558), near *Syringodendron*, erected for the following spp.: *H.* **bakhassuensis*** (p. 562); *H.* **approximata*** (p. 562); *H.* **confluens*** (p. 563); *H.* **microrugosa*** (p. 564); *H.* **costata*** (p. 564); *H.* **undata*** (p. 564); *H.* **sinuosa*** (p. 565); *H.* **helenataramensis*** (p. 566); *H.* **stylensis*** (p. 566); *H.* **elegans*** (p. 567); *H.* **genuina*** (p. 567); *H.* **bella*** (p. 568); *H.* **volnovakhica*** (p. 569); *H.* **prisca*** (p. 569); *H.* **conciliata*** (p. 570); *H.* **similis*** (p. 570); *H.* **pulchella*** (p. 571); *H.* **vera*** (p. 571); *H.* **germana*** (p. 571); *H.* **gracillima*** (p. 583), Lr. Carboniferous. *H.* **primaeva** (*Lepidodendron primaevum* Rogers) (p. 588). **HELENIELLA** (p. 572) (Sigillariaceae), related to *Rhytidolepis*, erected for *H.* **theodori*** (p. 573); including also *H.* **youngiana** (*Sigillaria y.* Kidston) (p. 584), *H.* **canobiana** (*Sigillaria c.* Kidston) (p. 584), *H.* **strivelensis** (Kidston) n. comb. (p. 584), *H.* **tchirkovaeana** (*Sigillaria t.* Zalessky) (p. 584), and *H.* **bellula*** (p. 584), Lr. Carboniferous. **AMADOKIA** (p. 577) (Sigillariaceae), near *Heleniella*, erected for *A.* **tchirkovae*** (p. 577); *Lepidodendron* **stylicum*** (p. 578); *L.* **satteles*** (p. 580); *Bergeria* **bellula*** (p. 580); *B.* **confluens*** (p. 581); *Knorria* **microcostata*** (p. 581); **VOLNOVAKHIA** (p. 582), resembling *Lepidodendron*, erected for *V.* **sagenarioides*** (p. 582).

5247. ZALESSKY, M. D. Sur l'extension du continent de l'Angaride et premières données sur la flore de ses limites oussouriennes. *Ann. Soc. Geol. du Nord* 53: 118-138. 19 fig. 1928.—Based upon the discovery of the characteristic *Gangamopteris* and *Rhipidopsis* flora in the mines of Soutchan near the village of Sitza, situated upon the Little Sitza river, the area of the Permian continent Angara is extended toward the Pacific and a connection between this ancient continent and that of Gondwana, by way of the Petchora river, is established. The following forms are reported from the mines of Soutchan: *Pecopteris* **maritima*** (p. 123), *Callipteris* **sahnii*** (p. 126), *C.* **orientalis*** (p. 128), *C.* **congermana*** (p. 130), *Thinnfeldia* **paulovi*** (p. 129), *Odontopteris* **ussuriensis*** (p. 131), *Scapanophyllum* **sitzense*** (p. 132), *Ctenis* **renaulti*** (p. 135), all Permian; and 2 species of *Ullmannia* including *U.* **longifolia*** (p. 136) from the overlying Mesozoic.—*W. Berry.*

PALEOZOOLOGY

(Abstracts of general papers only. Abstracts of systematic and morphological papers are grouped with those of a similar nature treating of living animals)

Geol.* 37(1): 30-46. 1 pl. 1929.—Records from this Carboniferous area the anthozoans *Campophyllum gasperense**, *Lithostrotion harmodites*, and *Lyropora*, the echinoderms *Pentremites pyriformis*, *P. godoni**, *P. planus*, *P. princetonensis*, *P. welleri*, *P. symmetricus*, *Talarocrinus de wolfi*, *T. ovatus*, *T. buttsi*, *T. sexlobatus*, *T. symmetricus*, *T. patei*, *Pterotocrinus serratus*, *Agassizocrinus*, and *Platycrinus penicillus*, the bryozoans *Archimedes confertus*, *A. laxus*, and *Cystodictya labiosa*, and the brachiopods *Composita trinuclea*, *Spiriferina subspinosa*, *Chonetes chesterensis*, *Productus inflatus*, *Martinia* sp., and *Spirifer pellaensis*.—*D. J. MacNeil.*

5250. CABLE, EMMETT J. Duration of Peorian interglacial interval. *Pan-Amer. Geol.* 51(3): 183-192. 1 fig. 1929.—Records some undescribed plants and the presence of many insect remains, including *Carabus meander sangamon* and *Chioenius plicatipennis*, from the Pleistocene glacial deposits of Illinois.—*D. J. MacNeil.*

5251. COLEMAN, A. P. Ice ages. Recent and ancient. xliii+296 p. 8 maps, 51 illus. The Macmillan Co.: New York, 1929.—This book includes non-technical discussion of the fossil life of the interglacial periods as well as the effects of continental glaciation on the faunas and floras living in various glacial periods.

5252. COLLIN, L. Un nouveau gisement à Calcéoles dans le Dévonien de la Presqu'Ile de Crozon. (Finistère [Brittany].) *Bull. Soc. Géol. et Minéral. Bretagne* 7(3/4): 201-208. 1926(1929).—Records and discusses the finding of a fauna of 5 corals, crinoids, 4 brachiopods, and a trilobite in some of these beds, and of 3 corals, 10 brachiopods, and a trilobite in others nearby; and gives the stratigraphic and faunal succession of the early, middle, and late Devonian strata of the Fret Syncline, naming a few of the most characteristic spp. of each division.—*B. F. Howell.*

5253. COLLIN, L. Étude géologique de la côte est de la Presqu'Ile de Roscanvel (Rade de Brest [Brittany]). *Bull. Soc. Géol. et Minéral. Bretagne* 7(3/4): 208-215. 2 maps, 1 fig. 1926(1929).—Records and discusses the numerous Devonian brachiopods, 2 trilobites, 1 pelecypod, and 1 conularid found in this district, and shows the distribution and succession of the beds.—*B. F. Howell.*

5254. DAVIES, J. A., and T. R. FRY. Notes on the gravel terraces of the Bristol Avon. *Proc. Spelaeological*

Soc. [*Bristol*] 3(3): 162-172. 2 fig. 1928(1929).—Lists and discusses the fossils found in various Pleistocene gravel terraces at several localities in this part of England, as follows: from the 100-ft. terrace, human implements, *Elephas,* mammoth, woolly rhinoceros, horse, and musk-ox; from the middle terrace derived Jurassic fossils (corals, a brachiopod, a bryozoan, cephalopods, and pelecypods), human implements and bones of the elephant, mammoth, lion, Irish deer, reindeer, *Bos primigenius,* bison, horse, woolly rhinoceros, and *Ovibos moschatus;* and from the low terraces derived Jurassic fossils (plants, corals, brachiopods, cephalapods, and pelecypods), a derived Tertiary shark, and Neolithic human implements.—*B. F. Howell.*

5255. **ESTORFF, FRITZ E. von. Kreyenhagen shale at type locality, Fresno County, California.** *Bull. Amer. Assoc. Petroleum Geol.* 14(10): 1321-1336. Map. 4 fig. 1930.—This "organic shale" proves to be Upper Eocene or Oligocene, not Miocene. One mollusk, fish scales, a broad-leaved plant, abundant *Radiolaria,* and 21 genera and 27 spp. of Foraminifera are reported. The Foraminifera include numerous *Spiroplectoides,* a genus hitherto not known as fossil on the Pacific Coast. They suggest faunal migration from the Gulf of Mexico region, accumulation in a deep marine basin, probably within the bathybic zone, and a cool bottom temperature (about 8° C.), although the climate may have been subtropical.

5256. **FAUSTINO, LEOPOLDO A. Stratigraphy of the coal measures of the Philippine Islands.** *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 2: 1535-1539. 1926 (1928).—The foraminiferal fauna and the characteristic molluscan genera *Vicarya* and *Ampullinopsis* indicate Oligocene age for the coal beds of the Philippines. The author questions some of Dickerson's determinations of fossil mollusks and other invertebrates.

5257. **GAERTNER, HANS RUDOLF von. Obersilurische Fauna aus den spanischen Pyrenäen.** *Nachrichten Ges. Wiss. Göttingen, Math.-Phys. Kl.* 1930(2): 179-188. 7 fig. 1930.—The author presents a list of 6 trilobites and 2 brachiopods, with synonymies, taxonomic remarks, and distributional data. Some of the forms are not specifically determined. Trilobitae: *Encrinurus* **rialpensis*** (p. 181), Carnic Alps [Austria or Italy] and Spain, Wenlock, type in Geol. Inst. Univ. Göttingen. The occurrence of *Ambocoelia praecox** [Spiriferidae] in the Wenlock of Spain is the earliest on record for this genus.

5258. **GALLWITZ, HANS. Stratigraphische und tektonische Untersuchungen an der Devon-Carbongrenze des Sauerlandes.** *Jahrb. Preuss. Geol. Landesanst. Berlin* 48: 487-527. 1 map. 3 fig. 1927(1928).—The fauna consists mainly of ostracods, trilobites, cephalopods, and brachiopods. Discussions and original references are given of the brachiopods *Orthis bergica, O. resupinata, Leptaena rhomboidalis, Chonetes tumidus, C. hardrensis, C. buchiana, C. muricata, C.* cf. *polita, C. perlata, Productella* cf. *semicostata, Productus* aff. *niger, P. fallax, P. praelongus*? v. *simplicior, P.* sp., *Strophalosia productoides, Liorhynchus subcurvata, Rhynchonella pleurodon, Atrypa tubaecostata, Spirifer* cf. *verneuili, S.* aff. *ranovensis, S. centronatus, S. distans, S. lineatus, S. urii, Spirifcrina laminosa, S. peracuta, Retzia multiplicata,* and *Athyris royosi.*—*F. Anderegg.*

5259. **GRIGOROVITCH-BERESOVSKI, N. A. Les dépôts tertiaires du Daghestan.** *Compt. Rend. Congrès Géol. Internat.* 14(4): 1997-2002. 1926(1928).—Fossil Foraminifera, sponges, mollusks and fishes are recorded from various horizons in the Tertiary of this province of southern Russia.—*L. S. Russell.*

5260. **JACKSON, J. WILFRID. Report on the animal remains found in the Kilgreany cave, Co. Waterford.** *Proc. Spelaeological Soc.* [*Bristol*] 3(3): 137-152. 1 fig. 1928(1929).—Bones of the domesticated ox, sheep, goat, pig, horse, and dog, and of the wild boar, hare, rabbit, badger, otter, wild cat, brown rat, bats, birds, frogs, and land and marine mollusks are recorded from an upper layer, of Prehistoric age; and the remains of man, wild boar, Irish elk, reindeer, wild ox, brown bear, wolf, dog?, fox, wild cat, stoat, hare, rabbit, field mouse, field vole, Arctic lemming, bats, birds, and land mollusks are listed and discussed from a lower, Late Pleistocene, horizon. The cave is in Ireland, and the single field vole skull found is the first trace of such an animal to be found in that island.—*B. F. Howell.*

5261. **KÜHNEL, JOHANNES. Geologie des Berchtesgadener Salzberges.** *Neues Jahrb. Mineral. Geol. u. Paläont. Abt. B* 61(3): 447-559. 4 pl. 6 fig. 1929.—Lists from the Triassic of Bavaria 10 corals, 3 pelecypods, 3 gastropods, and 1 cephalopod; from the Jurassic 16 cephalopods and a fish tooth. Bibliography.—*F. Anderegg.*

5262. **McLEARN, F. H. Stratigraphy, structure, and clay deposits of Eastend area, Cypress Hills, Saskatchewan.** *Canada Dept. Mines, Geol. Surv. Summary Rept.* 1927(Part B): 21B-43B. Map. 1928.—This report lists fossil plants from the Ravenscrag formation (late Cretaceous and ? early Tertiary), fossil mollusks from the marine shales (late Cretaceous) and the Ravenscrag formation, and fossil vertebrates from the Whitemud (late Cretaceous), Ravenscrag, and Cypress Hills (Oligocene) formations.—*L. S. Russell.*

5263. **McLEARN, F. H. Southern Saskatchewan.** *Canada Dept. Mines, Geol. Surv. Summary Rept.* 1928 (Part B): 30B-44B. 1929.—This geological report records plants from the upper Ravenscrag beds (early Tertiary?), mollusks from the Bearpaw formation (late Cretaceous), and vertebrates from the Whitemud and lower Ravenscrag beds (late Cretaceous).—*L. S. Russell.*

5264. **[MOISEEV, A. S.]** МОИСЕЕВ, А. С. К геологии юго-западной части главной гряды Крымских гор. **[Geology of the southwestern part of the principal mountain chain of Crimea.]** (French summary.) Геологический Комитет, Материалы по Общей и Прикладной Геологии. (*Com. Géol. Mat. Géol. Gén. et Appl.*) 89. 1-82. 2 pl. 1930.—Includes lists of fossil animals (largely mollusks, brachiopods, and echinoderms) and plants from various Permian, Triassic, and Jurassic formations.

5265. **OLIVEIRA, EUZEBIO PAULO de. O que realizou o Serviço Geologico na Amazonia. [What has been accomplished by the Geological Survey in the Amazon region.]** *Ministerio Agric. Industr. e Commercio Serv. Geol. e Mineral. Brasil* [*Rio de Janeiro*] pp. 1-20. 1929. —Many of the fossils recorded from the area in the past are noted—Silurian graptolites; Devonian trilobites, gastropods, pelecypods, brachiopods, foraminiferans, a gymnosperm, pteridophytes, and algae; Carboniferous brachiopods and pelecypods; a Cretaceous mosasaur; and Tertiary gastropods, pelecypods, and a stonewort.—*B. F. Howell.*

5266. **PAECKELMANN, WERNER. Die Konglomerate des Oberen Mitteldevons im Schwarzbachtale bei Ratingen und ihre belgischen Äquivalente.** *Zeitschr. Deutsch. Geol. Ges. B. Monatsber.* 80(11/12): 379-395. 1 fig. 1928(1929). —Lists from the Middle Devonian of Germany: 1 tabulate coral, 1 crinoid, 1 bryozoan, 12 brachiopods, and 4 pelecypods; and gives fossils characteristic of both the German and Belgian beds. Bibliography.—*F. Anderegg.*

5267. **PALMER, R. H. Geology of southern Oaxaca, Mexico.** *Jour. Geol.* 36(8): 718-734. 8 fig. 1928.—Records from the Cretaceous of this region foraminifera and the rudistids, *Apricardia* and *Radiolites.*—*D. J. MacNeil.*

5268. **PICQUENARD, CH. Notes d'excursion dans le Callovien entre Fontenay-le-Comte et Poire-sur-Velluire (Vendée [Western France]).** *Bull. Soc. Géol. et Minéral. Bretagne* 7(3/4): 192-196. 1926(1929).—Lists and discusses the fauna of the Jurassic Callovian west of Fontenay-le-Comte (a worm, 4 brachiopods, 5 pelecypods, a gastropod, and 17 cephalopods), discusses the stratigraphy and distribution of the beds and the correlation of the fauna, and reviews the work which has been done on it.—*B. F. Howell.*

5269. **REAGAN, ALBERT B. Pleistocene mollusks from Hopi Buttes.** *Pan-Amer. Geol.* 51(5): 337-338. 1 pl. 1929.—Records the pelecypod *Unio**, the gastropods *Planorbis trivolvis** and *Limnaea stagnalis* var. *appressa**,

some indeterminable plant-stems, and some fragments of an alga in this Pleistocene formation of northeastern Arizona. States that a short-nosed mastodon occurs in the lower portion of the section.—*D. J. MacNeil.*

5270. **RENZ, CARL.** Neue mittelkretazische Fossilvorkommen in Griechenland. *Abhandl. Schweizerischen Paleont. Ges.* 49(Mem. 5): 1-10. 2 pl. 1929(1930).—*Exogyra columbiana* has been found in the Middle Cretaceous limestone of the Skiron pass between Megara and Corinth. *Aspidiscus* felixi* (p. 9) (Coelenterata) is described from near Dremisa in the Kiona Mts. of central Greece. It is concluded that *Aspidiscus* is related to *Hydnophora* and thus to the Macandrinaceae of the coral family Astraeidae.—*C. Renz (transl. by C. O. Dunbar).*

5271. **SCHNÉEGANS, DANIEL.** Note préliminaire sur la répartition des faciès à Radiolaires dans le massif dévonien de la Bruche. *Compt. Rend. Somm. Séanc. Soc. Géol. France* 1928(15): 253-255. 1928.—The author describes radiolarian cherts from various horizons in the Devonian (Eifelian and above) of the Bruche valley, Alsatian Vosges Mts. He concludes that the radiolarians are facies fossils to be expected in any very fine-textured marine deposits rich in silica and in association with volcanic tuff or greywacke.—*D. Schnécgans (transl. by. B. F. Howell).*

5272. **STAPPENBECK, RICHARD.** Geologie des Chicamatales in Nordperu und seiner Anthracitlagerstätten. *Geol. u. Palaeont. Abhandl. [Jena]* 16(4): 307-355. 4 col. maps. 5 pl. 6 fig. 1929.—Mentions 16 ammonites from the Jurassic; and 7 echinoids, 42 pelecypods, 7 gastropods, and 24 cephalopods from the Cretaceous of Peru. —*F. Anderegg.*

5273. **STAUFFER, CLINTON R.** The Devonian of California. *Univ. California Publ. Bull. Dept. Geol. Sci.* 19(4): 81-118. 5 pl. 1930.—This consists of a thick deposit of shales and limestones well developed in the Inyo Mts. of the east central part of the state and in the Klamath Mts. of the northern part. The fossil content indicates that these deposits represent isolated parts of the Kennett formation. The fauna contains a large European contingent, among which are *Heliolites porosa* and *Calceola sandalina*, two of the characteristic Lower Middle Devonian fossils of England, Germany, Russia, and China. The Kennett formation, therefore, doubtless represents about the same age as the *Calceola*-Schichten of the Eifel region in Germany. Described as new are: (Coelenterata) *Heliolites* **occidentales*** (p. 108); (Echinodermata) *Strobilocystites* (?) **kearsargensis*** (p. 108), *Gomphocystites* (?) **californicus*** (p. 108), and *Urasterella* **inyoensis*** (p. 109); (Mollusca) *Eatonia* **bicostata*** (p. 109) and *Palaeotrochus* **kennettensis*** (p. 109). —*C. R. Stauffer.*

5274. **SUTTON, A. H.** Geology of the southern part of the Dawson Springs quadrangle. *Kentucky Geol. Surv.* 31: 175-280. 2 maps, 20 fig. 1929.—The abundant fossils collected from various localities in or near the quadrangle are listed from the following formations of the Chester Series (Mississippian): Renault, Paint Creek, Cypress, Golconda, Glen Dean, Menard, Clore, and Kinkaid. Many are not specifically identified.

5275. **SWINNERTON, H. H.** The growth of the world and of its inhabitants. 210p. 31 fig. Richard R. Smith, Inc.: New York. 1930.—A popular account of physical geology and earth history, with discussions of organic evolution and paleontology. The chapters dealing with fossils, evolution, and historical geology have the following titles. Life in its lowliest forms. Grades of animal structure. Styles of animal architecture. Fossils, their origin and uses. The stream of life through the ages. Racial progress and decline. The interlacing of lines of descent. The link between the generations. The growth of a species. The growth of complexity in nature. Individual and racial development. Adaptation and extinction. Adaptation to life on land. Specialization among mammals. The emergence of mankind. The growth of intelligence and culture. *Homo sapiens.*—*B. F. Howell.*

5276. **TRICALINOS, JOHANN.** Untersuchungen über den Bau der Celtiberischen Ketten des nordöstlichen Spaniens. *Zeitschr. Deutsch. Geol. Ges. A. Abhandl.* 80(4): 409-482. 2 pl. 1929.—Lists from the Cambrian a trilobite; from the Silurian gastropods, cephalopods, a brachiopod, graptolites, and a trilobite; from the Devonian a brachiopod and trilobite; from the Carboniferous brachiopods and a conifer; from the Triassic pelecypods, gastropods, cephalopods, corals, and plants; and from the Jurassic pelecypods, cephalopods, and brachiopods. Bibliography.—*F. Anderegg.*

5277. **WOODWARD, HERBERT P.** The age and nomenclature of the Rome ("Watauga") formation of the Appalachian valley. *Jour. Geol.* 37(6): 592-602. 1929.—Gives a complete list of the known fossils of this Lower and Middle Cambrian formation,—an alga, worms (trails), brachiopods, a pteropod, and trilobites. States that the most abundant and diagnostic fossil is the trilobite *Olenellus thompsoni.*—*D. J. MacNeil.*

5278. **YOUNG, C. C.** Bemerkungen ueber einige abnormale Formen von Fossilien und den Versteinerungsgrad der Knochenablagerungen von Chou Kou Tien. *Bull. Geol. Soc. China* 9(2): 183-188. 5 fig. 1930.—Abnormalities resulting from deformation of the enclosing strata, particularly brecciation, from the gnawing of contemporary rodents, and from disease are reported. Variability in degree of bone petrification in this deposit shows the unreliability of this criterion of age.

5288. **KUNTZ, ALBERT.** The autonomic nervous system. 576p. 70 fig. Lea & Febiger: Philadelphia, 1929. Pr. $7.—The entire field of visceral innervation is covered, the peripheral more fully than the central. A brief summary of the gross morphology is followed by chapters on general histology, general physiology and embryology. Next the autonomic innervation of the organs of the body is systematically reviewed, anatomically and physiologically, with excellent illustrations. Chapter 16 summarizes the pathology, including functional changes in nerve-cells, the functional significance of pathological changes in these cells, neoplasms and pathological changes in brain and cord. Visceral sensitivity is discussed in Chapter 17, together with referred pain and its mechanism, and in Chapter 18, vagotonia and sympatheticotonia. The following chapter treats of the autonomic system in disease, including endocrine disorders, emotional disturbances, infectious diseases, immune reactions, cardiovascular disease, reflex disorders of the digestive tract, gastric and duodenal ulcer and cutaneous reflexes. The final chapter on surgery of the autonomic system discusses sympathectomy in detail. There is a bibliography of 60 pages and an index. The extensive literature of the field covered is summarized and critically evaluated.—*C. J. Herrick.*

5301. **CAHN, ALVIN R.** Auditory ossicles of living and giant beavers. *Jour. Mammalogy* 11(3): 292-299. 1 pl. 1930.—Auditory ossicles of *Castor canadensis* and *Castoroides ohioensis*, described and illustrated, are very similar. The family Castoroididae belongs in the same suborder of rodents as the Castoridae.—*L. R. Dice.*

5302. **FROST, G. ALLAN.** A comparative study of the otoliths of the Neopterygian fishes. [Continued.] *Ann. & Mag. Nat. Hist.* [*London*] 4(19): 120-130. 2 pl. 1929.—The description of the otoliths of the order Percomorphi is concluded with the suborders Mugilioidea, 8 spp.; Stromateoidea, 3 spp.; Blennioidea, 20 spp.; and Gobioidea, 7 spp. Of the Symbranchii,—in the suborder Alabetoidea, small Australian fishes, *Alabes dorsalis*, no otoliths were discernible. In the Symbranchoidea, the otoliths of 3 spp. are described. In the division Ophidiiformes of the Blennioidea the otoliths are of a new type described as "Brotulid." The otoliths of the Gobioidea are highly specialized and form a type described as "Gobiid." Otoliths of 34 spp. are figured.—*R. P. Bigelow.*

5303. **GRODZIŃSKI, A.** Über die Lymphherzen von fossilen Reptilien. *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. (II)* 1929(8/10): 433-439. 4 fig. 1929.—On the basis of the relations of lymph hearts to caudal transverse processes in living lizards and snakes, an attempt is made to determine the position of these structures in the dinosaurs, *Apatosaurus* and *Diplodocus.*—*A. S. Romer.*

5304. **JOSIFOFF, J. M.** Die tiefen Lymphgefässe der Extremitäten des Hundes. *Anat. Anz.* 65(4/6): 65-76. 3 fig. 1928.—The author studied the course of the deep lymphatics of the extremities of the dog by injecting diluted India ink into the living muscle (of the chloroformed animal). As in man, the lymphatics may be divided into superficial and deep. The former lie external to the fasciae and drain the skin, while the latter drain the bones and muscles, and are prolonged as chief vessels along the deep arterial trunks. In the anterior extremity these lymph vessels extend to the axillary lymph node, from which a larger channel, the truncus subclavius, passes centrally. The lymph vessels that follow the femoral artery divide into 2 groups: an outer and an inner. The inner group drains the muscles nourished by the caudal femoral artery, and also receives lymph from the popliteal lymph node. The outer group of lymph vessels which accompany the femoral artery represents a continuation of the lymph trunks associated with the posterior tibial artery and draining the muscles supplied by it. In the middle of the thigh there is often a lymph node of insignificant size. Both the outer and inner group of femoral lymphatics pass above Poupart's ligament and form a plexus of 3-10 trunks which follow the external iliac artery and drain into 1 or 2 lymph nodes situated at the beginning of the artery.—*O. F. Kampmeier.*

5305. **JOSSIFOW, J. M.** Das Lymphgefässsystem des Kaninchens. *Anat. Anz.* 71(21/22): 464-475. 4 fig. 1931.—Injection of muscles and thoracic and abdominal organs of the living rabbit showed that the principal superficial lymph vessels followed the subcutaneous veins and the principal deep ones followed the principal blood vessels. In the extremities the lymph nodes and vessels resembled those of the dog though the nodes were relatively

smaller. The superficial axillary lymph nodes were divided into anterior and posterior (dorsal). Unlike the dog, there were no deep inguinal and popliteal lymph glands. The number of lymph nodes was relatively smaller than in man, particularly in the mesenterial lymph nodes.—*From author's summary (transl.).*

5306. KLAAUW, C. J. van der. On mammalian auditory bullae showing an indistinctly complex structure in the adult. *Jour. Mammalogy* 11(1): 55-60. 1930.—The very large collections of dry skulls of *Procavia (Hyrax), Galeopterus, Ictieyon* and *Tapirus* (which show a complex bulla according to investigations on fetal and young material with soft tissues) very seldom showed a distinct entotympanic, due to the fact that this element was either free and fallen out or early fused with the tympanic. The importance of investigating skulls in which the soft parts are preserved, as for example late fetal, new-born, and very young, is emphasized.—*C. J. van der Klaauw.*

5307. KLAAUW, C. J. van der. Een verzameling uit den eersten tijd van de vergelijkende ontleedkunde (de collectie Brugmans). [An old collection in comparative anatomy. The Brugmans' collection.] *Natuur* 50: 49-53; 73-78; 97-101; 122-126. 31 fig. 1930.—Discussion of this old collection in Leiden, the number of specimens illustrating the different systems of organs (very few invertebrates, of vertebrates especially dry preparations), the technique of the preparations (injections, etc.) and that of contemporaries (end of the 18th, beginning of the 19th centuries).—*C. J. van der Klaauw.*

5308. LATSKY, LULU. Die Borsskouerapparaat van Hemisus marmoratus. *S. African Jour. Sci.* 27: 470-480. 2 fig. 1930.—The episternum of *H. marmoratus* is well developed and represented by a cartilaginous as well as an ossified portion, which latter articulates syndesmotically with the procoracoidal arch. The sternum is totally absent. Although vestiges of the epicoracoidal cartilages are observed between the median ventral portions of the narrow coracoidal ossifications, the greater part of the epicoracoids is represented by connective tissue. It is suspected that the transitional cartilage, between the procoracoids and the epicoracoidal connective tissue, is nothing less than further vestiges of the epicoracoidal cartilage. The procoracoidal arch owes its solidity and sturdiness largely to the well developed clavicle, which covers the entire ventral portion of the procoracoid, with the exception of a small median ventral zone. An interesting ossification of the procoracoidal arch on the side approaching the glenoid cavity is totally fused with the clavicle. The condition prevailing in the suprascapular region can be compared osteogenetically with that of the procoracoidal arch. The cleithrum is completely fused with the ossified portion of the suprascapular region. If, as is frequently maintained, the Engystomatid-Brevicipitid genera tend to have the clavicular-procoracoidal arch reduced, the breast-shoulder apparatus of *Hemisus* is proof of its non-Brevicipitid affinities. Since, however, some Brevicipitidae possess a complete cartilaginous and bony anterior arch (e.g., *Breviceps* and *Dyscophus*), and since some Ranidae (e.g., *Arthroleptella*) show incipient reduction of the arch, not much importance of a phylogenetic nature can be ascribed to the variation of the girdle alone. Sections of a postmetamorphic specimen reveal skeletogenic processes, but the gross anatomy does not differ appreciably from that of the adult form.—*Author's English summary.*

5310. PALMGREN, AXEL. Zur Anatomie und Entwicklungsgeschichte des Mittelfelles (Mediastinum) der Haussäugetiere. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 87(3/4): 367-409. 32 fig. 1928.—The writer offers proof that the tissue around the venae cavae (Hohlvenengekrös) is a part of the mediastinum bounded by the cavum pleurae intermedium. This conclusion is based partly on investigation of the development of the postcardiac mediastinum in calf embryos and partly on the demonstration that in the sheep and goat the plica venae cavae is derived from a definite medial and ventral portion of the mediastinum. The septum which in young embryos separates the 2 pleural cavities gives origin only to the middle portion [dorso-ventrally] of the adult mediastinum. The portions which extend dorsal to the esophagus and ventral to the roots of the lungs result from secondary extension of the primitive pleural cavities in the dorsal and ventral directions. The development of the mediastinum cranial to the heart depends very little on the extension craniad of the pleural cavities, more upon their growth ventrad and dorsad, but chiefly on the displacement of the heart in reference to the vertebrae and ribs. The cause of this displacement is to be sought in the slower growth of the heart in the late embryonic period. The pleural cavities enlarge ventrally in older calf embryos so that ultimately the mediastinum at its sternal attachment occupies but a fraction of the breadth of the sternum. In the adult, however, the separation between the lines of junction of the costal and mediastinal pleurae in the cardiac region is as a rule greater than the breadth of the sternum. The post-fetal (secondary) displacement laterally of these lines of reflection is due to subpleural accumulation of fat in the cardiac region. Because of the lateral situation of these lines of reflection it is possible to trepan the sternum in the area extending from the 5th to the 7th incisura costalis and to open the pericardial cavity without injury to the pleura. In a horse, a similar lateral position of the reflection line between the costal and mediastinal pleurae is primary. Because of the topographical position of the pericardium and the lines of reflection of the cavum pleurae intermedium the anatomically most suitable sites for paracentesis of the pericardium are the base of the xiphoid cartilage or the 5th or 6th intercostal spaces medial to the reflection of the pleura. The cupula pleurae on the right side extends a few centimeters beyond the anterior border of the 1st rib ventral to the axillary vein; in cattle, 6-7 cm. beyond the anterior border of the 1st rib dorsal to the axillary vein; in the dog and cat, a variable distance beyond the anterior body of the 1st rib on the medial side of the sternothyroid muscle. On the left side in cattle and in the horse, the cupula pleurae does not reach the anterior border of the 1st rib; in the dog it extends further than on the right. In the horse, dog and cat intravital perforation of the mediastinum occurs.—*Author's summary (transl. by H. von W. Schulte).*

5314. VIALLI, MAFFO. Ricerche morfologiche e istologiche sui plessi coroidei dei rettili. [Morphologic and histologic studies on the choroid plexuses of reptiles.] *Riv. Sperim. Freniatria* 53(3/4): 277-345. 16 fig. 1930.—Among Chelonia, the author personally examined and studied *Emys orbicularis, Tryonix* [sic] *ferox* and *Testudo ibera;* among Lacertilia, *Tarentola mauritanica, Phyllodactylus europaeus, Agama inermis, Ophisaurus apus, Anguis fragilis, Lacerta muralis, L. viridis, Notopholis fitzingeri, Ophiops elegans, Acanthodactylus boskianus,*

Chalcides ocellatus, C. tridactylus, and *Blanus strauchii;* among Ophidia, *Tropidonotus natrix, Coronella austriaca, Tarbophis fallax, Vipera ammodytes* and *V. aspis.* Among reptiles, as among other vertebrates, 2 main portions of the plexus may be distinguished, a caudal (of the 4th ventricle) and a morphologically and embryologically more complex cephalic portion including a median portion which may be called "tela choroidea superioris" and 2 lateral portions, the plexuses of the lateral ventricles. The tela choroidea superioris is divided, in Studnička's terminology, into 3 portions, paraphysis, velum and dorsal sac. Each portion of the plexus assumes characteristic arrangements in the various groups of reptiles. The paraphysis is a permanent organ among reptiles. The epithelial cells of the plexus generally measure the same in all dimensions and are of equal size in all portions of the plexus. There are species in which the epithelial cells are very flat, and in some cases the cells of some portions of the plexus differ from those in other portions. The choroid epithelium is always vibratile. The nuclei are of the usual type; in some rare cases, immediately after lethargy, occasional karyokinesis may be observed, but normally no cell proliferation, mitotic or amitotic, is to be seen. The chondriome is always abundant, in the form of either mitochondria or chondriocontes, according to the species. Fats and lipoids are rare in the epithelial cells. Glycogen and hemosiderin are completely lacking in the epithelium; the pigment sparsely present is of the nature of melanin. The quantity and distribution of connective tissue varies greatly from species to species; it is generally more abundant in some species of saurians. Granular cells, reticulo-endothelial cells, fat and lipoid bearing cells, Kolmer's cells and chromatophores are present in the connective tissue of the plexus. The fibrillary portion of the connective tissue is represented by reticular fibrils, which are the most numerous, but collagen and elastic fibrils are not lacking.

5316. WINCKLER, GEORGES. La morphogénèse de la chair carrée de Sylvius. *Arch. Anat. Hist. et Embryol.* 9(4/7): 309-341. 9 fig. 1928/1929.—The quadratus plantae varies in the series of mammals from a maximal development (*Ornithorhynchus paradoxus, Homo sapiens*) to complete absence (*Erinaceus europaeus, Talpa europaea, Lepus cuniculus,* prosimians and gibbons). It does not always show the same relation to the long tibial flexor as in man. There is frequently fusion with the long peroneal flexor (*O. paradoxus*). The morphological equivalence of the quadratus plantae with the deep layer of the flexor of the toes is indicated when a perforating flexor tendon detaches itself from the elements of the quadratus plantae (*Didelphys virginiana, Hapale jacchus, Macacus rhesus*). This usually goes to the great toe. The quadratus plantae is here seen to take an active part in the flexion of the toes. In other cases its function cannot be so explained. In the carnivores the fibers lie transversely and obviously can not produce flexion. The obliquity of the long flexor of the toes certainly has great importance relative to the development of the quadratus plantae. However, this factor is not absolutely decisive. In *Talpa,* for example, where there exists a manifest obliquity, there is no trace of an accessory, while the muscle occurs elsewhere where there is no change in the primitive direction of the tendon of the long flexor (*Ornithorhynchus*). The pronation of the foot and the extent of movement in the talo-calcaneal and talo-navicular joints appear to have the greatest influence in the development, or absence, of the quadratus plantae. There is, in general, great development of the muscle in cases where pronation is the normal attitude of the foot, and free movement is permitted at the talo-calcaneal and talo-navicular articulations (*O. paradoxus, H. jacchus,* man). The action of the accessory is clearly to lessen the tendency to supination which the long flexor of the toes necessarily develops in flexion of the toes. Thus no trace of the quadratus plantae is found in species where, although there is pronation of the foot, accessory movement on the part of the flexor is not permitted (rabbit, *E. europaeus, T. europaea*). Furthermore this muscle is much reduced when the medial border of the foot is raised (*Cebus fatuellus, M. rhesus, Cercopithecus mona*). Where supination is maximal (*Lemur mongoz, Hylobates lar, Nycticebus tardigradus*) the suppression of the muscle becomes complete. The intermediate stages characterize the anthropoids.—*C. W. Osgood.*

5317. WISLOCKI, GEORGE B. A study of scent glands in the marmosets, especially Oedipomidas geoffroyi. *Jour. Mammalogy* 11(4): 475-483. 3 pl. 1930.—The author studied 13 specimens of *O. geoffroyi* (9 ♂♂ and 4 ♀♀), 1 of *Seniocebus bicolor,* 2 of *Callithrix penicillata,* and 2 of *C. jacchus.* Complex scent glands, located in the pubic region, on the genitalia, or in the perineum, are characteristic of a number of the Callitrichidae. They are most extensive in *O. geoffroyi* and are well developed in *C. pencillata* and *C. jacchus* but are absent in some members of the family (*Seniocebus bicolor* ♂ and, according to Pocock, *Leontocebus rosalia* ♂ and ♀, and *O. oedipus* ♀). The glands are not sex limited, but in at least *O. geoffroyi* are best developed in the ♀. The scents possibly serve for individual recognition or for sex attraction. The glands are developed from highly modified hair follicles. The presence of these glands lends support to the view that the marmosets are primitive and that they represent the lowest order of the Simiae.—*L. R. Dice.*

VASCULAR SYSTEM (INCLUDING LYMPHATICS)

5318. BAUM, HERMANN. Das Lymphgefässsystem des Huhnes. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 93(1/2): 1-34. 5 pl. 1930.—The lymph-vascular system of birds is phylogenetically distinguished by the general disappearance of the reptilian lymph-hearts, the appearance (in only some of the birds and never abundantly) of true lymph-nodes, and the attainment by the lymph-vessels of independent status and of valves, though both vessels and valves are less numerous than among mammals. These studies are on fowl preparations in which the macroscopically recognizable lymph-vessels were injected with blue fluid.

5319. DUBREUIL, G. Signification et valeur de la média et des tissus élastiques et musculaires des parois artérielles. *Arch. Anat. Microsc.* 25: 450-458. 1929.—The rôle of the elastic tissue is to maintain constant pressure in the arteries. The essential vascular wall is formed of elastic connective tissue. The muscular media is a supplementary acquisition of vessels with limited territory of irrigation; it is an intermittent regulator of the blood supply and not a permanent compensator of pressure.—*G. Dubreuil (transl. by J. P. McMurrich).*

5320. GRANT, R. T. Observations on direct communications between arteries and veins in the rabbit's ear. *Heart* 15(3): 281-303. 2 pl., 10 fig. 1930.—Observations on the ears of 10 living rabbits showed numerous direct arteriovenous anastomoses, which reacted to mechanical stimulation, histamine, acetylcholine and cold by dilatation, and to epinephrin by constriction. There is an unusually rich distribution of the perivascular sympathetic nerve plexus to the anastomoses. They can be dilated through the action of the local axon reflex. They are particularly responsive, contracting vigorously and quickly to sympathetic impulses. The anastomoses serve 2 functions (a) local, and (b) general: (a) It is mainly through their agency that the temp. of the ears is maintained when these are exposed to cold; (b) they are important in regulating body temp., aiding the dispersal of heat by allowing an enormous blood flow through the ears.

Biol.* 18(17): 1515-1517. 1 fig. 1928.—When increased colloidal permeability occurred the endothelium of capillaries and precapillaries of the subcortical and cortical nuclei of the brain in particular showed fatty infiltration. In crystalloid infiltration the capillaries of the choroid plexus appeared netted, with cellular desquamation.

5326. TANTURRI, D. Die Lymphbahnen zwischen Mittelohr und Schädelinnerem. *Monatsschr. Ohrenheilk. u. Laryngo-Rhinol.* 64(9): 1005-1015. 6 fig. 1930.—Injection of dye (experiments covering a period of 20 yrs.) showed that the normal routes of lymphatic communication between the middle ear and the interior of the skull are formed by lymph spaces and intermediate spaces, not by lymph vessels. These spaces are formed by the lymph routes of the nerve bundles of the facialis (via middle ear and interior of skull), of the acusticus (via labyrinth and interior of skull), and by the perilymphatic spaces of the cochlea (perhaps by way of the aquaeductus cochleae), more rarely by those of the vestibulum.—*From author's summary (transl.).*

5327. WOLHYNSKI, TH. Über den Bau der Verzweigungsstellen der kleineren Arterien. *Zeitschr. Wiss. Biol. Abt. B. Zeitschr. Zellforsch. u. Mikrosk. Anat.* 7 (1): 83-97. 6 fig. 1928.—The author considered primarily the structure of the tunica media and the lateral wall of the vessel at the region of the branching in 141 preparations of the A. lingualis and its branches in children and adults (3-70 yrs. old). The observations of others are confirmed and a few bundles of muscle fibers are added to the tunica media. The topography of these bundles is: (1) along the lateral wall of the main vessel and of the branch; (2) at the bend of the wall of the vessel where 2-3 branches are given off; (3) in the wedge at the point of branching. All these bundles are in different portions of the media. The first two originate some distance from where the branches are given off. At first the fibers are single and appear as a continuation or branch of the oblique fibers of the media but frequently are also independent. The more median circular muscle fibers decrease in number toward the branches while the longitudinal fibers increase and at the branching almost completely crowd out the circular fibers. The muscle fibers of 1 and 2 are 100-150μ long; they taper gradually toward each end and terminate in fine threads which become scattered among the circular fibers, many taking an oblique course and gradually disappearing in the circular fibers of the media. Some of the longitudinal fibers of the main vessel become circular fibers as soon as they reach the point of branching and loops may surround main vessel and branch. Such fibers were only on the side of the arteries from which the branches are given off. Close to where the lateral branches arise the media is thinner than elsewhere. The muscle fibers of the wedge at the branching were arranged in 2 directions. In one the longitudinal fibers are directly under the tunica elastica interna of the lateral wall of the main vessel and pass upwards to the wedge to meet the fibers of the opposite side, forming a swelling. The elastic fibers take a similar course. This condition was found primarily in the large arteries (aorta, coeliac, etc.). In the other case the muscle fibers in the large branches lie immediately over the fibers described and in the branches of the A. lingualis they are under the tunica elastica interna. The fibers in this case are (1) the endings of the median fibers and (2) the oblique fibers which pass from the main vessel to the lateral branch and, turning at various angles in the muscle mass of the wedge, return. The constant longitudinal muscle fibers are also described.—*H. F. Nachtrieb.*

GENITO-URINARY SYSTEM

5328. ALLEN, WILLARD M. I. Cyclical alterations of the endometrium of the rat during the normal cycle, pseudopregnancy, and pregnancy. II. Production of deciduomata during pregnancy. *Anat. Rec.* 48(1): 65-103. 6 pl. 1931.—This study was undertaken to determine whether during pseudopregnancy in the rat, there are sufficient histological alterations in the endometrium to warrant the substitution of these changes for proliferation of the rabbit's uterus as a routine test for the activity of corpus-luteum extracts known to cause proliferation. It was found that during pseudopregnancy the rat's endometrium undergoes cyclical changes which are different from those in the normal cycle, and that these alterations are identical with those which occur in pregnancy over the same period of time. However, these changes, although definite and characteristic, are not sufficiently pronounced to be used as a test for extracts. Incidentally, it was also found that, from the 4th to the 6th day of pregnancy or pseudopregnancy, the endometrium is histologically different from that at any other period. Since this period coincides with the periods of sensitization and of early implantation, it seemed likely that even in later pregnancy deciduomata could not be produced by mechanical stimulation. In II, it is shown that in the non-pregnant horn of unilateral pregnancy it is impossible to produce deciduomata after about the 6th day, thus physiologically as well as histologically the endometrium of later pregnancy is different from that of early pregnancy.—*Author (courtesy Wistar Bibl. Serv.).*

5329. BECCARI, N. Rigenerazione testicolare e genealogia delle cellule genitali nel "Triton cristatus." *Boll. Soc. Ital. Biol. Sper.* 3(6): 669-672. 1928.—In adult ♂♂ of *T. cristatus*, almost the entire testis was extirpated, and the regeneration of the remaining fragments was studied microscopically at intervals of 5, 8, 15, 30, and 60 days. After 60 days the fragments had produced a new lobe of normal size and spermatids were giving rise to spermatozoa. This indicates that all the genital cells are derived by cell division from original spermatogonia or primary spermatocytes.—*N. Beccari (transl. by P. Popenoe).*

5330. COURRIER, R. Les modifications saisonnières de l'appareil uro-génital chez Uromastix acanthinurus (Bell.). [Seasonal changes in the urogenital apparatus of U. acanthinurus.] *Arch. Anat. Microsc.* 25: 388-394. 3 fig. 1929.—Histological study of the secretory activity of the

glandular "sexual segment" of the ureter, in the ♂ of certain snakes and lizards, shows that this "sexual segment" exhibits cyclic changes which occur synchronously with changes in glandular activity of the epididymis. The idea that the structure is a part of the genital apparatus is thus confirmed.—*W. G. Lynn.*

5331. **ENGLE, EARL T. Prepubertal growth of the ovarian follicle in the albino mouse.** *Anat. Rec.* 48(2): 341-350. 1931.—The growth of the prepubertal follicle and the process of follicular atresia have been studied from the 1st to the 37th day of life in the mouse. Three litter mates were killed each day, affording 6 ovaries to be studied for each day of life. The diameters of the 10 largest follicles in each ovary were measured, and the median of the 60 follicles for each age day is plotted. A slow growth of the follicle occurs until the appearance of the antrum folliculi on the 12th, 13th, and 14th days. On the 15th day, the follicular diameters show a sudden and pronounced rise to a size almost equal to that of the follicle at the occurrence of the first oestrus. This growth level is maintained, within variable limits, in all later prepubertal stages. Follicular atresia appears not to be cyclic, as in the adult mouse. Pseudomaturation spindles and the degenerative fragmentation of such ova do not appear until after the ovum has attained mature size. A large number of atretic follicles are found about the 20th day, and this number is fairly constant until puberty.—*Author (courtesy Wistar Bibl. Serv.).*

5332. **IVANIZKY, M. Beiträge zur Anatomie des Ductus ejaculatorius.** *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 87(1/2): 11-21. 11 fig. 1928.—In material from 37 corpses (3 boys and 34 adults), the many variations of the ejaculatory duct could be grouped under 3 types. In (1) the vas deferens opens into the excretory duct of the seminal vesicle and the ejaculatory duct appears as a continuation of the excretory duct, which is thicker than the endpiece of the vas deferens; 22 of the 34 cases were of this type. In (2) the vas deferens and the excretory duct contribute equally to the formation of the ejaculatory duct. The caliber of the excretory duct is about the same as that of the vas deferens; 9 cases were of this type. In (3) the excretory duct (with narrower lumen) opens into the vas deferens (with wider lumen) and the ejaculatory duct appears as a continuation of the latter; 3 cases of this type. Measurements of position, etc. of the ducts are given in a table. The rotation of the lumen of the excretory duct at the ejaculatory sinus (Felix) was not observed; in the vas deferens, it was occasionally observed. The lumen of the ejaculatory duct turned through 90° in only 39% of the cases; its condition depends primarily upon the pressure of neighboring organs. If the ejaculatory duct lies within the prostate, as is frequent, the longer axis of the lumen is sagittal. If, however, the duct lies on the dorsal side of the prostate, the longer axis of the lumen is more frontal in direction.—*H. F. Nachtrieb.*

5333. **KAUFMANN, JOSEPH, and RUDOLF GOTTLIEB. The innervation of the renal parenchyma. A study to demonstrate nerve endings in renal epithelium.** *Amer. Jour. Physiol.* 96(1): 40-44. 8 fig. 1931.—Study of sections of kidneys from rats, guinea pigs, cats, dogs and man indicated that an extensive non-medullated innervation of the parenchyma of the kidney is present in addition to the purely vascular nerve supply.

5334. **PETER, KARL. Untersuchungen über Bau und Entwicklung der Niere. 2. [Structure and development of the kidneys.]** 196p. 1 pl., 24 fig. Gustav Fischer: Jena, 1927. Pr. 15 M.

5335. **SAIGRAEFF, M. Zur Frage der Histotopographie der Vorsteherdrüse und der Samenblasen. Vorläufige Mitteilung.** *Zeitschr. Urol. Chir. (Orig.)* 24(3/4): 389-412. 23 fig. 1928.—200-300 cc. of a 10% formol solution were injected into the urinary bladder of human bodies and the penis was then ligated, 24 hrs. before the autopsy. The organs removed were fixed 24 hrs. in 10% formol solution. Frozen sections, 40μ, were made through the prostate and the seminal vesicle, stained with hematoxylin-eosin and van Gieson. Two newborn, 1 4-yr. old, 49 adults, and 3 monkeys (pavian and chimpanzee) were examined. The accessory lobes of the prostate, described by Walker in rats and guinea pigs, were found in men and monkeys also, between the prostate and the seminal vesicle at the level of the body of the seminal vesicle. They were enclosed in a capsule and contained slightly developed villi, which were not found in the prostate. The straight ends of the seminal vesicles, the cervix, in monkeys and adult men form an angle of 50°; in the newborn, 90°; at 16-19 yrs., 60°-70°; at 60 yrs., 100°-120°. The wall is 250-700μ thick at the apex; the medial wall of the corpus is 200μ; the lateral, 800μ. In a hypertrophic prostate the wall of the seminal vesicle becomes thinner, the lumen broader. The villi of the mucous membrane are better developed in the corpus than in the apex. They can be divided into 3 groups: (1) the epithelial layer forming a shallow zig-zag line (in children); (2) the epithelial layer having a villous structure, 150μ high (in adults and old men); (3) the villi forming a dense network, sometimes filling the whole lumen of the seminal vesicle (in young men). The epithelium is columnar, with one or more layers, or it is cuboidal. The ampulla, the continuation of the vas deferens, is analogous in structure with the wall of the seminal vesicle. The muscle layer is 1000μ thick. The colliculus seminalis is covered with a connective tissue capsule containing muscle fibers. It is 1500-2000μ wide (at 26-40 yrs.), has a reticular structure and is clearly separated from the prostatic raphe by a layer of connective tissue. This network consists of muscular and connective tissue. The thickness of the walls is 300-400μ, the cubic epithelium has more layers, and in the interspaces homogeneous secretion and corpora amylacea are present. The 2 ejaculatory ducts are separately encircled by the 2 spermatic sphincters (Porosz); the 3rd strip of muscle, which encircles both of the excretory ducts, is not to be seen. In the upper corner of each ejaculatory duct (in the part turned toward the urinary bladder) are thick strips of muscle fibers which promote the expulsion of the contents. In the pavian, there are 7 excretory ducts of the prostate on each side of the colliculus seminalis. Their lumen is surrounded by strong annular muscle fibers. The seminal vesicle is 9 cm. long in chimpanzees, and 3.5 cm. wide; the prostate is 3.5 cm. long and 3 cm. wide.—*E. Barta.*

5337. **BETTMANN, S. Leichen-Dermatogramme.** *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 92(1): 27-33. 8 fig. 1930.—Skin impressions were made, on the same plan as finger prints of the living, from the abdominal skin of 2 corpses, 1, 2 and 11 hrs. after death, showing the gradual change in cutaneous tension. The author suggests that the method may be so refined as to be serviceable in determining the time that has elapsed since death.

5338. **[BITTNER, H.] БИТНЕРЪ, Г. Хистология на кожата, косъма и обработената кожа на бивола. [Histology of skin, hair, and leather of buffalo.]** Годишникъ на Софийския Университетъ, Ветеринарно-Медицински Факултетъ. *(Jahresber. Univ. Sofia Vet.-Med. Fakultät* 2: 127-178. 11 fig. 1926.—This work is a detailed histological description of the structure of the skin, hair, and leather of buffalo. These structures show great variation in comparison with those in cattle. —*A. Ralojanoff (transl. by Z. K. Cooper).*

5339. **CERUTTI, P. Ricerche sulla pigmentazione della cute dei conigli. [Pigmentation of the skin in rabbits.]** *Gior. Ital. Derm. e Sifil.* 71(4): 1281-1286. 1930.—In each of 2 gray rabbits (1 irradiated with ultraviolet, the other with infra-red) 4 areas were shaved on the back; 1 area was repeatedly injected with 0.1%

skatol solution, which, in the course of several days, gave rise to infiltration, induration and thickening of the skin. Another area was injected with acetic acid, which produced an eschar. The other depilated areas were kept as controls. In each of the depilated areas 2-3 slaty-brown spots appeared on about the 14th day, the spots being much larger in the control areas than in those injected with skatol and acetic acid. In these hyperpigmented spots abundant dark brown, almost black hairs began to grow, while scarcely a hair was seen in the non-pigmented areas after the lapse of months. In 4 rabbits 2 or 3 areas were depilated by plucking; 2 animals received repeated intravenous injections of 0.1% skatol, the other 2 intravenous injections of 0.1% dopa; 2 were kept in daylight and irradiated with ultraviolet and infra-red, 1 received daylight only for a few hrs. on certain days, and the 4th was kept in the dark. In all the rabbits all the spots turned dark by the 8th day and soon thereafter were covered with thick dark hair, as were spots plucked in 3 controls. In 2 rabbits in which 4 zones were depilated by different means (shaving, plucking, chemical depilation, cutting with scissors) all showed the same phenomena. In 3 white but not albino rabbits, 2 dorsal areas of each were depilated by plucking; in these no pigmentation appeared. Microscopically the melanic pigment in granular form appeared on the 4th day after plucking, in particular abundance corresponding to the cells and intercellular spaces of the connective tissue of the skin; pigment was present, but less plentiful, in the basal stratum of the epidermis. Tar painting over part of a depilated area on a gray rabbit produced infiltration and ulceration and delayed appearance of pigmentation and regeneration of hair, but the latter phenomena were essentially the same. The results, unlike those of Introzzi, showed no influence from ultraviolet rays on hair regeneration and pigmentation over plucked areas. Rabbits kept in complete darkness underwent the same changes as those kept in daylight. The author concludes that pigmentation of the depilated skin of the rabbit occurs spontaneously and that mechanical, physical or chemical factors affect it only by disturbing normal pigmentation or destroying the hair-producing mechanism, which is closely connected with it.

5340. CHAMBERS, G. K. The growth of angora rabbit hair. *World's Poultry Congress* 4(Sect. F): 964-969 (discussion 969-973). 1930.—The "suspension of growth" following clipping is normal and universal in rabbits. The stages of growth are: (1) the formation of hair ball in the follicle and the development of a thick tip, involving about 20 days after extraction of the old hair from the follicle; the length of (2), the growing stage, varies with the type of coat. The rate of growth for both long and short haired types approximates 1 mm. a day and apparently cannot be increased by dietary or genetic means. A dormant period (3) of the mature hair terminates with the extraction of the hair and root from the follicle. The bearings on clipping and plucking are discussed.—*E. W. Sheets.*

5341. DESSELBERGER, HERMANN. Über das Lipochrom der Vogelfeder. *Jour. Ornith.* [*Berlin*] 78(3): 328-376. 2 pl., 5 fig. 1930.—The paper is chiefly an inquiry on the histology and on the origin of the lipochrome pigment in the feather. In the first part the formation of the lipochrome in the feather—hitherto unknown—is described in different birds, mainly in *Amadina fasciata* Gm. In the second part these histological results are discussed and compared with the facts known about the lipochromes in all animal groups. The principal results are: The lipochromes—belonging to the carotinoids—are doubtless not autochthonous in the animal organism, but they originate in the plants only and are taken up by the animals with the food, absorbed in digestion and transported within the organism by the body liquids. The various lipochromes deposited in animals differ probably by several degrees of oxidation or only of concentration. In the feather germ the lipochrome begins to appear in connection with very small drops of lipoids. Subsequently these drops disappear again and the lipochrome, which often forms a flaky precipitate in this stage, dissolves in the first stages of keratin formation. When this formation is completed, the lipochrome pigment is wholly dissolved in the keratin. The lipochrome precipitates, unlike the melanin, only in cells which will be permanently stained by it; cells distributing the pigment to other cells, like the "melanophores" in the melanin feather germs, do not exist in the lipochrome feather germ. The precipitation of lipochrome also retards the development of the most differentiated parts of the feather. Since these parts, the little hooklets, are very important for the solidity of the feather, lipochromes are almost never found in the parts of the bird plumage, which have an important mechanical function.—*H. Desselberger.*

5344. MATTHEWS, SAMUEL A. Observations on pigment migration within the fish melanophore. *Jour. Exp. Zool.* 58(1): 471-486. 4 fig. 1930.—When the scales of *Fundulus* are mounted in tissue-culture preparations, their melanophore processes become so readily visible that they can be studied even when free from pigment, the cells themselves remaining alive for several days. Careful measurements failed to detect any change in the diameters of these processes during either central or peripheral migration of the pigment granules. The fish melanophore is in no sense amoeboid. The pigment in a melanophore process isolated from its cell by means of a microneedle can still spread over a wide field or concentrate in a small area, even when the body of the cell has been destroyed. Hence the centrosphere exerts no essential influence on pigment migration within melanophore processes. The differences in physical condition of a melanophore with expanded pigment, as contrasted with one with contracted pigment, tend to support Spaeth's interpretation of the mechanism of melanophore "contraction" as "a process similar to the gelation of an emulsoid."—*Author* (*courtesy Wistar Bibl. Serv.*).

5348. **BENOIT, JACQUES. Structure, origine et fonction des cellules interstitielles du testicule chez le coq domestique.** *Arch. Anat. Microsc.* 25: 173-188. 1 pl., 2 fig. 1929.—Mitochondrial stains were best for the tissue studied. Interstitial cells in adult fowl testes are glandular, with an abundance of chondriosomes—particularly of chondrioconts, and contain fatty substances formed largely of cholesterol but probably to a lesser degree also of phosphatides. Both interstitial and Sertoli cells arise from embryonic sex cords in the germinal epithelium. They do not degenerate in the embryonic testis, or at puberty, but are found, cytologically transformed, in the adult testis. The apparent scarcity of interstitial cells is due to the extensive development of the seminiferous tubules. Actual determinations show the ratios of the mass of interstitial cells to the mass of (1) testis and (2) body to be greater in the fowl than in cat or man. The interstitial cells produce the testicular hormone but their qualitative function depends upon the medium in which they are placed. In ovariotomized fowls which become in turn ♂-like, then ♀-like, the same interstitial cells (of the residual gonad) are considered to have elaborated in turn (1) ♀ hormone, before the operation, (2) ♂ hormone, following the operation, when under the influence of seminiferous tubules in the regenerating gonads, and finally (3) ♀ hormone, when these tubules are undergoing involution and transformation to interstitial cells which resemble those of the ovary in having fewer chondriosomes and less fat than the interstitial cells of the testis. Thus, it is considered that while interstitial cells of the testis are the sole source of the testicular hormone, they can produce it only through the intermediary action of the Sertoli cells in the tubules which maintain the necessary ♂ physiological environment.—*F. B. Hutt.*

5349. **BRYANT, ARTHUR R. The effect of total thyroidectomy on the structure of the pituitary gland in the rabbit.** *Anat. Rec.* 47(2): 131-145. 1 pl. (col.) 1930.—The structure of the normal pituitary gland is analyzed cytologically, and the changes produced by total removal of the thyroid gland are determined. In the normal gland the special cells of the pars intermedia described by Maurer and Lewis in the pig are confirmed for the rabbit. In the thyroidectomized animals an increase of weight of the hypophysis as compared with litter mates of the same sex is noted. No change could be detected in the pars tuberalis, pars nervosa, or pars intermedia, but the change in weight is due to a great increase in size of the chromophobe elements of the anterior lobe. With this change there is a progressive reduction in the number of eosinophiles of the anterior lobe.—*Author (courtesy Wistar Bibl. Serv.).*

5351. **DEANESLY, R. The development and vascularisation of the corpus luteum in the mouse and rabbit.** *Proc. Roy. Soc.* [*London*] 107: 60-76. 2 pl. 1930.—A description is given of the development of the corpus luteum in the mouse and the rabbit, up till the time when the lutein cells, formed by the enlargement of the follicular epithelium, have reached their full size. The theca interna gives rise to the vascular connective tissue of the corpus luteum; at its maximum state of development it includes numerous fat-containing cells, some of a fibroblastic type, and others with large oval vesicular nuclei. These cells do not become detached from the sheath but divide mitotically shortly after ovulation and give rise to fibroblastic cells containing fine cytoplasmic fat granules, which penetrate inwards, and constitute both the walls of the blood spaces and the supporting tissue of the corpus luteum. The repeated division of these cells produces a network of endothelial cells, with small darkly-staining nuclei, whose fibers ramifying among the lutein cells constitute the corpus luteum reticulum. During the vascularisation the large cells of the theca interna gradually disappear, leaving no evidence of wholesale degeneration; 36 hours after ovulation little or no trace of the theca interna persists. The theca externa takes part in the vascularisation and forms the sheath of the full grown corpus luteum, but the more active growth comes from the theca interna. It is suggested that the cells of the latter show affinities to the histiocytes of connective tissue. The conditions in the developing corpus luteum of the mouse and rabbit are contrasted with those described by other writers in man and larger mammals, where the theca interna cells are more abundant in proportion to the lutein elements. —*R. Deanesly.*

5352. **FRASER, A. H. H. Lipin secretion in the elasmobranch interrenal.** *Quart. Jour. Microsc. Sci.* 73(1): 121-134. 2 pl. 1929.—The occasional occurrence of an intimate anatomical relationship between the interrenal and chromaffin tissue in *Raja clavata* is described. In addition to the ordinary lobule commonly figured, the interrenal may show hypertrophied lobules, disintegrating lobules, and acini. These various histological pictures are interpreted as various phases in a definite cycle of glandular activity, viz.: resting lobule, distension of lobule; disintegration of lobule; formation of acinus; collapse of acinus; reformation of resting lobule. Evidence is advanced of a massive secretion of lipin into the interlobular capillaries. The exact nature of the lipin could not be determined histochemically. Melanin pigment occurs in glands in the secretory phase. A metabolic relationship between the formation of melanin and the secretion of lipin is thus indicated.—*From author's summary by J. H. Wales.*

5353. **NOBLE, G. K., and S. H. POPE. The modification of the cloaca and teeth of the adult salamander Desmognathus by testicular transplants and by castration.** *British Jour. Exp. Biol.* 6(4): 399-411. 2 pl. 1929. —*D. fuscus carolinensis* exhibits pronounced sexual dimorphism of dentition. In the ♂, premaxillary teeth are monocuspid, directed forward; maxillary teeth broadened, dentary teeth are hypertrophied and restricted to anterior part of jaw, vomerine teeth lacking. Castration of adult ♂ results in replacement of premaxillary and maxillary teeth of the ♂ type by those of ♀ type. No teeth are developed on posterior part of dentary or prevomers, where they occur in ♀♀. Transplantation of testis into adult spayed ♀ causes replacement of ♀ teeth by those of ♂ type. It also evokes the development of pelvic, abdominal and cloacal gland. In one case, where ovary was only partly removed, no cloacal glands developed, but median premaxillary teeth were hypertrophied in ♂ direction, thus exhibiting greater susceptibility to the testis hormone.—*F. A. E. Crew.*

5354. **SMITH, PHILIP E. The effect of hypophysectomy upon the involution of the thymus in the rat.** *Anat. Rec.* 47(1): 119-129. 4 fig. 1930.—The thymi of 17 rats hypophysectomized between the ages of 39 and 93 days have been compared as regards weights and structure with those from controls killed: (1) at the time the pituitary was ablated and, (2) at the termination of the experiment. The time elapsing between hypophysectomy and autopsy varied from 7 to 282 days. The thymus ceases to grow immediately after the ablation of the hypophysis and regresses in weight, although its growth may continue for some time in the controls. This is due to the loss of the anterior, not the posterior, hypophysis, as shown by partial hypophysectomies. The thymi of the operated rats in the long survivals weigh

less than ½ those of the controls. The percentage weights on body weights are, however, nearly the same in the two, due to the difference in general body weights. The hastened involution of the thymi in the operated rats is usually, though not invariably, shown by structural changes. The hastened involution of the thymus following hypophysectomy does not necessarily indicate a direct influence of the anterior pituitary upon the thymus, since other factors (inanition and gonadal, thyroid, and adrenal-cortex atrophy) induced by the hypophysectomy would be sufficient to account for the response.—*Author (courtesy Wistar Bibl. Serv.)*.

5355. **VIALLI, MAFFO.** L'apparato epifisario negli anfibi. [The epiphysial apparatus of amphibia.] [With French, English and German summaries.] *Arch. Zool. Ital.* 13(3/4): 423-451. 1 pl. 1929.—In studies of the histology and cytology of the epiphysial apparatus of anurans the author records the constant presence of sensory cells, indicating that this apparatus is fundamentally sensory. Also, the cycles of its cells and the fact that the products of disintegration (and often fats and lipoids) are poured into the epiphysial lumen show that this apparatus has a glandular function. The epithelial cells also have a secretory function besides their trophic one for the sensory cells; the possibility of an internal secretion, similar to that shown by Adler in the arrest of development of tadpoles after removal of the epiphysis, is also suggested.—*Author's summary.*

BONES, MUSCLES, JOINTS, FASCIAE

5356. **BINSWANGER, HERBERT.** Über physikalische Zustandsänderungen an Knochentransplantaten und krankhaft veränderten Knochen. *Deutsche Zeitschr. Chir.* 203-204: 413-428. 1 fig. 1927.—The changes that occur in bone transplants can be shown by the physical properties. In rabbits, autotransplantation into the soft parts of pieces of the diaphysis of the tibia covered with periosteum showed a decrease in bone elasticity during the first 20 wks.; after 35 wks., an increase (6 rabbits). In 9 wks. a tibia transplant showed about ½ the elasticity of a fresh piece of tibia from the same patient. Pathological changes in bones can also be recognized by variations in physical properties.—*R. R. Best.*

5357? **BÖHMIG, RICHARD.** Über die kataplastischen Veränderungen im menschlichen Rippenknorpel. *Beitr. Path. Anat. u. All. Path.* 81(1): 172-210. 2 pl. 1928.—Cross sections in 301 cases of the 1st, 3rd, 5th, and 7th ribs were examined microscopically. A description of the normal costal cartilage is given first, and includes the local changes which occur during various periods of growth, the course and disappearance of vessels in the cartilage, the development of structures, marrow spaces, fatty deposits, calcification, ossifications, and the appearance of the brown coloring deposits.—*From author's abstr. (transl. by A. Blumberg)*.

5358. **MECHANIK, N.** Untersuchung der Markhöhle und der kompakten Schicht des Oberarmbeines des Menschen und der Haustiere. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 89(4): 513-531. 7 fig. 1929.—Serial sections, each 1 cm. in thickness, were made of the diaphysis of the humerus, the number of the segments for each bone varying in accordance with its length. In all, 363 segments of human and 48 of animal humeri were made. The greatest thickness of the compact layer was found at the level of the 13th-20th segment at the narrowest part of the diaphysis. In childhood the compact layer is not relatively thick, but it increases with age and is thickest between the ages of 32 and 37. Later in life the compact layer becomes resorbed and sparse and the index reaches its lowest value in old age. The layer is thinner in ♀♀. The marrow cavity of the humerus is narrowest from the 13th-20th segment. In children, it is relatively large and has a high index. As age advances this value becomes less and reaches the relatively slightest size from the 32nd to the 37th yr. Later, with the resorption of the compact layer, the cavity becomes relatively large again. The index value is higher in ♀♀ than in ♂♂.—*N. Mechanik (transl. by C. S. Simkins)*.

5359. **NAUCK, E. TH.** Über die Kniescheibe. I. Teil. Das Baumaterial in seinen Beziehungen zur Funktion. *Verhandl. Anat. Ges.* 37: 156-180. 13 fig. 1928.—From a study of numerous amphibia, reptiles, and mammals the author finds that a patella occurs when the tendons of the extensor muscles of the knee converge and interlace. He describes 3 grades of patellae, (1) tendinous-vesicular or patelloid, (2) cartilaginous, and (3) bony. Patelloid forms are found where the tendons of the quadriceps muscle meet at an acute angle, the other forms where the tendons meet at an obtuse angle. The functional adaptions of the 3 sorts of patellae are discussed.—*E. Th. Nauck (transl. by R. F. Shaner)*.

5360. **PATERSON, R. E.** A radiological investigation of the epiphyses of the long bones. *Jour. Anat.* 64(1): 28-46. 1 pl. 1929.—A study based on the examination of some thousands of radiograms and including not only the epiphyses of the long bones, but also the primary centers for the carpal and tarsal bones. The general results are the throwing back of the times of appearance of many of the centers to earlier dates than are usually assigned to them and the emphasizing of their earlier appearance and especially their earlier fusion with the diaphysis in ♀♀, this latter difference in the cases of the epiphyses around the elbow joint amounting to as much as 4 yrs. The earlier appearance of sexual maturity in the ♀ is suggested as an explanation of the difference. —*J. P. McMurrich.*

5361. **RUNGE, HERMANN.** Die Beziehungen der Zahnkeime und Zahnwurzeln zur Oberkieferhöhle während des Kindesalters. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 85(5/6): 734-761. 18 fig. 1928.—In a series from the head of a newborn child to the skull of a 19 yr. old youth, the relation of the tooth-germs and roots of the milkteeth (canine and 2 premolars) and the permanent teeth (canine, 2 premolars and 2 molars) to the sinus was studied in decalcified halves of 6 heads and in 12 "Roentgenograms." The germs and roots of the milkteeth are not in close relation to the sinus at any stage of development. The distance of the germs and roots of the permanent teeth from the sinus is considerably less and more variable than that of the milkteeth. From the 1st to 5th yr. no germ, except the first permanent molar, comes into immediate contact with the sinus. From the 6th to 11th yr. practically all germs, with the exception of the first premolar, which in no case was close to the sinus, are in immediate contact with the sinus. From the 12th to 16th, 19th yr. the close relation of the germs of both molars and the 2nd premolar is maintained. Most variable and striking during this stage of development is the position of the canine in relation to the sinus, and the distance of the tip of the root from the floor or anterior wall of the sinus—less than .5 mm. in the 15th yr., 6.5 mm. in the 16th yr. and again .5 mm. in the 19th yr. In adults the canine is as a rule 7.1 mm. from the anterior wall of the sinus. The reason for the peculiar wandering of the canine is found in the spreading of the nasal cavity and the related growth in length of the upper jaw. If the width of the lower nasal passage in the first year is taken as 4 mm. and in the adult as 9 mm. it necessarily follows that portions of the alveolar arch which originally are lateral to the nasal cavity must later move to the region of the lower nasal passage. This also explains the medial movement of the canine in relation to the forward end of the jaw cavity.—*H. F. Nachtrieb.*

5362. **SCHELL, KLARA.** Das Verhalten des Musculus pectoralis minor bei verschiedenen Stellungen des Schulterblattes. *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 85(5/6): 784-789. 6 fig. 1928.—Observations were made on cadavers to determine the direction and length of the pectoralis minor muscle in the different positions of the shoulder blade in order to find out the usefulness of the muscle in the elevation of the ribs, and thus also for inspiration. With the shoulder

blade depressed or drawn back this muscle has little or no effect, it may even have an expiratory effect. The shoulder in high position is favorable for the inspiratory action of the pectoralis minor, but under physiological conditions this position is rare, as perhaps in swimming. In dyspnea it is of practical significance. The middle position is very favorable for inspiratory action for the normal length of the muscle.—*H. F. Nachtrieb.*

5363. **ALBRECHT, W. Zur Frage der Pneumatisation des Mittelohres. Histologische Untersuchungen am Schläfenbein des Neugeborenen.** *Acta Oto-Laryngol.* 14(1/2): 221-228. 4 fig. 1930.—Previous work has shown that the origin of the cells in the mastoid process and the development of the mucous membrane in the middle ear is definitely dependent on an hereditary character. These observations are supported by histological studies showing that of 44 newly born the process of dedifferentiation of the mucous membrane is extraordinarily varied, but that in one individual both ears are always alike. This is further evidence of the significance of heredity. The varying rates are caused partly by differences in the developmental energy of the epithelium, partly by variations in the resistance of the embryonic connective tissue.—*E. H. Behre.*

5364. **BERKSON, JOSEPH. Evidence of a seasonal cycle in human growth.** *Human Biol.* 2(4): 523-538. 1930.—Data contained in Woodbury's "Stature and Weights of Children under Six Years" were examined, and it was found that there is a suggestive yearly cycle in the progression of the means of stature and weight, plotted against age in months. The statistical significance of the cycle is tested in a number of ways, and it is concluded that the cycle is not fortuitous. Several explanations are suggested, the author favoring the one that there is a direct effect on growth of conditions that are correlated with season of the year, e.g., sunlight, food habits, etc.—*J. Berkson.*

5365. **CLARK, ELIOT R., and ELEANOR LINTON CLARK. Observations on the macrophages of living amphibian larvae.** *Amer. Jour. Anat.* 46(1): 91-147. 2 col. pl., 14 fig. 1930.—The life history, morphological characteristics, and reactive powers of the tissue macrophages have been studied by observation of living cells in the tails of amphibian larvae. Individual cells were followed by uninterrupted observation of 4-36 hours' duration. By means of extravascular injection of carmine granules, which were picked up by tissue macrophages, it was possible to follow with certainty the same cell groups and frequently even individual cells for 3 weeks or longer. The differentiation of early wandering cells from a strand of primitive mesoderm was followed before the appearance of vascular endothelium or of blood cells in the tail. The change of such early wandering cells, following phagocytosis of various substances, into typical large pigmented macrophages was observed. The tissue macrophages were actively migratory and exceedingly phagocytic and underwent amazing transformations in shape and size. Mitotic divisions of macrophages were seen. The permanent transformation of macrophages into any other form of blood or tissue cell was never observed. Macrophages were the most resistant cells in the region studied. They were never seen to die, even in cases of degeneration of, or of injury to, large surrounding areas. Moreover, individual macrophages marked with carmine were identified and followed for 3 weeks, and showed no sign of degeneration. —*Authors (courtesy of Wistar Bibl. Serv.).*

5366. **DALL'ACQUA, VIRGILIO. Ricerche sperimentali sulla fissazione dell'eosina nei tessuti viventi. [Fixation of eosin in living tissues.]** *Boll. Soc. Ital. Biol. Sperim.* 5(5): 724-726. 1930.—Through local action of anesthetics it was possible to obtain a retention of eosin by living tissues. No granular precipitates were observed in the cells or extracellularly. The coloration persisted longer in the surface layers of derma and epidermis; and disappeared first in the deeper layers of connective tissue. After 24 hrs. the eosin disappeared through elimination.—*M. Comel.*

5367. **DALL'ACQUA, VIRGILIO. Ricerche sperimentali sulla fissazione dell'eosina nei tessuti viventi. [Fixation of eosin in living tissues.]** *Lo Sperimentale* 84(5/6): 529-536. 2 col. pl. 1930.—Eosin injected intravenously into rabbits appeared fixed in the dermis and epidermis of areas in the ear over which ether had been applied. Many cells with eosinophilic granules were especially abundant along the blood vessels. The color disappeared in 24 hrs., being lost first in the deep connective tissue. —*M. L. Menten.*

5368. **DOLFINI, GIULIO. I grassi delle cellule cordali. [The fats of the chordal cells.]** *Monitore Zool. Ital.* 40(11/12): 360-361. 1930.—More or less frequently the cells of the notochord in the rabbit, guinea-pig, cat, dog, tadpole and sturgeon contain droplets of fat. The author considers the histochemical properties of this fat and discusses its probable significance.—*G. Dolfini (transl. by J. P. McMurrich).*

5369. **FRY, W. E. Variations in the intraneural course of the central vein of the retina.** *Arch. Ophthalmol.* 4(2): 180-187. 5 fig. 1930.—Serial sections of several optic nerves disclosed frequent variations in the course of the central vein with relation to the course of the central artery, occurring with great regularity and in many cases examined, and differing markedly from the usually described course. In 42% of the cases, the artery and vein pass through the center of the nerve, and at a variable distance behind the lamina cribrosa turn at right angles to the direction of the nerve stem and approach the periphery of the nerve. Usually, they proceed together and cross the intervaginal space immediately after gaining a subpial position. In 58% of the cases the artery and vein pass at a variable distance behind the lamina cribrosa, to the periphery of the nerve in such a way as to make a right angle course with each other. In the cases listed under type 2, the artery and vein approach the periphery of the nerve at different levels within the nerve, the vein usually doing so first; but, no matter which vessel comes to the periphery first, the artery is always the first to cross the intervaginal space and pierce the dura, and may do this a considerable distance anterior to the point of the venous crossing.

5370. **GALKIN, W. S. Über die Bedeutung der "Nasenbahn" für den Abfluss aus dem Subarachnoidalraum.** *Zeitschr. Ges. Exp. Med.* 72(1/2): 65-71. 1 fig. 1930.—The communication between the nasal passages and the subarachnoidal space was closed by operation on 10 dogs; subsequent injection of the subarachnoidal space with India ink and following necropsy demonstrated the great importance of the communication as an overflow passage.

5371. **GERARD, P., R. CORDIER, et L. LISON. Sur la nature de la réaction chromaffine.** *Bull. Histol. Appl. Phys. et Path.* 7(5): 133-139. 1930.—The color reaction in the suprarenal gland treated with bichromate, iodine, osmic acid, or silver nitrate is a compound of 2 stages. The first is the result of oxidation of adrenalin to a quinone which has an orange brown color which may be decolorized by ammonium hyposulphite. This may serve as a depot for the metals which in turn mask the original color. The term chromaffin, referring to chrome salts, should be dropped and pheochrome, signifying colored, should be substituted.—*J. G. Sinclair.*

5372. **HADJIOLOFF, ASSEN. Recherches sur le tissu adipeux chez les poissons et la grenouille.** *Bull. Hist. Appl. Phys. et Path.* 7(1): 8-20. 6 fig. 1930.—Supravital staining demonstrates the first appearance of oil in tiny vacuoles in fibrocytes. This leads to nuclear division probably amitotic, as the vacuole grows. Binucleate fat cells are the rule but multinucleate cells are found. Other cells may also become fat cells.—*J. G. Sinclair.*

5373. **HIGGINS, GEORGE M., and C. GRANT BAIN. The absorption and transference of particulate material by the great omentum.** *Surg., Gynecol. & Obstetr.* 50 (5): 851-860. 8 fig. 1930.—A method is described for the study of absorption by the omentum by isolating

its distal ⅔ in a pouch within the ventral abdominal wall between the integument and muscle layers. The degree of absorption by the isolated omentum was studied at frequent intervals, ranging from 30 min. to 48 hrs. after injection. Lymphatic vessels within the omentum have not been demonstrated conclusively and yet absorption from this organ is essentially by way of the lymphatics of the diaphragm and the mediastinum. It was not possible to demonstrate either free particles or graphite-laden histocytes in the omental blood vessels, following injection into the subcutaneous pouch. Following phagocytosis of the graphite particles by active mobile histocytes these cells accumulate along the blood vessels and pass toward the gastric and splenic attachments of the great omentum. The routes of drainage from the distal part of the omentum follow essentially the mesothelial lining of the lesser peritoneal sac. From the gastrolienal ligament, drainage follows around the dorsal surface of the stomach, along the lesser omentum to the caudate lobe of the liver, and thence along the coronary ligament of the liver and the central tendon of the diaphragm to the anterior mediastinal lymph nodes.—*Authors' summary.*

5374. **KIKAI, KUNIMARO. Über die Vitalfärbung des hinteren Bulbusabschnittes.** *Arch. Augenheilk.* 103(3/4): 541-553. 6 fig. (col.). 1930.—Following the intravenous injection of dyes into albino rabbits, the animals were examined with the ophthalmoscope and the eyes then quickly enucleated and the retinas examined. Some retinas were fixed by the gelatin-freezing method and sectioned. Only acid dyes such as fluorescein, eosin, trypan blue and Chicago blue colored the retinal vessels. Na indigo acid sulphate did not color the vessels; nor did the basic dyes used (malachite green, methyl violet, crystal violet, bismarck brown, isamine blue, aniline blue, Bavarian blue, diamond black, pyronin G, basic fuchsin and trypaflavin); these latter stained the retina and choroid at the moment of injection but almost immediately were reduced by the tissues; if the retinas were removed the coloring returned. Methyl blue, methyl green, toluidin blue, naphthylene blue, brilliant cresyl blue and neutral red stained the cellular elements of the retina but could be demonstrated only in flat preparations and not ophthalmoscopically. Methylene blue stained the layers of the nerve fibers and ganglion cells chiefly, while brilliant cresyl blue was selective for the amacrine cells. The acid sulphur dyes as fuchsin S, etc., stained the choroid and left the retinal vessels and retina uncolored. The choroid appeared to be more acid than the retina which remained alkaline.—*F. H. Adler.*

5375. **SCHAFFER, JOSEF. Über das sogenannte Ligamentum annulare einiger Knochenfische.** *Jahrb. Morph. u. Mikrosk. Abt. 2. Zeitschr. Mikrosk.-Anat. Forsch.* 18 (1 2): 37-46. 7 fig. 1929.—This paper represents a portion of the author's chapter on supporting tissues in "v. Möllendorff's **Handbuch der mikroskopischen Anatomie"** (1928). Observations on the ligamentum in the eye of *Anabas scandens, Cyprinus carpio, Alburnus lucidus, Belone guianensis* and *Ramphistoma belone* reveal the presence of the most primitive type of supporting tissue ("chordoidem Typus"), undoubtedly of mesodermal origin, in bony fishes, and also a hitherto unknown rich glycogen storer, apparently attached to this tissue. These peculiar supporting cells remind one of the tonofibrillae of the epidermis in the carp and of the conditions noted by Tretjakoff in the cells of the chorda dorsalis of cyclostomes.—*H. F. Nachtrieb.*

5376. **TURKEWITSCH, B. G. Alters- und Geschlechtseigenschaften des anatomischen Baues des menschlichen knöchernen Labyrinthes.** *Anat. Anz.* 70(11/12): 225-234. 8 fig. 1930.—The material consisted of 61 preparations, sources distributed as follows according to age and sex: 12 fetuses of 8 mos. (5 ♂, 7 ♀), 8 fetuses of 9 mos. (5 ♂, 2 ♀, 1 ?), 19 new-born (11 ♂, 2 ♀, 6 ?), 2 ♀ infants of 6 mos., 2 ♀ infants of 8 mos., 1 ♂ infant of 9 mos., 4 children 1 yr. old (2 ♂, 2 ♀), 4 children 1½ yrs. old (2 ♂, 2 ♀), 1 ♂ 2 yrs. old, 2 ♂♂ 2½ yrs. old, 1 ♂ 8 yrs. old, 1 ♂ 15 yrs. old, 1 ♂ 16 yrs. old, 1 adult (sex unknown) 30-40 yrs. old, 1 ♀ 45 yrs. old, 1 ♀ 81 yrs. old. The conclusions are: The length of the vestibule does not change up to 2½ yrs. and becomes only about 0.2mm.-0.3mm. larger towards old age. Growth in breadth of the vestibule stops at the 5th mo. The height of the vestibule is the same in both sexes. The vestibule becomes more flattened with age but the vestibular window does not change. The vestibular walls thicken with age and fuse with the compact substance of the petrous portion of the temporal bone. The vestibule is larger in ♂♂ than in ♀♀. The dimensions of the vestibular window are the same in both sexes. The semicircular canals do not enlarge with age but become rounded in cross section. The canals, ampullae and crus commune are longer in ♂♂ than in ♀♀. The S-shaped curve of the canals (i.e., the spiral lateral curve) is clearly marked in fetuses and new-born. The relationship of the planes in which the canals form the S-shaped curves does not change with age or sex. The cochlea becomes higher with age and the breadth of the base of its first coil becomes larger. Shape and size of the vestibular window are very variable, although unrelated to age and sex. In ♀♀, the cochlea is higher and the base of its first coil is broader. —*Author's conclusions (transl. by H. W. Kaan).*

DESCRIPTIVE

5377. **ALLEN, EDGAR, J. P. PRATT, Q. U. NEWELL, and L. J. BLAND. Human ova from large follicles; including a search for maturation divisions and observations on atresia.** *Amer. Jour. Anat.* 46(1): 1-53. 5 pl. 1930.—In human ovaries removed at operation, the number of follicles ranged from 2 to 32 per ovary, the size from 3 to 30 mm. in average diameter. Most of the normal ova were attached to the follicle walls. Mitotic division of follicle cells was used as a criterion of normale growing follicles. The description of normal ova includes measurements and observations on living eggs checked by study of sectioned specimens. One oocyte in the process of meiotic division was removed from a 10-mm. follicle on the 14th day following onset of the previous menses. The chromosomes of the second maturation spindle were intact and 22 were counted. The first polar body contained 12 chromosomes. Several follicle cells in mitotic division indicated that this follicle was still actively growing and might have ovulated. The pre-ovulation size of the human follicle is at least 10 mm. A majority of large follicles were atretic and several interesting types of atresia are described. One type showed the invasion of follicle cells under the zona pellucida combined with vacuolation or fragmentation of the vitellus. This may give rise to "cell balls" obtained from washing out uterine tubes. Selective elimination of ova occurs in human ovaries during late stages of growth of the follicles.—*Author (courtesy Wistar Bibl. Serv.).*

5378. **AOYAMA, FUMIO. Die Entwicklungsgeschichte des Kopfskelettes des Cryptobranchus japonicus.** *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 93(1/2): 107-181. 26 fig. 1930.—The trabeculae cranii of

the prechordal skull and the otic capsules of the parachordal skull are the first parts to appear. The fenestra olfactorii lies first in a vertical parasagittal plane, later much nearer the frontal plane. Just before metamorphosis there appears a hitherto undescribed cartilaginous plate beneath the cavum internasale, and it persists in the adult. The columella appears attached to the palatoquadrate. Its auricular end mushrooms, while the attachment to the palatoquadrate is lost. The base of the skull remains cartilaginous. The notochord degenerates except in the atlanto-occipital region where it chondrifies. The internasal cartilage arises from an independent center and completely separates the internasal cavity from the cranial cavity. The palatoquadrate offers several peculiarities including a hitherto undescribed hyoid process. Ossification in the neural skeleton begins around the nerve foramina. The first bones to complete their development are the premaxillary and the dental. Details of ossification of other bones especially of the pterygoid palatine, tympanic and operculare are given.—*R. F. Shaner (from summary).*

5379. BYERLY, THEODORE C. The effects of breed on the growth of the chick embryo. *Jour. Morph. & Physiol.* 50(2): 341-359. 1930.—The growth of embryos of heavy and light breeds and the reciprocal crosses between them is described. The embryos of the heavier breed and the hybrids were somewhat heavier than the embryos of the lighter breed from the 10th day of incubation to hatching time. In eggs of the same weight from the 2 breeds the size difference tends to disappear toward hatching time, probably due to the equivalence of the strictly limited food supply. It is pointed out that the size difference is more probably due to difference in the proportion of cells dividing at a given time than to a difference in duration of mitoses. The mortality of the hybrid embryos was intermediate between that characteristic of the parent breeds, while the percentage of monsters in the hybrids was less than that for either parent breed. There is thus some indication of heterosis. —*Author (courtesy Wistar Bibl. Serv.).*

5380. CHIARUGI, G. Stadi precoci nello sviluppo della cornea e della membrana pupillare in Petrogale penicillata. [Precocious stages of development of cornea and pupillar membrane in P. penicillata.] *Boll. Soc. Ital. Biol. Sperim.* 5(5): 790-791. 1930.—The middle layer of the cornea had the characters of a mesostroma in an embryo of 10 mm., while corneal cells and pupillar membrane were already differentiated in embryos of 15 mm. —*M. Comel.*

5381. DAWES, BEN. The development of the vertebral column in mammals, as illustrated by its development in Mus musculus. *Phil. Trans. Roy. Soc. London B* 218(453): 115-170. 4 pl., 7 fig. 1930.—This is a study of the development of the vertebral column in 200 embryos, representing 30 stages, from 2 mm. to parturition. Cells which subsequently comprise the sclerotomes are liberated from the dorso-mesial portions of the primitive somites. A narrow cleft divides each sclerotome into a cranial and a caudal sclerotomite. The caudal divides into a dorsal and a ventral half. The dorsal portion forms the basi-dorsal component; while the ventral forms the basi-ventral component. The development of the vertebral column in white mice falls naturally into 4 stages, designated the mesenchymatous, sclerotogenous, chondrogenous, and osteogenous. The mesenchymatous stage is the early one in which the notochord is surrounded by a loose layer of mesenchyme. It is not an axial supporting organ. Sclerotomes develop during this period, which terminates at about the 5.5 mm. body length. The sclerotogenous stage begins with the development of the perichordal disc from the cranial and caudal sclerotomites. Basi-dorsals and interdorsals form, and primordia of the ribs are formed. The stage reaches to about the 7.2 mm. body length. The chondrogenous period arises with the centrum rudiment and the chondrification of the basidorsal and the rib components. The procartilaginous basi-dorsals fuse with the centrum, the interdorsals and rib processes chondrify and the neural arches are completed during this period. The zygapophyses are formed near the end of the period, which extends to the 14 mm. stage. During the osteogenous period bone centers are laid down in the angles of the ribs, the neural arches and the centra in turn.—*G. M. Higgins.*

5382. GÖGL, HERMANN. Der sekundäre und tertiäre hintere Neuroporus beim Kanarienvogel. *Jahrb. Morph. u. Mikrosk. Anat. Abt. 2, Zeitschr. Mikrosk.-Anat. Forsch.* 23(1/2): 227-235. 4 fig. 1930.—Examination of 5—13 day old embryos and 3—5 day old canaries showed that the secondary posterior neuropore appeared very late in the incubation period (9th day), the first changes appearing on the 8th day. In manner of formation (distension and rupture) it was midway between the large and small secondary neuropore of the chicken, duck, and goose. The epithelium regenerated again, the canal was again surrounded with neuro-epithelium, and the end of the cord receded cranially. In the 3 day old bird a tertiary posterior neuropore formed, which was still present in the 5 day old and presumably was permanent.

5383. GRAY, PETER. The development of the amphibian kidney. Part I. The development of the mesonephros of Rana temporaria. *Quart. Jour. Microsc. Sci.* 73(3): 507-546. 5 pl. (1 col.), 8 fig. 1930.—In *R. temporaria* the early malpighian units (tubule + glomerulus and its capsule) arise as vesicles within the nephrogenic blastema, the tubules of the left side being always more advanced in development than those of the right. Some 5 or 6 of these units fail to develop completely but become modified into the so-called collecting tubules. The peritoneal funnels arise from a small mass of cells of uncertain origin but uniformly evident between a glomerulus and the peritoneal surface of the mesonephros. The later units begin to appear when the larva is about 18 mm. in length and continue to be formed until the end of the 2nd year of life. A vesicle appears within the blastema and later develops into glomerulus and capsule, the tubule growing out from the latter. Connection is established with the archinephric duct through fusion with buds which appear upon the collecting tubules. The vesicles are first formed in the dorsal part of the organ; as development proceeds they are pushed ventrally by those produced later; hence they occur in dorsiventral rows. Some peritoneal funnels arise as with the early units but more arise from special "funnel-forming" tubules which appear dorsally in the blastema and grow ventrally reaching the peritoneal surface of the mesonephros. Here their tips become ciliated, separate from the rest of the tubule, and while one end establishes a connection with a blood vessel the other end opens into the peritoneal cavity. No peritoneal funnel ever opens into a malpighian corpuscle. The short larval life seems to require the rapid development of mesonephric units; suggestions are offered as to the possible manner of derivation of this rapid method from the ancestral amphibian type.—*W. H. Piersol.*

5384. GUDGER, EUGENE WILLIS, and BERTRAM G. SMITH. The segmentation of the egg of the Myxinoid, Bdellostoma stouti, based on the drawings of the late Bashford Dean. In: **Bashford Dean Memorial Vol. Archaic Fishes, ed. by E. W. GUDGER.** p. 47-60. 2 pl., 7 fig. *Amer. Mus. Nat. Hist. New York,* 1931.—The egg is large, 14.3-29 mm. long; average length for 70 eggs, 22.8 mm., average width, 8 mm. The egg is strongly telolecithal: most of the protoplasm is segregated at the opercular end, in the vicinity of the micropyle. The blastodisc is upraised to form the unique germinal hillock. This at first is nipple-shaped, but through a gradual reduction in height and a broadening of the base it becomes dome-shaped or helmet-shaped. Its later history is obscure but it probably flattens out to conform to the general contour of the egg since it is entirely absent at the time of gastrulation. A fairly complete series of segmentation stages is illustrated by lithographic reproductions of Dean's drawings. Cleavage is discoidal; the marginal blastomeres are incompletely separated from each other and from the general protoplasmic mass

by radial furrows. Early cleavage is limited to the germinal hillock but in later stages extends beyond its site.—*B. G. Smith.*

5385. HARGITT, GEORGE T. The formation of the sex glands and germ cells of mammals. III. The history of the female germ cells in the albino rat to the time of sexual maturity. *Jour. Morph. & Physiol.* 49(2): 277-331. 5 pl. 1930.—The entire ovary, including its germ cells, is produced by a local proliferation of peritoneal cells. The germ cells of the embryonic ovary grow, divide, become grouped into nests, pass through synaptic changes, and becomes primary follicles by 3 days after birth. At that time, growth of all the ova and follicles begins, and this results in a normal maturation, then a degeneration of all the ova by about 32 days after birth; few, if any, of the original germ cells remain after this degeneration. About 23 days after birth, there begins a great activity of the germinal epithelium in forming new ova, reaching its maximum between 36 and 39 days, but continuing into the adult animal. The definitive ova of the adult are transformed peritoneal (germinal epithelial) cells formed anew during the late youthful and adult life. This occurs chiefly by a local enlargement of single germinal epithelial cells which become surrounded by follicle cells and push into the ovary; there is also the production of ova from ingrowing cords of the surface layer of the ovary. The original germ cells pass through synapsis and other meiotic changes in late embryonic and early postnatal periods, but these all degenerate; synapsis cannot be distinguished later than 3 days after birth. But it is possible to follow, in young and adult ovaries, the transforming germinal epithelial cells into ova which pass through normal maturation and ovulation; therefore, these must be considered as true ova, which they are in fact, even though synapsis cannot be observed in their history.—*Author (courtesy Wistar Bibl. Serv.).*

5386. HARGITT, GEORGE T. The formation of the sex glands and germ cells of mammals. IV. Continuous origin and degeneration of germ cells in the female albino rat. *Jour. Morph. & Physiol.* 49(2): 333-353. 2 pl. 1930.—The current view in mammals is that ova are formed in the embryo in large numbers and stored in the ovary as a reserve to be drawn on through adult life; they may persist for long periods in a latent condition, a few resuming active development at each recurring oestrous period; new ova are not and cannot be added. An alternative hypothesis has been presented by several authors: New ova are formed throughout life, from the embryonic period through the time of sexual maturity; each ovum so produced must at once begin its growth and development or die; long latency of oocytes and primary follicles is not possible and does not occur. There is a constant degeneration of most follicles, and only a few come to ovulation. A study of the albino rat presents evidence which is consistent with the second view and supports it more strongly than it does the older hypothesis. Similar evidence is found in other mammals. It seems probable that the newer hypothesis is the correct one, at least in some mammals; further investigation may show it to be of general application.—*Author (courtesy Wistar Bibl. Serv.).*

5387. HOFFMAN, A. C. Opsomming van nuwe Navorsinge oor die Opbou en Ontogenese van die Zonaalskelet bij amphibia, vernaamlik van Cryptobranchus alleghaniensis, Necturus maculatus, Heleophryne en Xenopus laevis. [Formation and ontogeny of the pectoral skeleton in amphibia.] *S. African Jour. Sci.* 27: 446-450. 1930.—In this paper a description of the development of the sternum and of the ypsiloid cartilage of the urodeles, of the epipubis of *Xenopus* and of the episternum of *Heleophryne* is given. The sternum of *Cryptobranchus alleghaniensis* is of mixed origin. It develops partly as a paired chondrification of the linea alba, and partly it is of zonal origin as in *Bombinator* (de Villiers, 1922). *Necturus maculatus,* in which the problematic chondrifications of the inscriptiones tendineae are totally absent, shows arcifery in the posterior portions of the coracoids only. The sternum is here only potentially present in the form of paired chondrifications in the linea alba. The episternum of *Heleophryne* seems to be of zonal origin, but a full developmental series must still be studied before this could be considered as proven. The ypsiloid apparatus develops in the form of a paired chondrification of the linea alba immediately in front of the girdle. There is never any cartilaginous continuity between the ypsiloid cartilage and the pubic region of the girdle. There is no homology between the ypsiloid apparatus and the processus epipubicus of *Necturus.* The ypsiloid cartilage must be considered as homologous to the epipubis of *Xenopus.*—*Author's summary.*

5388. LIU, CHENG-CHAO, and JU-CHI LI. The changes in the digestive system of Rana nigromaculata and Kaloula borealis during metamorphosis. *Peking Soc. Nat. Hist. Bull.* 4(4): 67-91. 3 pl. 1930.—The formation of the stomach and duodenum is earlier than the intestine as a whole, which is differentiated step by step from the central yolk mass. The liver and pancreas appear at about the same time as the stomach and duodenum. Due to the coil formation of the intestine, the stomach, liver and pancreas change their positions 4 times before they reach the adult condition. After metamorphosis the intestine is reduced until it is 1/9 of its maximum length. Shortening of the intestine and stomach is probably due to contraction of the newly developed muscular coats. The larval stomach and intestine consist of 2 layers of tissues, the inner epithelium and the outer membranous coat. Between the two, certain small, round, deeply-stained basal cells make their appearance in the 18 mm. tadpole. The degenerative process starts below the larval epithelium and near the basal cell region at the time the 2 hind legs of the tadpole are half developed. The degeneration is by autolysis and not by phagocytosis; it is accompanied by a compensating regenerative process centering around the basal cells which increase in number to form a growth zone from which the adult organs are differentiated. After the larval epithelium is discarded into the lumen of the intestine, some of the basal cells become giant cells and form a syncytial layer, from which the new mucosa is formed. Throughout metamorphosis the muscular layers constantly increase in thickness as a result of the mitosis of the primary muscle cells. The degeneration in the liver is due to autolysis as in the stomach and the intestine. The liver of the young adult is formed by rearrangement and aggregation of the larval tissue. In the pancreas, evidences of mitosis are found, indicating that beside the rearrangement and aggregation of larval elements there may be some new growth in the formation of the adult pancreas. Stomach and intestine show a gradual and constant increase in length, volume, and thickness from the 7 mm. to the 45 mm. stage when the hind legs are fully developed. Liver and pancreas likewise increase in weight and volume during the same interval except that the liver reaches its maximum size slightly later. After the 2-leg stage, while the stomach continues to increase its weight, volume and thickness as before, the intestine shows a rapid decrease in length, volume and weight. However, the thickness begins to increase gradually. Liver and pancreas after having reached their maximum size decrease in weight and volume continuously all through metamorphosis. The number of mitoses was carefully counted, showing that with increase in thickness of the alimentary canal there is a corresponding increase in the number of cell divisions. When metamorphosis is nearly completed the number of mitoses diminished. Great significance is attached to this phenomenon as clean-cut evidence to show that the new cellular activities are responsible for the formation of the adult organs.—*Authors' summary.*

5389. LOEB, LEO. Parthenogenetic development of eggs in the ovary of the guinea pig. *Proc. Soc. Exp. Biol. & Med.* 27(5): 413-416. 1930.—Embryological evidences are presented that the structures observed by the author in the ovaries of virgin guinea pigs (Arch.

Mikrosk. Anat. u. Entwicklungsgesch. 65: 3. 1905) are embryos, not merely abnormal corpora lutea as was suggested by Kampmeier (Amer. Jour. Anat. 43: 45. 1929). In some cases, these bodies were found in gravid ♀♀ in late pregnancy. They are not uncommon.

5390. **MEYER-RÜEGG, H. Die Einbettung und erste Blutversorgung des menschlichen Eies.** *Arch. Gynaekol.* 140(2/3): 466-495. 14 fig. 1930.—This article is based on histologic study of a human ovum in situ. The conclusion is that the human ovum, on its arrival in the uterus, finds a subepithelial blood focus into which the ovum with its coverings penetrates to the capillary wall. Thus, from the beginning it lies in a blood-space the contents of which are renewed by the capillaries, and which is gradually enlarged by inclusion of the surrounding vessels. Imbedding and blood-supply are essentially connected; neither is possible without the other.

5391. **ODGERS, P. N. B. Some observations on the development of the ventral pancreas in man.** *Jour. Anat.* 65(1): 1-7. 1 pl., 3 fig. 1930.—Reconstruction models of the pancreas were made from human embryos 5, 7.1, 11.4, 14 and 23 mm. in length. In the 5 mm. embryo the ventral pancreas appears as a bilobed mass, in which 2 apparent lumina can be distinguished; this is replaced in the 7.1 mm. stage by a single outgrowth. These observations tend to support the view that the ventral pancreas in man is developed by 2 separate proliferations from the hepatic diverticulum, both of which, fusing early, may share in the formation of the adult gland. This view is confirmed in the 11.4 mm. embryo. Here there is a duplication of the ventral duct, apparently due to delayed fusion of the 2 ventral anlagen.—*Author's summary and conclusions.*

5392. **PORTA, ELETTA. Sulla distribuzione topografica delle mitosi nel cuore di embrioni di pollo nei primi due giorni di incubazione. [Topographic distribution of mitoses in the chick heart during the first two days of incubation.]** *Boll. Soc. Ital. Biol. Sperim.* 5(6): 897-899. 1930.—The frequency of mitosis was greater in the dorsal region and the surrounding portions than in other portions of the embryo. In the stage preceding the disappearance of the dorsal mesocardium the growth of the heart is more intense in the dorsal region, whereas the growth becomes diffuse and uniform after disappearance of the dorsal mesocardium.—*M. Comel.*

5393. **QUIRING, D. P. The development of the ear of Acanthias vulgaris.** *Jour. Morph. & Physiol.* 50(1): 259-293. 3 pl., 27 fig. 1930.—This is the first single detailed account of the development of the selachian ear. The auditory placode appears at 3.5-4 mm. stage. The endolymphatic duct, formed at 5 mm., remains open to the exterior in the adult. Anlagen of the semicircular canals appear at 15-20 mm. At 22 mm. the sacculus, ventriculus, and lagena arise in the walls of the vesicle. The differentiation of the component structures of the ear is complete at the 33 mm. stage. Innervation of the ear is described. Comparisons with related forms are made. In *A. vulgaris,* the posterior semicircular canal opens into the sacculus medially. Eight drawings are from wax reconstructions of various stages.—*J. W. Price.*

5394. **ROMANOFF, ALEXIS L. Study of metabolic changes in the embryo and egg-contents under the standard conditions of artificial incubation.** *Proc. 21st Ann. Meet. Poultry Sci. Assoc. 1929.* In: *Bull. Alabama Polytech. Inst.* 25(1): 45-49. 1930.—Under standardized conditions of artificial incubation it was possible to obtain regular curves of the natural embryonic growth and metabolic changes in the embryo and in egg-contents. The embryonic growth curve was very regular, with but slight indication of the invariably present growth-cycles. The curves of the dry matter, total ash and Ca content of the embryo were also very regular and closely follow the growth curve. The curves of the % (a) of dry matter in wet-weight, (b) of total ash in wet-weight and in dry matter, and (c) of Ca in wet-weight, in dry matter and in total ash, were regular, but quite distinct in each case. The curves for the physico-chemical changes in eggs were regular and distinct, particularly in the loss of weight by eggs and in the percentages of dry matter in yolk, albumen and eggshell.—*Author's summary.*

[The partitioning of the primitive auricle and the manner of obliteration of the foramen of Botalli.]** *Ann. Anat. Path. et Anat. Normale Méd.-Chir.* 7(4): 478-484. 8 fig. 1930.

5396. **SONDERMANN, R. Beitrag zur Entwicklungsgeschichte der Vorderkammer und des Hornhautendothels.** *Graefe's Arch. Ophthalmol.* 125(3): 407-427. 21 fig. 1930.—Eyes of fetuses showed that the corneal endothelium was of ectodermal origin. The thick ectodermal layer lying before the lenticular vesicle was split toward the surface by ingrowing scleral fibers so that these were clasped by epithelial cells on both sides. The endothelium proceeded from the cells on the inner side. The anterior chamber formed in the periphery following the development of the pupillary membrane which began about the end of the 2nd month. The aqueous humor filtered from the relatively wide capillaries of the pupillary membrane and of the tissue lying before the transitional fold of the secondary optic vesicle. Filtration occurred because of the inhibitory pressure exerted on the efferent irido-scleral vein by the sclera, increasing the blood pressure above normal. The formation of the anterior chamber and the pupillary membrane often may be retarded even several months.

5397. **YAMAZAKI, K. Essai sur l'asymétrie mandibulaire normale chez le foetus et le jeune enfant.** *Arch. Anat. Histol. et Embryol.* 12(1/4): 111-124. 1930.—This paper presents the statistical results of comparisons of measurements of weights and several linear components of the right and left rami of the jaws (dried) of 167 fetuses and young infants ranging in age from 5 mos. before to 5 mos. after birth. The measurements taken in 0.1 mm. are applied to: rectilinear length from symphysis to condyle, tangential to the alveolar groove (*L T*); length of alveolar groove (*L A*); maximum height of coronoid process (*H R*); minimum width of coronoid process (*L R*); maximum thickness of mandibular ramus (*E H*); and minimum height of mandibular ramus (*H H*). Inequality of weight is more frequent on the right side as compared with the left (34% as compared with 17%). Inequality in the linear measures is more frequent on the left side for all measurements except the minimum height of the mandibular ramus. The linear measurements which follow most closely the variations in weight are the maximum height of the coronoid process and the minimum height of the mandibular ramus. Of all the linear measurements, *H R* is the most variable, followed by *L A* and *L T*. There is a correlation between the homolateral variations of *L T* and *L A*, *L T* and *L R*, and *H R* and *H H* (these are found either by using the method of frequencies or of means). It is concluded that if a mandible in contrast with its congener is variable in its length then the several components of its length are variable; the same is true of the variations in the components of height. The 2 principal types of asymmetry are of architectural origin, that is to say, they are consequent to a general asymmetry of the face and of the cranium rather than of local origin such as could be caused by asymmetry of muscles and teeth.—*J. E. Kindred.*

EXPERIMENTAL

5398. **ADAMS, A. ELIZABETH. Some effects of removal of endoderm from the mouth region of early Amblystoma punctatum embryos.** *Jour. Exp. Zool.* 58(1): 147-163. 1 pl., 20 fig. 1930.—A large rectangle of endoderm was removed from the stomodaeal region of *A. punctatum* embryos with closing or closed neural folds. 32 of 65 embryos operated upon survived for study of mouth- and tooth-germ formation. In some cases no ectodermal-endodermal contact was established, and if such embryos lived to a stage when the mouth should

have opened, no perforations were formed. In other instances, a contact between ectoderm and endoderm occurred, and such embryos developed open mouths, somewhat abnormal in shape and size, when old enough to do so. Tooth germs developed in all embryos of stage 38 or older, but they were in every case reduced in numbers when compared with normal animals of similar stages. This reduction occurred not only in tooth germs with endodermal enamel organs (endoderm had been removed), but also in those with ectodermal enamel organs (no ectoderm had been taken away). Numbers of both types of dental anlagen were relatively higher in animals where open mouths had formed. These results seem to emphasize the importance of a proper arrangement of the potential tissues for normal mouth formation. No decision was reached concerning which layer (epithelium or pulp) instigates the formation of a tooth germ. The results, perhaps, indicate a greater primary activity of the epithelium.—*Author* (*courtesy Wistar Bibl. Serv.*).

5399. EINSELE, WILHELM. Entwicklungserregung von Froscheiern durch Injektion zellfreier Organextrakte. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 123(2): 279-300. 1930.—Using glass capillary tubes, serum or extract of sperm, of blood cells, of muscle, or of blood was injected into frog eggs, controls being either pricked or injected with distilled water. Thus inoculation with formed elements was avoided in studying the nature and mechanism of the so-called 2nd factor of traumatic parthenogenesis in Anura. The results were about the same as with the old inoculation method (40-60% morulae). The percentage of developing eggs depended upon the concentration of the injected extracts. The undiluted extracts were lethal; increasing dilution led to increasingly high percentages of developing eggs to an optimal point. Great dilutions gave the same results as when eggs were only pricked. No difference between the action of sperm and blood extract was found. Muscle extract gave no positive results; when undiluted it killed the eggs, diluted it had no effect. Its pH was about 5.6, the pH of the other extracts ranged about 7; addition of n/200 NaOH to muscle extract, increasing its pH to 7, was also without effect. Experiments to reproduce the supposed colloid-chemical action of the organic extract by the swelling and precipitating action of salt solutions (sol. of KSCN, KCL, $MgCl_2$, $MgSO_4$, $CaCl_2$, mixtures of these solutions in the most varied concentrations injected into the eggs), likewise peptone, were unsuccessful. Only very high concentrations (more than 1 mol) of many salt solutions (e.g., KSCN not even in concentrated solution) caused injuries similar to those produced by the concentrated extracts; no improved development was observed. To determine whether definite substances were responsible for stimulating development, the ferments of the extracts were investigated; thus blood extracts which had been heated for varying periods of time were injected. Unequivocal results were not obtained. Thus far it appears as if the fermentative action participates, for blood extract quickly warmed to 75° had about the same effect on the eggs as the untreated extract, while blood extracts heated 1 hr. at 55° had almost no action. The same method was used to determine whether a certain colloid-chemical structure of the extract was necessary, since blood extract warmed to 75° was dirty gray and very clouded, while the untreated extract was ruby red and clear. Since the brief heating to 75° and the great change in structure apparently did not affect its action it is assumed that the colloid-chemical structure of the extract had no particular significance.

5401. HELFF, O. M. Studies on amphibian metamorphosis. VIII. The rôle of the urostyle in the atrophy of the tail. *Anat. Rec.* 47(2): 177-186. 1 fig. 1930.—*Rana pipiens* larvae, 75-90 mm. long were used. The urostyle develops from a small cartilaginous rod 2-3 mm. in length located near the junction of the body and tail between the notochord and dorsal aorta. In 26 cases of extirpation which lived through subsequent metamorphosis, normal tail atrophy took place during involution simultaneously with groups of normal and operated controls. Subsequent autopsy failed to reveal regeneration of urostyle cartilage. It is concluded that the growth of the urostyle cannot be considered the fundamental cause of tail atrophy, while the tissues of the tail appear to be specifically susceptible to histolytic agents in the blood stream. Possible lowering of the blood pH or the presence of specific chemical substances capable of inducing histolysis is suggested as the possible causative factor.—*Author* (*courtesy Wistar Bibl. Serv.*).

5402. HOOKER, DAVENPORT, and J. S. NICHOLAS. Spinal cord section in rat fetuses. *Jour. Comp. Neurol.* 50(2): 413-467. 3 pl., 1 fig. 1930.—An experimental study of the functional and morphological changes occurring after section of the spinal cord of 11-20 day fetuses of the albino rat (246 fetuses of *Mus norvegicus albinus* and 47 fetuses of a hooded strain). Following transection by electrocautery or by mechanical means, the fetuses exhibit no shock, nor are reactions reflexly elicited qualitatively different from the normal. The threshold to stimuli is, however, increased. The reactions shown result in coordinated movements during intra-uterine life. As no histological evidence of a continuous nervous pathway is found, an hypothesis to explain this phenomenon is as follows: The mechanism of the transmission of responses from one end of the body to the other across the break in the nerve paths probably is as follows: (a) stimulation posterior to the level of cord injury is transmitted by exteroceptive nerves to the intact portions of the cord; (b) through the cord, muscular movements in the dorsal, flank, and ventral musculature occur; (c) the muscular reaction sets up a tension in the flank muscles or a reaction in a contiguous muscle group; (d) the muscular contraction is carried by proprioceptive fibers to uninjured cord segments across the region of transection, where, (e) a reflex motor discharge occurs. When specific responses are individuated from the mass reactions of these rats after birth, coordination of movement fails in many respects. There is no evidence of regeneration in the cord or ganglia, the cells of which undergo cytolysis, probably autolytic in nature. There is little or no cellular replacement.—*Author* (*courtesy Wistar Bibl. Serv.*).

5403. HUMPHREY, RUFUS RICHARD. Studies on sex reversal in Amblystoma III. Transformation of the ovary of A. tigrinum into a functional testis through the influence of a testis resident in the same animal. IV. The developmental potencies exhibited by the modified ("freemartin") ovary of Amblystoma tigrinum following removal of the testis which had induced its modification. *Jour. Exp. Zool.* 58(1): 333-365. 5 pl., 2 fig.; 367-399. 4 pl. 1930.—III. By removal of 1 gonadic preprimordium from *Amblystoma* embryos of stages 24-32 and its replacement with a preprimordium from another embryo of like age, animals may be secured in which an ovary and a testis develop concomitantly from early embryonic life. Under these conditions, the ovary present in any host undergoes modifications reducing it to a rudimentary or vestigial state. Formation of the central ovarian cavity is suppressed and growth of the ovarian cortex is inhibited and its germ cells caused to degenerate. The proximal portion of the ovary (medulla, hilar region, and adjacent mesovarium) becomes prominent, due to the hypertrophy of its rete elements. If any considerable number of germ cells is present in this situation in any part of the ovary, this region may give rise to testicular lobules and thus transform into a testis of normal adult structure. In some cases spermatozoa were developed in such transformed ovaries; since these organs are connected by efferent ductules to the wolffian duct or vas deferens, they would be able to function as

normal testes. Germ cells of the ovary which give rise to testicular lobules appear to be those which do not become included in the ovarian cortex at the time of sex differentiation, but remain at the hilus of the organ or in the mesovarium.—IV. In the above mentioned rudimentary or vestigial condition of increased prominence of the hilar and medullary portions and the degenerate condition of the cortex of the ovary, the appearance is that of a testis rather than of an ovary. Upon removal of the testis which had induced this modification, however, the gonad usually regenerates as an ovary, unless, in some portion of its extent, it has already begun transformation into a testis. In this event, the transformed or testicular portion of the gonad usually suppresses or inhibits cortical regeneration in the remainder of the organ, and the gonad continues its development as a testis. Since germ cells of the cortex decrease in number during the time the ovary continues under testicular influence, while germ cells (spermatogonia) of the hilus and medulla tend to increase, even though slowly, it follows that early removal of the testicular influence favors regeneration of the modified ovary as an ovary, while delaying such removal favors reversal of the ovary into a testis.—*Author (courtesy Wistar Bibl. Serv.).*

Influence of temperature upon the growth of fibroblasts in coverglass cultures.** *Cytologia* 2(1): 77-80. 1930.—The longest time during which all the tissues in the hanging drop cultures (embryonic tissue juice and plasma of chicken) retain their activities to grow in unaltered media was 1 day at −1° C., 12 days at 25° C., and 10 days at 30° C. Fibroblasts from heart muscle of chick embryo were used.

5405. **KRÜGER, FRIEDRICH. Transplantation junger Linsen in das Blastocöl bei Tritonen.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(1): 1-11. 6 fig. 1930.—*T. palmatus, T. alpestris,* and *T. taeniatus* were used; 130 individuals were operated on, 95 of the transplantations being homeoplastic and 35 heteroplastic. The lenses were, in most cases, removed from the larvae shortly before or after detachment from the ectoderm, and implanted in blastulae or young gastrulae. Mortality in the days immediately following operation was great, and, in the specimens that survived to be sectioned, only 42 sections showed the lens. The conclusions are: "The lens of *Triton* transplanted into the blastocoele shows no inductive ability. Therefore, although the primitive gut not only induces the medullary plate but makes an inductor of the medullary plate itself, the eye anlage of the medullary plate can induce the lens but does not transfer to this its power of induction. It shows that further differentiation may take place in the lenses of *Triton* on which the experiments were performed, after the removal of the optic cup and the transplantation into a younger embryo. Lenses in which lens fibers are beginning to develop show a slightly developed lens knob a few days after transplantation. A lens placode which has been transferred merely rounds up and shows no lens fiber development."—*J. A. Welsh.*

5406. **LARSELL, O. The effect of experimental excision of one eye on the development of the optic lobe and opticus layer in larvae of the tree frog (Hyla regilla). II. The effect on cell size and differentiation of cell processes.** *Jour. Exp. Zool.* 58(1): 1-20. 6 fig. 1930.—Excision of one eye in the frog, after connections with the optic lobe had been established and after optic function had been experimentally demonstrated to be present, resulted in failure of the affected optic lobe to develop to normal size or to proliferate the normal number of cells. The neuroblasts of the 8th and 9th layers, which were most directly affected by the experiment, were reduced in number. They also failed to grow to normal size or to show the normal development of dendritic processes. These results appear due to the absence of normal functional stimuli which reach the optic lobes in the normally developing frog or to the absence of factors directly attributable to these stimuli.—*Author (courtesy Wistar Bibl. Serv.).*

5407. **NUSSMANN, T. C. Further observations on the influence of transplanted eyes on the development of spinal nerves in Amblystoma punctatum.** *Jour. Exp. Zool.* 58(1): 21-30. 1 fig. 1930.—The optic vesicle of *A. punctatum* (64 specimens) was transplanted to the right limb site of another embryo whose limb rudiment had been excised. Microscopic sections showed that the spinal ganglia in the brachial region had undergone a hypoplasia of about 50%. The presence of the eye did not influence their development, since removal of the limb alone causes the same amount of hypoplasia. The brachial nerves grow out toward the eye, but make no peripheral connections with it, showing that spinal nerves have a certain amount of specificity or power of selectivity in making peripheral connections.—*Author (courtesy Wistar Bibl. Serv.).*

5409. **SEVERINGHAUS, A. E. Cellular proliferation in heterotopic spinal-cord grafts.** *Jour. Comp. Neurol.* 51(2): 237-270. 12 fig. 1930.—These experiments were designed to study cellular proliferation in segments of *Amblystoma punctatum* spinal cord, which were excised at the tail-bud stage and transplanted into the somatic region of host embryos lateral to the normal cord. Segments of approximately 3 somites' length from various spinal levels were employed. A marked sensory hyperplasia and a moderate motor hyperplasia were characteristic of all these heterotopic grafts. An increase in the total cross-section area of the grafts corresponded closely to the increase of the cellular area. The interganglionic distances in the grafted cords were often less than in corresponding normal cords. A reversal of the anteroposterior axis of the graft gives results entirely similar to those recorded for grafts of normal orientation. The characteristic posterior taper seen in the normal cord is maintained in the grafted cords, and this feature is also independent of the orientation of the graft. The bearing of these results upon previous researches and upon the interpretation of suggested forces regulating cellular proliferation within the spinal cord is indicated. —*Author (courtesy Wistar Bibl. Serv.).*

5410. **TAZELAAR, M. A., J. S. HUXLEY, and G. R. de BEER. Some further effects of an antagonistic temperature gradient upon the frog's egg.** *Anat. Rec.* 47 (1): 1-11. 1 pl., 4 fig. 1930.—Frog eggs were treated with temp. gradients for long periods (24-48 hrs.). Previous results showing that eggs heated at the animal pole were more advanced, even as regards segmentation of the vegetative cells, than those kept at the same mean temp. but heated vegetatively (antagonistic gradient) were confirmed. Long-continued antagonistic gradients caused the following effects in gastrula stages: (1) A ring-shaped groove encircling the eggs, at the level of the top of the yolk. (2) A very thin roof to the blastocoel. (3) In later development strikingly microcephalic embryos were produced. If the closure of the blastopore is nearly complete, no other abnormality is noted. (4) Often, however, the blastopore remains widely open, producing extreme spina bifida. In these forms the foregut invagination is found dorsally just behind the brain; the proctodaeum, quite separate, dorsally just in front of the tail. The stomodaeum is later formed in the normal position, thus establishing a communication from the mouth to the dorsal surface just behind the brain. (5) In these forms it appears also that, probably owing to the incomplete extent of invagination, the most anterior section of the presumptive medullary plate does not become converted into actual medullary plate; thus the anterior end of the brain is in a different position, relative to the original egg axes, from that which it occupies in normal embryos.—*Authors (courtesy Wistar Bibl. Serv.).*

5411. WITSCHI, EMIL. Studies on sex differentiation and sex determination in amphibians. V. Range of the cortex-medulla antagonism in parabiotic twins of Ranidae and Hylidae. *Jour. Exp. Zool.* 58(1): 113-145. 5 pl., 8 fig. 1930.—From embryos of *Rana sylvatica, R. aurora,* and *Hyla regilla,* grafted together in the tail-bud stage, a total of 111 prs. of parabiotic twins has been obtained, 56 of which later proved to be heterosexual combinations. As reported previously, genetic ♀♀ twinned with ♂♂ first differentiate independently, but later undergo sex reversal. In 2 cases more quickly developing ♀♀ induced hermaphroditism in twin ♂♂. Analysis of the effects of heterosexual parabiosis reveals the following: The testicular medulla of a ♂ suppresses the development of the ovarial cortex of its ♀ co-twin. Vice versa, the ovarial cortex acts as a similar, though less powerful, inhibitor of medullar development. The principles causing these inhibitions spread with falling gradients of efficiency from the gonads of either animal into the body of its co-twin. The medullar development in ovaries following the inactivation of their cortex is not due to stimulation from side of the ♂ co-twin; but represents an autonomous reaction of the rete ovarii, released after elimination of the cortical control. It is assumed that the interactions of twin gonads are established through morphogenetic substances, the medullarin, product of the medulla, and the cortexin, product of the cortex. These substances differ from typical hormones in that they are not released into the blood stream, but spread out slowly through the tissues.—*Author (courtesy Wistar Bibl. Serv.).*

ANOMALIES, MONSTERS AND MARKED VARIATIONS IN DEVELOPMENT

[Rare supernumerary ossicle of the tarsus co-existent with a variation of superior astragalus-scaphoid ligament.] *Arch. Anat. Histol. Embryol.* 7(1/3): 135-144. 1 fig. 1927.

5413. BOULGAKOW, BORIS. The effect of non-development of the allantois as illustrated by a case of sympodia. *Jour. Anat.* 63(2): 253-258. 4 fig. 1929.—The conditions which characterize sympodia are correlated with incomplete formation of the hind-gut and, in particular, with non-development of the allantoic diverticulum and of the cloaca. Incomplete development of the hind gut results in absence of the organs which develop from these parts, i.e., kidneys, ureters, bladder, part of the penile urethra and part of the rectum. Non-development of the allantois and cloaca can be explained by maldevelopment of the hind gut which is arrested in its caudal growth at the level of the body stalk and therefore gives no opportunity for an allantoic diverticulum to enter the body stalk in order to form the allantois, and since the hind gut fails to reach the tail end of the embryo no cloaca could be established. The presence of only a single umbilical artery could be explained as due to the absence of an allantoic diverticulum in the body stalk along which, in the normal embryo, 2 arteries grow towards the chorion as allantoic vessels, becoming at a later stage umbilical arteries; but if the body stalk does not contain the diverticulum there is no necessity for a splitting of the umbilical artery which is to establish the placental circulation. It is suggested that, owing to the incomplete descent of the hind gut, the conditions appear to be favorable for the fusion of the lower limb buds, because there is now no intervening structure to keep them apart. This fusion explains the failure of the limb buds to rotate forwards.—*B. Boulgakow.*

5414. CHENG, TSO-HSIN. A new case of intersexuality in Rana cantabrigensis. *Biol. Bull. Marine Biol. Lab.* [*Woods Hole*] 57(6): 412-421. 1 fig. 1929.—This specimen is an adult wood-frog, measuring 3.7 cm. in body length, and is typically ♂ in its secondary sex characters and accessory sex organs. Both gonads, from a surface examination, appear as normal testes, containing, however, a number of ova amid their spermatic substance. The ova average about 200μ in diameter and closely resemble the normal young oöcytes of the 2nd growth period. The writer attempted to analyze the sex nature of the testis-ova, and to point out the possible causes of their genesis.—*T.-H. Cheng.*

5415. FISCHER, KARL. Über Umbildung der Knochen- und Gelenkform durch geänderte Muskelmechanik. *Zeitschr. Ges. Anat. Abt. I. Zeitschr. Anat. u. Entwicklungsgesch.* 87(5/6): 746-757. 4 fig. 1928.—The case is that of a woman who died of pernicious anemia at the age of 27 yrs. and who had never stood on her feet. The record notes, among other abnormalities, atrophic arms with small somewhat cramped hands, legs so abnormal that the lower legs can be bent forward at right angles to the thighs, which are short and thick, feet a kind of pes equinovarus, infantile breasts. Both legs and shoulders were "weak" at birth, but the child learned to turn the feet back to the rump and crawl about on its knees. Leg skeleton and musculature are described in detail. Apparently at birth, the leg bones and knee joints were normal but certain muscles, such as the biceps femoris and extensor muscles of the lower leg were practically absent. As a result of these defects and the reaction to the active muscles, the shaft and condyles of the femur especially and the tibia were so deformed that the knee joint became similar to that of the elbow. The defective musculature resulted both in the deformation of the bones and in a change in the muscle mechanics, especially in the region of the knee.—*H. F. Nachtrieb.*

5416. FONTANA, ALFREDO. Sulle atrofie renali congenite ed acquisite. [Congenital and acquired renal atrophy.] *Arch. Ital. Chir.* 22(5): 441-481. 12 fig. 1928.—The author, in a brief introduction, divides renal anomalies into those of defect (or deficiency), of excess (or superfluity), and of fusion; he then speaks of the various types of renal malformations which accompany malformations of other organs and defines the differentiating characters of congenital and acquired atrophies, and of congenital atrophy and renal hypoplasia. His observations are based upon the study of 2300 sections. He describes 2 cases of congenital renal atrophy: (1) an atrophic cystic kidney, with atresia of the ureter in the upper $\frac{2}{3}$, and lack of left testicle; (2) an atrophied cystic, horseshoe kidney. After discussing the etiopathogenesis of the various forms of renal atrophy, he confines himself in his own particular cases to unilateral congenital atrophy; this being an alteration difficult to establish histologically as well, in which the kidney is transformed into a single, large cyst. He cites the dualistic embryogenetic concept to explain the vitium primae formationis in his special cases. Next he takes up monolateral, acquired renal atrophies, distinguishing total from partial ones (3 cases), and points out that these may be the result either of an arteriosclerotic process or of circumscribed inflammation. In the first case the presence of marrow and very young osseous tissue led the author to study the genesis of renal osseous metaplasia, reporting 3 other instances; these being obtained from rabbits in which the vessels of the hilum were ligatured. Finally the author discusses functional hypertrophy of a compensatory type in 2 cases, in which the functioning power of a kidney, for various causes, had been wholly or partially lost. He concludes that the vicarious hypertrophy of a kidney is more pronounced in cases of congenital atrophy, and that vicarious hypertrophy is based principally upon an hypertrophy of the glomeruli and of the tubules along with cellular hyperplasia in the elements of the tubules.—*A. Fontana (transl. by E. W. Count).*

5417. FRANCESCHINI, PIERO. Su la ipertrofia compensatrice dei testicoli nell'uomo. A proposito di un caso di monorchidia vera. [Compensatory hypertrophy of the testicles in man. A case of true monorchism.] *Endocrin. e Patol. Costituz.* [*Bologna*] 4(11): 164-182. 9 fig. 1929.—A man of 22 yrs. with congenital absence of the left testicle, also lacked the vas deferens, seminal vesicle and the seminal ampulla; prostate gland was normal. The

right testicle was much bulkier than the average human testicle at the same age; histological analysis showed increase in the mass of seminiferous tubules and increase in interstitial tissue. The former appeared to be due to a dilatation of the tubules; the latter was caused primarily by hypertrophy and hyperplasia of the Leydig cells. With the technique of Del Rio-Hortega, the author shows the special relation of the Leydig cells with the delicate reticular tissue, by which the Leydig cells are united on one side to the membranes of the seminiferous tubes, on the other to the reticular adventitia of the blood capillaries. Extraordinary increase in the lipoid exchange, of both interstitial tissue and seminiferous tubules, was likewise shown.—*P. Franceschini.*

5418. **FRITSCHEK, F. Über eine amniogene Schädel- und Hirnmissbildung.** *Virchow's Arch. Path. Anat. u. Physiol.* 267(2): 318-325. 2 fig. 1928.—In a ♀ fetus, lacking the calvarium, of the anencephalus type with an oblique right facial fissure at the cranial end of which the amnion started, the placenta sprang directly from the skull base. A band extended from the placental tissue at the skull base to the left forearm where the epidermis was lacking. There was little amniotic fluid at birth; the amnion and the membranes were drawn tightly across the skull and the membranes intermingled with those of the brain. The general condition was that of an 8 months' fetus. The author believes that the time of the malformation can be established in the 2nd quarter of the 1st half of gestation, when the embryo was about 12 cm. long. In this case the adrenals were small,—typical anencephalic adrenals; the hypophysis was small, with a tiny, glious posterior lobe bent into a depression of the pars buccalis and a hyperemic anterior lobe with very sparse eosinophil cells. In accordance with causal relations laid down by Kraus and others, the author attributes the atrophy of the adrenals to the insufficiency of the eosinophil cells in the anterior lobe and connects this case of amniogenic hemicrania and exencephaly with the accompanying endocrine disturbances.—*From abstr. by B. Bickel.*

5419. **GASTEIGER, HUGO, und KO HIDANO. Experimentelle Beiträge zur Frage der Entstehungsweise der angeborenen Missbildungen des Auges.** *Graefe's Arch. Ophthalmol.* 119(3/4): 733-754. 2 fig. 1928.—The rats came from a stock bred in the laboratory for 3 yrs., with 500 offspring none of which had eye anomalies. Mice from a colony without eye anomalies were also used. The adrenals of both animals were removed in 6 prs. of rats. When these were mated, 1 ♀ produced no young, 2 had normal litters, and in 3 litters eye anomalies occurred. One litter had 7 normal young with 1 abnormal having a bilateral anophthalmus; another litter had 5 normal young and 1 in which an iris coloboma occurred. The 3rd litter contained 1 rat with combined micro-ophthalmus and coloboma. Extirpation of thyroid of 3 animals (2 ♀, 1 ♂) resulted in death of the 2 ♀♀. When the ♂ was paired with a normal ♀, no abnormal offspring resulted. Hyperthymic animals also produced no abnormal offspring. The rat with anophthalmus lacked the eye anlage. The micro-ophthalmic eye lacked the lens entirely and had only a partially developed retina. Both ♀ and ♂ rats were irradiated with accurately measured x-ray dosage. After irradiation, matings were performed as follows: Irradiated ♂ with non-irradiated ♀; irradiated ♀ with non-irradiated ♂; irradiated ♂ with irradiated ♀. No anomalies were produced by the 1st type of mating. Some of the ♂♂ were sterile and in some cases there were reduced litters. The mating of 2 irradiated parents produced no eye anomalies. Mating of an irradiated ♀ and a normal ♂ produced anomalies in 3 out of 5 litters. In litters with anomalies, 6 individuals occurred with either anophthalmus or micro-ophthalmus.

5420. **KADLETZ, MAXIMILIAN. Amelia anterior dextra beim Hund.** *Jahrb. Morph. u. Mikrosk. Anat. Abt. 1, Gegenbaur's Morph. Jahrb.* 60(2/3): 359-370. 5 fig. 1928.—All of the right foreleg was wanting. The scapula was practically normal. The presence of the Mm. latissimus dorsi and pectoralis major et minor leads the author to conclude that the anlage of the forearm was established but later was removed by an intrauterine amputation. The muscles connected with the scapula and their readjustments due to the absence of the forearm are described. The aortic arch also presented a rare variation in the origin of the great vessels and the author offers a developmental explanation which he thinks will, at least to some extent, correlate the human anomaly known as dysphagia lusoria and the "two-rooted vertebralis." In the diagram illustrating the embryonic relations of the anomaly, the aortic arch between the right common carotid and the right subclavian is wanting and the right subclavian communicates with the dorsal aorta through the original right dorsal portion of the arch. A brief account of variations in the nerves and the nerve plexus of the shoulder region concludes the paper.—*H. F. Nachtrieb.*

5421. **KAKUSCHKIN, N. Cysten- und Drüseneinschlüsse des Tubenwinkels der Gebärmutter in einem Falle von kongenitalem einseitigen Mangel der Tube und des Ovariums.** *Arch. Gynäkol.* 133(2): 533-557. 5 fig. 1928.—Congenital absence of only 1 ovary or of only 1 tube is very rare and is not infrequently associated with greatly changed vestiges of other organs though the remainder of the genital tract is usually normally developed. Unilateral congenital absence of the uterine adnexa is sometimes associated with presence of a dermoid in the ovary of the opposite side, which perhaps may be regarded as a product of excessive functional demands placed upon the single ovary. The general conception is that such absence of the uterine adnexa (more frequently on the right side) is the result of constriction following torsion or of the production of adhesions after inflammatory conditions in early periods of intra-uterine life and subsequent atrophy and resorption. Detailed anatomical examination of a growth excised from the region of the right tube indicates that the formation is an adenoma derived from rests of the Wolffian body and duct. In the present case it may be that the genital functions produced a definite irritation in the malformed parts, which favored both the production of the neoplasm and inflammation.—*Author's summary (transl. by O. F. Kampmeier).*

5422. **KRASTIN, LUCIJA. Hämapophysis beim Menschen.** *Anat. Anz.* 65(11/13): 222-239. 2 fig. 1928.—Among the skeletons at the Anat. Inst. of the Univ. of Lettland were 63 sacra in which the first coccygeal vertebra was ankylosed with the last sacral. In 2 cases this coccygeal vertebra had a small abnormal process on the anterior side. The sacro-coccygeal region and abnormal process of these 2 cases are described in detail; the few recorded accounts of this rare abnormality and related variations in other animals are noted and discussed. The author states that under certain formative stimuli during ontogenesis latent potentialities are awakened which may lead to the formation in their or neighboring regions of atavistic characteristics.—*H. F. Nachtrieb.*

5423. **LEECH, JOHN V., LAWRENCE W. SMITH, and HOWARD M. CLUTE. Aberrant thyroid glands.** *Amer. Jour. Path.* 4(5): 481-493. 4 pl., 1 fig. 1928.—In this study the probable etiology of aberrant thyroid glands is ascribed to the ultimobranchial bodies. It is supposed that in their migration these cells fail to meet and fuse with the thyroid and subsequently give rise to tumor formation. In a series of nearly 4,000 cases of thyroid disease only 4 with lateral, aberrant thyroid tumors were noted. Of the 4 cases, 1 was apparently frankly malignant and had metastasized to adjacent lymph nodes, 2 were considered as still benign although potentially malignant. A case of aberrant thyroid tissue in a multilocular teratoid cyst of the ovary is described.—*H. D. Caylor.*

5424. **LENTZE, F. A. Verwickelte Missbildungen der Harngeschlechtsorgane.** *Virchow's Arch. Path. Anat. u. Physiol.* 272(1): 279-294. 9 fig. 1929.—The abnormalities in a child 8 mos. old were as follows: spina bifida; horseshoe kidney; double right ureter; diverticulum of the

bladder due to interference with the sphincter; swelling of left ureter due to a valve-like closure of the posterior end due to pressure atrophy of the prostate; absence of both seminal vesicles and of right vas deferens with retention of left müllerian duct; scoliosis; club foot.—*W. H. T. Baillie.*

5425. LLOYD, J. H. Hermaphroditism in the common frog. (Rana temporaria.) *Amer. Nat.* 63(685): 130-138. 1929.—A description of 2 cases of hermaphroditism in the frog, the entire animal in 1 case and the urinogenital organs only in the other. Both possess testes and vasa efferentia, with one or more oviducts. Pigmented lobes which are attached to the testes are considered as ovarian tissue, though no histological examination seems to have been made. It is concluded that these specimens were originally ♀♀ whose ovaries have degenerated and testes formed, though no evidence is given to support the conclusion. The question of sex determination is discussed and it is concluded that evidence is accumulating that sex is not determined by sex chromosomes.—*G. T. Hargitt.*

5426. MILLS, H. M., and HYMAN STRAUSS. A case of pregnancy in uterus didelphys. *Amer. Jour. Obstet. & Gynecol.* 18(2): 263-265. 1929.—Examination showed 2 uteri separated by the recto-vesical ligament at the level of the internal os of each uterus.

5427. [NIKITSKIĬ, B. A.] НИКИТСКИЙ, Б. А. Два случая микроцефалии у детей. [Two cases of microcephaly in children.] [French résumé.] Материалы по Антропологии Украины. (*Anthrop. Ukraine*) 1: 177-181. 2 fig. 1926.

5428. [NIKOLAEV, L. P.] НИКОЛАЕВ, Л. П. Случай акромегалического гигантизма. [Acromegalogigantism.] [French résumé.] Материалы по Антропологии Украины. (*Anthrop. Ukraine*) 2: 198-206. 3 fig. 1926.—Description of a giant with acromegaly, whose daughter showed deformities suggesting heredity of acromegalic constitution.

5429. POLITZER, G., und H. STERNBERG. Über einen missbildeten menschlichen Embryo des ersten Monates. *Frankfurter Zeitschr. Path.* 37(1/2): 174-210. 23 fig. 1929; *Wien. Klin. Wochenschr.* 1928(33): (1-2). 1928.—The monster, from an ovule 8 x 10 x 14 mm., is 1.9 mm. long and presents a sharp curvature of the back so that the head and tail almost touch. In the otherwise excellently preserved tissue, especially the embryonal connective tissue, are numerous disintegrating cells, and open spaces. Individual organs show varying degrees of development. Somites and anlagen of the uropoietic system are lacking. The central nervous system is open its whole length, while other organs, such as the ear invagination and the hind gut, are further advanced in their development. The minimum age of the embryo corresponds to a normal one of about 20-22 pairs of somites or one of 4 wks. Deformities may be: (1) typical, involving usually only single organs or regions of the body, frequently hereditary, and apparently due to causes inherent in the embryonic anlage itself; or (2) atypical, involving many kinds of associated defects, often amounting to true monstrosities and apparently due to causes outside of the embryonic anlage, such as chorionic lesions or coalescence with the enveloping membranes. The present example belongs to the 2nd group. Pathologic changes are present in the chorion, and the question may be raised whether the disturbance in embryonic development caused the alterations in the chorion, or whether changes in the chorion caused the malformation of the embryo. The authors suggest, without coming to a final decision, that both chorionic and embryonic changes may be due to a single external cause, such as pathologic change in the site of implantation in the uterus.—*O. N. Eaton.*

5430. SCHIDLOWSKY, P. S. Zur Frage nach den Nieren-, Nierenbecken- und Harnleiteranomalien. *Anat. Anz.* 65(11/13): 193-214. 10 fig. 1928.—This paper is unusually valuable because of a review of the more important inaccessible Russian literature on this subject. Twelve original cases of urinary anomalies are given: partial double ureter and pelvis, left; complete double ureter and pelvis; 3 of horseshoe kidney; double ureter (right); 3 of fused single kidney; partially fused unilateral kidneys; ectopic kidney at brim of pelvis; and single right kidney. The embryology and practical considerations of these conditions are discussed.—*R. A. Moore.*

5431. SPANNER, R. Untersuchungen zur Genese der Rhachischisis anterior und posterior mit Berücksichtigung der Craniorhachischisis. *Zeitschr. Ges. Anat. Abt. I, Zeitschr. Anat. u. Entwicklungsgesch.* 85(3/4): 323-362. 20 fig. 1928.—The author agrees with Ernst that defective development of the medullary plate is the important factor in the production of posterior spina bifida. Since the normal medullary plate has been shown to be connected along its side walls with the epidermis, failure of closure of the medullary tube is regarded as the starting point of posterior spina bifida. Various other theories are thus excluded, e.g., that of Förster, that spina bifida results from abnormal accumulation of fluid in an already closed medullary tube; that of Lebedeff that primary axial curvature inhibits growth of the medullary tube; that of Dareste who believes that the amnion arrests closure of the tube. Anterior spina bifida results from an early growth arrest of the medullary plate, whereby lack of differentiation of the germ layer leaves ventral parts of the medullary plate free of ependyma and mantle layer, while marginal parts are normal. The author denies that anterior spina bifida represents persistent remains of the neurenteric canal. The cases of anterior spina bifida with abnormal opening between neural and intestinal canals are to be regarded not as disarrangements of the blastoporic closure, which would be required by the concrescence theory, but rather as a secondary growing together and breaking down of the undeveloped medullary plate and the intestinal tract. Regressive changes in the brain and the hypophysis are also discussed.—*From author's summary by C. F. DeGaris.*

5432. SULZBERGER, MARION B. Ueber eine bisher nicht beschriebene congenitale Pigmentanomalie (Incontinentia pigmenti). *Arch. Dermatol. u. Syph.* 154 (1): 19-32. 3 fig. 1928.—In 1925 Bloch presented a case of anomalous distribution of pigment which is here given in detail. Clinically it is the same condition as Naegeli's familial chromatophore nevus. This anomaly presented fine, very irregular, brown and grayish lines which had a tendency to heal slowly, forming scars after several years. The hypothesis is advanced that melanoblasts had undergone congenital pathologic changes, letting the melanin reach the cutis too rapidly, instead of further distributing it. The pigment in being eliminated is taken into the connective tissue cells and forms accumulations resembling tattoo marks.—*B. Bickel.*

5433. ANDERSON, B. G., and L. A. BROWN. A study of chitin secretion in Daphnia magna. *Physiol. Zool.* 3(4): 485-493. 1930.—An experimental method has been developed for the determination of the time at which chitin secretion begins. This method consists of injuring the carapace of an animal at a definite time within the instar and noting the type of wound resulting in the following instar. Three types of wounds are found, depending on the time at which the injury is inflicted. For injuries produced during the first half of the instar,

wounds with smooth edges result. For the next 20% wounds have rough edges during the postoperative instar, showing that chitin has been secreted to a small extent. Chitin was secreted after injury in the first group to produce a smooth edge. For wounds made during the last 30%, sufficient chitin had been secreted to carry over into the following instar the brown material which is formed shortly after injury. Experiments were run at 3 different temperatures. Approximately 480 animals were used. The data show that—The time at which chitin secretion begins in *Daphnia magna* at 3 temperatures (15°, 22°, and 25° C.) is approximately a period at which 60% of the instar has passed. For the temperature range studied the time at which chitin secretion begins within the instar is a function of the temperature, and temperature coefficient is of the same magnitude as that for instar lengths.—*Authors (courtesy Wistar Bibl. Serv.).*

5434. COMINI, ADELE. Sul connettivo reticolare della fibra muscolare dei vermi. [With French, English and German summaries.] *Arch. Zool. Ital.* 14(2/4): 373-380. 1 fig. 1930.—The author studied the sarcolemma of the muscles of various worms with the method of Del Rio Hortega for the reticular connective tissue and found an evident fibrillation in *Diphyllobothrium ranarum, Allolobophora trapezoides* and *Haemopis sanguisuga*. On account of the histochemical characters and relationships, he thinks that such fibers are reticular in nature and that in general they have a character similar to that already noted for the sarcolemma of the vertebrates.

5435. DANIEL, R. J. The abdominal muscular systems of Meganyctiphanes norvegica (M. Sars). *Proc. & Trans. Liverpool Biol. Soc.* 43[Append. I.]: 149-180. 1 pl., 1 fig. 1929.—A study of the abdominal musculature of a schizopod, with comparisons with that of *Crangon* and of *Praunus*, previously studied by the author. The ventral longitudinal muscles of *Meganyctiphanes* are less differentiated and show a greater tendency toward a segmental arrangement. Strong complex transverse muscles occur in the first 4 abdominal segments and independent U-shaped muscles in segments Q&E are homologized with the central muscles of *Crangon*. The superficial ventral muscles are in 2 parallel series and are segmental; the dorsal muscles are also in 2 series, a more median one in which the fibers are twisted on one another and a more lateral in which the fibers are parallel. A fan shaped lateral is present in segments 1 and 2.—*J. P. McMurrich.*

5436. DRACH, PIERRE. Étude sur le système branchial des crustacés décapodes. *Arch. Anat. Microsc.* 26 (1): 83-133. 26 fig. 1930.—I. The morphology of the branchial system is described. The dissymmetry of the branchiae is due to the difference in the amount of space afforded to the different branchiae in the various segments of the cephalothorax. While in the Brachyura generally the space for retained water in the branchial cavity is reduced to a minimum, in *Carcinus moenas* and *Pachygrapsus marmoratus* a sort of longitudinal gutter extending the length of the branchia permits the retention of a larger amount of water in the branchial chamber and favors the animal's prolonged sojourn out of the water. The extent of the respiratory surface varies within a species in proportion to the volume of the body. II. Histology and topography are described. The network contained in the branchiae (both tubes and lamellae and raphé) is epithelial, like the columns which join the 2 faces of each lamella. The differentiation of the network and the nephrocytes varies in accordance with the species. III. The constitution and the development of the nephrocytes are described. They accumulate both basic and acid stains, but the basic colors (methylene blue, Janus green) are rapidly eliminated or reduced, and thus are not flocculated in the vacuoles. Functionally, a colorless colloidal protein substratum in the large vacuoles of the nephrocytes is to be distinguished from a yellow acid substance fixed on this substratum. The greater or less abundance of the latter determines the localization of the vital stains absorbed by the nephrocyte, sometimes in the large central vacuole, sometimes in the little peripheral vacuoles, and sometimes in the form of what Chlopin calls a "crinoma," an accumulation of irregular granulations or of small new-formed vacuoles, the whole not corresponding to any preexisting element. The variations in the quantity of this yellow substance in the vacuoles is in proportion to the length of time from the last moult.

5437. GEBHARDT, HANS. Untersuchungen über die Determination bei Planarienregeneraten. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 107(4): 684-726. 19 fig. 1926.—Head- and tail-regenerating tissues from pre- and post-pharyngeal regions of *Planaria lugubris* were transplanted to various regions of individuals of the same species. Head-regenerates, 1-4 days old from pre- to post-pharyngeal, and 2-5 days old to post-pharyngeal regions, developed into heads. Head-regenerates, 3 days old from post-pharyngeal to pre-pharyngeal, and 3-4 days old to post-pharyngeal regions developed into indifferent structures. In both types, 5 day old transplants gave rise to heads. A 2 day old tail-regenerate from pre-pharyngeal and one from post-pharyngeal region developed into heads when placed in eye region; in other grafts, 2 and 3 days old, the resulting structures were indifferent. Isolated pieces of tissue similar to those transplanted were non-viable. Grafts of old tissue unaccompanied by regenerating material did not form heads, whereas grafts of regenerating material without old tissue did. The graft is said to have a slight influence on the zone to which it is transplanted, whereas host tissue, except in eye region, exerts no form-determining influence on donor tissue. The results on pre- and post-pharyngeal transplants are said to agree with Child's observations of a decrement of head-forming intensity from head to tail.—*E. D. Goldsmith.*

Neurobiol.* 10 (3): 238-244. 4 fig. 1930.—Description of sections of the nerve chain and of the fibrous neurogliar cells of the annelids *Arenicola marina, Serpula,* and *Perinereis culhijeru.*

5439. GRABENHORST, ANNALIESE. Die mit der Ausbildung des Frontauges zusammenhängenden postembryonalen Entwicklungsvorgänge im Lobus opticus einiger Ephemeridenmännchen. *Zeitschr. Wiss. Biol. Abt. A. Morph. u. Ökol. Tiere* 18(3): 430-473. 31 fig. 1930.—In *Cloëon dipterum* and *Leptophlebia marginata,* the frontal eyes are distinct from the lateral eye and in these the optic ganglia belonging to each eye are separate. The 3 ganglia of the frontal eye are: deuterolamina ganglionaris, deuteromedulla externa and interna. Their development is intimately associated with the first postembryonic appearance of the frontal eye. The cells of this deuteroganglion were developed from 2 formative foci, an outer and an inner. Through numerous divisions of the neuroblasts of the formative foci, new neuroblasts arise, then primitive ganglion cells and finally, ganglion cells. The fiber masses of the deuteroganglion are formed from the retinula fibers of the frontal eye and from the processes of the newly arising ganglion cells. The structure of this deuteroganglion is different from that of the ganglia of the lateral eyes. In *Ecdyonurus lateralis* the frontal eye is united to the lateral eye; so the optic centers show no separation. New ganglia were not formed; only an enlargement and differentiation of the 3 existing ganglia take place.—*A. Grabenhorst (transl.).*

5440. HENKE, KARL, und JULIUS PREISS. Über Naturfunde von Mehrfachbildungen an Schmetterlingsflügeln. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(1): 105-116. 6 fig. 1930.—Specimens are described showing that, besides the familiar duplications from 2 lateral components, triple supernumerary wings occur in moths to which Bateson's rules of symmetry apply. The size of the discoidal

ocellus of *Aglia tau* depends not on that of the wing but on the dimensions of the veins.—*Authors' summary (transl. by J. H. Gerould).*

5443. **MERTON, HUGO. Die Wanderungen der Geschlechtszellen in der Zwitterdrüse von Planorbis.** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 10(3): 527-551. 12 fig. 1930.—*P. planorbis, P. cornuta,* and *P. carinata* were studied and for comparison some species of *Helix* were also examined. The germinal epithelium of *Planorbis* is limited to the atrium of the hermaphroditic duct, differing in this respect from other stylommatophorous Pulmonates. The germ cells migrate from this region into the acini, within which their development is completed. Female germ cells migrate along the wall of the acinus, while the developing stages of ♂ germ cells are found toward the base of the acinus. The latter are not capable of independent movement, but are transported by basal cells to which they are permanently attached. After the completion of spermatogenesis, kinoplasm-spherules, which migrate into contact with the spermatids, develop in the basal cells. It is only after the sperm are enveloped by a covering of kinoplasm that they become motile. The oocytes become surrounded by nutritive cells only after reaching the body of the acinus. Male and female germ cells leave the acinus through the central portion of its lumen.—*H. Merton (transl. by L. E. Griffin).*

5444. **MILLOT, J. Le tissu réticulé du céphalothorax des aranéides et ses dérivés: néphrocytes et cellules endocrines.** *Arch. Anat. Microsc.* 26(1): 43-82. 2 pl., 10 fig. 1930.—By his histologic study of the cephalothorax in more than 90 species of spiders, the author has distinguished 4 kinds of elements of common origin in what previous authors have called merely "connective" or "adipose tissue." Besides these 4 elements and intermingled with them, he has found leucocytes of various kinds which have not previously been recognized as blood cells. (1) The connective tissue proper is always very sparse in arachnids; it occurs as thin sheaths, shown by the elective stains of the collagenous substance, surrounding the various organs, such as the mid-intestine and its diverticula, vessels, nerve ganglion, venom glands, etc. This tissue, found in both abdomen and cephalothorax, is more and more developed as the animal grows older. (2) The reticulated tissue is a network of cells linked together by laminated expansions enclosing hemolymphatic spaces; the protoplasmic expansions may contain fibers, but these are never stainable like collagenous substance. The reticulated tissue occurs at several points of election: in front of the cerebroid ganglion, at the base of the rostrum and at the anterior and posterior limits of the sternal region. It diminishes with age and is sometimes difficult to demonstrate in adults because of the more or less complete transformation of its elements into nephrocytes and endocrine cells. (3) The nephrocytes are large and numerous elements often multinucleated, isolated or agglomerated, which become differentiated with important specific variations from the previously described network. They are always limited to the cephalothorax, and predominate in the lower part, where they generally form an extensive layer separating the ganglionic nerve mass from the sternal wall. They absorb electively certain substances dissolved in the hemolymph which bathes them, and were colored red after injection of a spider with ammonia carmine. They produce crystalline waste enclaves, but do not in their entirety constitute a "kidney of accumulation," as was formerly thought, for their excreta are redissolved, taken up in the blood, and secondarily eliminated by the cloacal epithelium and the Malpighian tubes. Their rôle in the arachnids appears comparable to that of the pericardial cells in the insects. (4) The endocrine elements are extremely variable in size, with homogeneous very chromophil protoplasm, representing another stage in the development of the reticulated tissue. Their differentiation like that of the nephrocytes, with which they are often intimately mingled, is characterized by great specific variations. In general, however, the endocrine elements are found to a greater extent in the lateral regions of the cephalothorax. They multiply by amitosis, and their nuclei present remarkable figures of budding and direct division. These secretory elements discharge into the hemolymphatic spaces the products which they elaborate and ought consequently to be considered as forming, as a whole, a diffuse gland of internal secretion the precise rôle of which is at present difficult to define.—*Author's summary (transl.).*

5445. **PAILLOT, A., et R. NOEL. Recherches histophysiologiques sur les cellules péricardiales et les éléments du sang des larves d'insectes.** *Bull. Histol. Appl. Phys. et Path.* 5(3): 105-128. 5 fig. 1928.—Pericardial cells of *Bombyx mori* normally have a finely mottled chromatic nucleus and fuchsinophil nucleolus. Abundant chondriome filaments and rods of uniform caliber are present without polarized distribution. During metamorphosis the chondriosomes become albuminoid flakes and fuchsinophil granules appear. After moulting, fuchsinophil elements are of 2 categories, mitochondria and vacuolated elements. Blood cells include micronucleocytes with small, very chromatic nucleus and early stages of mitochondria, and macronucleocytes with achromatic nuclei. The latter undergo mitosis marked by a very condensed equatorial plate which splits without forming separate chromosomes. Homologous cells of *Pieris brassicae* are similar.—*J. G. Sinclair.*

5446. **SPEYER, W. Die Embryonalentwicklung und das Ausschlüpfen der Junglarven von Psylla mali Schm.** *Zeitschr. Wiss. Insektenbiol.* 24(7/8): 215-220. 5 fig. 1929.—In the spring, characteristic color changes in the egg make embryological development discernible. Shortly before the larva hatches, 2 hard spines for cutting the shell develop on the inner egg membrane. At very low temp. a great many eggs shrink, but they regain their original size and develop normally after the cold ceases. —*W. Speyer (transl. by A. L. Hintze).*

5447. **UMEYA, YOSITIRO. Duplication of sexual organs in the male-moth of Bombyx mori L.** *Proc. Imp. Acad. [Tokyo]* 6(9): 371-374. 3 fig. 1930.—In 4 individuals the external sexual organs and the internal sexual organs (except vas deferens and testes) were duplicated, this being probably the first record of such duplication in any animal not a gynandromorph. Since the external and internal sexual organs are formed from the ectoderm of Herold's organ, it is concluded that these abnormalities must have originated from the doubling of the imaginal discs. The abnormal moths came from a strain belonging to the pedigree of an abnormal ♂ having hereditary malformation of the genitalia.

5448. **WHITAKER, DOUGLAS, and T. H. MORGAN. The cleavage of polar and antipolar halves of the egg of Chaetopterus.** *Biol. Bull. Marine Biol. Lab. [Woods Hole]* 58(2): 145-149. 1930.—Eggs were cut before fertilization either in the equatorial plane or parallel to it; the membrane was not entirely severed after the egg was cut, so as to reduce injury to the segments. Polar halves of *Chaetopterus* eggs divide unequally, but without formation of the yolk lobe. Antipolar halves divide unequally with a proportionately small lobe. Lobe formation is therefore not a necessary part of the unequal cleavage pattern, nor is the size of the lobe determined as if by a fixed amount of "material." The relation is discussed of the "pear-shaped" stage and of lobe formation to size and position of the mitotic figure. —*D. Whitaker.*

COELENTERATA

5449. **BULMAN, O. M. B.** The genotypes of the genera of graptolites. *Ann. and Mag. Nat. Hist.* 4(20): 169-185. 1929.—The author presents a list of generic and subgeneric names of graptolites, with their types. He selects genolectotypes for genera in which they were previously lacking, and attempts to fix the synonymy of the forms in question. Authorities are cited for the selection of each genotype. *Akidograptus* Davies, emended to *Acidograptus; Buthograptus* Hall (=*Birastrites* Geinitz, of which *Buthograptus laxus* Hall is made genolectotype); *Chaunograptus* Hall (=*Thallograptus* Öpik, not Hall); *Didymograptus* M'Coy (=*Cladograpsus* Geinitz, of which *Graptolithus murchisoni* Beck is made genolectotype); *Cladograpsus dissimilis* Emmons is made genolectotype of *Cladograpsus* Emmons, 1855, which is preoccupied by Geinitz, 1852; *Nemagraptus* Emmons (=*Coenograptus* Hall, of which *Graptolithus gracilis* Hall is made genolectotype); *Diplograptus* M'Coy (s. str.) (=*Mesograptus* Elles & Wood); *Graptolithus palmeus* Barrande is made genolectotype of *Diprion* Barrande; *Diversograptus ramosus* Manck is made genolectotype of *Diversograptus* Manck; *Koremagraptus* Bulman, emended to *Coremagraptus;* though *Lomatoceras* Bronn and *Monoprion* Barrande have priority over *Monograptus* Geinitz, the last is suggested for the list of nomina conservanda; *Monograptus* Geinitz (=*Demirastrites* Eisel, of which *Rastrites triangulatus* Harkness is made genolectotype; =*Linograptus* Frech; =*Monoclimacis* Frech; =*Pomatograptus* Jaekel, of which *Lomatoceras priodon* Bronn is made genolectotype; =*Pristiograptus* Jaekel; =*Spirograptus* Gürich, of which *Graptolithus turriculatus* Barrande is made genolectotype); *Nanograptus lapworthi* Hadding is made genolectotype of *Nanograptus* Hadding; *Lasiograptus margaritatus* Lapworth is made genolectotype of *Neurograptus* Elles & Wood; *Retiolites nebula* Elles & Wood is made genolectotype of subg. *Plegmatograptus; Cyrtotheca corrugata* Matthew is made genolectotype of *Protistograptus* McLearn. Extensive bibliography.

5450. **CARLGREN, OSKAR.** **Actiniaria der Deutschen Tiefsee-Expedition.** In: *Wissenschaft. Ergeb. Deutschen Tiefsee-Exped. Dampfer "Valdivia"* 1898-1899. *Herausgeb. von Carl Chun.* 22(4): 125-266. 4 pl. (2 col.), 86 fig. Gustav Fischer: Jena, 1928.—The collection consists of 48 spp., 33 of which have not been described previously. *Halcurias* **capensis*** (p. 132), off Cape Province, 155 m.; *H.* **minimus*** (p. 134), off St. Paul Is., Indian Ocean, 672 m.; **MACROCNEMA** (p. 140) (Condylanthidae), based on *M.* **nicobarica** (p. 140), Nikobar Is., 805 m.; *Bolocera* **somaliensis*** (p. 143), off Italian Somaliland, 823 m.; *B.* **capensis*** (p. 146), off Cape Province, 106 m.; *Liponema* **brevicirrata*** (p. 149), off Cape Province, 500 m.; **PSEUDACTINIA** (p. 152), resembling *Actinia,* based on *P.* **flagellifera*** (*Anemonia f.* Hertwig, *Actinia anachoreta* Pax, *A. psapharoderma* Pax) (p. 153), new locality, off Cape Province, 102 m.; *P.* **plettenbergensis*** (p. 157), off Cape Province, 100 m.; *Myonanthus* **bankamensis*** (p. 160), off Sumatra, 141 m.; *Bunodactis* (*Parabunodactis*) **inflexibilis*** (p. 162) and *B.* **nikobarica*** (p. 164), both Nikobar Isl., at 296 m.; **ISADAMSIA** (p. 164), near *Adamsia,* based on *I. cancrisocia* (p. 167), off E. coast of Tanganyika, 818 m.; symbiotic with *Parapagurus armatus* v. *trispinosus;* **BATHYDACTYLUS** (p. 172) (Paractidae), based on *B.* **valdiviae*** (p. 172), 63° 16′ S. lat., 57° 51′ E. long., 4636 m.; *Sicyonis* **sumatriensis*** (p. 177), off Sumatra, 903 m.; *Actinostola* **kerguelensis*** (p. 179), off E. coast of Kerguelen Is., 88 m.; **PARACTINOSTOLA** (p. 181), near *Actinostola,* based on *P.* **bulbosa*** (p. 182), off Somaliland, 823 m.; *P.* **capensis*** (p. 184), off Cape Province 500 m.; *Exocoelactis* **valdiviae*** (p. 187), off Somaliland, 823 m.; **PARACALLIACTIS** (p. 193) (Sagartiidae), related to *Calliactis,* based on *P.* **valdiviae*** (p. 193), off Italian Somaliland, 823 m., symbiotic with *Parapagurus bicristatus* and *P. andersoni; Adamsia* (?) *involvens* McMurr. also is referred to this genus; *Actinauge* **granulata*** (p. 202), off Cape Province, 500 m.; *Hormathia* **bouvetensis*** (p. 205), east of Bouvet Is., Atlantic Ocean, 567 m.; *Phelliactis* Simon (=*Chondrodactis* Wassil.); *P.* **algoaensis*** (p. 208), Algoa Bay, off Cape Province; *P.* **somaliensis*** (p. 211), 823 m., and *P.* **siberutiensis*** (p. 213), 750 m., both off Italian Somaliland; **CHONDROPHELLIA** (p. 215), type *C.* **coronata** (*Actinauge nodosa* v. *coronata* Verr., *A. fastigiata* McMurr.) (p. 216), *C.* **africana*** (p. 216), off Italian Somaliland, 1079 m.; *Amphianthus* Hert. (=*Gephyropsis* Carlg.); *Stephanauge* **bulbosa*** (p. 220), S. W. of Nikobar Is., 296 m.; *Amphianthus* (*Korenia*) **capensis*** (p. 222), off St. Paul Is., 672 m.; *A.* (*K.*) **armatus*** (p. 225), off Nikobar Is., 362 m.; *A.* (*K.*) **radiatus*** (p. 227), off Principe Is., 2492 m.; *A.* (*K.*) **valdiviae*** (p. 229), off Italian Somaliland, 628 m.; *Sagartiogeton* **antarcticus*** (p. 231), 63° 16′ S. lat., 57° 51′ N. long., Antarctic Ocean, 4636 m.; **PARATHOE** (p. 233), based on *P.* **stimpsonii*** (*Cereus s.* Verr., *Sagartia capensis* Pax) (p. 233); *Isophellia* **algoaensis*** (p. 236), off Cape Province; *Phelliogeton* **kerguelensis*** (p. 239), off Kerguelen Is., Indian Ocean; *Synphellia* **dubia*** (p. 240), 54° 29′ S. lat., 3° 43′ E. long.; *Halianthella kerguelensis* (Stud.) (=*Dimyactis duplicata* Pax); *Rhytidactis antarctica* Pax, taxonomic note; *Anthosactis* **epizoica** (*Antholoba e.* Pax, =*Sagartia antarctica* Pax); *Stomphia selaginella* Steph. (=*Cymbactis frigida* Pax); *Thoe* **kerguelensis** (*Sagartia k.* Pax) (p. 255); *Bunodosoma* **fallax** (*Bunodactis f.* Pax) (p. 249); *Parathoe* (?) **vincentina** (*Calliactis v.* Pax) (p. 257).

5451. **CRAWFORD, W.** **Geology of the Black Forest area.** *Victorian Nat.* 46(7): 146-149. 1929.—Various Ordovician graptolites including *Cardiograptus morsus, Oncograptus upsilon, Didymograptus caduceus, D. c.* v. *deflexus, Tetragraptus serra, T. fruticosus,* and *Goniograptus speciosus,* are found in this area.

5452. **DAWYDOFF, C. N.** **Protohydra caulleryi nov. sp. des eaux indochinoises.** *Arch. Zool. Exp. et Gén. Notes et Rev.* 70(2): 55-57. 1930.

5453. **GREGORY, J. W.** **A new Ceratotrochus from the Upper Cretaceous of Portuguese East Africa.** *Geol. Mag.* 67(796): 475-477. 1 fig. 1930.—*C.* **mennelli*** (p. 475), Cheringoma district, an area including the southern end of the Great Rift Valley. *C. mennelli* furnishes evidence as to the date of the formation of that valley. —*M. A. Fenton.*

5454. **GREGORY, J. W.** **The fossil fauna of the Samana Range and some neighbouring areas: Part VII. The Lower Eocene corals.** *Mem. Geol. Surv. India, Palaeont. Indica* 15: 81-128. 6 pl., 1 fig. 1930.—The author discusses the stratigraphic position and lists the species from 4 horizons. There are descriptions, figures, and discussion of relationships of 41 spp. from 32 genera, including: *Placotrochus* **tipperi*** (p. 86); *Trochosmilia* ? **hastata*** (p. 87); *Placosmilia* **wadiae*** (p. 88); *Euphyllia* **thalensis*** (p. 89); **PLATASTROCOENIA** (p. 90), new subg. of *Astrocoenia,* type *A.* (*P.*) *ranikoti** (Duncan); *Cyclolitopsis* **pascoei*** (p. 93); **STAMINOCOENIA** (p. 94), type *S.* **rudis** (*Hydnophora r.* Duncan) (p. 97), near *Monticulastraea; Latimaeandra* **kurramensis*** (p. 98); *Pseudastraea* **daviesi*** (p. 99); *Paracyathus* **altus*** (p. 100); *Stylophora* **vaughani*** (p. 101); *Aplophyllia* d'Orb. (=*Rhabdophyllia* Ed. & H.); [*Circophyllia*] (*Antillia*) **octoformis*** (p. 104); *Stylina* **duncani*** (p. 107); *S.* **cellulata*** (*Astrocoenia c.* Duncan) (p. 108); *Astrocoenia* **daviesi*** (p. 111); *Stephanocoenia* **tricoro-**

nata* (p. 112); *Trochoseris* obliquatus* (p. 114); *T.* daviesi* (p. 114); *Thamnastraea* punctata* (*Isastraea p.* Duncan) (p. 117); *Thamnoseris* piriformis* (p. 118); *Thecoseris* circumvictus* (p. 119); *Actinacis* lata* (p. 122); *Goniarea* piriformis* (p. 123); *Isis* ranikoti* (p. 124); *Montlivaultia* lakiensis* (p. 125); and *Palassopora* eocenica* (p. 127). All types in Geol. Surv. India.

5455. **HERKLOTS, G. A. C.** Jelly fish. *Hong Kong Naturalist* 1(2): 72-75. 1 fig. 1930.—The author discusses some species occurring at Hong Kong, with notes on the effect and treatment of their stings.

5456. **LEWIS, HERBERT PRICE.** The Avonian succession in the South of the Isle of Man. *Quart. Jour. Geol. Soc.* 86(342): 234-290. 5 pl., 6 fig. 1930.—Formations are described and faunal lists are given; comparisons are made with other areas. Anthozoa: *Caninia benburbensis**, remarks on structure and distribution; *C.* minor* (p. 267); *C. subibicina* v. densa* (p. 268); *Clisiophyllum* nemistioides* (p. 268); *C. multiseptatum* v. rigidum* (p. 271); *Dibunophyllum* monense* (p. 271); *Koninckophyllum* divisum* (p. 272); *K.* scarlettense* (p. 273); *Lithostrotion martini* v. densum* (p. 274); *Zaphrentis enniskilleni* v. ashfellensis* (p. 279); *Z. e.* v. derbiensis* (p. 279). Cephalopoda: *Merocanites applanatus**, notes. Types in British Mus.—*M. A. Fenton.*

5457. **MOLANDER, ARVID R.** South and West African Octactiniae in the Gothenburg Natural History Museum. *Göteborgs Kgl. Vetensk. och Vitterhetssamh. Handl., Ser. B.* 1(paper 7): 1-16. 2 pl., 1 fig. 1929(1930). —Ten spp. from Cape Colony and 1 sp. from Angola are listed, with synonymies, habitat and distributional records, and taxonomic discussion. *Alcyonium paessleri* May (=*A. antarcticum* Hickson, *Metalcyonium patagonicum* S. Thompson, *M. variabile* vars. *molle* and *durum* S. Thompson); *Spongioderma verrucosa* (Möbius) (=*Dendrogorgia capensis* Simpson); *Eunicella papillosa* (Esper) (=*E. rigida* Kükenthal); *Lophogorgia* capensis* (*Gorgonia c.* Hickson) (p. 11).

5458. **ROWAN, WM.** On a new Hydra from Alberta. *Trans. Roy. Soc. Canada, Sect. 5, Biol. Sci.* 24(1): 165-170. 3 pl. 1930.—*Hydra* canadensis* (p. 165). Occasional redness in this colorless sp. is due to contained copepod eggs. The nematocysts may be the cause of an "itch" affecting local bathers. There is a marked periodicity in sexual reproduction. This begins in early October, ♀♀ maturing a week or 10 days later than ♂♂. Breeding is practically over within 3 weeks. A series of consecutive frosts prove fatal to the animals. Sexual activity seems independent of temperature fluctuations, but the length of the October day may be the controlling factor.

CTENOPHORA

5459. **DAWYDOFF, C. N.** Sur une nouvelle Coeloplanide (Coeloplana perrieri nov. sp.) provenant du Golfe de Siam. *Arch. Zool. Exp. et Gén. Notes et Rev.* 70(2): 52-54. 1930.—French Indo-China.

5460. **DAWYDOFF, C.** Une nouvelle Coeloplanide de la côte sud d'Annam (Coeloplana agniae nov. sp.). *Arch. Zool. Exp. et Gén., Notes et Revue* 70(3): 83-86. 1930. —Commensal with *Alcyonium* sp. [Anthozoa].

5461. **DAWYDOFF, C.** Coeloplana duboscqui nov. sp., Coeloplanide provenant du Golfe de Siam, commensale des Pennatules. *Arch. Zool. Exp. et Gén., Notes et Revue* 70(3): 87-90. 1930.—French Indo-China, commensal with *Pteroeides* [Anthozoa].

5462. **FAUSTINO, LEOPOLDO A.** Recent Madreporaria of the Philippine Islands. *Bur. Sci. Manila, P. I. Monogr.* No. 22. 1-310. 100 pl. 1927.—A compilation of descriptions of all species known, or reported to occur, in the archipelago. Original descriptions of the 221 species listed are copied; French and German descriptions are printed in the original languages with English translations. The collections studied belong to Leland Stanford Univ. and U. S. Nation. Mus. The following nomenclatorial changes occur: *Madrepora* alcocki (p. 106); *Cladocora* moseleyi (p. 112); *Goniopora* bernardi (p. 284); *Porites* mactanensis (p. 294); *P.* hoffmeisteri (p. 295).—*L. E. Griffin.*

PLATYHELMINTHES AND MESOZOA

H. W. STUNKARD, *Editor*

(See also in this issue Entries 3328, 4342, 4384, 4397, 5434, 5484)

5463. **BAYLIS, H. A.** Correction to the descriptions of two species of Notocotylus [Trematoda]. *Ann. and Mag. Nat. Hist.* 7(41): 507. 1931.—The shell-gland is anterior to the ovary in *N. chionis* Baylis and *N. tachyeretis* Duthoit.

5464. **BHALERAO, G. D.** Two new trematodes from reptiles: Paryphostomum indicum n. sp. and Stunkardia dilymphosa n. g., n. sp. *Parasitology* 23(1): 99-108. 5 fig. 1931.—*P.* indicum* (p. 99) obtained from the duodenum of *Uromastix hardwickii*, northern India, is the 3rd sp. of the genus recorded and the 2nd member of the family Echinostomidae obtained from a reptilian host. **STUNKARDIA** type *S.* **dilymphosa** (p. 103) is described from the rectum of the tortoise, *Batagur baska*, Rangoon. This genus is the 2nd member of the subfamily Zygocotylinae, which is here emended. The excretory and the lymphatic systems, hitherto unknown in Zygocotylinae, are described. An account of the amphistomes so far recorded from chelonians is given.—*G. D. Bhalerao.*

5465. **BROWN, F. J.** Some fresh-water larval trematodes from Cheshire. *Parasitology* 23(1): 88-98. 2 pl. 1931.—Two echinostome cercariae: *Cercaria* oscillatoria* (p. 89), redia and cyst from digestive gland of *Planorbis carinatus; C. limbifera**, redia, cyst, and excysted larva from digestive gland of *Limnaea palustris*. Three fork-tailed Cercariae: *C.* echinomorpha* (p. 94), cercaria, sporocysts, from digestive gland of *Planorbis carinatus; C.* chromatophora* (p. 95), cercaria, sporocysts, from digestive gland of *Limnaea stagnalis; C.* pygocytophora* (p. 96), sporocysts from *Planorbis carinatus.*

5466. **CHATTERJI, R. C.** Preliminary observations on the life-history of an amphistome cercaria—Cercariae Indicae XXVI Sewell 1922. *Zool. Anz.* 95(5/8): 177-179. 1931.—Amphistome cercariae and cysts of "Cercariae Indicae XXVI Sewell" obtained from *Indo-planorbis exustus* in Rangoon, were fed to a young goat, which died a month after the last infection and contained many young *Paramphistomum* sp. in duodenum and small intestine. As none were found in the check animal it is believed that the cercaria developed into the *Paramphistomum.*

5467. **DOGIEL, V.** Eine merkwürdige Redie aus turkestanischen Pulmonaten. *Zool. Anz.* 94(11/12): 319-322. 1 fig. 1931.—Reports the finding of *Redia* paradoxa* [Trematoda] (p. 319) in a species of *Planorbis* (?), Aral Sea.

5468. **KEPNER, WM. A., und JEANNETTE S. CARTER.** Olisthanella virginiana nov. sp. *Zool. Anzeiger* 95(3/4): 87-94. 3 fig. 1931.—From Virginia, in mud at base of *Typha latifolia* stalks. The sp. has extremely large ♂ reproductive organs*.

5469. **MOGHE, M. A.** A supplementary description of Lytocestus indicus Moghe (syn. Caryophyllaeus indicus Moghe 1925. Cestoda). *Parasitology* 23(1): 84-87. 6 fig. 1931.

5470. **PRICE, EMMETT W.** Four new species of trematode worms from the muskrat, Ondatra zibethica, with a key to the trematode parasites of the muskrat. *Proc. U. S. Nation. Mus.* 79(4): 1-13. 4 fig. 1931.—*Psilostomum* ondatrae* (p. 1), Ontario and Oregon, from liver of *O. zibethica* and proventriculus of gull, *Larus californicus; Echinochasmus* schwartzi* (p. 3), Maryland and District of Columbia, from small intestine of *O.*

zibethica and *Canis familiaris; Urotrema* **shillingeri*** (p. 7), Maryland, from small intestine of *O. zibethica; Paramonostomum* **pseudalveatum*** (p. 9), Maryland, from large intestine of *O. zibethica.* Types in U. S. N. M.

5471. PRICE, HELEN FLORENCE. Life history of Schistosomatium douthitti (Cort). *Amer. Jour. Hyg.* 13(3): 685-727. 4 pl. 1931.—The life history of *Cercaria douthitti* was completed experimentally in the laboratory in rats and mice. The natural host of the adult worm was found to be *Microtus pennsylvanicus,* a species of mouse trapped near ponds from which snails infected with the cercarial stage were collected. Two new spp. of snail hosts, *Lymnaea palustris* Müller and *Physa gyrina elliptica* Lea, were discovered. Every stage in the life history, including adults, egg, miracidium, mother sporocyst, daughter sporocyst, and cercaria, was studied in detail. New morphological facts discovered include a cirrus in the ♂; in the miracidium, a complicated sensory apparatus, definitely arranged ciliated epithelial cells, dorsal and ventral rods of cells of unknown function; in the cercaria, a pair of penetration glands present only before normal emergence of the larvae from the snail host, and unicellular, subcuticular glands.—*Author's summary.*

5472. STEINBERG, D. Die Geschlechtsorgane von Aspidogaster conchicola Baer und ihr Jahreszyklus. (Vorläufige Mitteilung.) *Zool. Anz.* 94(5/8): 153-170. 11 fig. 1931.—The annual cycle of the sexual organs of this trematode* in the mollusk *Pseudanodonta anatina* is described and figured.

5473. THAPAR, GOBIND SINGH. Sur un nouveau trématode d'un poisson de L'Inde, Gomtia piscicola n. g. n. sp. *Ann. Parasit. Hum. et Comp.* 8(3/4): 249-253. 4 fig. 1930.—A large number of specimens were obtained from the intestine of a siluroid fish at Lucknow, belonging to the family Opisthorchidae.—*G. S. Thapar.*

5474. ALLGÉN, CARL. Über einige freilebende Nematoden aus dem Wettersee. *Arch. Hydrobiol.* 17(4): 714-729. 9 fig. 1926.—*Monhystera* **suecica*** (p. 718), *M.* **parasimilis*** (p. 718), and *M.* **paradoxa*** (p. 719), Sweden. Critical notes, in some cases descriptions, are given for *Aphanolaimus aquaticus, Tripyla papillata, Chromadora leuckarti, C. ratzeburgensis, Ethmolaimus pratensis, Trilobus gracilis, T. medius, Desmolaimus brachystoma*, Diplogaster fictor, Plectus cirratus* v. *rhizophilus,* and *Dorylaimus carteri.*

5475. ALLGÉN, CARL. Südschwedische marine Nematoden. *Göteborgs Kgl. Vetensk. och Vitterhetssamh. Handl. Ser. B.* 1(2): 1-40. 10 fig. 1929(1930).—A report on 36 spp. collected in the littoral zone of the southwestern coast of Sweden. The systematic account includes references to previous literature, ecological data, measurements, and taxonomic discussion. *Eurystomina* **littorale*** (p. 13); *Cothonolaimus* **longisetosus*** (p. 16); *Paracanthonchus* **kreisi*** ♂ (p. 18); *Spilophora* **spectabilis*** (p. 21); *Oistolaimus* **suecicus*** (p. 25); **DIPLOLAIMELLA** (Monhysteridae; Monhysterinae) (p. 29), erected for *D.* **monhysteroides*** ♂ (p. 29); *Linhomoeus lepturus* v. **zosterae*** ♀ (p. 30); *Trigonolaimus* **setosus*** ♂ (p. 37).

5476. ALLGÉN, CARL. Über einige freilebende Moosnematoden. *Nyt Mag. f. Naturvidensk.* [*Oslo*] 67: 211-229. 7 fig. 1929.—The material was collected by Sten Wallin during Captain C. A. Larsen's expedition to the Ross sea in 1923-1924, when Tasmania, New Zealand, Campbell and Macquarie Islands were visited. All spp. belong to known genera. 18 spp. are listed of which 5 are new: *Alaimus* **tasmaniensis*** (p. 212), Tasmania; *Monhystera* **campbelli*** ♀ (p. 214), *Oncholaimus* **campbelli*** (p. 219), *Mononchus* **campbelli*** (p. 222), and *M.* **parazschokkei*** (p. 224), all 4 Campbell Is. One *Dorylaimus* sp. described but not named.

5477. ALLGÉN, CARL. Über eine neue Art des Genus Siphonolaimus de Man, S. obtusicaudatus n. sp., von der schwedischen Westküste. *Zool. Anz.* 92(9/10): 235-238. 3 fig. 1930.—*S.* **obtusicaudatus*** (p. 235), 70 m.

5478. CHITWOOD, B. G. Studies on some physiological functions and morphological characters of Rhabditis (Rhabditidae, nematodes). *Jour. Morph. & Physiol.* 49(1): 251-275. 3 pl. 8 fig. 1930.—Intravitam stains were used to determine the functions of several organs in 2 spp. of nemas (*R. strongyloides* and *R. elongata*). The organs were also studied in section. From the results obtained it is concluded that the amphids are not excretory in function, but more probably sensory, for definite connections were observed to extend to the nerve ring. No migratory cells, such as those described by Stefanski, were seen. The phasmids stained with all intravitam stains used, but were never observed to secrete. It seems doubtful that they serve as excretory organs. The excretory system was seen to consist of a typical X system. Actual excretion was observed. Deirids were seen for the first time in both species. Oesophageal glands were also described. A study was made of the structure of the intestinal cells, rectal glands, and anal muscles. Attention was called to the fact that there are two kinds of ejaculatory glands, one of which probably serves as a "cement gland," while the function of the other is still in doubt.—*Author (courtesy Wistar Bibl. Serv.).*

5479. COBB, N. A. A nemic parasite of Pecten. *Jour. Parasitol.* 17(2): 104-105. 1 fig. 1930.—*Paranisakis* **pectinis*** from scallop, North Carolina.

5480. FUCHS, GILBERT. Diplogaster horticola n. sp. *Zool. Anzeiger* 81 (7/10): 229-237. 8 fig. 1929.—*D.* **horticola*** (p. 229), found in heads of red cabbage and cauliflower.

5481. KREIS, HANS A. Freilebende terrestrische Nematoden aus der Umgebung von Peking (China). II. *Zool. Anzeiger* 87 (3/6): 67-87. 9 fig. 1930.—*Diplogaster* **minutus** (*D. minor* Kreis) (p. 67); *Rhabditis* **lepidus** (*R. elegans* Kreis) (p. 67); **ASYMMETRICUS** n. n. for *Pseudorhabditis* Kreis (p. 67); *Plectus* **aberrans*** (p. 67); *P.* (*Wilsonema*) **fausti*** ♀ (p. 69); *Acrobeles* **obtusicaudatus*** ♀ (p. 71); *A.* **sinensis*** (p. 72); *Dorylaimus* **rhabdotus*** (p. 75); *D.* **mesonyctius*** (p. 77); *D.* **gibbero-aculeatus*** (p. 80); *D. monohystera* de Man, first description of ♂; *Dolichodorus* **heterocercus*** (p. 84).

5482. MUELLER, JUSTUS F. The mechanism of copulation in the nematode Ascaris lumbricoides. *Trans. Amer. Microscop. Soc.* 49(1): 42-45. 1 pl. 1930.—A pair fixed *in copula* were studied with reference to the mechanism of transmitting the sperms. The spicules are found withdrawn into their sheaths, apparently playing no part at this time. The posterior gut, cloacal cavity, distal ends of the spicule sheaths, vesicula seminalis, and ductus ejaculatorius are found packed with mature sperms. These are also present in the terminal portion of the vagina, and are massed around the vulva. The transfer seems to have been accomplished by simple apposition of the ♂ and ♀ orifices.—*Author's summary.*

5483. POPOFF, N. P. Contribution to the fauna of horse-strongylids of U. S. S. R. *Ann. Trop. Med. & Parasitol.* 22(2): 265-266. 1928.—List of nemas from horse in Russia: *Oesophagodontus robustus, Triodontophorus serratus, T. brevicauda, T. tenuicollis, Gyalocephalus equi, Poteriostomum imparidentatum, P. ratzii, Trichonema coronatum, T. labiatum, T. labratum, T.*

sagittatum, T. calicatum, T. longibursatum, T. minutum, T. poculatum, T. catinatum, T. goldi, T. pateratum, T. radiatum, T. adersi, T. elongatum, T. insigne, T. leptostomum, T. nassatum, T. triramosum, T. bicoronatum, T. euproctum, T. prionodes, T. brevicapsulatum.

5484. **SANDGROUND, J. H.** A new liver fluke from a monkey and new parasitic roundworms from various African animals. *Proc. U. S. Nation. Mus.* 75(12): 1-11. 2 pl. 1929.—A list of parasitic worms collected by the Harvard African Expedition (1926-27) contains the following new forms. Trematoda: *Dicrocoelium* colobusicola* (p. 2) from liver of the monkey *Colobus*, Belgian Congo. Nematoda: **LEIPERIATUS** (p. 5) (Trichostrongylidae), type *L.* hopkeni* (*Nematodirus h.* Leiper) from *Hippopotamus amphibius*, Lake Albert; *Oswaldocruzia* agamae* (p. 7) from intestine of *Agama colonorum*, Liberia: **COLOBOSTRONGYLUS** (p. 8) (Strongylidae), type *C.* strongi* (p. 9) from intestine of *Colobus polykomos*, Liberia. All types in U. S. Nation. Mus.—*H. W. Manter.*

5485. **SCHWARTZ, BENJAMIN and JOSEPH E. ALICATA.** Two new species of nodular worms (Oesophagostomum) parasitic in the intestine of domestic swine. *Jour. Agric. Res.* 40(6): 517-522. 12 fig. 1930.—*O.* brevicaudum* (p. 517) and *O.* georgianum* (p. 520) from large intestine of swine (*Sus scrofa domestica*), Georgia. Types in U. S. Nation. Mus.—*J. E. Alicata.*

5486. **THOMAS, LYELL J.** Rhigonema nigella spec. nov., a nematode and its plant commensal, Enterobrus sp.? from the milliped. *Jour. Parasitol.* 17(1): 30-34. 2 pl. 1930.—*R.* nigella* (p. 31) from the intestine of *Parajulus dux*, Michigan. A fungus, *Enterobrus* sp., appears as a commensal in the milliped intestine and often covers the cuticula of the nematode, giving the latter the appearance of woolly caterpillars. The author found the nematode excellent material for teaching the anatomy of round worms to beginning students.

5487. **TRIFFITT, MARJORIE J.** On the morphology of Heterodera schachtii with special reference to the potato-strain. *Jour. Helminthol.* 6(1): 39-50. 1 pl. 1928.—This nematode causes damage to beets, oats, potatoes, etc. A strain specialised on one host will not readily attack another. This gave rise to the idea that *H. schachtii* represented several similar but distinct spp. parasitic upon different hosts. The strain attacking potatoes has been named *H. rostochiensis* by Wollenweber. Students of the morphology of the worm have given widely varying measurements of the various developmental stages from beets and oats. A comparative study of *H. schachtii* on beets, oats, and potatoes, shows that, although dimensional variations are even greater than was supposed, they occur equally in all 3 strains, whereas the general morphological characters are identical in all major particulars, regardless of the sp. of host plant. Zimmermann, 1927, 1928, claims successfully to have infected beets with the potato-strain by growing crops for 2 successive seasons on heavily infested land. The author concludes that *H. rostochiensis* is not a true sp. but a synonym of *H. schachtii.*—*M. J. Triffitt.*

5488. **WALTON, A. C.** Studies on some nematodes of North American Amphibia. II. Cryptobranchidae. *Jour. Parasitol.* 17(1): 20-24. 1 pl. 1930.—From *Cryptobranchus allegheniensis* from Pennsylvania rivers are described: *Spironoura* cryptobranchi* ♀ (p. 20), *Zanclophorus* cryptobranchi* (p. 21), and *Spiroxys* allegheniensis* ♂ (p. 22). Types in coll. of H. B. Ward, Univ. Illinois.

5489. **WALTON, A. C.** A new Hedruris from Diemyctylus viridescens. *Jour. Parasitol.* 17(1): 49-51. 1 fig. 1930.—*H.* brevis*, North Carolina, type in coll. of H. B. Ward, Univ. Illinois.

5490. **WEHR, EVERETT E.** New species of bird nematodes from the Philippine Islands. *Jour. Parasitol.* 17(2): 80-84. 1 pl. 1930.—*Ceratospira* thriponaxis* (p. 80) and *Thelazia* philippinensis* (p. 81) from *Thriponax* sp.; *Ascaridia* subequalis* (p. 82) from *Cuckoo* sp.; *Diplotriaena* corrugata* (p. 83) from *Ptiocichla basilonica.* Types in Parasitol. Coll., Univ. Illinois. A key to the spp. of *Ceratospira* is given.

5491. **WETZEL, RUDOLF.** On the biology of the fourth stage larva of Oxyuris equi (Schrank). *Jour. Parasitol.* 17(2): 95-97. 1 pl. 1930.—These larvae attach themselves to the mucous membrane of the colon by drawing a portion of the stratum gladulare into the anterior part of the esophagus, which for this purpose has adapted itself to the shape and function of a mouth capsule. This results in a mechanical destruction of the superficial layers of the mucosa, the cells of which, together with tissue juice, are probably the actual food of the larvae.—*Author's summary.*

5492. **WETZEL, RUDOLF.** Description of a new species of amidostomine worm of the genus Epomidiostomum from the gizzard of anserine birds. *Proc. U. S. Nation. Mus.* 78(21): 1-10. 2 pl. 1931.—*Epomidiostomum* crami* (p. 4), Washington, D. C., under the cuticular layer of the gizzard of *Branta canadensis c.* and *Chen caerulescens.* Life history unknown. Type in U. S. N. Mus. A key to the spp. of the genus is given, and the type species, *E. uncinatum*, is redescribed.

ACANTHOCEPHALA

H. J. VAN CLEAVE, *Editor*

(See also in B. A. 5(11): Entries 28443, 29307)

5493. **BHALERAO, G. D.** On a new species of Acanthocephala from Ophiocephalus striatus. *Ann. and Mag. Nat. Hist.* 7(42): 569-573. 4 fig. 1931.—*Farzandia* nagpurensis* (p. 569), Central Provinces, in duodenum and intestine of host, type in Indian Mus., Calcutta. The infection occurred in 60% of the fishes dissected, but only 2 to 19 worms could be obtained from each host.

5494. **BHALERAO, G. D.** Two new parasites from the king cobra (Naja hannah). *Ann. and Mag. Nat. Hist.* 8(43): 102-109. 5 fig. 1931.—Nematoda: *Kalicephalus* radicus* (p. 102), from intestine and rectum of *Naja hannah.* Acanthocephala: *Centrorhynchus* reptans* (p. 106), from intestine and rectum of *N. hannah*, both from Muktesar, India. Types in Imp. Inst. Vet. Res., Muktesar, Kumaun, U. P., India.

5495. **DATTA, M. N.** On Echinorhynchus sp. inq. from common crows, Corvus corax and Corvus splendens, of Allahabad. *Allahabad. Univ. Studies* 4: 41-61. 9 pl. 1928.—*E.* robustus* (p. 59) is described in detail.

5496. **MEYER, A.** Die Stellung des Genus Heterosentis Van Cleave 1931 im Acanthocephalensystem. *Zool. Anzeiger* 94(9/10): 258-265. 2 fig. 1931.—The genus *Heterosentis* Van Cleave is referred to the Quadrigyridae; *H. heterancanthus** is described from intestine of *Atherinichthys microlepidotus* [Pisces]. Quadrigyridae (=Pallisentidae) is emended to contain *Quadrigyrus, Pallisentis, Neosentis,* and *Heterosentis,* with *Cleaveius* as an "Anhang," all parasitic in fishes. Rhadinorhynchidae contains *Serrasentis, Telosentis, Tegorhynchus, Rhadinorhynchus, Leptorhynchoides,* and *Polyacanthorhynchus,* all parasitic in fishes. Echinorhynchidae contains *Acanthocephalus, Echinorhynchus, Pomphorhynchus,* and **ACANTHOCEPHALOIDES** (p. 263), based on *A.* propinquus (Dujard) new comb., all parasitic in fishes. These three families and the Polymorphidae and Acanthogyridae belong to the order **PALAEACANTHOCEPHALA** (p. 264), and the Neoechinorhynchidae are assigned to the order **ARCHIACANTHOCEPHALA** (p. 264). These two orders are to be defined in a work in press.

5497. **VAN CLEAVE, HARLEY J.** Heterosentis, a new genus of Acanthocephala. *Zool. Anz.* 93(5/6): 144-146. 2 fig. 1931.—Rhadinorhynchidae: **HETEROSENTIS** (p. 144), type *H.* heteracanthus* (*Echinorhynchus h.* v. Linstow) (p. 144), of which an emended description is given.

NEMERTEA

W. R. COE, *Editor*

5498. **COE, WESLEY R. A new species of nemertean (Lineus vegetus) with asexual reproduction.** *Zool. Anz.* 94(1/2): 54-60. 7 fig. 1931.—*L. vegetus** (p. 55), California. Morphology of organ systems, reproduction by fragmentation, and remarkable capacity for regeneration of minute pieces are described.

5499. **STIASNY-WIJNHOFF, G. Die Gattung Oerstedia.** *Zool. Mededeel.* 13(3/4): 226-240. 3 pl., 1 fig. 1930.—*Oerstedia* is redefined and its generic position is discussed anatomically. The genus does not belong to the Prostomatidae, but rather to the Emplectonematidae. *O. rustica* (Joubin) is referred to *Prostoma*. The internal anatomy of *O. dorsalis** is described.

5500. **VALKANOV, A. Über das Vorkommen von Süsswassernemertinen in Bulgarien.** *Zool. Anz.* 95(3/4): 76. 1931.—A report of the finding in 3 places in Bulgaria of *Tetrastemma* [=Prostoma] *graecense*.

ROTATORIA, GASTROTRICHA, ECHINODERA, AND CHAETOGNATHA

CHARLES H. BLAKE, *Editor*

(See also in this issue Entries 3319, 3328, 6048)

5501. **HÜNERHOFF, ERNST. Über ein bisher unbekanntes Larvenorgan und die Regeneration bei dem Rädertier Apsilus vorax.** *Zool. Anz.* 92(11/12): 327-332. 6 fig. 1931.—The larva of *A. vorax** (rare in Europe) possesses an organ which, from its structure and function, must be a statocyst. The statolith shows strong double refraction in polarised light and disappears 2-3 days after metamorphosis. The fully developed sessile animal can regenerate portions cut from the nucleated coronal mask. The question of the regeneration of the excised nuclei has great theoretical importance in connection with cell constancy in Rotatoria. The investigation is being continued.—*E. Hünerhoff (transl. by C. H. Blake)*.

5502. **LUNTZ, ALBERT. Rädertier-Tabellen.** *Tabulae Biologicae Periodicae* 1(1): 107-109. 1 fig. 1931.—Growth, growth curves, and specific wts. are tabulated.

ANNELIDA

J. PERCY MOORE, *Editor*

5508. **SCRIBAN, I. A., und E. EPURE. Beobachtungen über das Gefässsystem von Herpobdella atomaria Carena.** *Zool. Anz.* 94(11/12): 322-328. 5 fig. 1931.—Describes the circulatory system, which is derived from the coelom, the sphincter serving to regulate blood flow.

BRACHIOPODA, BRYOZOA, PHORONIDEA

R. C. OSBURN, *Editor*

(See also in this issue Entries 3319, 5249, 5252, 5253, 5254, 5257, 5258, 5264, 5265, 5266, 5268, 5276, 5277, 5862)

GENERAL

5509. **[FREDERIKS, GEORGII.] ФРЕДЕРИКС, ГЕОРГИЙ. Верхнепалеозойская фауна Хараулахских гор. [Upper Palaeozoic fauna of the Kharaulakh Mts.]** [English summary.] Известия Академии Наук СССР., Отделение Математических и Естественных Наук. (*Bull. Acad. Sci. URSS., Cl. Sci. Math. et Nat.*) 1931(2): 199-228. 4 pl. 1931.—This Permian fauna of 29 described forms includes: *Aviculopecten (Deltopecten) subclathratus* mut.? **multicostatus*** (p. 199); *Dielasma truncatum* mut. **borealis*** (p. 201); *Lytha* **tolmachoffi*** (p. 205); *Cyrtospirifer dubium**, an Australian form reported from Asia for the first time; *C.* **kharaulakhensis*** (p. 207); *Strophalosia* King (=*Aulosteges* Helmersen); **WYATKINA** (p. 211) (Productidae), type *Aulosteges gigas* Netschaew; *Marginifera* **verkhoyanica*** (p. 211), Verkhoyanskii Range; *Krotovia* **tolli** (p. 213), with vars. **semicircularis*** (p. 214) and **semiovalis*** (p. 214); *K.* **vollossovitschi*** (p. 215); *Cora* **kharaulakhensis*** (p. 216). All from Kharaulakh Mts., Siberia, unless otherwise stated.

BRACHIOPODA

5510. **ALLAN, R. S. On a new Recent Terebratella from northern New Zealand.** *New Zealand Jour. Sci. and Tech.* 12(6): 385-387. 4 fig. 1931.—*T.* **haurakiensis*** (p. 385), type in author's coll.

5511. **DUTERTRE, A. P. Découverte d'Uncites dans le Dévonien du Boulonnais.** *Ann. Soc. Geol. du Nord* 53: 287-288. 1928.—The new found occurrence of *Uncites* in this region of northern France is discussed.—*W. Berry*.

5512. **LICHAREV, B. On two new representatives of the family Productidae from the Lower Permian of North Caucasus.** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(16): 436-440. 4 fig. 1930.—*Loczyella* (?) **parvula*** (p. 437); **PECTENOPRODUCTUS** (p. 439), near *Productus*, type *Pectenoproductus* **proprius*** (p. 439).

5513. **MUIR-WOOD, HELEN MARGUERITE. The fossil fauna of the Samana Range and some neighboring areas: Part III. The Brachiopoda.** *Mem. Geol. Surv.*

India, Palaeont. Indica 15: 25-37. 2 pl. 1930.—One Jurassic and 9 Cretaceous forms are treated, with descriptions, figures, and taxonomic remarks. *Rhynchonelloidea arcuata** recorded as new to India; *Rhynchonella* **samanensis*** (p. 27); *R.* **reticulata*** (p. 29); *Terebratula* **samanensis*** (p. 29); *T.* **daviesi*** (p. 32); *Kingena* **tumida*** (p. 34). All new forms from the Lr. Gault (Cretaceous) of India; types in Geol. Surv. India.

5514. **RUIZ, CARMELA.** Gli Strofomenidi del Permiano del bacino del Sosio (Palermo). Nota preventiva. *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 12(11): 588-590. 1930.—In this preliminary note the author records 12 forms of Strophomenidae from the Permian of the Sosio Basin. The following are new to Sicily: *Streptorhynchus crenistria, S. c.* var. *senilis, S. pelargonatus, S. pseudopelargonatus, Derbya buchi, Orthotetes guadalupensis, O. distortus,* and *Meekella uncitoides.*

5515. **SCHAEFFER, CORNELIA.** Untersuchungen zur vergleichenden Anatomie und Histologie der Brachiopodengattung Lingula. [Comparative anatomy and histology of Lingula.] *Vierteljahrsschr. Naturforsch. Ges. Zürich* 72(1/2): 186-204. 1927.

BRYOZOA

5516. **BASSLER, R. S.** Pursuing microfossils. *Smithsonian Inst., Explorations and Field-Work of the Smithsonian Inst. in 1930. Publ.* 3111. 7-12. 2 pl. 1931.—A popular account of field investigations of Bryozoa in the Atlantic Coast States by the author and Ferdinand Canu. Also a description of the Cushman Foraminiferal Laboratory* at Sharon, Mass.

5517. **FRITZ, MADELEINE A.** Two new species of fossils from the Palaeozoic rocks of Ontario. *Trans. Roy. Canadian Inst.* 17(2): 223-225. 1 pl. 1930.—*Zitteloceras* **fimbriatum*** (p. 223) (Cephalopoda), Black River formation; *?Amplexopora* **spinulifera*** (p. 224) (Bryozoa), Hamilton formation. Types in Royal Ontario Mus. Palaeontology.

5518. **GRAUPNER, HEINZ.** Haltung und Aufzucht von Meeresbryozoen. In: **EMIL ABDERHALDEN. Handbuch der biologischen Arbeitsmethoden. Abt. IX. Methoden der Erforschung der Leistungen des tierischen Organismus. Teil 5, Heft 3, Methoden der Meerwasserbiologie. Lief. 278.** p. 421-430. 3 fig. Urban & Schwarzenberg: Berlin, 1928.—Methods are described for obtaining, transporting, and keeping marine Bryozoa in the aquarium. Special devices are discussed for observing spawning and cleavage which cannot be observed in ordinary aquaria with a flowing current or the usual type of aeration. For observation of the budding process and of incrusting forms the animals should be attached on a silk thread. A chapter is devoted to the rearing of larvae, substrata for the final settling of which must be prepared in time to have them in a handy condition for microscopical work. Finally, methods are described for the breeding of Bryozoa in the open sea, especially important for the studying of the life cycle, the density of growth, and the budding conditions.—*C. R. Boettger.*

MOLLUSCA

5522. **BUCKMAN, S. S. Type Ammonites. VII., With editorial note, chronological and other tables and index,** by **A. MORLEY DAVIES.** 7 (64-72): 1-78. 118 pl. Published by the author (pts. 64-70) and by the executors of the late S. S. Buckman (pts. 71-72). Sold by Wheldon & Wesley, Ltd.: London, 1927-1930.—The text discusses a series of unrelated topics pertaining chiefly to the Jurassic of England: *Dichotomosphinctes* **ingens** (*Ammonites i.* Young & Bird) (unnumbered page). The relations of *Dichotomoceras; Harpoceratoides;* **GLYPTARPITES** (p. 8), type *G.* **glyptus*** (p. 8); **TARDARPOCERAS** (p. 9), type *T.* **tardum*** (p. 9), *Poecilomorphus,* including *P.* **regulatus*** (p. 10), *P.* **umbilicatus** (*Ammonites cycloides* d'Orb., part) (p. 10), *P.* **evolutus** (p. 10), *P.* **primiferus*** (p. 10), *P.* **fasciatus** (*Ammonites cycloides* d'Orb., part) (p. 10), *P.* **asper** (p. 10), *P.* **inclusus** (p. 10), *P.* **angulinus*** (p. 10), *P.* **capillaceus** (p. 10); **MACERATITES** (p. 11), type *M.* **aurifer*** (p. 11), including *M.* **costulatus** (*Poecilomorphus macer* Buckman, part paratype) (p. 11), *M.* **macer** (*Poecilomorphus macer* Buckman, typical) (p. 11); **SPATULITES** (p. 12), type *S.* **spatians*** (p. 12); *Dundryites;* **ZUGELLA** (p. 12), type *Z.* **connata*** (p. 12); **NANNINA** (p. 13), type *N.* **evoluta*** (p. 13); *Maconiceras,* including *M.* **soloniacense*** (*Grammoceras s.* Lissajous, part) (pl. 721), *M.* **lassum*** (*Grammoceras soloniacense* Lissajous, part) (pl. 722); **PHAULARPITES** (p. 13), type *P.* **exiguus*** (p. 13). And the form of the inner margin of the whorl. The remaining text pages are contributed by A. Morley Davies as a conclusion of the 7 volumes and include: A historical note; an explanation of Buckman's system of notation; a table showing the arrangement of the families touched upon in the 7 volumes of Type Ammonites; a geologic chronology and index of the species included; a chronologic list

of the plates; alphabetic indexes of genera and species included; an index of the species names changed during the publication of the volumes; and a list of the new specific names appearing in the text matter. Since the publication of the final part, the editor has printed a further series of corrigenda. Subscribers who have not received this are requested to write for it to Dr. A. Morley Davies, Imperial College of Science and Technology, London, S. W. 7, England. The plates bear no pagination and are mostly unrelated to the text. Each plate contains 1 species and a brief diagnosis. New are: *Schlotheimia* **antiquata*** (*Ammonites antiquatus* Simpson) (plate 718A), *Nodicoeloceras* **crassescens*** (*Ammonites c.* Simpson) (pl. 719), *Zugodactylites* **mutatus*** (pl. 720), *Emileia* **vagabunda*** (pl. 723A), *Chondroceras* **gervillii*** (*Sphaeroceras g.* Buckman) (pl. 724), *Sphaeroceras* **globus*** (pl. 725), *Bajocisphinctes* **curvatus*** (pl. 726), *Pseudocadoceras?* **laminatum*** (*Ammonites sublaevis* Pratt) (pl. 727), *Nodicoeloceras* **acanthus*** (*Porpoceras a.* d'Orb.) (pl. 729A), *Emileia* **bulligera*** (pl. 732A), *E.* **multifida*** (pl. 733), *Pseudocadoceras?* **concinnum*** (pl. 735), **PARACORONITES,** type *P.* **noduliferus*** (pl. 737A), *Orthodactylites* **mitis*** (pl. 738), *Harpoceratoides* **strangwaysi*** (*Ammonites s.* Sowerby) (pl. 739), *Harpoceras* **concinnum*** (pl. 742), *Zugodactylites* **rotundiventer*** (pl. 743), *Emileia* **contrahens*** (pl. 744A), *Witchellia* **laeviuscula*** (*Ammonites laeviusculus* Sowerby) (pl. 745), *Dichotomoceras* **strumatum*** (pl. 747A), *Parinodiceras* **reineckii*** (*Ammonites striatus r.* Quenstedt) (pl. 748A), *Harpoceras* **falciferoides** (pl. 749), *Dundryites* **pavimentarius*** (*Sonninia* sp. Lutz: Stuttgart, 1927. 12 M.—A well illustrated descriptive monograph of German fossil and recent land and fresh water mollusks, with keys to families, genera and species, many of which are illustrated.

5529. HAAS, F. Bivalvia (Muscheln). In: **Bronn's Klassen u. Ordnungen des Tier-Reichs. 3**(Abt. 3. Lief. 1): 1-176; (Lief. 2): 1-292. 80 fig. 1929.—The first Lieferung begins with a classification of bivalve (pelecypod) families which is an amplification of Thiele's scheme and is mainly based on conchological characters. Orders Anisomyaria, Taxodonta, and Eulamellibranchiata are recognized; the last is divided into the suborders Schizodonta, Heterodonta, Hemidapedonta, Desmodonta, and Anomalodesmata. The discussion begins with a general account of the orientation of the entire body and the relative positions of the organs. The remainder of this part deals with the shell. Chapters follow on: the mathematical interpretation of growth form, the various adult shapes, beaks, beak and shell sculpture, internal topograph, brood chamber, hinge, ligament, hinge armature (with a discussion of the various formulae proposed), phyletic and ontogenetic development of hinge armature, accessory shelly growths, secondary shells, erratic forms, and sexual dimorphism. The second Lieferung consists of a bibliography, which is arranged alphabetically by authors; this lists all of the papers on bivalves known to the author (almost 7000 citations).—*H. B. Baker.*

5531. HESSE, P. Die Nacktschnecken der paläarktischen Region. *Abhandl. Arch. Molluskenk.* 2(1): 1-152. 2 pl. 1926.—Since the times of Simroth and Pollonera, there has been a certain standstill in the anatomical and systematic study of Palaearctic slugs. The author, therefore, herein presents a comprehensive account showing what is already known and how much yet remains to be done in this field of research. The slugs treated are arranged into 3 families: (1) Limacidae, (2) Trigonochlamydidae, and (3) Arionidae; all of which must be allocated to their proper place within the general system, since the only character common to all is the absence of external shell. The paper gives a description and classification of genera and subgenera based on anatomical characters and also points out the gaps in our knowledge of this group. The insertion of these families within the Stylommatophora is discussed. The family Limacidae (divided into 2 subfam., Limacinae and Parmacellinae) is regarded as related to the Vitrinidae. Many of the groups of Stylommatophora have branched off rapacious forms, which have been grouped together as Agnatha by certain authors. But in light of present knowledge, this arrangement, based on absence of jaw, must be modified, and (e.g.), *Plutonia* classed with the Vitrinidae, and *Daudebardia* with the Zonitidae. There are also rapacious slugs in the Palaearctic region, e.g., the Trigonochlamydidae, grouped with the Limaci-

dae, especially within the genera *Milax* and *Parmacella*, as pointed out by Simroth. The Trigonochlamydidae are probably as closely related to the Parmacellinae as these latter are to the Limacinae. This small group of rapacious slugs, restricted to the Caucasian district, might, therefore, well be included as a special subfamily amongst the Limacidae, as the Daudebardiinae, which have a similar mode of life, are within the Zonitidae. Of the Arionidae (3 subfam.: Binneyinae, Ariolimacinae, Arioninae), only the Arioninae, which is the most specialized of the subfamilies, belongs to the Palaearctic region. Pilsbry regards them as a descendent of the Endodontidae. A list is given of the 266 spp. of slugs found in the Palaearctic region, which is valuable both as a catalogue of the spp. and of the scattered literature. A list of corrections was published in *Arch. Molluskenk.* 58: 234-235, 1926. The following new groups are described: **CASPILIMAX** (p. 14), subg. of *Limax*, type *L. keyserlingi* Marts.; **SVANETIA** (p. 15), subg. of *Limax*, monotype *L. svaneticus* Simroth; **MICROMILAX** (p. 33), subg. of *Milax*, type *Milax cyprius* Simroth (substitute for *Cypria* Simroth); **MESARION** (p. 65), section of *Arion*, type *A. subfuscus* Drap.; **CARINARION** (p. 65), sect. of *Arion*, type *A. circumscriptus* Johnston (substitute for *Carinella* Mabille); **MICROARION** (p. 66), sect. of *Arion*, type *A. intermedius* Normand.—*C. R. Boettger.*

5532. HULL, A. F. BASSET, and JEAN RISBEC. The loricates of the New Caledonian region. (Class Mollusca—Order Loricata.) [To be cont'd.] *Australian Zoologist* 6(3): 277-286. 5 pl. 1930.—Previous literature on the Loricata of this region is reviewed. Owing to great individual variation, the radula is less useful than the valves and the girdle in differentiating the forms. *Ischnochiton* **acomphus*** (p. 278). Egg-laying and larval development are described in detail.

5533. IHERING, HERMANN von. Die Nephropneusten in systematischer und phylogenetischer Hinsicht. *Abhandl. Arch. Molluskenk.* 2(2): 1-229. 5 fig. 2 pl. 1929.—The Nephropneusta includes the stylommatophorous pulmonate mollusks. The present paper is divided into 6 parts: (1) The nephropneust question in light of the latest data; (2) Genitalia and systematics of the Helicidae and Fruticicolidae; (3) Origin of nephropneust lungs; (4) The classification of Mollusca; (5) The classification of Nephropneusta; and (6) Bibliography of the author's published works (1872-1929). The Helicidae are divided into the subfamilies Helicinae, Campylaeinae, Lysinoinae, and Leucochroinae; the Fruticicolidae into the Fruticicolinae, Xerophilinae (=Helicellinae), Eulotinae, Cepolinae, and Cochlostylinae. Many anatomical references are included. The order Nephropneusta includes 2 groups: Meganota and Micronota. The Meganota is subdivided into the Ditremata (Onchidiidae, Vaginulidae, and Rathouisiidae) and the Monotremata (Janellidae and Philomycidae). The Micronota also includes 2 groups: Orthurethra (Achatinellidae, Amastridae, Partulidae, Cochlicopidae, Buliminidae, Pupidae, and Valloniidae) and Anurethra (=Heterurethra+Sigmurethra). The Anurethra are further subdivided into the Aulacopoda (Endodontidae, Phenacohelicidae, Zonitidae, Limacidae, Parmacellidae, Urocyclidae, Trigonochlamydidae, Systrophiidae, Streptaxidae, Aperidae, Rhytididae, Glandinidae, Testacellidae, Arionidae, and Ostracolethidae) and the Holopoda (Acavidae, Achatinidae, Ferussaciidae, Megaspiridae, Clausiliidae, Cerionidae, Cylindrellidae, Bulimulidae, Sagdidae, Helicidae, Fruticicolidae, Polygyridae, Pleurodontidae, and Succineidae). In the phylum Mollusca, 3 subphyla are recognized: (1) Amphineura, (2) Arthromalakia, including the classes Solenoconcha (=Scaphopoda auct.), Cephalopoda, Lamellibranchia and Cochlides (=Prosobranchia auct.), and (3) Platymalakia, with one class, Ichnopoda (=Opisthobranchia+Pulmonata auct.).—*H. B. Baker.*

5534. IREDALE, TOM. Mollusca from the continental shelf of eastern Australia. No. 2. *Rec. Australian Mus.* 17(4): 157-189. 4 pl. 1929.—Continuing an earlier paper (published in 1925), the author describes new pelecypods and gastropods and suggests that some are possibly related to fossil forms. Nuculanidae: *Nucula obliqua* **subdilecta** (p. 158), S. Australia; **SCAEOLEDA** (p. 158), type *S.* **crassa** (*Nucula c.* Hinds) (p. 158); *S. c.* **illepida** (p. 158), S. Austr.; **TERETILEDA** (p. 158), type *Nuculana oculata* Iredale, including also *N. fortis;* **MAGALEDA** (p. 158), type *Leda inopinata* E. A. Smith; **THESTYLEDA** (p. 158), type *Leda ramsayi* E. A. Smith; *Comitileda* **remensa** (p. 159), S. Austr.; *Leda pala* Hedley is transferred to *Comitileda; Poroleda* **flindersi** (p. 159), S. Austr.; **MICROCUCULLAEA** (p. 159), near *Cucullaea*, type *Bathyarca perversidens* Hedley; *M.* **adelaideana** (p. 159), S. Austr.; **LORINGELLA** (p. 160), type *Limopsis loringi* Angas; **PHRYNELIMA** (p. 160), type *Limopsis-brazieri* Angas; **ASPALIMA** (p. 160), near *Trinacria*, type *A.* **erecta** (*Limopsis erectus* Hedley & Petterd) (p. 160); *A. e.* **idonea** (p. 160); S. Austr.; **CYRILLONA** (p. 160), type *Cyrilla dalli* Hedley; **CYRILLISTA** (p. 160), type *Nuculina concentrica* Verco; *Glycymeris* **magnificens*** (p. 161), N. S. Wales; *G.* **broadfooti** (p. 162), S. Austr.; **MESOPEPLUM** (p. 162), type *M.* **caroli*** (p. 162), N. S. Wales; **MIMACHLAMYS** (p. 162), type *Pecten asperrimus* Lamarck; **SCAEOCHLAMYS** (p. 162), type *Pecten lividus* Lamarck; **EQUICHLAMYS** (p. 162), type *Pecten bifrons* Lamarck; **BELCHLAMYS** (p. 164), subg. of *Chlamys*, type *Pecten aktinos* Petterd; **TALOCHLAMYS** (p. 164), subg. of *Chlamys*, type *C. famigerator* Iredale; **VEPRICHLAMYS** (p. 164), subg. of *Chlamys*, type *C. perillustris* Iredale; **CHLAMYDELLA** (p. 164), type *Cyclopecten favus* Hedley; **CTENAMUSIUM** (p. 164), type *Amusium thetidis* Hedley; *C.* **salacon** (p. 164), locality not stated; *Spondylus* **regillus*** (p. 165), N. S. Wales; **AUSTROLIMA** (p. 165), type *A.* **nimbifer** (*Lima n.* Iredale) (p. 165); *A. n.* **gemina** (p. 165) and *A.* **spectata** (p. 165), S. Austr.; **ESCALIMA** (p. 165), type *Limea acclinis* Hedley; *Lima murrayi* Smith is also referred to this genus as *E. m.* **murrayi** (p. 166); *E. m.* **acclinis** (*Limea a.* Hedley) (p. 166); *E. m.* **maugeana** (p. 166), Tasmania; *E. m.* **relegata** (p. 166), S. Austr.; **GEMELLIMA** (p. 166), type *Limaea austrina* Tate; **ISOLIMEA** (p. 166), subg. of *Gemellima*, type *Limaea parvula* Verco; **EXOSIPERNA** (p. 166), type *Arcoperna scapha* Verco; *E.* **relata** (p. 167), N. S. Wales. Trochidae: The genus *Minolia* is rejected; *Spectamen* **epitheca*** (p. 168), N. S. Wales; **MINOLOPS** (p. 169), type *Minolia pulcherrima emendata* Iredale; *Minolops* **emendata*** (*Minolia pulcherrima e.* Iredale) (p. 169); *M.* **pulcherrima*** (*Minolia p.* Angas) (p. 169); *M.* **rosulenta** (*Solarium rosulentum* Watson) (p. 169); *M.* **arata*** (*Minolia a.* Hedley) (p. 169); **ARCHIMINOLIA** (p. 170), type *Monilea oleacea* Hedley & Petterd; *Talopena* **gloriola*** (p. 170), N. S. Wales; *Astele subcarinata* Swainson, new to N. S. Wales; *Onustus* **peronianus** (p. 172), Australia. Cymatiidae: *Charonia* **euclia** (*C. nodifera* var. *e.* Hedley) (p. 172); *C. e.* **instructa*** (p. 172), eastern Austr.; *Cymatium boltenianum** A. Adams is reinstated as a sp. distinct from *C. spengleri* Perry; *C. spengleri* **procerum*** (p. 173), locality not stated; *Mayena australasia* **benthicola*** (p. 174), locality not stated; *Cymatiella verrucosa** (Reeve) redescribed; *C.* **lesueuri*** (p. 175), Victoria (type), S. Austr., and Tasmania; *C.* **gaimardi*** (p. 176), S. Austr.; *C.* **peroniana*** (p. 176), N. S. Wales; **CYMATONA** (p. 177), type *C.* **kampyla** (*Nassaria k.* Watson) (p. 178); **NEGYRINA** (p. 177), type *N.* **subdistorta** (*Triton subdistortus* Lamarck) (p. 178), new to N. S. Wales; *Cymatium waterhousei* **frigidulum*** (p. 177), *Xenogalea* **spectabilis*** (p. 178), and *Natica* **luculenta*** (p. 179), N. S. Wales. Volutidae: **AMORENA** (p. 180), subg. of [*Voluta* ?], type *Voluta undulata* Lamarck; **ZEBRAMORIA** (p. 180), subg. of [*Voluta* ?], type *Voluta zebra* Leach; **CYMBIOLENA** (p. 181), type *Voluta magnifica* Shaw & Nodder; **CYMBIOLISTA** (p. 181), subg. of [*Voluta* ?], type *C. marmorata* Swainson; **CYMBIOLACCA** (p. 181), subg. of [*Cymbiola* ?], type *Cymbiola complexa* Iredale; *Voluta kenyoniana* Brazier is reinstated to specific rank; **MESERICUSA** (p. 181), type *M. sowerbyi* **perspecta*** (p. 181), N. S. Wales; **NANNA-**

MORIA (p. 181), type *N.* amicula* (p. 181), N. S. Wales; *Conus* howelli* (p. 182), N. S. Wales; **LARGISIPHO** (p. 183), type *L. oligostira* spectanda* (p. 182), N. S. Wales; **RATIFUSUS** (p. 183), type *R.* adjunctus* (p. 183), N. S. Wales; **XENOTROPHON** (p. 184), type *X.* euschema* (p. 184), N. S. Wales; **ENIXOTROPHON** (p. 185), type *Trophon carduelis* Watson; **EMOZAMIA** (p. 185), type *Murex licinus* Hedley & Petterd; **ENATIMENE** (p. 185), type *Trophon simplex* Hedley; **LITOZAMIA** (p. 185), type *Peristernia rudolphi* Brazier; **GEMIXYSTUS** (p. 185), type *Trophon laminatus* Petterd; **APIXYSTUS** (p. 185), subg. of [*Trophon* ?], type *Trophon stimuleus* Hedley; **BENTHOXYSTUS** (p. 185), type *Trophon columnarius* Hedley & May; **OLLAPHON** (p. 168), near *Fusinus*, type *Trophon molorthus* H. & M.; **ANATROPHON** (p. 186), type *Trophon sarmentosus* H. & M.; **GATLIFFENA** (p. 186), type *Donovania fenestrata* Tate & May; **TOLEMA** (p. 186), type *T.* sertata* (*Purpura s.* Hedley) (p. 186); **MATHILDONA** (p. 186), type *M.* euglypta* (p. 186), N. S. Wales; **CHARILDA** (p. 187), type *Mathilda rosae* Hedley; **EUCHARILDA** (p. 187), type *Mathilda elegantula* Angas; **OPIMILDA** (p. 187), type *Mathilda decorata* Hedley. Taxonomic notes are given on a number of other spp. —*J. S. Williams.*

5535. **JAYET, AD.** Les limites de la variation individuelle chez les Ammonites et la diagnose des espèces. Note préliminaire basée sur l'analyse d'Inflaticeras varicosum (Sowerby). [Limits of individual variation in ammonites and diagnosis of species. Preliminary note based on the analysis of I. varicosum.] *Verhandl. Schweizer. Naturforsch. Ges.* 110: 192-193. 1929.—Abstract.

5536. **JOUBIN, L.** Notes préliminaires sur les Céphalopodes des Croisières du Dana (1921-1922) Octopodes-2e partie. IV. Études sur quelques Octopodes dépourvus de Nageoires (Apteroti). *Ann. Inst. Océanograph.* 7(1): 1-24. 2 pl., 19 fig. 1929.—*Tremoctopus violaceus** is redescribed on the basis of an Atlantic specimen, and a detailed comparison is made with Berry's description of specimens from Hawaii, which he determined as this sp. but which are really *T. quoyanus. Ocythoe tuberculata**, description of young ♂; **HEPTAPUS** (p. 11), compared with *Alloposus*, erected for *H.* danai* (p. 11), Atlantic Ocean, off Cape Hatteras, 100 m.; *Vitreledonella* ingebörgae* (p. 16), Azores, 2000 m. The last is the second known incubating cephalopod.

5537. **KEVAN, D. K.** Land and fresh-water Mollusca of Great Cumbrae. *Scottish Nat.* 1930(184): 117-119. 1930.—The author lists 26 spp. found on a recent visit to this Scottish island.

5538. **LAMY, ÉD.** Note sur l'"Erycina cardioides" Lamarck. *Arch. Mus. Hist. Nat.* [*Paris*] 6: 59-61. 1 pl., 1930. —The author briefly reviews the nomenclatural history of 11 spp. placed by Lamarck in his genus *Erycina*, and discusses more fully the synonymy of *E. cardioides**, now known as *Chioneryx cardioides.*

5539. **LEONARDI, PIERO.** Nota preliminare sul Werfiano inferiore (Strati di Siusi) di Valle di Fiemme nel Trentino. [The Lower Werfenian (Seiss beds) of the Valle di Fiemme in the Trentino.] *Atti Accad. Sci. Veneto-Trentino-Istriana* 20: 61-68. 1929.—The author lists 28 forms of mollusks from this formation, including. *Pseudomonotis clarai* v. tesidea (p. 63); *P. c.* var. radialis (p. 63); *P. aurita* v. flemmensis (p. 63); *P.* dalpiazi (p. 64); *P.* (?) catharinae (p. 65); *Pleuromya* zanoni (p. 66); *Homomya canalensis* Catul., emended description.

5540. **LONES, T. E.** Notes on a species of Succinea. *Trans. Hertfordshire Nat. Hist. Soc. & Field Club* 18 (3): 180. 1927.—*Succinea putris* v. *vitrea* recorded in Hertfordshire.

5541. **MATHEWS, A. L.** Natica as a radicle. *Amer. Naturalist* 64(694): 430-435. 1930.—Observations of fossil and living coiled gastropods show that the protoconchs are naticoid. *Natica* is the radicle for the entire group, since it fulfills the following biogenetic law: If any primitive character appears in the protoconchs of the highly divergent stocks which can be attributed to the simple early form, it would be indicative that such a form serves as a parent from which the divergent stocks sprang, and thus can be considered the radicle for the entire group.—*A. L. Mathews.*

5542. **MINELLI, TERESA de.** Osservazioni sugli stadi giovanili di Chiroteuthis veranyi (Férussac). *Boll. Mus. Zool. e. Anat. Comp. Univ. Genova* 9(31): 1-4. 1 pl. 1929.—Description of a *Doratopsis* larva measuring 42 mm., at the beginning of the metamorphosis. On comparing the suckers of the clubs in different stages it was found that *Doratopsis* larvae belong to the same Mediterranean species, *Chiroteuthis veranyi* (Fér.).—*T. de Minelli.*

5543. **MORIN, G., et A. JULLIEN.** Sur la structure du coeur chez Murex Trunculus. *Bull. Hist. Appl. Phys. et Path.* 7(3): 79-96. 4 fig. 1930.—The heart of this mollusk contains circular and longitudinal fibers, both striate, the latter serving as a conduction system from very primitive muscle at the ventricular base. Nerve cells are present. The striations are confined to the middle of the cells and longitudinal fibrils are prominent. —*J. G. Sinclair.*

5544. **ODHNER, NILS HJ.** Die Molluskenfauna des Tåkern. *Sjon Tåkerns Fauna och Flora* (*K. Svenska Vetenskapsakad.*) Paper 8. 1-129. 7 pl., 89 fig. 1929.—Tåkern is a small, shallow lake in central Sweden long known for its abundant animal life. In the 1st section single species composing the fauna are treated; for each species the characteristic features of its ecology, its variation, and striking peculiarities in habitus and occurrence are discussed. The 55 spp. considered were all previously known in the Swedish fauna. New facts of morphology, however, are given with a view to completing our knowledge of the systematic interrelations of the Planorbidae especially; a key of the Swedish genera is based on anatomical characters; a survey of the Swedish spp. with chief synonyms follows. A detailed study was also made of the anatomy of all the Swedish Sphaeriidae, the spp. of *Sphaerium* and *Pisidium* having been only imperfectly known morphologically. Even the soft parts are useful in characterizing the species, and diagnoses taking into account the anatomical as well as the conchological characters are given for *Pisidium amnicum* Müll., *P. lilljeborgi* Cless., *P. henslowanum* Shepp., *P. cinereum* Ald., *P. subtruncatum* Malm., *P. pulchellum* Jen., *P. nitidum* Jen., *P. hibernicum* West., *P. obtusalastrum* Woodw., and *P. milium* Held. Stress is also laid upon the habitus, number and variation of the young mussels still within the gills of the mother. Reproduction of the Pisidia is, as a rule, autogamous, and there is also, it is stated, a tendency to neoteny. These facts, together with the morphological variation, have influenced the origin of species in *Pisidium* and complicates their specific identifications. The 2nd part deals with the fauna as a whole, its appearance and adjustment to environmental and seasonal, or other conditions, e.g., drought. The fauna shows a differentiation into concentric zones according to the vegetation. On the shore there is a dry zone characterized by a few xerophilous forms, e.g., *Limnaea truncatula, Pupilla muscorum, Succinea pfeifferi* f. *nilssoniana.* Next follows the girdle of humid strand meadows with *Agriolimax agrestis, Vallonia pulchella, Zonitoides nitidus, Carychium minimum,* and others, and farther towards the lake this passes into the Magnocaricetum with the aquatic *Planorbis*-fauna composed chiefly of *Limnaea palustris* and *Planorbis planorbis;* here *Succinea putris* occupies the real contact zone at the water's edge. Of the following limnetic fauna certain species are restricted to the large emerged plant-formations, e.g., *Ancylus lacustris, Valvata cristata, Bithynia tentaculata,* whereas *Limnaea stagnalis* is common also on the submerged vegetation characterized and frequented by *Planorbis carinatus, Bathyomphalus contortus, Limnaea ovata, Physa fontinalis, Valvata piscinalis antiqua, Sphaerium* and most of the *Pisidium* species; *Anodonta* prefers naked muddy or stony parts of the bottom in the open lake. Changes in the components of the fauna

were noted at the time of these investigations, and these results have been supplemented by comparing with earlier data. Before the lowering of the lake in 1844, its shores were stony and the vegetation rare; *Valvata antiqua* and *Anodonta minima* then were common; the latter did not survive the lowering, and the former species now occurs in an altered form. Of the changes noted from later years the most striking is the sudden invasion of *Myxas glutinosa*, which was absent before 1910 but which was found dominating in 1914. *Armiger crista* and *Bathyomphalus contortus*, on the contrary, were dominating formerly and have disappeared recently. To some extent these changes are due to climatic conditions such as cold winters with heavy ice, which, when breaking, destroys vegetation and fauna in shallow parts of the lake; but also purely biological causes may bring about a regression after a time of luxuriance. The last chapter contains a brief survey of the fauna in the vicinity of the Tåkern.—*N. H. Odhner.*

5545. **[PANOCHINI, S.].** ПАНОЧІНІ, С. Причинки до лізнання фавни слимаків м. Київа та його околиць. **[Slugs of Kiev and vicinity.]** [German summary.] Всеукраінська Академія Наук, Труды Фізично-Математичного Відділу (Збірник Праць Зоологічного Музею ч. 7.) (*Acad. Sci. 5548. **RISBEC, JEAN. Nouvelle contribution à l'étude des Nudibranches Néo-Calédoniens.** *Ann. Inst. Océanograph.* 7(7): 263-298. 1 col. pl., 69 fig. 1930.—Further collections by the author have raised to 110 the number of nudibranchs known from New Caledonia; 25 are listed from Mouac Isl., and 5 from Neba Isl. The author describes an unnamed sp. of *Melibe**, and unnamed varieties of *Doridopsis mollis**, *Kentrodoris inframaculata**, and *Placobranchus guttatus**. Emended descriptions are given of *Platydoris spongilla**, *Phlegmodoris paagoumenei**, *Asteronotus boholiensis**, *Carminodoris punctulifera**, *Trevelyana kouaouae**. *Doridopsis* **arenosa*** (p. 266); *Chromodoris* **mouaci*** (p. 278); *Noumea* **violacea*** (p. 281); *Carminodoris* **cockerelli*** (p. 283); *Aeolidia* **nebae*** (p. 294).

5549. **ROBSON, G. C. Cephalopoda, I. Octopoda.** *Discovery Repts. Government Dependencies Falkland Isl.* 2: pp. 371-402. 2 pl., 18 fig. 1930.—This report covers 14 spp., taken mostly in subantarctic or antarctic waters. There are introductory remarks on the distribution and taxonomy of the group. *Cirroteuthis* **glacialis*** ♂ (p. 375), Palmer Arch., 278-500 m.; *Eledonella massyae* ssp. **purpurea*** ♀ (p. 379), 33°25′ S., 6°31′ E., 1000 m.; *Vitreledonella* **translucida*** ♂ (p. 380), 9°38′ S., 12°42′ E., 200-230 m.; *Amphitretus* **thielei*** ♀ (p. 383), 34° S., 16° E., 350-400 m.; *Graneledone* **polymorpha*** (p. 390), with forms **oblonga** (p. 391) and **affinis** (p. 391), South Georgia, 15-273 m.; **THAUMELEDONE** (p. 392) (Octopodidae), type *Eledone brevis* Hoyle, including also *T.* **gunteri*** ♀ (p. 392), 53°48′ S., 35°57′ W., 401-411 m., type in Brit. Mus.; *Alloposus* **hardyi*** ♂ (p. 397), 00° 56′ S., 14°08′ W., 250 m. For the previously known spp. there are notes on distribution, morphology, and taxonomy.

5550. **ROBSON, G. C. Two remarkable cephalopods.** *Nat. Hist. Mag.* [*London*] 2(16): 257-259. 2 fig. 1930. —A popular account of *Melanoteuthis beebei** and *Bathothauma lyromma**.

5551. **ROTH, HANS. Zur Kenntnis des Epithels und der Entwicklung der einzelligen Hautdrüsen von Helix pomatia.** *Zeitschr. Wissenschaft. Zool.* [*Leipzig*] 135 (3/4): 357-427. 64 fig. 1929.—The epithelium covering the body of *H. pomatia* consists of a single layer which is ciliated on the sole of the foot, the lateral borders of the foot as far as the lateral groove, and about the breathing pore only. In embryonic stages the epithelium of the sole contains small, apparently albuminous inclusions. The mantle-epithelium found beneath the shell is especially differentiated for secretion of the shell in young individuals. There can be distinguished mantle-groove, glandular fillet, epithelium covering the lung, and the epithelium of the visceral sac. All these portions produce a changing mixture of lime and organic substance from which the different layers of the shell are formed. Outside the shell are numerous and variable forms of subepithelial cutaneous glands. Of these there are 3 principal types: (1) Mucous glands, with mantle and sole subtypes; (2) albuminous glands, with subtypes of pure albumen glands and lime-secreting glands; (3) the pigment glands. Embryological studies show that all the cutaneous glands develop from the body-epithelium by the sinking of a yet undifferentiated cell into the dermis. In the cell, connected with the epithelium only by a secretory duct, then begins the transformation of the plasma into the secretion of the time being. All types of glands described may develop an extraordinary number of modifications in their mature as well as in their juvenile stages. Most variable are the pure albuminous glands, which also present a peculiar modification with strongly refractive granules. The pigment glands, and a portion of the normal epithelial cells, contain a yellow pigment which appears to be an excretory product of the body. The lime glands develop from certain albumen glands in which in the course of time lime is deposited, derived from reservoirs in the body in the process of metabolism.—*H. Roth* (*transl. by L. E. Griffin*).

5552. **SMITH, BURNETT. Some specific criteria in Conus.** *Proc. Acad. Nat. Sci. Philadelphia* 82: 279-288. 12 fig. 1930.—The value of 2 criteria of specific discrimination in *Conus* is discussed. These are apex and subsutural flexure; 4 types of apex and 2 types (including 2 subtypes) of subsutural flexure are described and illustrated. *Conus* **waccamawensis*** (p. 286), Pliocene (Waccamaw formation of Waccamaw River), S. Carolina. Holotype in Acad. Nat. Sci. Philadelphia.

5553. **STOHLER, R. Beitrag zur Kenntnis des Geschlechtszyklus von Mytilus californianus Conrad. [Sex-cycle in M. californianus.]** *Zool. Anz.* 90(9/12): 263-268. 3 fig. 1930.—In *M. californianus*, collected at Salada Beach, California, no sex products were found between March 7, 1929, and June 13, 1929. Ripe and ripening sex-products (spermatocysts with spermatocytes, and oöcysts with oöcytes) were observed in the mantle after June 13, 1929. Mantles increased in thickness until Aug. 1, 1929; on Aug. 5, 1929, all observed were "empty." Until Oct. 21, 1929, no changes were seen; on Nov. 4, 1929, very active spawn formation appeared. From Nov. 18, 1929, to Jan. 14, 1930, the mussels again became full of sex products; but on Jan. 27, 1930, they were again "empty." That 2 spawning seasons occur in the mussels from that locality is concluded from these observations. That sexes in *M. californianus* are separate was observed macroscopically.—*R. Stohler.*

5554. **STOHLER, R. Gewichtsverhältnisse bei gewissen marinen Evertebraten. [Weight-relations in certain marine invertebrates.]** *Zool. Anz.* 91(5/8): 149-155. 1930. —Fresh-weight, skeleton-weight, skeleton-weight in % of fresh-weight are tabulated for *Pisaster ochraceus* (Brandt); *P. brevispinus* (Stimpson); *Pycnopodia helianthoides* (Stimpson); *Acanthina spirata* (Blainville); *Acmaea cassis pelta* (Eschscholtz); *A. scutum patina* (Eschscholtz); *A. scabra* Gould; *Tegula funebralis* (A. Adams); *Mopalia muscosa* (Gould). Total fresh-weight, weight of water content, total dry-weight, net skeleton-weight, dry-weight of meat, expressed in grams, and dry-weight in % of fresh-weight, skeleton-weight in % of dry-weight, skeleton-weight in % of fresh-weight,

are tabulated for *Pisaster ochraceus; Pycnopodia helianthoides; Dermasterias imbricata* (Grube); *Strongylocentrotus purpuratus* (Stimpson); *Ischnochiton cooperi* Carpenter; *Katharina tunicata* (Wood); *Cryptochiton stelleri* (Middend.); and *Mytilus californianus* Conrad. The same data and in addition the lengths of the arms are given for 36 specimens of *Pisaster ochraceus* (one specimen with 6 arms instead of 5); for 10 specimens of *P. brevispinus;* and for 6 specimens of *Asterina miniata* (Brandt). Autotomy was especially noticed in *P. brevispinus.* Notes on the stomach-contents of 8 *P. ochraceus.* Since only empirical data are given in connection with other work of the author, no conclusions are drawn.—*R. Stohler.*

5555. **THIEL, MAX EGON.** Untersuchungen über den Einfluss der Abwässer von Hamburg-Altona auf die Verbreitung der Arten der Gattung Sphaerium in der Elbe bei Hamburg. *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 24(5/6): 467-484. 14 fig. 1930.—The sewage content of the Elbe water at Hamburg affects both favorably and unfavorably the distribution of species of *Sphaerium.* Their growth is favored by the use of sewage as food, but hindered by poisonous gases and lack of oxygen. Their distribution is correlated with their ability to tolerate the gases and the lack of oxygen. The unique occurrence of *S. corneum* in the whole harbor area is due to its greater resistance to the effects of sewage and of the bottom mud. Thus this species alone is able to profit by the great abundance of food afforded by the sewage. The other species, through their lesser tolerance of pollution, are restricted to the periphery of the harbor area, where the amount of the sewage is reduced. Their abundance here is explained by the nourishment they receive from the dilute sewage.—*From author's summary.*

5556. **THIELE, JOH.** Revision des Systems der Hydrobiiden und Melaniiden. *Zool. Jahrb. Abt. Syst. Ökol. u. Geogr. Tiere* 55(5/6): 351-402. 1 pl., 63 fig. 1928.—Mainly on the basis of radulae, new arrangements of the families Hydrobiidae (or Amnicolidae), Micromelaniidae, and Melaniidae are attempted. A "typische Art" is designated for each of the recognized groups. Hydrobiidae, Hydrobiinae: **PROBYTHINELLA** (p. 370), section of *Hoyia*, type *H. emarginata* (Küster); **INDOPYRGUS** (p. 373), subg. of *Potamopyrgus,* type *P.* **nevilli*** (p. 373), Andaman Is.; **WALKERILLA** (p. 372), sect. of *Somatogyrus,* type *S. coosaensis* Walker; genus **PACHYDROBIELLA** (p. 367), type *P.* **brevis*** (*Pachydrobia brevis* Bavay) (p. 367), Indo-China; genus **LITHOGLYPHOPSIS** (p. 366), type *L.* **modesta*** (*Lithoglyphus modestus* Gredler) (p. 365). Radulae* of *Pseudamnicola similis, Lithoglyphoides fluminensis, Cincinnatia cincinnatiensis, Hoyia emarginata, Lyogyrus petiti, Littoridina australis, Potamopyrgus corolla, P. nevilli, Amnicola limosa, Cochliopa rowelli, Somatogyrus isogonus, S. coosaensis, Fluminicola* sp., *Benedictia baicalensis, Lithoglyphus naticoides, Tricula minutoides, Pachydrobiella brevis, Lithoglyphopsis modesta, Emmericia patula* and another species. Verges* of *Bythinella, Littoridina, Amnicola, Fluminicola,* and *Benedictia.* Truncatellinae: Radulae* of *Pomatiopsis lapidaria, Oncomelania* sp., *Pyrgula annulata, Truncatella pacifica, T. truncatula, Geomelania lirata,* and *Tomichia ventricosa.* Synolopsinae: no new data. **HYDROCOCCINAE** (p. 375): **HYDROCOCCUS** (p. 375), type *H.* **graniformis*** (*Paludina granum* Mke., non Say) (with radula*), Australia. Stenothyrinae: Radula* of *Gangetia uzielliana.* Bithyniinae: **EMMERICIOPSIS** (p. 357), sect. of *Bithynia,* type *B. lacustris* (Mart.), Sumatra. Radulae* of *B. lacustris,* and *Mysorella marginata.* Verge* of *B.* (*Hydrobioides*) *nassa.* **IRAVADIINAE** (p. 355): Radula* of *Iravadia ornata.* Micromelaniidae, Micromelaniinae: Radula* of *Chilopyrgula sturanyi;* verge* of *Baicalia* (*Liobaicalia*) sp. Conocaspiinae: genus **CASPIELLA** (p. 353), type *C.* **conus** (*Rissoa c.* Eich.) (p. 353), Caspian Sea. **FAIRBANKIINAE** (p. 354): Radula* of *Fairbankia bombayana.* Melaniidae, Melanatriinae: *Pachychilus* **rasconensis*** (p. 384), Mexico; *Potadoma* **mayumbensis*** (p. 387), *P.* **togoensis*** (p. 387), and *P.* **urundica*** (p. 388), West Africa; *P.* (*Rhinomelania*) **angulata*** (p. 386), Cameroons. Radulae* of *Pachychilus pila, P. tristis, Brotia finschi, B.* (*Sulcospira*) *hügeli, Melanatria fluminea, Potadoma nigritina,* and *P. angulata.* Melanopsinae: Radula* of *Fagotia esperi.* Pleurocerinae: Radulae* of *Pleurocera strigosa, Lithasia armigera, Io umbilicata, Semisulcospira libertina,* and *S. globus.* Amphimelaniinae: Radula* of *Amphimelania holandri* and *A. parvula.* Paludominae: genus **PSEUDOCLEOPATRA** (p. 394), type *P.* **togoensis*** (p. 394), West Africa; *Paludomus* **binaluanensis*** (p. 392), Palawan. Radulae* of *Cleopatra bulimoides, C. moniliata, C. africana, Pseudocleopatra togoensis, Paludomus nigricans, P. globulosa, P. stephanus, P. sulcata,* and *Paramelania damoni.* Melaniinae: *Melania* **voltae*** (p. 396) and *M.* **manguensis*** (p. 396), West Africa. Radulae* of *Melania glans, M. amarula, Pachymelania byronensis,* and *Hemisinus brasiliensis.* **CUBAEDOMUS** (p. 397), subg. of *Hemisinus,* type *H. brevis* (Orb.), Cuba.—*H. B. Baker.*

5557. **THORSON, G.** Über die Landschnecken der Dolomiten und ihre Verbreitung. *Vidensk. Meddel. Dansk. Naturhist. For. Köbenhavn* 88: 113-138. Map. 1929/1930.—This report is based upon material collected by the author in 1928. Special attention is paid to the limits and manner of distribution of the spp. The systematic list of 65 spp. consists mainly of local and altitudinal records, with remarks on general distribution. Records of previous workers are also included. The author lists 17 northern, 10 southern, and 3 eastern spp. whose range seems to be limited in part by the Dolomites.

5558. **TORRE, CARLOS de la.** New Cuban Urocoptidae. *Proc. Acad. Nat. Sci. Philadelphia* 81: 443-447. 1929.—*Urocoptis* **intusfalcata*** Torre & Ramsden (p. 443); *U.* **manzanillensis*** (p. 444); *U.* **nodulifera*** (p. 444); *U.* **cuestai*** (p. 445); *U.* **terebella*** (p. 445); *U.* **rocai*** (p. 446); *Microceramus* **bermudezi*** (p. 446). Types in Acad. Nat. Sci. Philadelphia.

5559. **TRUEMAN, A. E.** Results of some recent statistical investigations of invertebrate fossils. *Biol. Rev. and Biol. Proc. Cambridge Philos. Soc.* 5(4): 296-308. 9 fig. 1930.—Statistical investigations of lamellibranchs and gastropods show that there is considerable variation in any series collected at one horizon. The variation is greatest in such sedentary forms as *Gryphaea* and *Carbonicola,* but the variations appear to be similar in character, although they are not so wide in range, in certain gastropods. At each horizon variation appears to be continuous, and the characters, on the whole, vary independently. Each community is apparently homogeneous and indivisible. It is suggested that such an evolving stock must be regarded as a "plexus" or bundle of anastomosing lineages.—*Author's summary.*

5560. **WAGNER, HANS.** Über die Schnecken des Mátragebirges (Oberungarn). *Zool. Anz.* 92(5/6): 155-159. 2 fig. 1930.—A list of 35 spp., including a *Bythinella.*

5561. **[VÏALOV, O. S.]** ВЯЛОВ, О. С. Описание третичных пелеципод из некоторых мест Тургайской области. **[Description of Tertiary Pelecypoda from Turgai.]** [French summary.] Известия Главного Геолого-Разведочного Управления. (*Bull. Geol. & Prospecting Service, USSR.*) 49(3): 75-102. 4 pl. 1930.—Twelve forms, probably referable to the Lr. Oligocene, are described, with synonymies and taxonomic remarks, including *Crassatella deshayesiana* v. **elliptica*** (p. 76); *Pectunculus turanglicus*; Chlamys* (*Aequipecten*) cf. *aturi* v. *rotunda**; *C.* (*A.*) **turgaicus*** (p. 81); *Ostrea* (*Cubitostrea*) *plicata**; *O.* (*C.*) *p.* var. **aralensis*** (p. 86); *O.* (*C.*) *flabellula**; *O.* (*C.*) *prona**.

5562. **VINCENT, EMILE.** Les Erycines des sables de Wemmel (Éocène Supérieur.) *Bull. Mus. Roy. Hist. Nat. Belgique* 6(7): 1-7. 5 fig. 1930.—The author adds 5 spp. of this group to the 2 previously known from the

Wemmel sands of Belgium. *Spaniorinus* wemmelensis* (p. 2); *Erycina* nystana* (p. 3); *E. ruellensis** Cossm.; *E.* brabantica* (p. 6); *Kellya* wemmelensis* (p. 6).

5563. WIESER, G. Gelege einer Weinbergschnecke. [Nidus of the edible snail.] *Aus der Heimat* 43(10): 314. 1 fig. 1930.—One of these snails laid 35 eggs* in a self-excavated hole in the ground in June, then covered the hole with earth and slime.

5564. BEHRE, CHAS. H. Jr. Branchinecta at Leadville, Colorado. *Science* 73(1887): 235-236. 1931.—*Branchinecta coloradensis* (Packard) was found at 11,450 ft. in 2 isolated permanent pools, both probably completely frozen during winter. Apparently activity ceases in these Alpine species about Sept. 1. Time and manner of "seeding" isolated ponds is speculated upon.

5565. BORUTZKY, E. W. Materialien zur Harpacticidenfauna des Baikalsees III. *Zool. Anz.* 94(9/10): 281-287. 12 fig. 1931.—BAIKALOCAMPTIDAE (p. 281), new fam. placed between Laophontidae, Cletodidae, and Canthocamptidae, based on BAIKALOCAMPTUS (p. 282), type *B.* verestschagini* (p. 283), Baikal.

5566. BOSCHMA, H. On the identity of Sacculina triangularis and Sacculina inflata. *Proc. Roy. Soc. Edinburgh* 51(1): 64-70. 6 fig. 1930/31.—Specimens of *Sacculina** from *Cancer pagurus*, from the type locality of *S. triangularis* And., are co-specific with *S. inflata* Leuckart from *Hyas coarctatus*. Therefore *S. triangularis* is reduced to synonymy. The internal anatomy of the species is described from sections.

5567. BRIAN, ALEXANDRE. Copépodes parasites de poissons et d'annélide provenant des campagnes scientifiques de S. A. R. le Prince Albert Ier de Monaco. Résultats des Campagnes Scientifiques accomplies sur son yacht par Albert Ier Prince de Monaco. *Fasc.* 76: 1-36. 5 pl. (2 col.). 5 fig. 1929.—Seven species of parasitic Copepoda (Crustacea Entomostraca) are recorded, 5 of which were taken from fishes and 1, only, from an annelid. The host of *Caligus bi-aculeatus* is unknown. The spp. were collected at different stations in the Atlantic, 4 from the Sargasso Sea, 1 from the coasts of Newfoundland, and 1 from the Azores (S. Jorge). The following genera are represented: *Caligus* Müller (3 spp.); *Pandarus* Leach (1 sp.); *Sarcotretes* Jungersen (1 sp.); *Pennella* Oken (1 sp.); and *Hedyphanella* Leigh-Sharpe (Herpyllobiidae) with 1 species, *H. superba* L.-S., parasitic on the annelid, *Gattyana cirrosa* Pallas. Detailed descriptions are given of the species, especially of *Pennella sagitta** L., parasitic on *Antennarius histrio* L. The author examined several post-larval stages of *P. sagitta* hitherto overlooked and also describes the previously unknown ♂.—*A. Brian (transl. by W. M. Tattersall).*

5575. MONTEROSSO, B. Sulla persistenza dei fenomeni respiratorii nei Ctamalini mantenuti in ambiente subaereo. *Boll. Soc. Ital. Biol. Sperim.* 3(8): 1067-1070. 1928.—*Chthamalus stellatus*, an inhabitant of the tidal zone, which when uncovered by the receding tide rhythmically aspirates atmospheric air into the pallial cavity by means of complex movement of the opercular parts of the mantle and of the body itself. In this way oxygen comes in contact with the persistent layer of water covering the surface of the body, and carbon dioxide and other gases are given up. This continues for a variable period. The barnacle passes from aquatic to aerial respiration without difficulty. The latter is comparable in a measure to the respiration of higher animals. After an interval, the aerial respiratory rhythm becomes slower and finally ceases, the opercular fissure closes hermetically, and the cirripede becomes dormant.—*B. Monterosso (transl. by W. L. Schmitt).*

5576. ORTMANN, A. E. Crawfishes of the southern Appalachians and the Cumberland Plateau. *Ann. Carnegie Mus.* 20(2): 61-160. 1931.—This work was published after the author's death (Jan. 3, 1927). The writer discusses 38 forms of *Cambarus* as to taxonomy, and distribution according to drainage areas. They fall into the subgenera *Ortmannicus*, *Faxonius*, and *Cambarus*. These subgenera are divided into sections and keys are given to the forms of each section. *C.* (*F.*) *erichsonianus* Faxon (=*C. spinosus gulielmi* Faxon); *C.* (*F.*) *rusticus* forceps (*C. f.* Faxon) (p. 72); *C.* (*F.*) *r.* placidus (*C. p.* Hagen) (p. 76); *C.* (*F.*) *r.* mirus (p. 81), Tennessee; *C.* (*F.*) *juvenilis* Hagen (=*C. putnami* Faxon) is distinct. Much material formerly attributed to *C. spinosus* also belongs to *C. j. C.* (*Cambarus*) *extraneus* Hagen (=*C. girardianus* Faxon, *C. jordani* Faxon); *C.* (*C.*) *montanus* Girard is removed from *C.* (*C.*) *bartoni* and restored to specific rank; *C.* (*C.*) *montanus* acuminatus (*C. a.* Faxon) (p. 108); *C.* (*C.*) *m.* veteranus (*C.*

bartoni v. Faxon); *C.* (*C.*) *longulus* longirostris (*C. longirostris* Faxon); *C.* (*C.*) *bartoni* striatus (*C. latimanus striatus* Hay); *C.* (*C.*) *monongalensis* Ortmann is sustained as a good species. The bibliography contains 46 references.

Cambrian (Etcheminian). **WALCOTTELLA** (p. 31), type *W. apicalis* (p. 33), Arizona, Middle Cambrian. The following spp. are from Arizona, Middle Cambrian (Bright Angel shale): *W.* concentrica* (p. 34); *W.* breviuscula* (p. 34); *W.* scitula* (p. 35); *W.* pulchella* (p. 36); *W.* leperditoides* (p. 37); *W.* nitida* (p. 37); *W.* oblonga* (p. 38); *W.* obsoleta* (p. 39); *W.* limatula* (p. 40); *W.* ventrosa* (p. 41); *W.* subtruncata* (p. 41); *W.* longula* (p. 42). **BEYRICHONIDAE** (p. 42) (includes the following genera: *Beyrichona* Matthew (=*Escasona*), *Sellula* Wiman, *Aluta* Matthew, *Eremos* Westergaard, *Hipponicharion* Matthew, *Polyphyma* Groom). *Aluta* Matthew emended; *A.* (?) rimulata* (p. 61), Alberta, Middle Cambrian (Ptarmigan); *Hipponicharion* plicatum* (p. 64), *H.* parvum*, and *H.* confluens* (p. 64), Nova Scotia, Middle Cambrian (Johannian); *Polyphyma* marginata* (p. 66), Newfoundland, Up. Cambrian; **INDIANIDAE** (p. 68) (includes *Indiana* Matthew emended, and the new genera, *Dielymella* and *Mononotella*). *Indiana* longula* (p. 73), New Brunswick, Lr. Cambrian (Hanfordian); *I.* suberecta* (p. 74), New York State, Lr. Cambrian; *I.* matthewi* (p. 76), N. Brunswick, Middle Cambrian; *I.* labiosa* (p. 79), Brit. Columbia, Middle Cambrian. The following are from Arizona, Middle Cambrian (Bright Angel shale): *I.* faba* (p. 79), *I. faba* intermedia* (p. 80), *I.* curta* (p. 81), *I.* impressa* (p. 81); **DIELYMELLA** (p. 85), type *D.* recticardinalis* (p. 86); *D. recticardinalis* angustata* (p. 87); *D.* nasuta* (p. 88); *D.* appressa* (p. 88); *D.* dorsalis* (p. 89). *D.* brevis* (p. 89), Vermont, Lr. Cambrian: **MONONOTELLA** (p. 91), type *M.* fusiformis (*Primitia? f.* Matthew) (p. 92). Types of new forms in U. S. Nat. Mus.—*E. O. Ulrich.*

5584. **VECCHI, ANITA.** Anfipodi di Cirenaica raccolti dal Prof. Edoardo Zavattari. [Amphipods of Cirenaica, N. Africa, collected by Zavattari.] *Boll. Zool.* [*Napoli*] 2(2): 57-66. 7 fig. 1931.—Includes *Gammarus* eduardi* (p. 57); *Orchestia* magnifica* ♂ (p. 62).

5585. **WILSON, CHARLES BRANCH.** Parasitic copepods from the White Nile and the Red Sea, 1901. *Results Swedish Zool. Exp. to Egypt and the White Nile* 5(Paper 3): 1-17. 3 pl. 1928.—*Ergasilus* nodosus* (p. 2), from gills of *Bagrus bayad; Caligus* lunatus* (p. 4), Sinaitic Pen., from gills of *Seriola aurovittata; Lamproglena* angusta* (p. 11), from gills of *Malapterurus electricus; Lernaea* composita* (p. 13), from skin of *Malapterurus electricus.* Except where otherwise given, new spp. are from the White Nile. Types in Naturhist. Mus., Stockholm. Notes are given on *Hatschekia sargi* Della Valle. Complete description is given of *Lernanthropus micropterygis* Richiardi, hitherto but partially described.

5586. **WOODS, HENRY.** A monograph of the fossil macrurous Crustacea of England. Pt. IV, V, & VI. (Continuation and to be cont'd.) In: *Palaeontographical Soc.* [*London*] 79(paper 2): 49-64. Pl. 13/16, 3 fig. 1925(1927); 80(paper 2): 65-72. Pl. 17/20, 2 fig. 1926(1928); 82(paper 4): 73-88. Pl. 21/24. 1928(1930).—Continues description of the genus *Glyphea* of Glypheidae. From the Lias: *G.* prestwichi* (Carter MS.) (p. 51), Up. Toarcian, Yorkshire coast, type in Mus. Yorkshire Phil. Soc.; *G. regleyana*; G. udressieri*; G. rostrata*; G.* calloviensis* (p. 59), Scarborough, Kellaways Rocks (Up. Jurassic). From the Cretaceous: *G.* vectensis* (p. 60), Isle of Wight, Lr. Aptian, type in Brit. Mus.; this species is the only form of *Glyphea* at present known in the Lr. Cretaceous of England; *G. cretacea*; G. carteri*; G.* willetti* (*Meyeria w.* Woodward) (p. 63); *Mecochirus* clypeatus* (*Gebia c.* Carter=*Upogebia c.* van Straelen) (p. 65); *M. socialis*; M. pearcei*; Meyeria ornata*, rapax* and *magna*.* Erymaidae: *Eryma birdi*, bedelta*, ventrosa*, mandelslohi*, georgii*, villersi; E.* stricklandi (*Glyphea s.* Phillips) (p. 79); *E.* portlandica* (p. 79), Dorset, Portland Limestone; *E. sulcata*; Enoploclytia* dorsetensis* (p. 81), Dorset, Corallian (Up. Jurassic), type in Brit. Mus. The following species are from the Cretaceous: *E. tuberculata*, E.* dixoni (*Palaeastacus d.* T. Bell) (p. 83), *E. leachi*.* The present part begins a list of Cretaceous spp. of the genus *Homarus.*

5587. **BERTOLINI, FAUSTA.** Distribuzione dei parassiti delle piante forestali in Alto Adige. [Distribution of parasites on forest plants in Alto Adige.] *Atti Accad. Sci. Veneto-Trentino-Istriana* 20: 103-131. Map. 1929.—A list is given of various Orthoptera, Lepidoptera, Hemiptera, Coleoptera, and Hymenoptera, found on forest plants in this region, with notes on geographical and particularly altitudinal distribution. Some of these parasites are found up to the maximum altitude at which the plants they infest occur, but others only up to certain lower limits. *Ips acuminatus* and *Ernobius abietis* [Coleoptera] are new to Italy.

5588. **DINELLI, LUIS M. Vuelos. [Flight.]** *Anal. Soc. Cient. Argentina* 103(1/3): 113-118. 1 fig. 1927.—The flight of the Cathartidae, Colubridae, Icteridae, and Hylactidae are discussed briefly and compared with the flight of certain insects, the Lamellicornidae, Elateridae, Buprestidae, Aphididae, and the Diptera furnishing examples. The method of flight of *Phanaeus,* a lamellicorn beetle, is described and illustrated by 2 schematic figs. Sound production in both birds and insects, and its mechanical basis, is briefly indicated.—*P. Knappen.*

5589. **GUILLEAUME, F. [Account of the insects collected by the author [in Belgium] since 1884.]** *Bull. & Ann. Soc. Ent. Belgique* 66(1/2): 17-30. 1926.—An address. Some species are rare, others new to the country. Notes are given on the method of collecting.

5590. **HORN, WALTHER. Über den musealen Missbrauch mit Insekten-"Typen."** *Congrès Internation. Xe Zool. à Budapest* 1927. Part 2. pp. 1022-1042. 1929.—The chaos prevalent in the use and definition of types is reviewed and criticized. The author gives a list of 122 different expressions for types.—*C. Zeimet.*

5591. **HORN, WALTHER. Über die Not der Entomo-Bibliographie.** *Congrès Internation. Xe Zool. à Budapest* 1927. Part 2. pp. 1043-1052. 1929.—A critical review of the subject, and an announcement of the author's "Index Literaturae Entomologicae," which is in preparation. —*C. Zeimet.*

5592. **JONES, DAVID T. A snail-collecting aphis-lion larva. A preliminary study of external features.** *Marietta Coll. Res. Publ., Zool. Ser.* 1(1): 1-9. 3 pl. 1929.—This aphis-lion larva [possibly of the Chrysopidae], found in Vinton Co., Ohio, instead of carrying the usual cloak of aphis hulls, prefers a cloak of minute snail shells, such as *Punctum pygmaeum, Euconulus fulvus,* and *Striatura milium,* intermingled with fragments of beetles. Elongate, hairy thoracic pedicels, and shorter, tufted abdominal pedicels, aid the hairs of the back in supporting the burden. The eye and empodium present peculiarities.—*D. T. Jones.*

5593. **MUIR, F. The rôle of function in taxonomy and relationship to the genitalia in insects.** *Trans. 4th Internat. Congress Ent., Ithaca, 1928* 2: 600-604. 1929.—The chief taxonomic divisions of the animal kingdom are based upon function although they are generally defined in terms of morphology. As we descend to the lower divisions function is less evident, until, in genera and species, it is seldom looked for. Evidence is presented, especially from the class Insecta. The functional differences of the ♂ genitalia of the insects, as evinced by their structure, especially of the Hemiptera and Coleoptera, are considered with the idea of giving them a more definite place in taxonomy as a better knowledge of the form and function of the genitalia of insects will enable us to understand better their evolution and relationships, and therefore enable us to rest their classification upon a more scientific basis than at present is possible in many groups. It is suggested that specializations often may have arisen from chance variations but that it is improbable that the gradate series of considered mutations necessary for the evolution of complex functional structures are due to chance independent mutations.—*F. Muir.*

5594. **NEL, R. I. Studies on the development of the genitalia and the genital ducts in insects. I. Female of Orthoptera and Dermaptera.** *Quart. Jour. Microsc. Sci.* 73(1): 25-85. 3 pl. 5 fig. 1929.—The material examined was mainly from the genera *Locustana** and *Colemania*, Blattella**, and *Forficula**. The anterior ovipositor lobes (ventral valves) are serially homologous with the lateral ovipositor lobes (dorsal valves) and represent gonocoxites from which no telopodites corresponding to the inner lobes are differentiated. The common oviduct is wholly ectodermal and arises as an unpaired invagination between sterna 7 and 8, the position of the gonopore in the adults of saltatorial Orthoptera being due to a secondary extension of the common oviduct along the 8th sternum. In *Forficula* and *Blattella* the primitive position of the gonopore is retained up to the adult stage. Accessory genital invaginations develop in the Orthoptera between the ovipositor lobes on sterna 8 and 9. The invagination on the 8th atrophies in *Blattella* but in other Blattidae and in Orthoptera in general it gives rise to the spermatheca. An homologous invagination of similar function is present also in *Forficula,* arising practically between sterna 8 and 9. The spermathecal function in *Blattella* is served by 2 pairs of accessory invaginations in the 7th intersternal membrane. The invagination of the 9th sternum gives rise in *Blattella* to the paired colleterial glands; in the Locustidae it is vestigial; in *Forficula,* it is absent. A hypothetical ancestral condition of the oviducal system is deduced for insects in general, in which paired mesodermal oviducts opened separately within the 7th intersternal membrane. An ectodermal common oviduct and a single gonopore between sterna 7 and 8 were acquired at an early stage, the oviduct extending later upon the 8th and sometimes the 9th sternum. Extensive bibliography.—*E. M. Walker.*

5595. **ORFILA, RICARDO N. Sobre canibalismo en insectos. [Cannibalism in insects.]** *Rev. Soc. Ent. Argentina* 1(4): 65-66. 1927.—Several examples of this habit were observed.

5596. **PICTET, ARNOLD. Démonstration d'un piège**

lumineux démontable. *Bull. Soc. Lépidoptérol. Genève* 5(4): 154. 1927.

5597. SAEZ, FRANCISCO ALBERTO. ¿Puede la citología influir en la orientación de los problemas taxonómicos? [Has cytology an influence on taxonomic problems?] *Rev. Soc. Ent. Argentina* 10: 251-262. 17 fig. 1929.—A brief review of the papers of Montgomery, and of McClung and his school, on the germ cells of insects, together with a discussion of the importance of the chromosomes in the establishment of phylogenetic relationships of any determined biological group. The author believes that the taxonomic criteria offered by external characters are frequently insufficient and that systematics of the future must take into consideration the behavior of the chromosomes.—*I. Corey.*

5598. ZABINSKI, JAN. Élevage des blattides soumis à une alimentation artificielle. *Compt. Rend. Soc. Biol.* 98(1): 73-77. 1928.—Larvae were fed on synthetic diets. B, a diet with ovalbumin as the protein source, diet G, glycocoll substituted for ovalbumin, diet Z, gelatin as protein source. One adult ♀ was obtained reared on synthetic, vitamin-free diet G, development requiring 45 days more than for those on a normal diet. For a part of the period the rate of growth was similar for all of the diets, but the larvae on a normal diet began at once to grow more rapidly. The period of development for *Periplaneta orientalis*, under optimum conditions, was determined as 10-14 months, that of *Blattella germanica* as 3-5 months.

5599. ZABINSKI, JAN. Nouvelles recherches sur l'élevage des blattides soumis à une alimentation artificielle. Influence de la composition du régime. *Compt. Rend. Soc. Biol.* 98(1): 78-80. 1928.—Cockroach larvae, on a nitrogen-free diet, survive for some time without loss of weight. Decreased nitrogen in the diet leads to slower growth. Carbohydrate-free diets result in rapid death. Beer, yeasts, bran extracts, and ultra-violet irradiation of the diet seem to have no effect on the growth.

5600. ANONYMOUS. IV. Internationaler Entomologen-Kongress in Ithaca. *Ent. Blätter* 24(1): 188-192. 1928.—A general account of the meeting with a copy of the resolutions adopted and of W. Horn's proposal of an "Entomological Institute for International Service."—*M. H. Hatch.*

News* 42(7): 192-195. 1 fig. 1931.—[Chernetidae] PARACHERNES (p. 192), near *Chernes*, type *P. ronnaii** (p. 194), Rio Grande do Sul, taken clinging to a fly. Type in Stanford Univ.

5609. DENIS, JACQUES. Les araignées au fond des houillères. *Ann. Soc. Ent. France* 99(4): 273-310. 3 fig. 1930.—As coal mines are of recent development, and made by man, the fauna is of recent adaptation and more or less influenced by human activity. The questions of temp., humidity, variable factors, and depth are discussed. In certain mines the vicinity of the silicious conglomerate "tourtia" greatly increases the humidity so that the wooden supports for the mine tunnels have to be frequently replaced. In such places the spiders and insects are abundant. Notes are presented on the occurrence, habits, and hypotheses of origin of habit for the following species: *Dysdera crocata, Pholcus phalangioides, Theridion tepidariorum, Lessertia dentichelis, Lepthyphantes leprosus, Bathyphantes gracilis, Nesticus cellulanus, Tegenaria domestica*, and *T. urbana*.

5611. FAGE, LOUIS. Biospeologica LV. Araneae. Cinquième série, précédée d'un essai sur l'évolution souterraine et son déterminisme. *Arch. Zool. Exp. et Gén.* 71 (2): 99-291. 48 fig. 1931.—A study of cave-dwelling spiders from North Africa and Europe. The writer notes especially the absence from caves in this region of the entire suborder Theraphosae, and also of the families Gnaphosidae, Zodariidae, Mimetidae, Thomisidae, Pisauridae, Lycosidae, Oxyopidae, and Salticidae. The general condition of life in caverns is darkness, an even temp. throughout the year, fluctuating perhaps 5° C. and

a constant humidity, near saturation. Some species are found in caves in winter and not in summer, showing the influence of the warmer temp. The influence of darkness and high humidity upon various species is considered, as regards habits and structure. The species discussed consist of 4 Dictynidae, 1 Uloboridae, 1 Sicariidae, 10 Leptonetidae, 6 Dysderidae, 1 Pholcidae, 5 Theridiidae, 94 Argiopidae, 4 Clubionidae, and 16 Agelenidae. *Amaurobius* **cerberus*** ♂ (p. 126), Spain; *Leptoneta*, partial key to species, *L. jagei** redescribed; *Dysdera* **bicornis*** (p. 133), Spain; *Stalita stygia** Joseph (=*S. gracilipes* Kulczynski) redescribed; *S. schiödtei** Thorell (=*S. hercegovinensis* Nosek) redescribed; *S. taenaria*, descriptive notes; *Robertus* **cantabricus*** ♀ (p. 141), Spain; illustrations of seminal receptacle of *R. mazaurici**, *R. lividus**, and *R. truncorum**; *Trogloneta granulum** (p. 143), descriptive notes; *Gonatium* **orientale*** (p. 144), Rumania; *Scotoneta barbara**, first record from Spain; *Porrhomma proserpina* (E. S.) and *P. myops* E. S. are reduced to forms of *P. pygmaeum* (Bl.); new descriptive data are given for *P. subterraneum**, *P. rosenhaueri**, *P. microphthalmum**, *P. oblongum**, and *P. egeria**; *Centromerus microps**, first description of ♀; *C.* **chappuisi*** ♀ (p. 171), Rumania; *C.* (?) **viduus*** ♂ (p. 172), Spain; *Troglohyphantes* **kulczynskii*** (p. 175), Rumania; *T. herculanus**, first description of ♂; *Leptyphantes centromeroides** position doubtful in this genus, showing resemblance to *Troglohyphantes*; *L.* **phallifer*** ♀ (p. 181), Spain; *L. lorifer**; *L.* **berlandi*** ♀ (p. 184), Portugal; *L.* **bolivari*** (p. 185), Spain; *L.* **byzantinus*** (p. 186), Turkey; *L. afer**; *L. venereus** descriptive notes; *L.* **emarginatus*** ♀ (p. 190), Algeria; *L.* **gadesi*** ♀ (p. 191), Spain; *Taranucnus* **bihari*** ♀ (p. 193), Rumania; **METELLA** (p. 195), near *Meta* in Tetragnathinae, type *M.* **breuili*** ♀ (p. 196), Spain; *Nesticus* **lusitanicus*** ♀ (p. 199), Portugal; descriptive notes are given for *N. puteorum**, *N. spelaeus**, *N. fodinarum**, *N. hungaricus* first descr. of ♂*, and *N. biroi**; *N.* **simoni*** ♂ (p. 203), Rumania; *Brachyanillus liocraninus* descriptive notes; *Tegenaria antrorum**, *T.* **herculea*** ♀ (p. 210) and *T.* **hispanica*** ♀ (p. 212), Spain. The bibliography contains 68 references. This is followed by a list of species with names of caves where found, and a list of 558 caves in Kenya, Seyidie, Tanga, Zanzibar, Madagascar, Algeria, Morocco, Spain, France, Italy, Portugal, Rumania, Turkey, and Jugoslavia, with species recorded from each. Types of new spp. in Mus. Nation. d'Hist. Nat., Paris.

5612. GRAVIER, CH. Les appendices fouisseurs des Limules. *Arch. Anat. Microsc.* 25: 270-279. 4 fig. 1929.—The 6th cephalothoracic appendage is used for digging; it is composed of 7 articles besides the 2 terminal ones which form a chela. The functions of the different articles as seen in *Tachypleus tridentatus* are described. The author reviews the studies of previous writers.—*M. J. Rathbun.*

5613. HINGSTON, R. W. G. Spiders: their devices for concealment and protection. *Jour. East Africa and Uganda Nat. Hist. Soc.* 1929(36): 149-156. 8 pl. 1931.—The author describes and figures various devices constructed by orb-weaving spiders as a protection against parasitic wasps. Some add to the web pellets, bits of bark, or cocoons bearing a marked resemblance to themselves. Others construct silky bands, zigzags, or spiral threads, among which the spiders themselves become inconspicuous. In thus manufacturing an artificial protective environment, the spiders go beyond the host of animals which are merely passive in resembling their environment.

5614. ILLINGWORTH, J. F. The black widow spider. *Proc. Hawaiian Ent. Soc.* 7(3): 410-414. 1 pl. 1931.—This poisonous spider, *Latrodectes mactans*, has spread very rapidly in the pineapple areas, especially where mulching paper is used. The irregular web surrounds a pineapple plant*. The ♀ forms an egg cocoon a week, each cocoon containing hundreds of eggs (one contained 521). As many as 15 egg sacs have been made by one ♀ in captivity, only one mating being necessary. The young spiders are distributed by the wind blowing thin light webs, sometimes hundreds of miles to sea. They reach maturity in 1-2 months. Laboratory animals (rabbits, guinea pigs) are partially paralyzed by the bite.

5615. JERMOLAJEW, W. Beschreibung einer neuen sibirischen Spinnengattung aus der Familie Linyphiidae. *Zool. Anz.* 90(7/8): 216-221. 3 fig. 1930.—**NARCISSIUS** (p. 216), resembling *Stemonyphantes*, erected for *N. taiganus** (p. 217), Siberia.

5616. KISHIDA, KYUKICHI. Trapdoor spiders of Japan and their bearing on zoögeography. *Annot. Zool. Japonenses* 11(4): 385-387. 1928.—A list of 18 spp. of 2 families, Liphistiidae (1) and Avicullariidae (17), with distributional notes.

5617. KISHIDA, KYUKICHI. A new linguatulid, Armillifer yoshidai, with notes on the Porocephalidae. *Annot. Zool. Japonenses* 11(4): 397-405. 1 pl. 1928.—*A. yoshidai** (p. 397), Osaka Zool. Park, Japan, in the lungs of *Python molurus*, type in author's coll. **POROCEPHALIDAE** (p. 399), type genus *Porocephalus* Humboldt, to include the subfams. Porocephalinae Sambon and **ARMILLIFERINAE** (p. 400), type genus *Armillifer* Sambon; **CUBIREA** (p. 400), type *C.* **annulata** (*Pentastoma annulatum* Baird) (p. 400). Key to genera and spp. of Armilliferinae is given.

5618. KISHIDA, KYUKICHI. Pseudoscorpions (Microcreagris) of Japan. *Annot. Zool. Japonenses* 11(4): 407-413. 3 fig. 1928.—An annotated list of 5 spp. of *Microcreagris*, with key to Chinese and Japanese species, including *M.* **cyclica*** (p. 409), Japan, type in author's coll.; *M.* **japonica** (*M. gigas* var. *j.* Ellingsen) (p. 408); *M.* **formosana** (*M. granulata* v. *f.* Elling.) (p. 411); *M. pygmaea**.

5620. LAWRENCE, R. F. The harvest-spiders (Opiliones) of South Africa. *Ann. South African Mus.* 29(2): 341-508. 90 fig. 1931.—Opiliones, key to suborders. Suborder Cyphophthalmi. Sironidae, key to subfamilies. Sironinae, key to genera. **SPELEOSIRO** (p. 348), near *Purcellia*, based on *S.* **argasiformis*** (p. 348), found in a cave. Suborder Laniatores, key to families. Phalangodidae, key to subfamilies. *Metabiantes*, key to spp.; *M.* **maximus*** ♀ (p. 356). Assamiidae, key to subfamilies: **NAMUTONIA** (p. 357), in Trionyxellinae, based on *N.* **scabra*** (p. 358), South West Africa. Assamiinae, key to genera: **CRYPTOPYGOPLUS** (p. 360), near *Wintonia*, key to spp., based on *C.* **africanus*** (p. 361), Portuguese E. Africa; *C.* **damaranus*** (p. 362), S. W. Africa; *C.* **rhodesianus*** (p. 363), Rhodesia. Triaenonychidae, key to subfamilies. Triaenonychinae, key to genera: *Ceratomontia*, key to spp.; *C.* **tabulae*** (p. 371); *C.* **fluvialis*** (p. 372); *C.* **karrooensis*** (p. 373); *C.* **minor*** (p. 374); *C.* **hewitti*** (p. 376); *C.* **irregularis*** (p. 378); *C.* **setosa*** (p. 379); **MENSAMONTIA** (p. 381), in Triaenonychinae, key to species, based on *M.* **morulifera*** (p. 382); *M.* **melanophora*** (p. 383); **ROEWERIA** (p. 384), near *Mensamontia*, based on *R.* **inermis*** (p. 385); **AMATOLA** (p. 386), in Triaenonychinae, based on *A.* **dentifrons*** (p. 387); **ROSTROMONTIA** (p. 388), in Triaenonychinae, key to spp., based on *R.* **truncata*** (p. 389); *R.* **granulifer*** (p. 391); *R.* **lisposoma*** (p. 392); *R.* **capensis*** (p. 394); **CRYPTOBUNUS** (p. 396), in Triaenonychinae, based on *C.* **setifemur*** (p. 396), Natal; **AUSTROMONTIA** (p. 398), near *Rostromontia*, key to spp., based on *A.* **silvatica*** (p. 398); *A.* **capensis*** (p. 400); *A.* **caledonica*** (p. 402); **BIACUMONTIA** (p. 403), in Triaenonychinae, key to spp., based on *B.* **paucidens*** (p. 404); *B.* **cornuta*** (p. 406); *B.* **truncatidens*** (p. 408); *B.* **fissidens*** (p. 410); **AUSTRONUNCIA** (p. 411), in Triaenonychinae, based on *A.* **spinipalpis*** (p. 411); **GRAEMONTIA** (p. 413), in Triaenonychinae, key to spp., based on *G.* **bifidens*** (p. 414); *G.* **dentichelis*** (p. 415); **MONOMONTIA** (p. 416), in Triaenonychinae, key to spp., based on *M.* **atra*** (p. 417); *M.* **rattrayi*** (p. 418); *Acumontia*

natalensis* (p. 420), Natal; **SPELEOMONTIA** (p. 422), in Triaenonychinae, based on *S.* **cavernicola*** (p. 422), found in complete darkness in caves. Adaeinae, key to genera; *Adaeulum*, key to spp.; *A.* **natalense*** (p. 426), Natal; *A.* **godfreyi*** (p. 428); *A.* **coxidens*** (p. 430); *A.* **bicolor*** (p. 433), Zululand (type) and Natal; *Adaeum*, key to spp.; *A.* **spatulatum*** (p. 439); *A.* **granulosum*** (p. 441); *A.* **squamatum*** (p. 442); **CRYPTADAEUM** (p. 445), near *Adaeulum*, based on *C.* **capense*** (p. 445); **MICRADAEUM** (p. 448), in Adaeinae, based on *M.* **rugosum*** (p. 448); *Larifuga*, key to spp.; *L.* **dentifer*** (p. 451); *L.* **granulosa*** (p. 453); *L.* **calcarata*** (p. 456); *L.* **capensis*** (p. 457); *L.* **montana*** (p. 459); **MONTADAEUM** (p. 464), in Adaeinae, based on *M.* **purcelli*** (p. 464); **PARADAEUM** (p. 466), in Adaeinae, based on *P.* **rattrayi*** (p. 466). Suborder Palpatores, key to "Tribes." Acropsopilionidae: **OONOPSOPILIO** (p. 470), near *Acropsopilio*, based on *O.* **africanus*** ♂ (p. 470). Phalangiidae, key to subfamilies. **NEOPILIONINAE**, new subfam. (p. 473), based on **NEOPILIO** (p. 473), with *N.* **australis*** (p. 474). Phalangiinae: *Rhampsinitus*, key to spp.; *R.* **capensis*** (p. 478); *R.* **littoralis*** (p. 480); *R.* **vittatus*** (p. 482); *R.* **longipalpis*** (p. 483); *R.* **unicolor*** ♂ (p. 485) and *R.* **flavidus*** ♂ (p. 486), Transvaal; *R.* **levis*** (p. 487); *R.* **cristatus*** (p. 489); *R.* **silvaticus*** (p. 491); *R.* **transvaalicus*** (p. 493). Unless otherwise specified, new spp. are from Cape Province. All new species in coll. of S. African Mus.

5621. **MELLO-LEITÃO.** Aranhas de Pernambuco, colhidas por D. Bento Pickel. [Spiders of Pernambuco collected by Bento Pickel.] *Ann. Acad. Brasileira Sci.* 1(2): 91-112. 3 pl. 1929.—*Phormictopus* **multicuspidatus*** ♂ (p. 91); *Dolichothele* **scintillans** ♀ (p. 92); *Ariadna* **taperae** (p. 93); *Scytodes* **plumbeus*** ♂ (p. 94); *Physocyclus globosus*, first record for Brazil; *Psylochorus* **taperae*** (p. 94); *Leptopholcus* **occidentalis*** ♀ (p. 95), first record of the genus in America; *Selenops maranhensis* Mello-Leitão, first description of ♂; *S.* **rapax** ♂ (p. 96); *Ctenus ocelliventer* Strand, first descr. of ♀; *C.* **senex*** ♀ (p. 98); **CENTROCTENUS** (Ctenidae) (p. 98), type *C.* **longimanus*** ♂ (p. 99); **MESOCTENUS** (Ctenidae) (p. 100), type *M.* **sericeus*** ♀ (p. 100); *M.* **spinulosus*** ♂ (p. 101); *M.* **omega*** ♀ (p. 101); *Gayenna* **taperae*** ♀ (p. 102); *Teudis* **heraldicus** ♀ (p. 103); *T.* **lecochlorus*** ♂ (p. 104); *T.* **dichotomus*** ♂ (p. 105); *Osoriella* **discolor*** (p. 105); *Castianeira* **polyacantha** ♂ (p. 106); *C.* **atypica** ♀ (p. 107); *C.* **leptopoda** ♀ (p. 108); **PSEUDOCETO** (Clubionidae) (p. 109), type *P.* **pickeli*** ♀ (p. 109); *Acacesia foliata*, *Hypognatha testudinaria*, and *Micrathena bifidum*, new to Brazil; *Micrathena* **conspicuum*** ♀ (p. 110); *Peucetia* **heterochroma*** (p. 112). A few previously known spp. are also recorded.

5622. **MILLOT, J.** Les glandes venimeuses des Aranéides. *Ann. Sci. Nat. Zool.* 14(1): 113-147. 23 fig. 1931. The writer examined 107 spp. in 29 families of spiders. Anatomical illustrations of the head, showing the venom glands, are presented for *Segestria senoculata**, *Thomisus onustus**, *Holocnemus pluchei**, *Dolomedes plantarius**, *Tetragnatha extensa**, *Palpimanus gibbulus**, *Thanatus formicinus**, *Filistata insidiatrix**, *Sicarius* sp.*, *Zoropsis spinimanus**, *Oecobius cellariorum**, *Pholcus phalangioides**, *Aelurillus insignitus**, *Nemesia carminans**, *Uroctea durandi**, *Tegenaria domestica**, *Loxosceles rufescens**. A section through the cephalothorax* of *Hyptiotes paradoxus* shows that venom glands are lacking. The article discusses the form and structure of the poison gland, and its excretory canal, and the digestive role of the venom. He holds that these glands are of taxonomic value. Spiders with reduced nervous system have enlarged poison glands, and vice versa. The bibliography contains 35 references.

5623. **ROBINS, E. A.** Spiders. *Jour. Quekett Microscop. Club* 16(97): 201-205. 1931.—An account of habits of a number of spp., chiefly British.

5624. **ROEWER, C. FR.** Opilioniden aus Süd-Amerika. *Boll. Mus. Zool. ed Anat. Comp. R. Univ., Torino* 40 (Paper 34): 1-34. 2 pl. 1925(1926).—This report is based upon material in the Turin Mus., collected by Borelli and Festa, chiefly in Ecuador and Bolivia. Cosmetidae, Cosmetinae: *Rhaucoides* **festae*** (p. 3); *Cynorta* **dariensis*** (p. 4) and *Eucynortula* **ypsilon*** ♂ (p. 5), Colombia; *Paecilaema* **festae*** ♀ (p. 6); **CYNORTELLULA** (p. 6), erected for *C.* **bimaculata*** (p. 7); **LIBITIOLA** (p. 7), erected for *L.* **borellii*** (p. 8), Bolivia, and *L.* **tibialis*** (p. 9), Argentina; **CYNORTOPLUS** (p. 9), erected for *C.* **albimaculatus*** (p. 9); **VONONELLA** (p. 10), erected for *V.* **maculata*** (p. 11); **PYGOCYNORTA** (p. 12), erected for *P.* **festae*** (p. 12); **PAECILAEMELLA** (p. 13), erected for *P.* **festae*** ♀ (p. 13). Gonyleptidae: *Parabalta* **sicaria*** (p. 14), Bolivia (type) and Argentina; *P.* **borellii*** ♂ (p. 16), Argentina; **IBARRA** (p. 17) (Pachylinae), erected for *I.* **festae*** (p. 17); *Rhopalocranaus* **festae*** ♂ (p. 18); *Cranaus* **similis*** (p. 19); *Phareicranaus* **parallelus*** (p. 21); *P.* **festae** ♂ * (p. 23); **RHOPALOCRANELLUS** (p. 24) (Cranainae), erected for *R.* **festae*** (p. 25); **PERIPA** (p. 26) (Cranainae), erected for *P.* **clavipus*** (p. 26); **NIEBLIA** (p. 27) (Cranainae), erected for *N.* **festae*** (p. 28); **PUNA** (p. 29) (Cranainae), erected for *P.* **festae*** ♀ (p. 29). Phalangiidae: *Geaya* **elegans*** ♂ (p. 31); *Prionostemma coxale*, first record for Ecuador; *P.* **festae*** (p. 31), Colombia; **CAIZA** (p. 32) (Gagrellinae), erected for *C.* **colliculosa*** (p. 32), Bolivia (type) and Ecuador. Except where otherwise given, new spp. are from Ecuador. Types of new spp. in Mus. Zool. Turin.

5625. **WILLIAMS, F. X.** A spider eating ant larvae or pupae. *Proc. Hawaiian Ent. Soc.* 7(3): 425-426. 1931. —An attid (salticid) spider was observed grabbing larvae from a stream of moving ants, *Prenolepis bourbonica* Forel, and eating them. On another occasion the spider *Heteropoda regia* was observed capturing swarming queens of *Prenolepis sharpii*.

COLEOPTERA

ANDREW J. MUTCHLER, *Editor*

5626. **ANDREWES, H. E.** On some new species of Carabidae from Sumatra. *Arkiv Zool.* [*Stockholm*] 21A (4, paper 29): 1-12. 1930.—*Clivina* **trachys** (p. 1); *Tachys* **nephelodes** (p. 2); *Oxycentrus* **nitidus** (p. 3), type in British Mus.; *O.* **striolatus** (p. 4); *Trichotichnus* **laticeps** (p. 4), type in Brit. Mus.; *Stenolophus* **volucer** (p. 5); *Colpodes* **sjöstedti** (p. 6), type in Genoa Mus.; *Lachnothorax* **malayicus** (p. 7), Kuala Lumpur, type in Brit. Mus.; *Orthogonius* **orphnodes** (p. 8); *Holcoderus* **chrysomeloides** (p. 9); *Mochtherus* **magnus** (p. 10), type in Genoa Mus.; *Risophilus* **fulgureus** (p. 11) and *Pentagonica* **tenebrosa** (p. 12), both Singapore, and types in author's coll. Types in Stockholm Mus., unless otherwise indicated.

5627. **APFELBECK, V.** Neue Anaspis-Arten aus Jugoslavien. (Coleopt., Mordellidae.) *Ent. Anzeiger* 11 (2): 37-39. 1931.—*A.* (*Larisia*) **cavipalpis** and **bernikovi** (p. 37), and *A.* (*Silaria*) **serbica** (p. 38).

5628. **BEESON, C. F. C.** The biology of the genus Xyleborus, with more new species. *Indian Forest Rec.* 14(10): 209-272. (Ent. Ser. pp. 33-96.) 2 pl., 8 fig. 1930.—The following new spp. of Indian *Xyleborus* are described: **burmanicus** ♀ (p. 210); **intextus** ♀ (p. 211); **senchalensis** ♀ (p. 212); **rodgeri** ♀ (p. 213) and var. **privatus** (p. 213); **concinnus** ♀, India, Burma, and Java (p. 214); **citri** ♀ (p. 215); **eggersi** ♀ (p. 215); **butamali** ♀ (p. 216); **hirtuosus** ♀ (p. 217); **melancranis** ♀ (p. 218); **dorsosulcatus** ♀ (p. 219). Types are in British Mus. The

genus *Xyleborus* includes a large section of the pinhole and shothole borers of Indian timbers. The development of the pattern of the gallery-system in different spp. is described; figures are given for *cognatus* Bldfd., *incurvus* Eggers, *interjectus* Bldfd., *kraatzi* Eichh., *noxius* Samp., *riehli* Eichh., *rodgeri* Beeson, *semigranosus* Bldfd., *shoreae* Stebb., *vicarius* Eichh. The life-cycles, seasonal history, and emergence-periods are discussed. The life-cycle may be as short as 10 days for spp. boring in twigs and branchlets (e.g., *discolor, morigerus*) while at the other extreme colonies may inhabit suitable timber continuously for over a year before emerging (e.g., *kraatzi, minor, submarginatus, shoreae*). The emergence of beetles from attacked timber occurs at all seasons of the year, though a few spp. such as *interjectus* and *minor* show a tendency to swarm contemporaneously in the early hot weather. Records are given in detail of the distribution and food-plants of some 93 spp. found in India. The better known spp. of *Xyleborus* are intensely polyphagous; *fornicatus* Eichh. is known to bore into 32 trees or woody shrubs, *interjectus* Bldfd. into 41, *kraatzi* Eichh. into 75. An alphabetical index to nearly 200 spp. of food-plants with the associated *Xyleborus* spp. is provided.—*C. F. C. Beeson.*

5629. **BERNHAUER, MAX. Neue Zyras-Arten aus dem tropischen Afrika. (25. Beitrag zur Staphylinidenfauna Afrika's.)** *Wiener Ent. Zeit.* 47(3): 126-148. 1930. —Locality is Belgian Congo, except where otherwise specified. Key to 9 spp. of *Zyras* is given; *Z.* (*Trigonodonia*) **bicallosus** (p. 127); *Z.* (*T.*) **hargreavesi** (p. 128), Sierra Leone; *Z.* (*T.*) **subglaber** (p. 129); *Z.* (*T.*) **bifoveolatus** (p. 130); *Z.* (*T.*) **subopacus** (p. 131); *Z.* (*Cephalodinia*) **sparsicauda** (p. 132); *Z.* (*Camonia*) **kabetensis** (p. 133), Kenya Colony; *Z.* (*C.*) **magniceps** (p. 134), Tanganyika Terr.; *Z.* (*C.*) **depressicollis** (p. 135); *Z.* (*C.*) **pustulipennis** (p. 136) and *Z.* (*Glossacantha*) **cylindricus** (p. 137), S. W. Africa; *Z.* (*G.*) **johnstoni** (p. 138), Sudan; *Z.* (*G.*) **turnerianus** (p. 139) and *Z.* (*G.*) **okahandjae** (p. 140), S. W. Africa; *Z.* (*Trachydonia*) **patrizii** (p. 141); *Z.* (*T.*) **puncticauda** (p. 142); *Z.* (*T.*) **densatus** (p. 143), *Z.* n. subg. **MICROCEPHALODONIA**, with *Z.* (*M.*) **diabolicus** (p. 144); *Z.* (*Grammodonia*) **silvestrii** (p. 145), French Guinea; *Z.* (*G.*) **nitidipennis** Bernh., 1st description of ♂; *Z.* (*G.*) **bilineatus** (p. 146); *Z.* (*Parophthalmonia*) **manowensis** ♀ (p. 147), Kenya Colony [?], type in author's coll.; *Z.* (*Ctenodonia*) **yeboensis** (p. 148).

5630. **BLAIR, K. G. The Indian species of Palorus Muls. (Coleoptera: Tenebrionidae) and some associated beetles.** *Indian Forest Rec.* 14(5): 133-152. (Ent. Ser. pp. 1-20.) 1 pl. 1930.—A key is provided for the Indian spp. of *Palorus* in which 3 new subg., **COELOPALORUS, STENOPALORUS,** and **PALORINUS,** are characterised (p. 135) and the following spp. described as new: *Palorus* (*Coelopalorus*) **foveicollis***, India, Burma, Malacca, Philippines, etc. (p. 136); *P.* (*Stenopalorus*) **hypophloeoides***, Dehra Dun, ex *Dalbergia sissoo* and *Pinus longifolia* (p. 136); *P.* **sinuaticollis***, Burma, Tonkin, ex *Tectona grandis* and *Mangifera* sp. (p. 137); *P.* **longifoliae***, ex *Pinus longifolia* (p. 138); *P.* **shoreae,** ex *Shorea robusta* (p. 138); *P.* **andrewesi** (p. 139); *P.* **tenuipunctatus,** Burma, ex *Mangifera* sp. (p. 139); *P.* **beesoni,** India, Burma, ex *Ficus glomerata, F. religiosa, Butea frondosa, Boswellia serrata, Mangifera* sp. (p. 140); *P.* **genalis,** Ceylon, Andamans, Philippines, ex *Myristica andamanica* and dry paddy (p. 140); *P.* (*Palorinus*) **quadraticollis** (p. 142); *P.* (*P.*) **bicolor,** ex *Poinciana elata* (p. 143); *P.* (*P.*) **carinatus*** Nilgiris, Bombay, Ceylon, ex *Ficus* and *Grevillea* (p. 143); key to separate the similar genera *Palorus, Hypophloeus* (*H. flavipennis**), *Latheticus* (*L. oryzae**), *Tribolium, Lyphia,* and *Ocholissa* (*O. laticeps**); *Hypophloeus* **dorsalis,** ex *Mallotus philippinensis* and *Ficus bengalensis* (p. 145); *H.* **beesoni,** ex *Ficus religiosa* (p. 146); *Tribolium* **indicum,** ex *Dalbergia sissoo,* described and separated in a key from its allies; *Lyphia* **orientalis,** Sylhet, ex *Vitex negundo* Belgaum, Ceylon, Siam, Burma, China (p. 150); *L.* **subopaca,** ex *Shorea robusta, Mallotus philippinensis,* and *Boswellia serrata* (p. 150); *L.* **assamensis***, ex *Vatica lanceaefolia* and *Mesua ferrea* (p. 151). Records of the distribution and associated timbers are given for the Indian spp. of the genera mentioned above and a note on the biology of the group is added by C. F. C. BEESON. Types are in British Mus.—*C. F. C. Beeson.*

5631. **BORGMEIER, TH. Zwei neue Gattungen ecitophiler Aleocharinen (Col., Staph.).** *Zool. Anz.* 92 (7/8): 165-178. 27 fig. 1930.—[Staphylinidae] **ECITOPHANES** (p. 165), related to *Leptanillophilus,* type *E.* **crassicornis*** (p. 167), associated with *Eciton crassicorne;* **ECITOCRYPTUS** (p. 173), related to *Diploeciton,* type *E.* **sulcatus*** (p. 174), associated with *Eciton schlechtendali.* Both spp. from Goyaz, Brazil.

5632. **BRUCH, CARLOS. Un género y especie nuevos de estafilínido ecitófilo. [A new genus and species of staphylinid, parasitic on Eciton.]** *Physis* [*Buenos Aires*] 10(35): 17-20. 1 pl. 1930.—**ACAMATUSINA** (p. 18), near *Mimonilla,* type *A.* **inopinata*** (p. 20), parasitic on *E. strobeli,* Argentina.

5633. **BRYANT, G. E. Some new injurious Phytophaga from Somaliland and Uganda.** *Bull. Ent. Res.* [*London*] 21(3): 361-363. 3 fig. 1930.—*Sebaethe* **guavae*** (p. 361), Italian Somaliland, feeding on *Psidium; Epitrix* **pubipennis*** (p. 362), Uganda, on *Solanum* sp.; *Phyllotreta* **hargreavesi*** (p. 362), Uganda, on flowers of *Gynandropsis* sp.

5634. **CARTER, H. J. A new species of Stigmodera (Buprestidae).** *Australian Zool.* 6(4): 386. 1931.—*S.* (*Castiarina*) **callubriensis** ♀, New S. Wales, type in author's coll.

5635. **CHAPIN, EDWARD A. A new Serica from New Jersey.** *Proc. Biol. Soc. Washington* 44: 5-6. 1931.—*S.* **imitans** (p. 5), New Jersey, type in U. S. Nation. Mus.

5636. **DELAHON, PAUL. Nachträge zu "Schilskys systematischen Verzeichnis der Käfer Deutschlands" von 1909 mit besonderer Berücksichtigung der Formen der Mark Brandenburg, sowie einige sonstige Bemerkungen über Käfer aus Deutschland. (Col.).** *Mitteil. Deutschen Ent. Ges.* 1(9): 130-134. 1930.

5637. **FISHER, W. S. A new leaf mining buprestid from the Canal Zone (Coleoptera).** *Proc. Ent. Soc. Washington* 33(2): 42-43. 1931.—*Pachyschelus* **psychotriae** (p. 42), type in U. S. Nation. Mus.

5638. **GAUSE, G. F. Die Variabilität der Zeichnung bei den Blattkäfern der Gattung Phytodecta.** *Biol. Zentralbl.* 50(4): 235-248. 7 fig. 1930.—The application of statistical and geometrical methods to the study of variation of pattern in chrysomelid beetles showed different stability of different components of pattern and the existence of the polymorphous and binomial distribution of pattern in different species. The form of elytra was expressed by means of an equation and the correlation between the form of elytra and the position of pattern was studied. It was found that the correlation within the species (intragroup) has an opposite sign from the correlation within the genus (intergroup).—*G. F. Gause.*

5639. **GSCHWENDTNER, L. Neue Dytiscidae aus Formosa.** *Ent. Anzeiger* 11(1): 21. 1931.—*Bidessus* **megacephalus** and *Hyphoporus* **rotundatus,** Kotosho Is.

5640. **HAYES, WILLIAM PATRICK. Morphology, taxonomy, and biology of larval Scarabaeoidea.** *Illinois Biol. Monogr.* 12(2): 3-119. 15 pl. 1929.—The study of the larvae of North American Lamellicornia, including the now recognized families Scarabaeidae, Lucanidae, Trogidae, and Passalidae, attempts to bring together facts of their biology, including the writer's life-history studies, and presents keys for their identification based on morphological studies. No comparative structural studies of these insects have hitherto been made. The mouthparts and the last abdominal segment have proved the most useful taxonomic characters. The analytical keys are preliminary, a great many of the spp. being still unknown in the larval stage. The long life-cycle in many spp. makes rearing difficult. In the biological discussion the general facts concerning postembryonic development are compared. Consideration is given to the late embryonic processes, and larval and pupal de-

velopment are discussed. There are detailed life-history studies in the subfamilies Melolonthinae, Rutelinae, Dynastinae, Cetoniinae, and in the coprophagous spp. of the Scarabaeidae.—*W. P. Hayes.*

5641. **HELLER, K. M. Vier neue Tanymecini (Col. Curculionidae) der palaearktischen Region.** *Wiener Ent. Zeit.* 47(3): 105-109. 3 fig. 1930.—*Chlorophanus* **mimus** ♀ (p. 106), *C.* **funicularis** (p. 106), and *C.* **roseipes** (p. 106), all from Sze-chwan; *Enaptorrhinus* **convexiusculus*** (p. 108), near Peking, with key to differentiate it from *sinensis* and *granulatus*.

5642. **KANO, T. Formosan Paussidae, with descriptions of two new species.** (In Japanese and English.) *Kontyu* 4(2): 90-98. 1 pl. 1930.—Keys to subfamilies and to Formosan genera and spp., with descriptions of all the spp. *Pseudorhopalus* Shiraki is a synonym of *Platyrhopalus; Paussus* **elongatus** (p. 92 & 96); *P.* **horikawae** (p. 93 & 97). Types in author's coll.—*R. Takahashi.*

5643. **KLEINE, R. Bestimmungstabelle der Trichalusverwandtschaft.** *Treubia* 11(3): 325-338. 2 pl. 1930.—Key to *Eniclases, Enylus, Diatrichalus, Flabellotrichalus, Microtrichalus,* and *Leptotrichalus,* and keys to their spp. *Flabellotrichalus* Pic (=*Stereotrichalus* Kleine). The following are described (in the key): *Eniclases* **moluccanus** ♀ (p. 328), Moluccas, type in author's coll.; *Enylus* **amplus** ♂ (p. 329), N. S. Wales; *Diatrichalus* **ternatensis** ♀ (p. 329), Moluccas; *Flabellotrichalus* **duplicatus** ♂ (p. 330), West Australia; *Leptotrichalus* **reticulatus** ♀ (p. 333), Sarawak; *L.* **timorensis** ♀ (p. 333), Dutch E. Indies; *L.* **insulanus** ♀ (p. 335), Sangir Is.; *L.* **parvicostatus** ♀ (p. 336), Sunda Is. Unless otherwise specified, types are in British Mus.

5644. **KLEINE, R. Zur Lycidenfauna der Kleinen Sunda-Inseln.** *Treubia* 11(3): 341-347. 21 fig. 1930.—New localities are listed for 15 previously described spp. New spp. are: *Lycostomus* **timorensis*** ♀ (p. 342); *L.* **andonarensis*** ♂ (p. 342); *Calochromus* **timorensis*** ♀ (p. 343); *Cladophorus* **latithorax** (p. 343); *Plateros* **obscuriventris*** ♂ (p. 344); *P.* **tecticollis*** ♂ (p. 344); *P.* **pervulgatus*** ♀ (p. 345); *P.* **fuliginosus*** (p. 345); *P.* **obscuritarsis*** ♀ (p. 346); *P.* **nitens*** (p. 346); *Conderis* **flavicolor** ♀ (p. 347). Types are in British Mus.

5645. **KLEINE, R. Studien zur Gattung Bulenides C. O. Wtrh.** *Treubia* 11(3): 349-355. 15 fig. 1930.—*B.* **malayensis*** ♀ (p. 349) and *B.* **coccineus*** ♂ (p. 350), Malay Peninsula, and types in Fed. Malay States Mus., Kuala Lumpur; *B.* **nebulosus*** ♂ (p. 350), Malay Peninsula; *B.* **bicoloratus*** ♀ (p. 351), Sumatra; *B.* **triangularis*** ♀ (p. 351), Sarawak; *B.* **philippinensis*** ♂ (p. 351) and *B.* **reticulatus*** ♂ (p. 352), Philippines. Types are in author's coll., unless otherwise stated. Key to the spp. is given.

5646. **KRAUTWIG, META. Untersuchungen am Kornkäfer (Calandra granaria L.). Der Bau der Geschlechtsorgane und ihre gegenseitigen Korrelationen.** *Zool. Jahrb. Abt. Anat. u. Ontog. Tiere* 52(4): 539-596. 34 fig. 1930.—In addition to whole mounts, 3-10μ sections through the sexual organs of *Calandra granaria* were studied, fixation in Susa and staining in Azan and Heidenhain proving most satisfactory. Spermatogenesis proceeds from the follicular margin to the middle of the testis. The spermatozoa possess a needle-shaped head with perforatorium and centriole and a flagellum with undulatory membrane. The vasa deferentia are without musculature. The secretions of the accessory gland and prostate consist each of 2 components. Secretion begins in the larval stage. The apparatus for its discharge, commonly present in insects, is lacking in both glands. The penis consists of a chitinous tube, continued into a wide-spaced preputial sac, upon the ventral side of which the ejaculatory duct opens. Longitudinal muscles serve as retractors. The upper side of the preputial sac is armed with hooks, denticles and plates. A praepenis is absent. In the ovary the protoplasmatic space in the terminal chamber is confined to the anterior section. The ovarioles are without a nutritive chamber. The oviduct, lined with fine gliding scales [chitinous platelets, overlapping posteriorly to assist in the discharge of the eggs], opens ventrally into the vagina, opposite the dorsal entrance of the spermathecal duct. The spermatheca is a falciform chitinous capsule, on whose broader end the accessory gland terminates in a conical prominence. Adjacent to this the spermathecal duct begins in a dome-like invagination provided with chitinous tubules. The spermatheca acts as a sperm pump. The accessory gland is of a complex type. Each gland cell possesses a collecting vesicle for secretion and a slender chitinous duct. In coitus only the end of the penis enters the vagina. The preputial sac is then unfolded within the genital passage of the ♀. The ejaculatory duct opens into the bursa copulatrix just before the entrance of the spermathecal duct. The differentiations of the chitinous lining of the preputial sac and that of the bursa function as claspers and titillators. A spermatophore is formed in which the seminal filaments lie in the prostatic secretion and are enveloped by that of the accessory gland.—*M. Krautwig (transl. by E. M. Walker).*

5647. **LEA, ARTHUR M. On Australian Coleoptera. Part VI.** *Rec. S. Australian Mus.* 4(2): 243-273. 1 fig. 1930.—*Blaps gigas* v. *azorica** reported from S. Australia, probably introduced by ships from Africa. *Decilaus* **megapholus** (p. 244) and *D.* **abdominalis** ♂ (p. 244), Queensland; *D.* **nitidirostris** (p. 245), Victoria; *D.* **curvirostris** (p. 246), New S. Wales; *D.* **mediolalbus** (p. 246) and *D.* **albohumeralis** (p. 247), Victoria; *D.* **parvidens** (p. 248), Queensland, type in Queensland Mus.; *D.* **nigrohumeralis** (p. 249), Norfolk Isl. [New S. Wales]; *D.* **episternalis** (p. 250), *D.* **triangulifer** (p. 251), *D.* **semicalviceps** (p. 252), and *D.* **lineifer** (p. 252), all 4 Victoria; *D.* **ruficornis** (p. 253), Tasmania; *D.* **subfasciculatus** (p. 254), *D.* **erythropholus** (p. 255), *D.* **wilsoni** (p. 255), and *D.* **erythromelas** ♂ (p. 256), all 4 Victoria; *Exithius* **murinus** ♀ (p. 257), Tasmania; *E.* **edentatus** ♂ (p. 258) and *E.* **semicalviceps** ♀ (p. 259), New S. Wales; *E.* **bidentatus** (p. 260), Victoria; *E.* **squamosis** (p. 260), Queensland, type in Queensland Mus.; *E.* **parvidens** (p. 262) and *E.* **microps** ♂ (p. 262), New S. Wales; *E.* **carinicollis** (p. 263), Victoria; *E.* **insularis** (p. 264), Tasmania; *E.* **episternalis** (p. 265), *E.* **pullatus** (p. 266), and *Ophrythyreocis* **fasciculatus** (p. 268), all 3 Victoria; *O.* **vigilans** (p. 269), W. Australia; *O.* **niger** (p. 270), S. Australia; *O.* **alternatus** (p. 270), New S. Wales; *O.* **tibialis** (p. 271), Victoria; *O.* **cyclothreus** (*Exithius c.* Lea) (p. 272); *O. microps* Lea, first record from Victoria and first description of ♂; *Roptoperus* **lissorhinus** (p. 272), Tasmania; *R.* **carinatus** (p. 273), Victoria. Types presumably in S. Australian Mus., except where otherwise stated. There are distributional and taxonomic notes on several previously known spp.

5648. **LIEBKE, M. Revision der amerikanischen Arten der Unterfamilie Colliurinae (Col. Carab.).** *Mitteil. Zool. Mus. Berlin* 15(3/4): 647-726. 62 fig. 1930.—The present paper is based on a study of the Carabidae of the Mus. für Naturkunde, Berlin, Stettiner Mus., British Mus., and others, besides those of many private collections. A catalogue is given of genera, subgenera, and spp., with keys and notes. *Calophaena* **caeruleofasciata** (*C. unifasciata* Motsch. not Chaudoir) (p. 679); *Colliuris* (**PROCOLLIURIS** n. subg.) (p. 658), type *C. rugicollis* Dej.; *C.* (*P.*) **viridiocellata*** (p. 682), Bolivia, type in Zool. Mus. Berlin; *C. rugicollis* v. **nigra** (p. 682), Colombia, type in Zool. Mus., Berlin; *C.* (*P.*) **maculipennis** (p. 682), Sta. Catharina and Mexico; *C.* (*P.*) **laeviceps** (p. 683), Peru and Mexico; *C.* (*P.*) **crispella** (p. 683), Paraguay; *C. subdistincta* v. **maculata** (p. 683), Mexico; *C.* (*P.*) **gratiosa*** (p. 685), and var. **viridana** (p. 686), both Matto Grosso, types in Zool. Mus., Berlin; *C. crispa,* new to Bolivia; *C.* (*P.*) **arrowi** (p. 707), Argentina; *C.* (*P.*) **cuyabana** (p. 708), Matto Grosso; *C.* (**COLLIURINA** n. subg.) (p. 658), type *C. batesi* Chaud.; *C.* (*C.*) **kuntzeni** (p. 684), Matto Grosso; *C.* (*C.*) **immaculipennis** (p. 704), Amazonas, type in Brit. Mus.; *C.* (**ANAPLAGIORRHYTIS** n. subg.) (p. 658), type *C.* (*A.*) **lugubris*** (p. 686), Matto Grosso, in

Zool. Mus., Berlin; *C.* **(COLLIURELLA** n. subg.) (p. 658), type *C. flavicornis* Brullé; *C. elongata**, emended description; *C.*(*C.*) **lagoenicollis*** (p. 692), Sta. Catharina, type in Zool. Mus., Hamburg; *C.* (*C.*) **gestroi** (p. 705), Argentina, type in Museo Civico Genoa; *C.* (*C.*) **variabilis*** (p. 706), Rio de Janeiro; *C.* **(PSEUDOCASNONIA** n. subg.) (p. 658), type *C. leprieuri* Cast.; *C. viridicollis* and *C. signata,* new to French Guiana; *C. rudis,* new to Dutch Guiana; *C.* (*P.*) **multifoveata*** (p. 702), French Guiana, type in Zool. Mus. Berlin; *C.* (*P.*) **ellipticeps*** (p. 703), Honduras; *C.* (*P*). **bucephala*** (p. 704), Bolivia, type in author's coll.; *C. marginestriata,* new to Costa Rica; *C.* **(ODACANTHELLA** n. subg.) (p. 658), type *C. pennsylvanica* L.; *C.* (*O.*) **portoricensis** (p. 688), Porto Rico; *C.* (*O.*) **humboldti*** (p. 688), Paraguay and Matto Grosso, type in Zool. Mus., Berlin; *C. picta* vars. **concluda** and **extrema** (p. 689), Mexico; *C. surinamensis* L. (=*C. maculicornis* Gory); *C. tristigma,* new to Mexico; *C. peruana* Erichs., emended description; *C.* (*Odacanthella*) **demerarae** (p. 693), Brit. Guiana, type in Zool. Mus., Hamburg; *C.* (*O.*) **trimaculata** (p. 694), Sta. Catharina, type in Zool. Mus., Berlin; *C.* (*O.*) **horni** (p. 695), Brazil, type in Deutsch Ent. Inst., Berlin-Dahlem; *C.* (*O.*) **emdeni*** (p. 696), Peru, type in Mus. f. Tierkunde, Dresden; *C.* (*O.*) **cyanea*** (p. 699), Amazonas; *C.* (*O.*) **cyanella** (p. 700), Amazonas, type in Brit. Mus.; *C.* (*O.*) **yucatana** (p. 700), Yucatan, type in Brit. Mus.; *C. strasseni,* established in subg. *Odacanthella; C. geniculata** Gory (=*C. incerta* Chaud.); *C.* (*Plagiorrhytis*) **robusta*** (p. 696), Peru, type in Langenhan coll.; *C. flavipes** Chaud. (=*C. bella* Liebke); *C. flavipes* ssp. **ecuadorica** (p. 684), Ecuador; *C. corrusca,* new to Peru; *C. plicaticollis,* new to French Guiana and Brazil, previously known only from Colombia; *C.* **(PSEUDOPLAGIORRHYTIS** n. subg.) (p. 657 & 697), type *C.* (*P.*) **excellens*** (p. 697), Peru, in Langenhan coll.; *C.* (*P.*) **hubenthali*** ♀ (p. 698), Costa Rica, type in Langenhan coll.; *C.* **(PARACOLLIURIS** n. subg.) (p. 658), type *C.* (*P.*) *sipolisi* Oberth.; *Calophaena* **grandispina*** (p. 710), Colombia, type in Naturhist. Mus., Stettin; *C.* **ephippigera*** (p. 711), type in author's coll., *C.* **hieroglyphica*** (p. 711), and *C.* **moseri*** (p. 712), all 3 Peru; *C.* **arrowi*** (p. 713), Ecuador, type in Brit. Mus.; *C.* **nevermanni*** (p. 714), and *C.* **costaricensis*** (p. 715), Costa Rica; *C.* **rutilicollis*** (p. 716), Ecuador; *C.* **schroederi*** (p. 717), Brazil, type in Naturhist. Mus., Stettin; *C.* **buckleyi*** (p. 717), Ecuador; *C.* **dupuisi*** (p. 718), Peru, type in Langenhan coll.; *C.* **sexmaculata*** (p. 719), Costa Rica; *C. gerstaeckeri,* described and figured; **CALOPHAENOIDEA** (p. 721), near *Calophaena,* based on *C.* **arrowi*** (p. 721), Ecuador, type in Brit. Mus.; **PSEUDOMETABLETUS** (p. 722), near *Stenocheila,* based on *P.* **nevermanni*** (p. 723), Costa Rica, type in Nevermann coll. An alphabetic list of the genera and sp. concludes the paper.

5649. MADER. Mitteilungen der Sammelstelle für Neubenennungen des V. D. E. V. [Union of German-speaking Ent. Soc.] (Col.). *Ent. Anz.* 10(18): 359. 1930. —*Semiadalia 11-notata* abs. **7-notata** and **patricia,** in Wien Mus.; *Scymnus subvillosus* ab. **sahlbergianus** (*S. subvillosus* ab. *fulvicollis* Sahlb. not Muls.); *Hippodamia 13-punctata* ab. **10-punctata** Mader; *H. heydeni* ab. **varia**; *H. 7-maculata* abs. **paupera, modesta, praespectata, nutans, praedicta,** and **exspectata.**

5650. MADER, L. Über paläarktische Coleopteren. I. *Ent. Anzeiger* 11(1): 19-20. 1931.—*Cystocnemis discoidea* Gebl. (=*Chrysomela nigrovittata* Ball); *Gastroidea viridula* ab. **cyanicollis** (p. 20).

5651. MAŘAN, JOSEF. Nova aberace Chlaenius vestitus Payk. z Čech. [New form of C. vestitus.] *Časopis Československé Společnosti Ent.* [*Prague*] 26(1/2): 33. 1929.—*C. v.* ab. **stichai,** Bohemia.

5652. MARSHALL, GUY A. K. New Curculionidae (Col.) from cultivated plants. *Bull. Ent. Res.* [*London*] 19(4): 391-400. 5 fig. 1929.—*Mimaulus* **matabelenus** (p. 391), Rhodesia, on tobacco; *Tanymecus* **arushanus** (p. 391) and *Systates* **habenatus*** (p. 392), both Tanganyika Terr., on cotton; *Cholus pistor* **bahiensis** (p. 394), on *Paspalum densum, Rhyssomatus* **psidii** (p. 395), on guava trees, and *Conotrachelus* **bondari*** (p. 396), on *Anona squamosa,* all 3 Bahia; *Cryptorrhynchus ephippiatus* and *strangulatus* Boh. are referred to *Metoposoma* (p. 397); *Metoposoma* **canavaliae*** (p. 397), Bahia, on *Canavalia* beans; *Peloropus* **batatae*** (p. 399), Uganda, on sweet potatoes.

5653. MARSHALL, GUY A. K. New Curculionidae (Col.) from cacao and camphor. *Bull. Ent. Res.* [*London*] 20(2): 201-204. 2 fig. 1929.—*Ischnotrachelus* **theobromae** ♀ (p. 201), Fernando Po, on cacao trees; *Dermatodes* **camphorae** (p. 201), Java, on *Cinnamomum camphora; Tylodes* **vellericollis*** (p. 202) and *Conotrachelus* **curvicostatus*** (p. 203), both Bahia, on cacao.

5654. MAULIK, S. New injurious Hispinae. *Bull. Ent. Res.* [*London*] 20(1): 81-94. 10 fig. 1929.—*Promecotheca* **nuciferae*** (p. 81), Celebes, mining leaves of coconut palm, larva* and pupa* also described; *P.* **soror*** (p. 84), Moluccas, damaging coconut palm; *Octotoma* **tessellata*** (p. 85), Bahia, on leaves of *Canavalia ensiformis; Anisostena* **fasciata*** (p. 87), Bahia, on grasses; *Cephalolia* **saccharina*** (p. 88), Bahia, on sugar cane; *Anoplitis* **canavaliae*** (p. 89), Bahia, on leaves of *Canavalia ensiformis,* larva* and pupa* also described; *Chalepus* **bondari*** (p. 92), Bahia. Types in British Mus.

5655. MAULIK, S. Injurious Hispinae from the Solomon Islands. *Bull. Ent. Res.* [*London*] 20(2): 233-239. 6 fig. 1929.—This paper is based on material belonging to the Imperial Bur. Ent. **PHARANGISPA** (p. 233), type *P.* **purpureipennis*** (p. 233), also description of larva*, on "ginger in bush"; **AULOSTYRAX** (p. 235), type *A.* **nuciferae*** (p. 235), on coconut leaflets; *Promecotheca* **alpiniae*** (p. 238), on *Alpinia* sp. Types in British Mus.

5656. MAULIK, S. New injurious Hispinae. *Bull. Ent. Res.* [*London*] 21(1): 45-56. 8 fig. 1930.—*Craspidonispa* **saccharina*** (p. 45), Trinidad, on sugar-cane; *Xenochalepus* **mucunae*** (p. 46), Bahia, on leaves of *Mucuna pluricostata;* **CODIOHISPA** (p. 48), resembling *Probaenia,* type *C.* **anonicola*** (p. 48), Bahia, on leaves of *Anona squamosa;* **CNESTISPA** (p. 49), resembling *Acanthodes,* type *C.* **darwini*** (p. 50), Bahia, on *Cymbotoma; C.* **acuminata*** (p. 51), Para; *C.* **flavipes** (*Acanthodes f.* Baly) (p. 52); *Acanthodes* **rana*** (p. 52), Brazil; *Gyllenhalius* **palmarum*** (p. 53), Gold Coast, from oil palm and coconut leaves; *Wallaceana* **phoenicia*** (p. 54), Malay Peninsula, on *Oncosperma tigillaria.* Types in British Mus.

5657. [MEDVEDEV, S. I.] МЕДВЕДЕВ, С. И. Материалы по фауне жуков (Coleoptera) Хивы. **I. Scarabaeidae. [The Coleoptera fauna of Khiva, Asiatic Russia.]** Русское Энтомологическое Обозрение. (*Rev. Russe. d'Ent.*) 24(1/2): 128-131. 1930.—A list of 43 spp. with locality records, and a discussion of general distribution of some spp. not previously recorded from this region.

5658. MIWA, YUSHIRO. H. Sauter's Formosa-Ausbeute (Elateridae I.). *Wiener Ent. Zeit.* 47(2): 91-97. 1930.—Annotated list, including: *Cardiophorus* **anpingensis** (p. 91); *Neodiploconus* **castaneus** (p. 92); *Athous* **rufithorax** (p. 92); *Csikia* **taiwana** (p. 93); *Agriotes* **fuscus** (p. 93); *Glyphonyx* **longulus** (p. 94); *Silesis* **sauteri** (p. 95), with key to differentiate it from *assimilis* and *okinawensis.* Types in Ent. Mus. Gov. Res. Inst., Formosa.

5659. [PLIGINSKII, V. G.] ПЛИГИНСКИЙ, В. Г. Две новых формы **Meloidae (Coleoptera). [Two new Meloidae.]** [In Russian and German.] Русское Энтомологическое Обозрение. (*Rev. Russe d'Ent.*) 24(1/2): 109-110. 1930.—*Proscarabaeus* **abyssinicus** ♂ (p. 109), Abyssinia; *Meloë variegata* ssp. **mandzhurica** (p. 110), Manchuria. Types in Zool. Mus., Leningrad.

5660. [REICHARDT, A. N.] РЕЙХАРДТ, А. Н. Заметки о палеарктических **Histeridae (Coleoptera). II. [Notes on palaearctic Histeridae. II.]** [German summary.] Русское Энтомологическое Обозрение. (*Rev. Russe d'Ent.*) 24(1/2): 46-55. 1 fig. 1930.—Locality records and taxonomic notes are given for 25 spp., including *Hypo-*

caecus dauricus (p. 52), Transbaikalia and northern Mongolia, type in Mus. Zool. Acad. Sci. [Leningrad]. *Gnathoncus suturifer** Rtt. is removed from the synonymy of *G. rotundato* Kug. and here redescribed.

5661. **St. GEORGE, R. A.** The discovery of what is possibly the larva of an introduced tenebrionid, Leichenum variegatum Küst. *Proc. Ent. Soc. Washington* 32 (7): 122-123. 1 pl. 1930.—The characters of the larvae of Opatrinae are described and compared with those of the specimen tentatively determined as *L. variegatum*.

5662. **STSHEGOLEVA-BAROVSKAJA, T.** De duabus novis Mordellidarum speciebus e tesquis ponticis (Coleoptera). Русское Энтомологическое Обозрение. (*Rev. Russe d'Ent.*) 24(1/2): 56-58. 8 fig. 1930.—*Mordellistena*, n. subg. **MORDELLISTENULA**, with *M.* **planifrons*** (p. 56) and *M.* **parvuliformis*** (p. 57), both southern Russia. Types in Mus. Zool. Acad. Sci. Leningrad. *M. parvuliformis* is reported to be injurious to sunflowers.

5663. **UHMANN, E.** Amerikanische Hispinen aus den Museen für Tierkunde und Völkerkunde zu Dresden. (25. Beitrag zur Kenntnis der Hispinen [Col. Chrys.].) *Wiener Ent. Zeit.* 47(3): 149-155. 1 fig. 1930.—*Cephalolia* **daguana*** (p. 149), Colombia; *C. deplanata*, emended description; *C.* **emdeni** (p. 151), Petropolis, Brazil; *Acentroptera* **emdeni** (p. 152), Colombia; *Stenispa* **peruana** (p. 153), Peru; *S.* **guatemalensis** (p. 154), Guatemala.

5664. **VOSS, EDUARD.** Die Attelabiden der Hauserschen Sammlung. (Col. Curc.) (28. Beitrag zur Kenntnis der Curcul.) *Wiener Ent. Zeit.* 47(2): 65-88. 1930.—The majority of these spp. were found in the Manchurian and the oriental subregions. Types, where specified, are mostly in the Hauser coll. *Auletobius* (*Aletinus*) **perturbatus** ♀ (p. 65), Szechwan [China]; *A.* (*A.*) **consimilis** (p. 66), "Yunnan-sen," type in Marshall coll.; *Aderorrhinus* **pedicellaris** (p. 67), "Yunnan-fou"; *Eugnamptus* **cervinus** (p. 67), Sze-chwan; *Rhynchites* (*Auletomorphus*) **monticola** (p. 68), Yunnan; *R. coeruleus* ssp. **ussuriensis** (p. 69), Ussuri; *R.* (*Involvulus*) **lepidus** (p. 69), Sze-chwan; *R.* (*I.*) **obsitus** (p. 70), "Yunnan-fou"; *R.* (*I.*) **indubius** (p. 71), "Yunnan-fou"; *R.* (*I.*) **marshalli** (p. 71), Maymyo, India, type in Marshall coll.; *R.* (*I.*) **gentilis** (p. 72), Himalaya and "Yunnan-fou," China; *R.* n. subg. **CYLLORHYNCHITES** (p. 73), with key to the spp. [described only in the key]; *R.* (*C.*) **cumulatus** (p. 75), "Yunnan-sen"; *R.* (*C.*) **spinicollis** (p. 75), Darjeeling Distr., India; *R.* (*C.*) **andrewesi** (p. 75), type in Marshall coll., *R.* (*C.*) **homalinus** (p. 76), and *R.* (*C.*) **subcumulatus** (p. 76), all 3 "Yunnan-sen"; *R.* (*C.*) **auricapillus** (p. 77), Sze-chwan; *R.* (*C.*) **rostralis** (p. 78), "Yunnan-sen"; *R. heros* ssp. **mongolicus** (p. 78), E. Mongolia; *Bycticus* **regularis** (p. 79), Siberia; *Deporaus unicolor* f. **yunnanica** (p. 80), "Yunnan-sen"; *Paramecolabus* (*Catalabus*) **nigrosuturalis** (p. 80), Sze-chwan; *Henicolabus* (*H.*) **haematideus** (p. 82), Sze-chwan; *Euops* (*Neosynaptops*) **viridiceps** (p. 82), Dutch New Guinea; *Paroplapoderus* **hauseri** (p. 83) and *Apoderus* (*A.*) **tuberculimerus** (p. 84), Sze-chwan; and f. **subopaca** (p. 85); *A.* (*Strigapoderus*) **funebris** (p. 85), Hupeh and Chekiang; *A.* (*Leptapoderus*) **cinctipectoralis** (p. 86), Yunnan-fou; *A. dimidiatus* f. **umbrata** (p. 86), Hupeh and Chekiang; *A.* (*Leptapoderus*) **pedestris** (p. 87), Yunnan; *Paracycnotrachelus* **foveostriatus** (p. 88), Yunnan.

5665. **WEST, AUGUST.** Some notes on the coleopterous fauna of Iceland. *Ent. Meddel.* [*Copenhagen*] 16 (8): 414-416. 1930.—Comments on previously published works by various authors. Total number of spp. of Coleoptera at present known from Iceland is about 141.

5666. **WEST, AUGUST.** Tillaeg og Rettelser til Fortegnelserne over de danske Coleoptera. [Additions and corrections to the list of Danish Coleoptera.] *Ent. Meddel.* [*Copenhagen*] 16(8): 441-448; (9): 449-492. 1930.—An extensive list, 68 species of which are new to Denmark.

5667. **WILLIMZIK, EDITH.** Über den Bau der Ovarien verschiedener coprophager Lamellicornier und ihre Beziehung zur Brutpflege. *Zeitschr. Wiss. Biol. Abt. A, Morph. u. Ökol. Tiere* 18(4): 669-700. 23 fig. 1930.—A distinction is made between Brutfürsorge, placing the egg in a supply of food, and Brutpflege, care of the young. Both are correlated with diminished egg production and thus with changes in the reproductive system. The female system is described for a number of beetles of the fam. Scarabaeidae, subfam. Coprophaginae; *Aphodius fimetarius, A. inquinatus, A. fossor, Geotrupes stercorarius, G. vernalis, G. silvaticus, Ceratophyus typhoeus, Lethrus apterus, Onthophagus fracticornis, O. nuchicornis, Copris lunaris,* and *C. hispanus.* The seminal receptacle and histology of the ♀ system are described in detail. Reduced ovaries, simple accessory parts, lack of a typical bursa copulatrix, modified seminal receptacles, and absence of terminal filaments on the egg tubes are the chief features of the ♀ system of the Coprophaginae. Reduction in egg output in correlation with care of young is accomplished in 2 ways: by production of very large, slowly ripening eggs with normal number (5 to 7 on each side) of egg tubes, as in *Aphodius* and *Geotrupes;* or by reduction of the ovaries to a single (left) egg tube as in the Coprinae.—*L. H. Hyman.*

DIPTERA

E. T. CRESSON, JR., *Editor,* Brachycera

O. A. JOHANNSEN, *Editor,* Nemocera

(See also in this issue Entries 4309, 4315, 4317, 4323, 4327, 4333, 4339, 4345, 4360, 4644, 4648, 4665, 4669, 4686, 4716, 4733, 4744, 5044, 5588, 5745, 6048)

5668. **ALDRICH, J. M.** New two-winged flies of the family Calliphoridae from China. *Proc. U. S. Nation. Mus.* 78(1): 1-5. 3 fig. 1930.—*Calliphora* **grahami*** (p. 1), China and Siberia, and introduced in California; **XANTHOTRYXUS** (p. 3), near *Pollenia,* type *X.* **mongol*** (p. 3), Szechuen; *X.* **draco** (p. 4), Szechuen; **LISPOPAREA** (p. 4), allied to *Pollenia,* type *L.* **flava*** (p. 5), Szechuen. Types in U. S. Nation. Mus.

5669. **ALEXANDER, CHARLES P.** New or little-known Tipulidae (Diptera). XLVII. Australasian species. *Ann. and Mag. Nat. Hist.* 7(37): 17-36. 4 fig. 1931.—*Trentepohlia* (*Mongoma*) **brevipes** ♀ (p. 18), Papua, and *T.* (*T.*) **taylori** ♀ (p. 19), Queensland, types of both in Australian Inst. Trop. Med.; *Gonomyia* (*Lipophleps*) **mesoneura** ♀ (p. 20), Victoria, type in Wilson coll.; *Teucholabis* (*T.*) **reginae** (p. 21), Queensland; *Tasiocera* **hiemalis** (p. 23), Victoria, type in Wilson coll.; *T.* **terrae-reginae** ♂ (p. 23), Queensland, type in Univ. Queensland; *T.* **acanthophallus** ♂ (p. 24), New South Wales; *T.* **cyatheti*** ♂ (p. 25), *T.* **bucephala*** ♂ (p. 26), and *T.* **dicksoniae*** ♂ (p. 28), all 3 Victoria, and types in Wilson coll.; *T.* **taylori** ♂ (p. 29), Queensland, type in Australian Inst. Trop. Med.; *Cryptolabis* (*C.*) **convoluta** (p. 29), N. S. Wales; *Amphineurus* (*A.*) **fergusoni** (p. 30), W. Australia, type in E. W. Ferguson coll.; *A.* (*A.*) **spinitergatus** ♂ (p. 32), N. S. Wales; *Erioptera* (*E.*) **diplacantha** ♂ (p. 33) and *Paragymnastes* **riedeli** (p. 34), both Queensland and N. S. Wales, type of latter in Riksmuseet, Stockholm; *Ceratocheilus* **davidsoni** ♂ (p. 35), Queensland. Unless otherwise stated, types are in author's coll.

5670. **ALEXANDER, CHARLES P.** New or little-known Tipulidae (Diptera). XLVIII. Australasian species. *Ann. and Mag. Nat. Hist.* 7(38): 153-172. 1931.—*Molophilus* **militaris** (p. 153), *M.* **bunyipensis** (p. 155), *M.* **distinctissimus** (p. 156), *M.* **obliteratus** (p. 157), *M.*

elatus (p. 158), *M.* subhorridus (p. 159), *M.* bawbawiensis (p. 160), *M.* sublyratus (p. 161), *M.* permutatus (p. 162), *M.* vividus (p. 163), *M.* trigonalis (p. 164), *M.* subalpicola (p. 165), *M.* congregatus (p. 166), and *M. chloris* ssp. inquirendus (p. 167), all from Victoria, and types in Wilson coll.; *M.* tersus (p. 167), New S. Wales, type in author's coll.; *M.* subasper (p. 168), Victoria, and subhastatus (p. 170), Victoria and Tasmania, types of last 2 in Wilson coll., *M.* capitellum ♂ (p. 171), New S. Wales, type in Tonnoir coll.

5671. ALEXANDER, CHARLES P. The crane-flies. (Family Tipulidae, order Diptera). In: The African Republic of Liberia and the Belgian Congo, based on the observations made and material collected during the Harvard African Expedition 1926-27. Vol. 2. (*Contr. Dept. Trop. Med. & Inst. Trop. Biol. & Med.* no. 5) Part 3. XXXII: Entomology. p. 1004-1021. 2 fig. Harvard Univ. Press: Cambridge, 1930.—The author reports on about 31 forms collected by J. Bequaert in Liberia and the Belgian Congo, giving synonymies, distributional records, and taxonomic remarks. *Tipula* speiseriana ♂ (p. 1004) and *Nephrotoma* tumidiverticalis ♂ (p. 1006), Belgian Congo; *Limonia* rhizosema Speiser (=*L. rhanthisa* Speiser); *L.* subapicalis (*Libnotes capensis* Alex., not *Limonia c.* Macq.) (p. 1007); *Limonia* (*Limonia*) firestonei* ♂ (p. 1007) and *L.* (*L.*) bequaerti* ♀ (p. 1008), Liberia; PROTORIMARGA (p. 1010), near *Orimarga* and *Diotrepha*, type *P.* bequaertiana* ♂ (p. 1011), Liberia; a key is given to the 3 genera of the subtribe Orimargaria; *Eriocera* monroviae* (p. 1012), Liberia; a key is given to the Ethiopian spp. of *Eriocera; Clydonodozus* schoutedeni ♂ (p. 1014), Belgian Congo; a key is given to the Ethiopian spp. of *Clydonodozus; Trentepohlia speiseri* ssp. africana ♀ (p. 1016), Sierra Leone to Uganda; *Gonomyia* (*Gonomyia*) liberiensis (p. 1016), Liberia; a key is given to the 3 spp. of *Podoneura; P.* bequaertiana* ♂ (p. 1018), Belgian Congo; *Teucholabis nodipes* ssp. praescutellaris* (p. 1019), Liberia; a key is given to the African spp. of *Teucholabis* and *Ceratocheilus; Styringomyia* liberiensis* (p. 1020) and *S.* dendroides* (p. 1021), Liberia. Types in author's coll.

5672. ALEXANDER, CHARLES P. New or little-known Tipulidae from eastern Asia (Diptera), VII. *Philippine Jour. Sci.* 42(4): 507-534. 2 pl. 1930.—The present paper is based on material from Japan, Formosa, and China. Lists are given in full of spp. of Tipulidae taken by Prof. Issiki on Mount Kirishima, Yakushima Is., and on Arisan, Formosa. Types of new spp. are in author's coll. *Tipula* latiligula* ♂ (p. 509), Honshiu; *Limonia* (*Dicranomyia*) kansuensis* ♂ (p. 510), Kansu, China; *L.* (*L.*) yakushimensis* ♂ (p. 511) and *L.* (*L.*) tristina ♀ (p. 512), Japan (Kiushiu); *L.* (*L.*) unicinctifera* (p. 513), Szechwan, China; *Helius* (*Helius*) costofimbriatus* (p. 514), Japan (Loochoo Is.); *H.* (*H.*) pallidissimus* ♀ (p. 515), Szechwan; *Antocha* (*A.*) subconfluenta* ♂ (p. 516), Japan (Kiushiu); *Orimarga* cruciformis* (p. 517), Szechwan; *O.* yakushimana* (p. 517), Japan (Kiushiu); *O.* omeina* (p. 518) and *O.* seticosta* (p. 519), Szechwan; *Dicranota gibbera* ssp. karafutonis* ♂ (p. 520), Japan (Karafuto); *Dactylolabis longicauda* ssp. megastylata ♂ (p. 521), Japan (Kiushiu); *Limnophila* (*Dicranophragma*) dorsolineata* ♂ (p. 521), Formosa; *L.* (*Prionolabis*) lipophleps* (p. 522), *L.* (*P.*) liponeura* (p. 523), and *L.* (*Tricholimnophila*) satsumicola (p. 524), all 3 Japan (Kiushiu); *L. platystyla* ssp. parallela (p. 524) and *Atarba* (*Atarbodes*) issikiana* (p. 525), Formosa; *Atarba,* key to Japanese and Formosan spp.; *A.* (*A.*) minuticornis ♂ (p. 526) and *Elephantomyia* (*E.*) dietziana (p. 527), Japan (Kiushiu); *Gonomyia* (*Progonomyia*) perturbata* ♂ (p. 528) and *G.* (*G.*) omeiensis* (p. 529), Szechwan; *G.* (*Lipophleps*) quadrifila* ♂ (p. 530), Japan (Kiushiu); *Erioptera* (*E.*) luteicornis* (p. 531), Szechwan; *E.* (*E.*) himalayae* ♂ (p. 532), eastern Himalayas; *Molophilus* aricola (p. 533), Formosa.

5673. ALEXANDER, CHARLES P. Observations on the dipterous family Tanyderidae. *Proc. Linn. Soc. N. S. Wales* 55(3): 221-230. 2 pl., 1 fig. 1930.—The author gives a preliminary description of the immature stages of the Tanyderidae, this being the sole remaining family of lower Orthorhapha the larva of which had baffled discovery to the present time. The description is based upon specimens of *Protoplasa fitchii** from Quebec. A key is given to the larvae of families of orthorhaphous Diptera, and to the pupae of several families allied to the Tanyderidae. *Radinoderus* dorrigensis* ♀ (p. 228), N. S. Wales, type in author's coll.

5674. BEQUAERT, M., et P. WALRAVENS. Phlébotomes du Katanga [Belgian Congo]. *Rev. Zool. et Bot. Africaines* 19(1): 34-42. 9 fig. 1930.—Among a series of phlebotomes collected in 1925 and 1926 at Elisabethville were: *Phlebotomus* katangensis* (p. 35), *P. africanus* v. congolensis* (p. 38), and *P. ingrami** Newst.

5675. CURRY, DALFRES P. Anopheles (Anopheles) neomaculipalpus. A new species of the Arribalzagaia group of Anopheles from Panama. *Amer. Jour. Hyg.* 13(2): 643-647. 1 fig. 1931.—Larvae of *A.* neomaculipalpus* (p. 645), type in Gorgas Memorial Lab., Panama, have been taken in considerable numbers from water in cattle tracks exposed to the sun in low-lying marshy pastures, on the Atlantic side of the Isthmus near Gatun and on the Pacific side in the flat coastal savannas east of Panama City. A key is given to the Panama spp. of the *Arribalzagaia* group of *Anopheles.*

5676. CURRY, D. P. Recognition of Anopheles argyritarsis by the characteristics of the male genitalia. *Amer. Jour. Hyg.* 13(2): 648. 1931.

5677. DAVIS, NELSON C. A new anopheline mosquito from Pará, Brazil. *Amer. Jour. Hyg.* 13(1): 345-348. 2 pl. (col.) 1931.—*Anopheles* shannoni* ♀ (p. 345), type in U. S. Nat. Mus.

5678. DUBOVSKY, N. Über die systematische Stellung von Aëdes (Ochlerotatus) behningi Martini. *Zool. Anz.* 86(7/8): 179-184. 1 fig. 1930.—The ♂ of this sp.*, previously unknown, is described from Russia. The sp. proves to be distinct, though close to *A. excrucians* and *A. fitchii.*

5679. EDWARDS, F. W. Some Nematocerous Diptera from Yunnan and Tibet. *Ann. and Mag. Nat. Hist.* 1(6): 681-703. 1 pl. 1928.—This paper is based on material of Nematocerous Diptera in the British Mus. collections from Tibet and from high altitudes in adjacent territories. Scandinavian spp. were found on Mt. Everest at a height of 17,000 ft. Up to 10,000 or 12,000 ft., the fauna seems to be almost purely oriental in type but above this altitude there is a definite admixture of Palaearctic spp. *Penthetria* pilosa ♀ (p. 683), Tibet; *Tipula* gregoryi* ♀ (p. 684), Yunnan; *T.* waltoni* ♀ (p. 685) and *T.* hobsoni ♀ (p. 685), Tibet; *T. thibetana**, notes; *T.* wardi* ♂ (p. 686), Tibet; *T. griseipennis* Brun. var., described but not named; *T.* bodpa* (p. 688), Tibet, *T.* trilobata* ♂ (p. 688) and *T.* subscripta ♂ (p. 689), Yunnan, *T.* avicularia ♂ (p. 689), Tibet and Sikkim; *T.* pleuracantha* ♂ (p. 690), Sikkim; *T.* scandens ♀ (p. 691), Tibet; *T.* tardigrada (p. 691), Yunnan; *T. nigroapicalis,* note; *T.* tetragramma* ♂ (p. 292), Yunnan; *T.* cruciata* (p. 693), Tibet and Sikkim; *T.* leucosema* ♀ (p. 694), *T.* yunnanica* (p. 695), *T.* brunnirostris* ♂ (p. 696), and *T.* atuntzuensis ♀ (p. 696), all 4 Yunnan; *T.* chumbiensis ♂ (p. 697), Tibet; *T. continuata,* emended description, *T.* xanthopleura* (p. 698), Tibet, Kumaon, and Sikkim; *T.* hingstoni ♀ (p. 699), *Nephrotoma* nigrohalterata ♀ (p. 700), *N.* distans ♂ (p. 700), and *Cylindrotoma* rufescens ♂ (p. 700), all 4 Tibet; *Limonia* yunnanica* (p. 701), Yunnan, *L. kashmirica** note; *Dicranomyia* baileyi* ♀ (p. 702), Tibet; *Neolimnophila* fuscinervis* ♀ (p. 702), Yunnan; *Rhaphidolabis* punctipennis* ♂ (p. 703).

5680. ENDERLEIN, GÜNTHER. Entomologica Canaria. VII. *Zool. Anz.* 92(1/2): 41-56. 12 fig. 1930.—Diptera: PAMPHAGOPHAGA (Tachinidae) (p. 42), near *Acemyia,* type *P.* gomerana (p. 43), on *Acrostira bellamyi; P.* acuminata (*Masicera a.* Becker) (p. 42); *Platystoma* euphorbiinum (p. 44), feeding on *Euphorbia canariensis; Alliophleps elliptica,* development described;

Acrostira, emended diagnosis. Orthoptera: *Arminda* **hierroënsis*** (p. 55); *A.* **latifrons*** ♀ (p. 56). There are descriptive and distributional notes on some previously known spp. All forms are from the Canary Is.

5681. FERRIS, G. F. Some African Diptera Pupipara. *Parasitology* 22(3): 275-282. 6 fig. 1930.—The author questions the distinctness of *Pseudornithomyia* Lutz, Neiva and Costa Lima, from *Ornithomyia* Latr. *O.* **inocellata*** (p. 275), Transvaal, host *Petrochelidon spilodera; Echestypus paradoxus*, emended description; *Raymondia pagodarum**, emended description, with records from *Hipposideros ruber*, Uganda, and from an undetermined host, China; *R.* **bedfordi*** (p. 281), South West Africa, host *Nycteris damarensis*, type in Stanford Univ. coll.; *Nycteribosca kollari*, recorded from *Rhinolophus mehelyi*, Italy, and from *R. geoffroyi*, Transvaal.

5682. HARDY, G. H. Australian Empididae. *Australian Zool.* 6(3): 237-250. 1930.—This is a general review of Australian forms, with some references to those of New Zealand. Marked affinity with this country and with South America is evident in the family. Keys to subfamilies, genera, and some of the spp. are provided. Chief attention is given to genera and higher groups. *Hilara certa* Walker (=*H. efficiens* White); *H. confirmata* Walker (=*H. nimia* White); *Hilarempis* Bezzi (=*Hilaropus* White); *Ceratomerus* **albistilus** ♀ (p. 246), *C.* **tuberculus** ♂ (p. 247), and *C.* **inflexus** (p. 247), Tasmania; *C.* **ordinarius** ♂ [in key, p. 245; but *ordinatus* in description, p. 247], Tasmania.

5683. HENDEL, FR. Entomologische Ergebnisse der schwedischen Kamtchatka-Expedition 1920-1922. 28. Diptera Brachycera 2. Fam. Cordyluridae und Dryomyzidae. *Arkiv Zool.* [*Stockholm*] 21A(3, paper 18): 1-12. 1930.—(Cordyluridae) An annotated list of 18 spp. Excepting the new spp. here described, most are palaearctic; a few are nearctic, and several holarctic. *Norelliosoma* **septentrionale** ♂ (p. 2); *Cordylura* **latigenis** (p. 3); *C.* **apicata** ♀ (p. 4); *C.* **nigrithorax** (p. 5); genus *Parallelomma* Becker, reduced to subgeneric rank under *Cordylura; C.* (*Parallelomma*) **ochracea** ♀ (p. 6); *Gonatherus* **fumipennis** ♀ (p. 7); *Orthochaeta* **fuscipennis** ♂ (p. 8); *Amaurosoma* **kamtschatkense** (p. 9); *A. k.* var. **variofemoratum** (p. 10); *A.* **carbonarium** (p. 11). Types in Stockholm Mus. (Dryomyzidae) 1 sp. is listed.

5684. KEILIN, D., and P. TATE. On certain semi-carnivorous anthomyid larvae. *Parasitology* 22(2): 168-181. 1 pl. 5 fig. 1930.—The larvae studied are *Ophyra leucostoma, Polietes albolineata, P. lardaria, Mesembrina meridiana*, and *M. mystacea*. In all these larvae the bucco-pharyngeal armature consists of a strong basal sclerite, a strong intermediate sclerite, and oral sclerites consisting of a pair of lateral hooks, of unequal length in all except *M. meridiana*, a median ventral arc, a pair of oral bars, and an anterior ribbon. This type of armature is found in carnivorous cyclorhaphous dipterous larvae, but the presence of longitudinal pharyngeal ridges in the above larvae indicates that they are semi-carnivorous or omnivorous. This is in agreement with previous knowledge of the biology of all the larvae, except *M. meridiana* which has been observed only as a pure coprophage.—*P. Tate.*

5685. KRÖBER, O. Die Tabanidensubfamilie Silviinae der neotropischen Region. *Zool. Anz.* 88(9/10): 225-239. 11 fig. 1930.—There are keys to tribes, genera, and some of the 10 spp. discussed. There is a description, a statement of distribution, and (with one exception) a figure of each sp. *Dasyapha annulicornis* (Phil.) (=*Tabanus rubricornis* Phil.); *Veprius* **rubricornis*** ♂ (p. 236), Chile, type in Vienna; **HEMICHRYOPS** (p. 237), erected for *H.* **fascipennis*** (p. 237), Colombia and Costa Rica, type in London; **HISTRIOSILVIUS** (p. 238), erected for *H.* **longipalpis** (*Pangonia l.* Macq.) (p. 238).

5686. KRÖBER, O. Die Pityocerini (Tabanidae) der neotropischen Region. *Zool. Anz.* 88(11/12): 305-312. 5 fig. 1930.—There is a key to 3 genera of this tribe, including **PSEUDELAPHELLA** (p. 305), near *Elaphella*, erected for *P.* **nana*** (*Pangonia n.* Wlk.) (p. 306) and *P.* **patellicornis*** (p. 307), Matto Grosso, Brazil, type in London. There are also synonymies and descriptions of *Elaphella cervus** and *Pityocera festae**.

5687. KRÖBER, O. Die Dipterenausbeute der Sunda-Expedition Rensch. Beitrag II: Therevidae und Conopidae. *Zool. Anz.* 89(3/4): 65-73. 7 fig. 1930.—The author lists 8 Therevidae and 12 Conopidae previously known from the Sunda Is., mentioning those represented in the present collection and describing certain new spp. Conopidae: *Physocephala* **renschi*** ♀ (p. 67); *Conops* **rubripes*** ♀ (p. 68); *C.* **rufitarsis*** ♂ (p. 69); *C.* **inconspicuus*** ♀ (p. 70); *C.* **microvalvus*** ♀ (p. 71), Java; *Pleurocerinella* **violacea*** ♂ (p. 72).

5688. KRÖBER, O. Neue Tabaniden und Zusätze zu bereits beschriebenen. *Zool. Anz.* 90(3/4): 69-86. 21 fig. 1930.—*Chrysops* **semiignitus*** ♀ (p. 69), Szechuan, type in Dresden; *C.* **engeli*** ♀ (p. 70), Mexico, type in Munich; *C.* **auroguttatus*** ♀ (p. 71), Colombia and Trinidad, type in London; *C. a.* var. **pallidefemoratus*** ♀ (p. 72), Trinidad, type in London; *Diachlorus* **angustifrons*** ♀ (p. 74), Bahia, type in London; *D.* **nigrithorax*** ♀ (p. 74), British Guiana, type in London; *Spheciogaster* **albomarginatus*** ♀ (p. 76), Colombia, type in London; *Bolbodimyia* **lateralis** ♂ (p. 77), Argentina, type in Stuttgart; *Stenotabanus* **brunnipennis*** ♀ (p. 78), Uruguay, type in Tropenhygien. Inst., Hamburg; *Acanthocera* **formosa** ♀ (p. 79), Peru, type in Halle; *Pseudacanthocera* **fraterna** ♀ (p. 80), Paraguay, type in Budapest; *P.* (?) **minuscula*** ♀ (p. 80), Mexico, type in Munich; *Phaeotabanus* **intermedius** ♀ (p. 81), Costa Rica, type in Budapest; *Lophotabanus* **communis** ♀ (p. 83), Dutch Guiana, *L.* **macquarti** ♀ (p. 83), Venezuela, and *L.* **albopruinosus** ♀ (p. 85), Brazil, types of all 3 in Vienna. Emended descriptions of *Chrysops tanyceras, Balbodimyia erythrocephala, Lophotabanus flavibarbis*, and *L. lividus*. *Tabanus ocellus* Wlk. is an artifact. *Diachlorus ferrugatus* F. (=*Tabanus rondanii* Bell.).

5689. LENGERSDORF, FR. Les Sciarides (Lycoriidae) de la collection de J. W. Meigen. *Encyclop. Ent. Ser. B. Diptera* 5: 55-61. 2 fig. 1929.—The writer has re-examined a number of Meigen's types in the Mus. Nation. Hist. Nat., Paris. The collection contains 2 specimens labeled *Sciara annulata* Meig., one =*S. autumnalis* Winn. and the other *S. ornata* Winn., and the writer inferentially establishes the synonymy as *Sciara brunnipes* v. *annulata* Meig. (=*S. autumnalis* Winn., *S. hyalinipennis* Meig.); *S. bicolor** Meig. (=*S. rufiventris* Macq.); *S. morio* Meig. (=*S. lugubris* Winn.), synonymy based on 1 ♂, 3 ♀♀; two other ♀♀ are *annulata; S. carbonaria* Meig. (=*S. atra* Meig.); *S. nervosa* Meig. [1818, p. 282] (=*S. fucata* Meig. [1818, p. 280], *S. placida* Winn.) (p. 61); *S. longipes*, descriptive notes. Under *S. nitidicollis* are confused three spp. and the writer selects one of these as type, establishing the synonymy as *S. nitidicollis* Meig. (=*S. albicans* Winn., *S. alacris* Winn. ♂, *S. fenestrata* Meig.). A second specimen is now described as *S.* **pygmaea*** (Meigen i. litt.) (p. 60); the third specimen is perhaps *S. vivida* Winn. Under the name *S. pallipes* Fabr. are confused 3 species in the Meigen coll.; of these one may be identified as *S. solani* Winnertz (*S. nitidicollis* auct. not Meig. as now defined); a second as *S. forcipata* Winn.; the third is redescribed (p. 58) but not identified. The *S. lutea* material consists of 2 ♀♀ which may be regarded as typical and one ♂ *Phorodonta flavipes* Meig. Part of the *S. fenestrata* material equals *nitidicollis* but 1 ♂, 1 ♀ are *S. mundula*. *Sciara pusilla* Meig. (=*S. pavida* Winn.) based on the present reviser's decision; a ♀ in the series equals *S. albicans* Winn., and a ♂ belongs to *Lestremia. S. vitripennis* Meig. (=*S. hirticornis* Meig., *S. quinquelineata* Macq.), but in the *S. v.* series one is equal to *S. autumnalis* Winn. and one ♀ equal to *S. fera* Winn. *S. scatopsoides* Meig. (=*S. albicans* Winn.), although the writer thinks *scatopsoides* ought to be eliminated. Descriptive data are given on *S. aprilina* Meig. (=*S. nemoralis** Meig.), *S. minima, S. ruficauda*, and *S. nigripes** (which is close to *S. myrtilli** Winn.). *S. glabra* Meig. (=*S. splendens* Winn.); *S.*

*vittata** Meig. (=*S. opaca* Winn.), redefined; *S. praecox* Meig. (=*S. simplex* Winn.), redefined.

5690. **MALLOCH, J. R. Exotic Muscaridae (Diptera). 30.** *Ann. and Mag. Nat. Hist.* 6(33): 321-334. 3 fig. 1930.—*Sigaloessa* **insularis*** ♂ (p. 321), Society Is.; *S. melbournensis* Malloch, transferred to *Astiosoma; Asteia* **striatifrons** ♂ (p. 323), Peru; *Cyrtonotum gibbum* (Fabr.) (=*Curtonotum taeniatum* Hendel); *Cyrtonotum* **hendeli** (p. 325); *C.* **striatifrons** ♀ (p. 325); Sudan, type in Imp. Bur. Ent.; *C.* **magnum** ♀ (p. 326), Brazil; key is given to the spp. of **ANASEIOMYIA** (p. 328), (Drosophilidae) near *Cyrtonotum*, type *A.* **uniformis*** (p. 328), also *A.* **dissimilis** (p. 330), both Federated Malay States, types of both in British Mus.; *Mycodrosophila* **halterata** ♀ (p. 331), Society Is.; *Xenosina* **setipennis** ♀ (p. 332), Malay Peninsula, type in Federated Malay States Mus.; *Actia* **perdita** ♂ (p. 333), Federated Malay States, type in Brit. Mus.

5691. **MALLOCH, J. R. Ortalidae, Calliphoridae. Insects of Samoa, Part 6. Diptera.** *Fasc.* 5. 215-237. 6 fig. 1930.—The author gives distributional and taxonomic notes on 14 Ortalidae and 7 Calliphoridae, 2 of the former being recorded only from other South Sea islands than Samoa. New forms are from Samoa unless otherwise specified. Ortalidae: *Euxesta* **semifasciata*** (p. 216), Ellice Is.; **NEOEUXESTA** (p. 218), near *Euxesta*, type *N.* **fumicosta*** ♂ (p. 218); *Rivellia*, key to 4 spp.; *R.* **imitans** (p. 220); **APACTONEURA** (p. 223), resembling *Plagiostenopterina*, type *A.* **flavicornis*** ♀ (p. 223), in Bishop Mus., Honolulu; **XENOGNATHUS** (p. 225), resembling *Engistoneura*, type *X.* **bryani*** (p. 226), type in Bishop Mus.; *X.* **inermis*** (p. 228); *Plagiostenopterina* **samoaënsis** (p. 230), type in Brit. Mus. Calliphoridae: *Paurothrix* **auriceps** ♂ (p. 236), type in Hamburg State Zool. Mus.

5692. **[MUFEL, P. P.]** МУФЕЛЬ, П. П. **Anopheles bifurcatus L. в центрально-черноземной области. [A. bifurcatus in the central black soil region.]** [German summary.] Русский Журнал Тропической Медицины. [*Russ. Jour. Trop. Med.*] 7(1): 56-57. 1929.—29 ♀♀ and 26 ♂♂ were collected, the first record of this sp. from the Government of Voronezh.—*B. Van Rosen.*

5693. **ORLOWA, A. A., und S. D. SCHACHOW. Culicidae und Phlebotominae des Bezirkes Kaarry-Kala in Turkmenien.** *Arch. Schiffs- u. Tropen-Hyg.* 34(11): 593-608. 12 fig. 1930.—A survey indicating relation of local topography to distribution, enumerating 6 spp. of Culicidae and 6 of the Phlebotominae, found in this region, and describing some anomalies of the sexual organs in the Phlebotomi.

5694. **RINGDAHL, O. Entomologische Ergebnisse der schwedischen Kamtchatka-Expedition 1920-1922. 30. Diptera Brachycera 3. Fam. Muscidae.** *Arkiv Zool.* [*Stockholm*] 21A(3, paper 20): 1-16. 6 fig. 1930.—Of 116 spp. of Muscidae, 73 were European, 5 were hitherto known only in North America, and of the rest, 15 are new: *Phaonia* **malaisei** (p. 6), *Coenosites* **grisescens** ♀ (p. 6), *Fucellia* **kamtchatica** ♂ (p. 7), *F.* **hypopygialis** (p. 7), *Acroptena* **kamtchatica** ♂ (p. 8), *Phorbia* **subgrisea*** (p. 8), *Hylemyia* (*Euryparia*) **aculeata*** ♂ (p. 9), *H.* **angulosa** ♂ (p. 9), *H.* (*Delia*) **gracilipes** ♂ (p. 10), *H.* **simplex*** ♂ (p. 10), *H. discreta* v. **angustifrons** (p. 11), *Coenosia* **luteipes** (p. 11), *C.* **oblongolamellata** (p. 11), *C.* **griseiventris** ♂ (p. 11), and *C.* **pilipyga** ♂ (p. 13). *Alloeostylus albi-basalis* Zett., note; *Pegomyia frigida* Zett. (=[*P.*] *bivittata* Stein).

5695. **SCHMITZ, H. Pnyxia dispar n. spec. (Dipt.).** [In German & Spanish.] *Rev. Soc. Ent. Argentina* 1(4): 27-30. 3 fig. 1927.—*P.* **dispar*** (p. 27), La Plata, myrmecophile of *Acromyrmex lundi.*

5696. **THIENEMANN, AUGUST. Chironomiden-Metamorphosen 2. Die Sectio Tanytarsus genuinus.** *Arch. Hydrobiol.* 20(1): 93-123. 1 fig. 1929.—A review of the spp. of *Tanytarsus* (sens. lat.) of which larval and pupal stages are known, with keys to immature stages, and with biological and distributional data. The author recognizes 3 groups: *Eutanytarsus, Rheotanytarsus,* and *Paratanytarsus.* The larvae of the 1st group, which live in cylindrical cases in quiet waters, are usually red in color and have small, long petiolate Lauterborn organs. The anal angles of the penultimate segment in the pupa are provided with 10-20 teeth. This group includes the genera *Micropsectra, Cladotanytarsus, Goetghebueria, Lundströmia, Calopsectra, Phaenopelma, Tanytarsus, Tetratanytarsus, Xenotanytarsus, Fournieria, Clinotanytarsus,* and *Lauterbornia.* The group *Rheotanytarsus* contains but the 1 genus, the larvae of which are usually yellowish, with small, short petiolate Lauterborn organs. They live in swift water in conical cases which have 2 or more longitudinal ribs that are continued into filaments. The anal angles of the penultimate segment of the pupa are each produced into a rather strong hook. The group *Paratanytarsus* with the genera *Paratanytarsus, Stylotanytarsus,* and *Monotanytarsus* have reddish or more rarely greenish larvae which live in uncontaminated water in cylindrical cases that usually are attached to plants. The Lauterborn organs are large and sessile. The anal angles of the penultimate segment of the pupae are provided with 5-8 teeth. Of the 88 spp. of which more or less is known concerning immature stages, 72 belong to the 1st, 6 to the 2nd, and 10 to the 3rd group.—*O. A. Johannsen.*

HEMIPTERA AND HOMOPTERA

GENERAL

5697. **WEBER, HERMANN. Biologie der Hemipteren. Eine Naturgeschichte der Schnabelkerfe.** (*Vol. 11 of "Biologische Studienbücher."*) 543p. 329 fig. Julius Springer: Berlin, 1930. Pr. 44 M.—This book deals chiefly with the morphology, biology, and ecology of the Hemiptera and Homoptera. A list of hemipterous families mentions the characters for each. The order Hemiptera is regarded as a super-order divided into the orders Heteroptera and Homoptera. The Heteroptera is divided into suborder Geocorisae containing 24 families, and suborder Hydrocorisae with 8 families. The order Homoptera is divided into 5 suborders as follows: (1) Cicadina with families Fulgoridae, Cercopidae, Cicadidae, Jassidae, and Membracidae; (2) Psyllina; (3) Aleurodina; (4) Aphidina with families Aphididae, Phemphigidae, Chermesidae, and Phylloxeridae; (5) Coccidae. While these names are not new they are employed in an unusual category. The author considers with much detail the morphology of special structures and modifications in Hemiptera and Homoptera. The subjects dealt with are: (A) Movement as a mechanical phenomena; nervous system and sense organs; (B) methods of taking food; secretions, respiration; and circulation of blood; (C) genital organs, structure and function; development and metamorphosis; also pigmentation; (D) ecological relationships and geographical distribution; (E) relationships between Hemiptera and other animals; symbiosis and parasitism; relationship to plants; galls. A bibliography and index complete the volume.—*H. H. Knight.*

HEMIPTERA

5698. **CHINA, W. E. A new genus and two new species of Plataspidae (Hemiptera).** *Ann. and Mag. Nat. Hist.* 7(42): 574-578. 2 fig. 1931.—A large collection of

Hemiptera from Sikkim (north India) contained: **ERYTHROSOMASPIS** (p. 574), near *Coptosoma*, type *E.* **stevensi*** ♂ (p. 575); *Coptosoma* **sikkimensis** ♀* (p. 576).

5699. **CHINA, W. E.** Heteroptera. In: Insects of Samoa. Part 2: Hemiptera. Fasc. 3. pp. 81-162. 28 fig. *Brit. Mus.* (*Nat. Hist.*): London, 1930.—The known Samoan heteropterous fauna (apart from Miridae) includes 70 spp. in 51 genera, 60 spp. of which are treated in this paper. The distribution is given by islands in Samoa, and elsewhere, and is compared by families with Fiji. The distribution of Samoan genera is shown by a table to be world-wide. The systematic list includes synonymies, distributional records, and notes on taxonomy and habits. *Glaucias* **samoanus*** (p. 93); *Riptortus* **insularis*** ♂ (p. 97) and var. **obscurus** ♀ (p. 100); *R. tutuilensis** ♀; **CHIASTOPLONIA** (p. 104) (Dysodiidae), near *Mezira*, type *C.* **pygmaea*** ♂ (p. 104), in rotten bark of *Hibiscus tiliaceus; Pictinus* **pacificus*** (p. 106); *Ctenoneurus* **samoanus*** ♂ (p. 108); *Carventus* **kirkaldyi*** ♀ (p. 109); *Protacanthus* Uhler (=*Auchenoplus* Bergr.); *P.* **pacificus*** (p. 111), Fiji (type) and Samoa; *P.* **bihamatus** (*Metacanthus b.* Dist.) (p. 112); *Melanerythrus* Stål, distinct genus; *Nesostethus* Kirkaldy, raised from subgeneric to generic rank (p. 115); *N.* **niger*** ♀ (p. 113); *Graptostethus* **nigriceps** (*G. servus* var. *n.* Stål) (p. 115); *Nysius* (*Nysius*) **pacificus*** ♀ (p. 116), New Hebrides (type) and Samoa; *Germalus* **samoanus*** (p. 118); *G.* **buxtoni*** (p. 122); **NEOCROMPUS** (p. 125) (Lygaeidae), near *Crompus* and *Ischnorhynchus*, type *N.* **kellersi*** (p. 126); *Reclada moesta* B. White (=*Clerada minuta* China); *Orthaea* **ventralis*** (p. 130); *O.* **puberula*** (p. 133); **BRYANELLA** (p. 135), (Lygaeidae), near *Ozophora*, type *B.* **longicornis*** (p. 136); *Cligenes* **swezeyi*** ♀ (p. 138) and ssp. **major** ♀ (p. 139); **IDIOCYSTA** (p. 141) (Tingitidae), near *Physatocheila*, type *I.* **hackeri*** (p. 142); *Gardena* **geniculata*** ♀ (p. 143); *Luteva insolida** B. White (=*Ploiaria collenetti* Cheesman), redescribed; **DICTYNNA** (p. 150), **n. subg.** of *Empicoris*, type *E.* (*D.*) **nitidicollis*** ♀ (p. 148); *Polytoxus* **similis*** (p. 151); *Sastrapada* **hopkinsi*** (p. 153); *Arbela costalis* **v. flavicollis** (p. 156); *Reduviolus* **annulipes*** (p. 157). New forms are from Samoa, unless otherwise stated. The following spp. are new to Samoa: *Brachyplatys pacificus, Geotomus pygmaeus, Coleotichus sordidus, Cantheconidea cyanacantha, Platynopus melacanthus,* on caterpillars of *Atella exulans, Pegala biguttula, Piezodorus rubrofasciatus, Leptoglossus australis, Leptocorisa varicornis, Melanacanthus margineguttatus, Leptocoris insularis, Mezira membranacea, Pyrrhobaphus leucurus, Graptostethus nigriceps, Orthaea pacifica, O. nigriceps, O. nietneri, Aphanus insularis, Dysdercus insularis, D. impictiventris, Gardena pacifica, Luteva insolida, L. subaequalis, Empicoris rubromaculatus, Oncocephalus pacificus, Peregrinator biannulipes, Arbela costalis, Reduviolus capsiformis,* and *Cimex hemipterus.* Altitude records are given for many spp.

5700. **DRAKE, CARL J.** Two new species of Tigava from South America (Hemiptera-Tingitidae). *Proc. Hawaiian Ent. Soc.* 7(3): 405-406. 1931.—*T.* **semota** ♂ (p. 405) and *T.* **bondari** (p. 405), Brazil. Types in author's coll.—*O. H. Swezey.*

5701. **EVANS, J. W.** A new species of Nysius (Hem., Lygaeidae) from Australia. *Bull. Ent. Res.* [*London*] 19(4): 351-354. 3 fig. 1929.—*Nysius* **clevelandensis*** (p. 351), Queensland, on *Sonchus oleraceus, Gnaphalium purpureum,* and *Erigeron linifolius,* type in Brit. Mus.; *N. vinitor**, redescribed. The author states that the subgenera of *Nysius* may be regarded as valid genera, and treats them as such in a "key to genera included under *Nysius* auctt." Described in the key are: **HUDSONA,** type *Nysius anceps* B. W. (p. 353); **MYERSIA,** type *Nysius clavicornis* F. (p. 353).

5702. **ILLINGWORTH, J. F.** Notes on some bugs associated with pineapples in Hawaii. *Proc. Hawaiian Ent. Soc.* 7(3): 465-467. 1931.—*Leucopoecila albofasciata,* an introduced sp., breeds in purslane and nightshade, and under certain circumstances will oviposit in the tender pineapple leaves; *Pycnoderes 4-maculatus,* a newcomer, has been found on purslane in the pineapple fields; *Triphleps persequens* oviposits in the leaves of purslane and is a valuable predator on aphids and thrips.

5703. **[KIRICHENKO, A. N.]** КИРИЧЕНКО, А. Н. Водные полужесткокрылые (Hemiptera: Hydrobiotica и Sandaliorhyncha), собранные Д. А. Тарноградским в с. -з. Персии и на Кавказе. [Aquatic Hemiptera-Heteroptera collected by Tarnogradsky in northwestern Persia and in the Caucasus.] [German summary.] Работы Северо-Кавказской Гидробиологической Станции. (*Trav. Sta. Biol. Caucase du Nord.*) 3(1/3): 45-62. Map. 1930.—The author lists 11 spp. from Persia and 25 spp. from North Caucasus, with locality and date records. *Microvelia reticulata* and *Micronecta minutissima* are new to the Caucasus. Study of *Notonecta* material in various collections shows the following distribution of the 4 recognized spp. of the eastern Palaearctic: *N. maculata,* E. and SE. Persia; *N. marmorea,* southern Russia to Persia and Turkestan; *N. glauca,* N. and S. Russia to Siberia, Mongolia, and Chinese Turkestan; *N. obliqua,* S. Russia to Turkestan. There is also a supplement to that part of the author's "Hemiptera-Heteroptera Faunae Caucasicae, I" (1918) which deals with aquatic Hemiptera.—*From author's summary.*

5704. **NIÑO, FLAVIO L.** Breves noticias sobre el Triatoma infestans en la República Argentina. *Rev. Soc. Ent. Argentina* 1(4): 55-64. Map, 2 pl., 1 fig. 1927.—Description and figures of eggs, larvae, nymphs, and adults of this blood-sucking sp., with notes on life history and habits in captivity. A distributional map is given.

5705. **SCHOUTEDEN, H.** Un genre nouveau d'Etrichodien du Congo. *Rev. Zool et Bot. Africaines* 20(2): 207-208. 1931.—**OKONDO** (p. 207), near *Katanga* and *Afrocastra,* type *O.* **collarti** (p. 207), Belgian Congo.

5706. **WALLEY, G. STUART.** A review of the genus Palmacorixa Abbott (Hemip., Corixidae). *Canadian Ent.* 62(5): 99-106. 2 pl. 1930.—The genus, type *P. gillettii** Abb., is re-defined, original description is quoted, and a key to the spp., based on ♂♂, is given. *P. gillettii* **v. confluens*** (p. 103), and *P.* **nana*** (p. 106), Quebec, types in Canadian Nat. Coll. *P. gillettii, P. bueoni,* and *P. mexicana* are discussed.

HOMOPTERA

5707. **BLÖTE, H. C.** Nieuwe Naamlijst van Nederlandsche Jassidae. [New name-list for the Jassidae of the Netherlands.] *Tijdschr. voor Ent.* 70(3/4): 210-231. 1927.—These number 161; the total of all other Homoptera known to the country is 459, of which 221 are Cicadariae, 31 Psyllidae, 3 Aleurodidae, 166 Aphidoidea, and 38 Coccidae.

5708. **BUEKER, ELMER D.** Two new mealy-bugs (Coccidae) in nests of ants (Lasius). *Amer. Mus. Novitates* No. 453. 1-3. 8 fig. 1931.—*Cryptoripersia* **leucocystis*** (p. 1) and *Trionymus* **interjecti*** (p. 3), Colorado.

5709. **DELONG, DWIGHT M.** A new species of bean leaf-hopper from Haiti. *Canadian Ent.* 62(4): 92-93. 1 fig. 1930.—*Empoasca* **fabalis*** (p. 92).

5710. **FROGGATT, WALTER W.** Notes on gall-making coccids with descriptions of new species. II. *Proc. Linnean Soc. N. S. Wales* 55(4): 468-474. 2 pl. 1930.—*Apiomorpha* **dumosa** (p. 468), Victoria on *Eucalyptus* sp.; *A.* **longmani*** (p. 469), *A.* **annulata*** (p. 469), and *A.* **fusiformis*** ♀ (p. 470), all 3 Queensland, on *Eucalyptus* sp., and types in Queensland Mus.; *A.* **spinifer** ♀ (p. 470), Queensland, on *Eucalyptus* sp. The galls of a number of previously known spp. of *Apiomorpha* are described and recorded from various spp. of *Eucalyptus.*

5711. **GILLETTE, C. P., and M. A. PALMER.** Notes on Colorado Aphididae. *Ann. Ent. Soc. Amer.* 21(1): 1-24. 4 pl. 1928.—*Macrosiphum* **longipes*** (p. 1) on *Artemisia tridentata; M.* **glabrum*** (p. 2) on *Artemisia dracunculoides; Macrosiphoniella* **frigidicola*** (p. 3) on *A. frigida, A. abrotanum,* and *Eurotia* [*Eurotium?*]

lanatum; Macrosiphum **filifoliae*** (p. 5) on *A. filifolia* and *A. vulgaris; M.* **jonesii** (p. 7) on *A. cana; Anuraphis* **minutissima*** (p. 8) on *A. filifolia; A.* **filifoliae*** (p. 9) on *A. filifolia; Chaitophorus* **populella*** (p. 15) from *Populus* spp.; *Myzus* **alpinus*** (p. 18) on *Pedicularis bracteosa.* The new name **essigi** (p. 18) is proposed for *Eichochaitophorus populifolii* Essig preocc. Critical notes, based on examination of type slides, are given for: *Anuraphis canae* A. hermistonii, A. oregonensis*, Aphis artemisicola.* There are also notes on *Macrosiphum valerianae*.*

5712. **GREEN, E. ERNEST.** Two new mealy bugs from India. *Ann. and Mag. Nat. Hist.* 7(42): 557-560. 2 fig. 1931.—*Ripersia* **oryzae*** (p. 557), Madras, on rice-plants and various wild grasses and sedges; *Rhiziecus* **cynodontis*** (p. 559), at the roots of *Cynodon dactylon.*

5713. **GREEN, E. ERNEST.** Fauna Sumatrensis. (Bijdrage Nr. 65.) Coccidae. [In English.] *Tijdschr. voor Ent.* 73(3/4): 279-297. 10 fig. 1930.—The present paper is based on collections made by Edward Jacobson in Sumatra, 1923-1927. Only 6 spp. of Coccidae have been previously reported from this region. The present collection contains 23 spp., listed here, and including: *Drosicha* **sumatrensis*** (p. 281); *Icerya* (*Crypticerya*) **nuda*** (p. 282), on *Gigantochloa aspera; Pseudococcus* **jacobsoni*** (p. 284), on *Ficus retusa; Lecanium* **bambusicola*** (p. 285), on *Bambusa nana; L.* (*Saissetia*) **crassum*** (p. 287), on *Broussonetia papyrifera,* and from India on *Ficus religiosa* and *Psidium guyava; Ctenochiton* **formicophilus*** (p. 288), in nests of ant *Dolichoderus carbonarius-latisquama* associated with *Ctenochiton inclusus* and *Anomalococcus multipori; C.* **inclusus*** (p. 289), in nests of ants associated with *C. formicophilus* and *Anomalococcus multipori; Vinsonia* **magnifica*** (p. 290), on *Mangifera odorata* and *Eugenia malaccensis; Aulacaspis* **sumatrensis*** (p. 292), on *Mangifera odorata.* Types in author's coll.

5714. **KUSNEZOV, VICTOR.** Asiatische Penthimia-Arten. *Ent. Nachrichtenbl.* 5(1): 8-12. 1931.—*Penthimia nigra* v. **caucasica** (p. 10), Caucasus; *P.* **nana** ♂ (p. 12), Amur [Siberia].

5715. **KUWANA, INOKICHI.** The diaspine Coccidae of Japan, VI. Genus Phenacaspis. *Min. Agric. & Forestry Japan Sci. Bull.* 2. 1-14. 3 pl. 1931.—Includes a key to the 6 spp. described, with *Phenacapsis* **quercus*** (p. 6) on *Quercus myrsinaefolia,* Yokohama; *P.* **fujicola*** (p. 8) on leaves of *Wistaria chinensis* v. *multiguga,* Angyo; *P.* **momi*** (p. 9), on leaves of *Abies firma,* Mt. Hakko, Shiznoka-ken; *P.* **kentiae*** (p. 10) on *Kentia* and other green house plants, Yamamoto.

5716. **LAING, F.** An interesting aphid and coccid from the Argentine Republic. *Rev. Soc. Ent. Argentina* 1(4): 23-26. 2 fig. 1927.—*Myzocallis* **edwardsi*** ♀ (p. 23), on *Nothofagus* sp.; *Fagisuga triloba*,* emended description.

5717. **LALLEMAND, V.** Homoptères nouveaux de la Somalie Italienne méridionale. *Boll. Soc. Ent. Ital.* 62 (10): 185-187. 1930.—*Hilda* **paolii** (p. 185), on *Abutilon; Sepullia* **somalica** (p. 186), on *Abutilon asiaticum* and on cotton.

5718. **LALLEMAND, V.** Decription de trois nouveaux Homoptères Congolais. *Rev. Zool. et Bot. Africaines* 20 (3): 302-304. 1931.—**LEPTOFLATA** (p. 302) (Flatidae), near *Flatamorpha* and *Sanurus,* type *L.* **seydeli** (p. 302), type Congo Mus.; *Ricania* **lujai** (p. 303) and *R.* **burgeoni** (p. 303), both in author's coll. All 3 from Belgian Congo.

5719. **MUIR, F.** New and little-known Fulgoroidea in the British Museum (Homoptera). *Ann. and Mag. Nat. Hist.* 7(40): 297-314. 11 fig. 1931.—Types of the following spp. are in Brit. Mus. Tropiduchidae: *Daradax* **grandis*** ♀ (p. 297), Siam; *Mulucha* **variegata** ♀ (p. 298), Gold Coast; *Numicia* **viridis** (p. 299), Natal, and var. **infuscata** (p. 299); *N.* **nitida*** (p. 300), Uganda; **CATULLIARIA** (p. 300), type *C.* **njalae*** (p. 300), Sierra Leone; *C.* **ugandae*** (p. 301), Uganda; **AMACLARDEA** (p. 301), near *Amapala* and *Clardea,* type *A.* **gowdeyi** ♀ (p. 302), Jamaica; *Neotangia* **munda** ♂ (p. 302), Brit. Guiana; *N.* **emarginata** (*Dictyophara e.* Uhler) (p. 303); *Tambinia* **zonata** ♀ (p. 303), Madras Presidency; **PARAGARUMNA** (p. 303), type *P.* **pseudolepida*** ♀ (p. 304), Siam.; *P.* **melichari** (*Garumna m.* Baker) (p. 305); *Tangidia* **uhleri** (p. 305), Grenada; *Rotunosa* **intermedia** ♂ (p. 306), Honduras; *Neommatissus* **bakeri** ♀ (p. 306), Philippine Is.; **STENOCONCHYOPTERA** (p. 307), related to *Conchyoptera* and *Turneriola,* type *S.* **darwini*** (p. 308); also *Turneriola* **breviceps** ♂ (p. 308), and *T.* **hirsuta** ♀ (p. 310), all 3 Cape Province; *Ommatissus* **bimaculatus** ♀ (p. 310), United Provinces. *Buca simplex** Walker is referred to the Issidae. Eurybrachidae: **MICROEURYBRACHYS** (p. 312), type *M.* **vitrifrons*** ♂ (p. 313), Pondoland.

5720. **MUIR, F.** New and little-known Fulgoroidea from South America. *Proc. Hawaiian Ent. Soc.* 7(3): 469-480. 1 pl. 1931.—*Taosa* **viridis** ♂* (p. 470), Brazil, type in Stockholm Mus.; *T.* **bimaculifrons*** (p. 470), Brazil (type) and Ecuador, and *T.* **lineatifrons** ♀* (p. 471), Brasil, types in H.S.P.A. Exp. Sta., Honolulu; *T.* **pseudoscriptiventris** (p. 472), Brazil, type in Brit. Mus.; *T.* **scriptiventris** (*Cladodiptera s.* Walker) (p. 472); *T.* **holmgreni** ♂* (p. 472), on frontier between Peru and Bolivia, east side of Andes, type in Stockholm Mus.; *T.* **viridifrons** (*Cladodiptera v.* Walker) (p. 473); *T.* **sororcula** (*Dictyophora s.* Berg) (p. 473); *T.* **rufa** ♀* (p. 473), Brazil, type in Brit. Mus.; *T.* **herbida*** (*Dichoptera h.* Walker) (p. 474); *T.* **paraherbida*** (p. 474), British Guiana, type in H.S.P.A. Exp. Sta.; **BRACHYTAOSA** (p. 474), (*Dictyophoridae*) near *Taosa,* based on *B.* **venturii** ♀* (p. 475), Argentina, type in Brit. Mus.; *Alcestis* **costalis** ♂* (p. 475) and *A.* **romani*** (p. 476), Brazil; **CARRIONIA** (p. 476), (Lophopidae) near *Jivatma,* based on *C.* **flavicollis** ♀ (p. 477), Ecuador, type in Brit. Mus.; *Hesticus* Walker is referred from Dictyophoridae to Lophopidae; *H.* **rufimanus** (*Cladodiptera r.* Walker) (p. 480); *H.* **sanguinifrons** ♀* (p. 480), Ecuador. —*O. H. Swezey.*

5721. **SCHMIDT, EDMUND.** Gynopygoplax schultzei, eine neue Cercopide von den Philippinen. (Hemipt.-Homopt.) *Ent. Rundschau* 48(6): 64. 1931.—*G.* **schultzei,** Luzon. Type in Berlin-Dahlem Mus.

5722. **SLEESMAN, J. P.** A monographic study of the North American species of Euscelis and allied genera. (Homoptera—Cicadellidae.) *Ent. Americana* [*Brooklyn*] 10(2): 87-148. 10 pl. 1929(1930).—*Drylix* **truncatus*** (p. 100), Ohio; *Ophiola* **luteola*** (p. 120), Massachusetts; **AMBLYSELLUS** (p. 131), type *A.* **curtisii*** (*Athysanus c.* Fitch) (p. 131); *Thamnotettix* **tetanus*** (*Athysanus t.* Osborn & Ball) (p. 132); *Deltocephalus* **dentatus** (*Athysanus d.* Osb. & Ball) (p. 133). Types of new spp. in De Long coll. Redescriptions and keys to the genera and spp. are given, also food habits, distribution, and ecological habitats. A detailed comparative study of the internal ♂ genitalia* is included.—*J. P. Sleesman.*

HYMENOPTERA

S. A. ROHWER, *Editor*

(See also in this issue Entries 3294, 3915, 4372, 4606, 4628, 4647, 4656, 4683, 4708, 4713, 4719, 4720, 4723, 5625, 5632, 5695, 6043, 6044, 6046, 6048)

5723. **BENOIST, R.** Une nouvelle espèce d'Osmie d'Algérie. *Ann. Soc. Ent. France* 96(3/4): 270. 1927; 97(1/2): 18. 1928.—*Osmia* **armala** (p. 270), type in Paris Mus.; *O.* **insolita** (p. 18), type in coll. J. Pérez.

5724. **BEQUAERT, J.** Podalonia violaceipennis (Lepeletier), a dimorphic fossorial wasp. (Hymenoptera.) *Bull. Brooklyn Ent. Soc.* 24 (4): 220-221. 1929.—A case of color dimorphism among the Hymenoptera.

P. luctuosa ♀ and *P. violaceipennis* ♂ were found mating. This, together with the fact that the latter was recently raised from a *P. luctuosa* parent, confirms the conjecture that *P. violaceipennis* is a dimorphic sp.

5725. BRADLEY, J. CHESTER. The species of Campsomeris (Hymenoptera-Scoliidae) of the plumipes group, inhabiting the United States, the Greater Antilles, and the Bahama Islands. *Proc. Acad. Nat. Sci., Philadelphia* 80: 313-337. 3 maps. 1 pl. 1928.—All spp. of the scoliid wasps of the subg. *Campsomeris*, with the exception of 4, are discussed: *C. plumipes* (including ssp. *fossulana* and *confluenta*), *C. tolteca*, and *C. pilipes* within the U. S. A.; *C. tolteca*, *C. dorsata*, *C. trifasciata*, and *C. t.* ssp. **nassauensis** (p. 322) (Bahamas, type in Cornell Univ.), in Central Amer. and the West Indies. These constitute what the author calls the *plumipes* group, about which there has been considerable uncertainty in regard to status and distinctions. A large amount of material from the main collections of the U. S. A., as well as from the museums of Budapest and Vienna, was studied.—*L. O. Howard.*

5726. BRÈTHES, JEAN. Hyménoptères Sud-Américains du Deutsches Entomologisches Institut: Terebrantia. *Ent. Mitteil.* 16(5): 319-335. 3 fig. 1927.—[For abstract of the first half of this paper see B. A. 3(1/3): entry 3853.] Ichneumonidae, Pimplinae, tribe Acoenitini: **LEPTOGLYPHIS** (p. 319), with *L.* **minasensis** (p. 320); **NEOGABUNIA** (p. 322) (tr. Xoridini), with *N.* **paulistana*** (p. 322). Braconidae, Coenocoelininae: **PLECTOBRACON** (p. 325), with *P.* **testaceus** (p. 326), and *P.* **minor** (p. 326). Chalcididae, Eulophinae: **PARASYMPIESIS** (p. 328), with *P.* **cecidicola** (p. 328); **TROPIMIUS** (p. 329), with *T.* **willei*** (p. 329); **IDIOBIA** (p. 330) (Miscogasterinae), with *I.* **schmidti** (p. 330), Costa Rica. Serphidae, Diapriinae: **KIEFFEROPRIA** (p. 333), with *K.* **horni** (p. 334). Other new spp. are: *Casinaria* **brasiliensis** (p. 323); *Parabatus* **neotropicus** (p. 324); *Astiphromma* **albitarse** (p. 324); *Ipobracon* **horni** (p. 327); *I.* **guaruja** (p. 327); *Bracon* **pauloënsis** (p. 328); *Bruchobius* **brasiliensis*** (p. 329); *Eucharomorpha* (?) **brasiliensis** (p. 331); *Spilochalcis* **fischeri** (p. 332); *S.* **T-nigrum** (p. 332); *Syntomaspis* (?) **alegrensis** (p. 333); *Tropidobria* (?) **brasiliana** (p. 334); *Lophyroides* **paraguayensis** (p. 335), Paraguay; *Ptilia* **uberaba** (p. 335); *Chelonus* **mexicanus** (*C. annulipes* Cameron). Except where otherwise given, new spp. are from Brazil. There are taxonomic notes on *Cecidopimpla ronnai*.—*C. E. Mickel.*

5727. BUCKLE, J. W. Ancistrocerus capra and the larvae of Epargyreus tityrus. (Hymenop.) *Canadian Ent.* 61(12): 265-266. 1929.—The hunting, capture, and stinging of the larva of the silver spotted skipper (*E. tityrus*) by the wasp *A. capra*, are described.

5728. BUCKLE, J. W. Croesus varus (De Villaret) (Hym.). *Canadian Ent.* 62(1): 21-22. 1930.—The author reports the taking of a specimen of this sawfly, which is quite rare in N. Amer., at the flowers of the common parsnip (*Pastinaca sativa*) at the foot of Mt. Royal, Canada. The only previous record of the sp. in N. Amer. is apparently that of a ♂ taken in Nova Scotia.

5729. COCKERELL, T. D. A. Descriptions and records of bees. CXXII. *Ann. and Mag. Nat. Hist.* 5(25): 156-163. 1930.—*Bombus discrepans*, emended description; *Trigona ambusta*, *T. bakeri*, and *T. biroi*, listed as new to Siam; *Augochlora* (*Pseudaugochloropsis*) **ogilviei** ♀ (p. 157); *A.* **phanerorhina** (p. 149); *A.* (*Augochloropsis*) **cataractae** (p. 159); *A.* (*A.*) **semitoralis** (p. 160); *Halictus* **potaroënsis** (p. 161); *Sphecodes biroi* **mariae** ♂ (p. 162), Siam; the ♀♀ of *Habropoda sutepensis* Ckll. and *Osmia pseudamala* Ckll., are described. Except where otherwise stated, new spp. are from Brit. Guiana.

5730. COCKERELL, T. D. A. New bees from the Mesa Verde National Park, Colorado. *Jour. New York Ent. Soc.* 37(4): 441-448. 1929.—*Emphoropsis* **citulus** ♂ (p. 442); *Anthophora* **subignava** ♀ (p. 443); *Nomada* **frankei** ♂ (p. 443); *Andrena* **viridibasis** ♀ (p. 444); *A.* **speculifera** ♀ (p. 444); *A.* (*Trachandrena*) **abjuncta** ♀ (p. 445); *A.* **heterura** ♀ (p. 445); *A.* (*Pterandrena*) **platyrhina** ♀ (p. 446); *A.* (*Trachandrena*) **tardula** ♀ (p. 447).

5731. COSTA LIMA, A. da. Sur le Dielocerus formosus Klug. (Hymenoptera, Tenthredinoidea.) *Compt. Rend. Soc. Biol.* 97(31): 1366-1367. 1927.—Some latent larvae of *D. formosus* were found in material from Pernambuco. A case is cited of larva of this sp. remaining latent for a period of 3 years.

5732. CRÈVECOEUR, AD., et J. de WALSCHE. Description de trois Hyménoptères gynandromorphes ou monstrueux. *Bull. et Ann. Soc. Ent. Belgique* 69(1/2): 37-39. 3 fig. 1929.—A specimen of *Halictus calceatus**, of *Andrena albicans** and of *Vespa vulgaris** is described.

5733. CROS, AUGUSTE. Contribution à la biologie de Scolia interstincta Klug. *Bull. et Ann. Soc. Ent. Belgique* 69(10/11): 354. 1930.—The author confirms the identity of the victim of *S. interstincta* as *Aethiessa floralis*.

5734. CUSHMAN, R. A. Three new ichneumonoid parasites of the rice-borer (Chilo simplex (Butler)). *Proc. Hawaiian Ent. Soc.* 7(2): 243-245. 1929.—*Centeterus* **alternecoloratus** (p. 243), *Dioctes* **chilonis** (p. 244), and *Chelonus* **chilonis** (p. 244), all China, types in U. S. Nation. Mus.

5735. CUSHMAN, R. A. Miscellaneous notes and descriptions of ichneumon-flies. *Proc. Soc. Nation. Mus.* 72(Art. 13): 1-22. 2 fig. 1927.—Short revisions of N. Amer. spp. of several genera, key to N. American spp. of *Agrothereutes*, *Protarchoides*, and *Ceratogastra*. *Ischnopsidea* **alberta** ♀ (p. 1), *Cryptus* **caligatus** ♀ (p. 2), and *Agrothereutes* **rufopectus** ♀ (p. 4), Alberta; *A.* **slossonae** ♀ (p. 4), New Hampshire; *A.* **microalatus** ♀ (p. 4), New England; *Ischnus* **doddi** (p. 5), Uruguay; *Trichocryptus* **bicolor** (p. 8), with critical notes on the genus; **TRICHESTEMA** (p. 9) resembling *Trichocryptus*, based on *T.* **helcostizoides*** ♀ (p. 9), S. Dakota; *Ephialtes* **nigroaeneus** ♀ (p. 10), Jamaica; *E.* **polychromus** ♀ (p. 11), Cuba; *Hemitales hemipterus* (Fabr.) (=*H. insignipennis* Schmied.); *Syrphoctonus* **foutsi** (p. 12), Maryland; *Himertus* Thomson (=*Clepsiporthus* Davis, *Neoprotarchus* Cushman); *Himertus* **ater** (*Neoprotarchus a.* Cushman); *H.* **flavidus** (*Clepsiporthus f.* Davis) (p. 14); *H.* **dakota** ♀ (p. 14), S. Dakota; *H.* **rubiginosus** (*Mesoleptus* ? *r.* Cresson) (p. 15); *Protarchoides* **pallipes** ♀ (p. 15), Alberta; *Phrudus* **dakota*** (p. 17), S. Dakota; *P.* **exarealatus** ♀ (p. 19), New York; notes on the systematic position of *Phrudus*; *Podogaster* **cactorum** (p. 19), Argentina; *Ceratogastra* **trifasciata** ♀ (p. 21), Massachusetts; *C.* **rufa** (*Dyspetes rufus* (Prov.)) (p. 21). Types in U. S. Nation. Mus.

5736. EBEL, GUILLERMO. El Syntomaspis laetus. *Rev. Chilena Hist. Nat. Pura y Aplicada* 32: 167-170. 1 fig. 1928(1929).—This sp., whose larvae are found in the galls of "coliguay," is described and figured. The author believes that it is parasitic upon *Exurus colliguayae* and feeds upon it.

5737. FERRIÈRE, CH. Notes on some chaldic parasites of lac-insects. *Bull. Ent. Res.* [*London*] 19(2): 171-176. 2 fig. 1928.—*Tachardiaephagus tachardiae* (How.) (=*T. thoracicus* Ashm., *Lissencyrtus troupi* Cameron); *Lissencyrtus somervilli* is included in the genus *Tachardiaephagus* (p. 171); *Elasmus claripennis** (Cam.) (=*E. colemani* Mahdih.); *Coccophagus tschirchii** Mahdih., described for the first time (p. 173); *Tetrastichus purpureus** (Cam.) (=*T. immsii* Mahdih.).

5738. FINZI, BRUNO. Quarto contributo alla conoscenza della fauna mirmecologica della Venezia Giulia. [Fourth contribution of the ants of Venezia Giulia, Italy.] *Boll. Soc. Ent. Italiana* 60(8): 128-130. 1928.—A short list, including *Leptothorax sordidulus* v. **tergestina** (p. 129).

5739. FORSIUS, RUNAR. Eine neue Cephide aus Japan. *Notulae Ent.* [*Helsingfors*] 8(3): 67-69. 1928.—*Monoplopus* **japonicus** ♂ (p. 67). A key is given to the 4 known spp. of *Monoplopus*.

5740. FORSIUS, RUNAR. Über neue oder wenig bekannte Tenthredinoiden aus Sumatra. *Notulae Ent.* [*Helsingfors*] 9(2): 53-64; (3): 65-70. 1929.—Of 179

specimens, collected by Edward Jacobson of Fort de Kock, 2 genera and 10 spp. are new and here described, besides 4 genera and 4 spp. new to Sumatra. Types in Naturhist. Mus., Leyden. *Corporaalinus* **jacobsoni** ♀ (p. 54); *Anapeptamena* **montana** ♂ (p. 56); *A.* **albicornis** ♀ (p. 57); *Canonias* **jacobsoni** (p. 58); **CANONIADES** (p. 59), resembles *Canonias,* type *C.* **jacobsoni** ♀ (p. 60); *Athalia* **funebris** (*A. proxima* var. *f.* Forsius) (p. 61), ♂ described for the first time; *Stromboceridea* **jacobsoni** (p. 61); *Neothrinax* **sumatranus** ♂ (p. 64); *Salatigia roepkei,* new to Sumatra; **JACOBSONIELLA** (p. 65), resembling *Athlophorus* and *Canonias,* type *J.* **brachycera** ♀ (p. 66); *Athlophorus orbitalis,* ♂ described for the first time; *A.* **sumatranus** (p. 67); *A.* **similis** ♀ (p. 68); *Tenthredella umboginera,* ♂ described for the first time.

5741. FORSIUS, RUNAR. Notes on some little known Australian Tenthredinoidea. *Notulae Ent.* [*Helsingfors*] 9(3): 81-84. 1929.—*Pterygophorus interruptus* v. **queenslandicus** (p. 81), *Perga hartigi* Westw. ♂, and *Diphamorphos nigriscens* Roh. ♂, are described for the first time; *Clarissa variabilis* v. **sternalis** (p. 83). Types of n. vars. in Wilson coll. *Neoeurys caudatus, N. pusillus,* and *N. leai* are new to Victoria.

5742. FORSIUS, RUNAR. Perga titschacki eine neue australische Tenthredinoide. *Notulae Ent.* [*Helsingfors*] 9(3): 85-86. 1929.—*Perga* **titschacki** ♀ (p. 85), Victoria, type in Naturhist. Mus., Hamburg.

5743. FRISON, THEODORE H. A contribution to the knowledge of the life history of Bremus bimaculatus (Cresson) (Hym.). *Ent. Amer.* 8(4): 159-223. 4 pl. 1928.—Information is given regarding technique used in securing data, and series of experiments and observations regarding this sp. of social bee. Data on nesting habits, anthophilous habits, duration of the developmental stadia, seasonal appearance of the castes, caste ratios, size of colonies, color variation of adults, cocoons and food storage, mating, and domestication, are given. Bibliography.—*T. H. Frison.*

5744. GEDDE, FRIEDRICH. Feuer im Ameisenhaufen! *Kosmos* 27(2): 47-48. 4 fig. 1930.—When a candle was inserted in an ant-hill in the Austrian Alps, and lighted, the ants (*Formica rufa*) quenched the flame in 4½ minutes by sprinkling it with a fluid from the hind end of their bodies. To do this, they assumed an upright position, with the hind end of the body directed forward. This was done by large ants, the smaller ones giving no visible aid.

5745. GIRAULT, A. A. Notes on and descriptions of chalcid wasps (Chalcididae) in the South Australian Museum. *Rec. S. Australian Mus.* 3(3): 309-338. 1927.—An annotated enumeration, including: *Stethynium* **poema** (p. 309), S. Australia; *Hexanusia* **sanguinithorax** (p. 310), host, *Syrphus balteatus; Anusoidea* **varia** (p. 310), N. S. Wales; *Taneostigmodes* **unifascia** (p. 311), S. Austr.; *Eupelmus* **unipunctipennis** (p. 311), Tasmania; *Mesamotura* **keatsi** ♀ (p. 312); *M.* **aeschyli** (p. 312); **SCHIZONOTELLA** (p. 312) (Cleonyminae), type *S.* **eupelmoidea** ♀ (p. 312); *Aligherinia* **angustifrons** ♀ (p. 313); *Epistenia* **speciosissima** (p. 313); *Thaumasura* **marmoratipennis** ♀ (p. 314); *T.* **pulchripes** ♀ (p. 314); *T.* **auritegula** ♀ (p. 315); *T.* **dentatitibia** ♀ (p. 315), Victoria; *Westwoodiana* **purpureipes** (p. 316); *Systolomorphella* **silvifilia** ♀ (p. 316), Tasmania; *Dinoura* **pulchra** ♀ (p. 316), S. Austr.; **EPISYSTOLE** (p. 317) (Cleonyminae), type *E.* **peota** (p. 317); *E.* **meteora** (p. 317); *Perilampus* **cupreovarius** (p. 318) and *Eurytomomma* **atricoxa** ♀ (p. 319), S. Austr.; *Eurytoma* **eylandti** (p. 320), N. Territory; *E.* **silvipuer** ♀ (p. 320), *E.* **saltinatus** ♀ (p. 320), and *E.* **filisilvae** ♀ (p. 321), S. Austr.; *Decatoma* **sidnica** ♀ (p. 321), N. S. Wales, reared from *Ficus rubiginosus; D.* **persephone** ♀ (p. 321), reared from *Ficus* fruit; *Chalcis pomonae* v. **edna** ♀ (p. 322), *C.* **juno** (p. 323), *C.* **minerva** ♀ (p. 323), and *C. schuberti* v. **mariana** ♀ (p. 323), S. Austr.; *C.* **puella** (p. 323); *C.* **aligherei** ♀ (p. 324); *C.* **poema** ♀ (p. 324); *Phasgonophora* **miltoni** (p. 325); **METARRETOCERA** (p. 325) (Chalcidinae, Haltichellini), type *M.* **burnsi** ♀ (p. 325); *Xenarretocera* **tricarinata** ♀ (p. 325); *Pareniaca* **emersoni** ♀ (p. 326); *P.* **atricornis** ♀ (p. 326), and *Stomatoceras carlylei* v. **salti** (p. 327), S. Austr.; *S.* **saltensis** ♀ (p. 327), Tasmania; *S.* **luci** ♀ (p. 327), W. Austr.; *Chalcidellia* **guttatipennis** ♀ (p. 327); a key to the *Irichohaltichella,* with *I.* **silvae** ♀ (p. 329), S. Austr., and *I.* **silvifilia** ♀ (p. 329), N. S. Wales; *Macrodontomerus* **aligherini** ♀ (p. 329), N. S. Wales, type in Macleay Mus.; *Podagrionella* **julia** (p. 330), S. Austr.; *Megastigmus* **quadrisetae** ♀ (p. 330), and *M.* **sexsetae** (p. 331), Tasmania; *Neomegastigmus* **ater** (p. 332), from galls on leaves of *Eucalyptus obliqua,* S. Austr.; **PSEUDIDARNES** (p. 332) (Callimominae, Idarnini), type *P.* **minerva** ♀ (p. 332), N. S. Wales, from *Ficus rubiginosus; Koebelea fusca* v. **flava** ♀ (p. 332), N. Terr., from *Ficus glomeratus; Ormyromorpha* **silvifilia** ♀ (p. 333), N. S. Wales; *O.* **aeneiscapus** ♀ (p. 333) and *Tomocera* **viridivertex** ♀ (p. 333), S. Austr.; *Ophelosia* **aligherini** ♀ (p. 334), Tasmania; *O.* **keatsi** (p. 334), S. Austr.; **PSEUDIPARELLA** (p. 334) (Pteromalinae, Diparini), type *P.* **emersoni** ♀ (p. 335), Tasmania; *Isoplatoides* **quadripustulatus** ♀ (p. 335), N. S. Wales; *Systasis* **keatsi** ♀ (p. 335), S. Austr.; *Erotolepsiella* **Nemorum** ♀ (p. 336) and *Closteromyiia* **speciosa** (p. 336), Tasmania; *Entedonella* **aereiscapus** ♀ (p. 337), S. Austr.; *Pleistodontes* **nigricaput** (p. 337), from *Ficus rubiginosus,* S. Austr. and N. S. Wales; *Blastophaga* **niveipes** (p. 338), from *Ficus glomeratus,* N. Terr.; *B.* **semiauriceps** (p. 338), S. Austr. Except where otherwise given, new spp. are from Queensland.

5746. GOURLAY, E. S. A note on the validity of the proctotrypoid genus Tanyzonus Marshall. *Trans. & Proc. New Zealand Inst.* 58(3): 310. 1927.—*T. bolitophilae* Marsh. appears to be distinct from *Betyla fulva* Cameron.

5747. HANNES, F. Noch einmal "Der Bienenflugton." Ein Nachtrag zu dem Aufsatz "Bienenflugton und Flügelschlagzahl" im Märzheft dieser Zeitschrift. *Biol. Centralb.* 46(9): 563-564. 1926.—The author gives the results of further observations on the flight tones of bees and concludes that there are 2 fundamental tones, an octave apart. Comparisons by ear are erroneous and only by the use of tuning forks can correct decisions be made.—*H. F. Wilson.*

5748. HARTMANN, FR. Beiträge zu Badens Ameisenfauna. *Mitteil. Bad. Land. Naturkunde und Naturschutz.* 2(1/2): 12-16. 1926.—The following are recorded: Ponerini, 1 genus (1 sp.); Myrmicini, 6 genera (9 spp., several subspp.); Dolichoderini, 2 genera (2 spp.); Camponotini, 4 genera (12 spp., numerous subspp.).

5749. HERBST, PAUL. Nuevos ponpilidos chilenos. *Rev. Chilena Hist. Nat. Pura y Aplicada* 32: 135-139. 1 pl. 1928(1929).—*Pompilus* **smaragdinus*** (p. 135), *P.* **eximius*** ♀ (p. 136), *P.* **araucanus*** (p. 138).

5750. KUZNETZOV-UGAMSKIJ, N. N. Vorläufige Uebersicht über die mittelasiatischen Formen der Gattung Messor (Hym., Form.). *Folia Myrmecologica et Termitilogica* 1(7): 89-94. 1927.—A key which includes the following from Central Asia and Russian Turkestan: *M. barbarus meridinalis* vars. **denticulatus** (p. 90), **glabriusculus** (p. 90), **inermis** (p. 90), and **infumatus** (p. 91); *M. structor* ssp. **turanicus** (p. 91); *M. s.* var. **subpolitus** (p. 92); *M. similis* v. **striolatus** (p. 92); *M.* **similis** (p. 93); *M. s.* var. **clypeatus** (p. 93); *M.* **vicinus** (p. 94); *M.* **variabilis** (p. 94).

5751. [KUZNETSOV-UGAMSKII, N. N.] КУЗНЕЦОВ-УГАМСКИЙ, Н. Н. Материалы по мирмекологии Туркестана. III. **[Contribution to the myrmecology of Turkestan.]** (In Russian and German.) Русское Энтомологическое Обозрение. (*Rev. Russe Ent.*) 21(3/4): 186-196. 23 fig. 1927.—Keys are given to the spp. and subspp. of *Acanthomyops,* including *A. niger* ssp. **nitidus*** (p. 188); *A. niger alienus* vars. **turkmenus*** (p. 189), **pilicornis*** (p. 189), and **flavidus*** (p. 189); and of *Myrmica,* including *M. rugosa dshungarica* vars. **infuscata** (p. 192) and **brevispina** (p. 193), and *M. scabrinodis* ssp. **intermedia** (p. 194). Notes and figures are also given on other forms.

5752. MENOZZI, C. Due nuove specie di Eciton Latr. (Hymenoptera—Formicidae). *Folia Myrmecologica et*

Termitologica 1(2/3): 29-32. 2 fig. 1926.—*E.* (s. str.) velutatus* ♂ (p. 30), Costa Rica; *E.* (*Labidus*) sedulus ♂* (p. 31), Colombia, types in author's coll.

5753. **MERCET, R. GARCIA.** Afelínidos paleárticos (Hym. Chalc.). *Bol. R. Soc. Espan. Hist. Nat.* 28(5): 289-294. 4 fig. 1928.—*Casca* occidentalis* Silvestri & Mercet (p. 289), and *Encarsia* longicornis* (p. 292), both from Spain.

5754. **OGLOBLIN, A. A.** Two new species of Acolus (Scelionidae, Hym.) from podkarpathian Russia. *Casopis Ceskoslov. Spol. Ent.* 26(3/4): 51-55. 2 fig. 1929.—*A.* černosvitovi* (p. 51); *A.* aureopetiolatus* (p. 53).

5755. **RAYMENT, TARLTON.** The plumed bees. *Victorian Naturalist* 46(8): 155-162. 1 pl., 1 fig. 1929.—The range of *Trichocolletes venustus** is extended from Queensland to Victoria, where it frequents a bitter-pea (*Daviesia ulicina*). The ♂ is described for the first time. *Paracolletes marginatus* also occurs in Victoria, but harvests from different plants. Both species excavate shafts in the ground, where their larvae remain for 10 months. *Trichocolletes* nigroclypeatus* ♀ (p. 162), Victoria, frequents *Daviesia corymbosa*. All 3 spp. have a high-pitched note in flight.

5756. **RÉAUMUR, de.** Histoire des fourmis. Avec notes de **CHARLES PÉREZ.** (Encyclopédie entomologique Vol. 11). 116 p. Paul Lechevalier: Paris, 1928. 40 fr.

5757. **ROMAN, A.** Oxford University Greenland Expedition, 1928. Ichneumonidae collected by Major R. W. G. Hingston on the Oxford University Expedition to Greenland, 1928. *Ann. and Mag. Nat. Hist.* 5(27): 281-288. 1930.—This collection consists of 25 specimens representing 13 spp., for which dates, localities, habitats, and taxonomic notes are given. Though not represented in the collection, *Cryptus fabricii* Schiödte is considered a race of *C. laborator* Thbg. *Plectiscus* arcticus ♀ (p. 284); *Bauchus monileatus* Gr. (=*B. palpalis* Ruthe); *Mesoleius* groenlandicus ♂ (p. 285); *Anilasta pectinata* Thoms. (=*Limneria deichmanni* Nielsen, *Astiphromma d.* Lundbeck).

5758. [ROSA, J.] A new host for Cremastus hymeniae Vier. *Proc. Hawaiian Ent. Soc.* 7(2): 217. 1929.—Reared from *Chilo simplex* in a rice stalk.

5759. **ROSS, HERBERT H.** Two new forms of the genus Zaschisonyx Ashmead (Tenthredinidae: Hymenoptera). *Canadian Ent.* 61(12): 272-273. 1929.—*Selandria montana* (=*S. gentilis* Cresson); *Zaschisonyx montana* v. drabula (p. 272), Manitoba, type in Canadian Nat. Mus.; *Z. m.* ssp. occidentalis (p. 272), Idaho, type in Univ. Illinois coll.

5760. **SANTSCHI, F.** À propos du Tetramorium caespitum L. *Folia Myrmecologica et Termitologica* 1(4/5): 52-58. 1927.—*T. c.* vars. indocile (p. 53), and sulcinode (p. 53), Russian Turkestan, penninum (p. 54), Switzerland, coeleste (p. 54), China, and immigrans (p. 54), Chile; *T. semilaeve* vars. liparaeum (p. 55), punctatum (p. 55), and siciliense (p. 56), Sicily, and kutteri (p. 56), Switzerland; *T. inerme* st. *armatum* v. ligatum (p. 57), Russian Turkestan; *Strongylognathus huberi* st. *cecconii* v. kutteri (p. 58), Sicily.

5761. **SCHERTZ, EDUARD.** Ein eigenartiges Nest der Ameise Lasius mixtus. *Ber. Senckenberg. Naturforsch. Ges.* (*Natur u. Mus.*) 59(9): 473-475. 1 pl., 1 fig. 1929.—A nest near Mainz, Germany, was constructed of sand grains with the aid of a viscid secretion, forming a spongelike network. In it were observed the ant guests: a lepismatid and 3 isopods (*Plathyarthrus hoffmannseggi*).

5762. **[SCHOUTEDEN, H.]** Un nid des guêpes "Digba" de l'Uelé. *Rev. Zool. Africaine* 15(3): [37]-[38]. 1927.—Notes on the nest and behavior of *Polybioides tabida* and *P. melaina*.

5763. **SCHULTHESS, A. von.** Some more South African Masaridae (Vespoidea). *Ann. and Mag. Nat. Hist.* 5(27): 326-330. 3 fig. 1930.—A key is given for *Masaris discrepans* and *M.* braunsiella* (p. 326), and a supplementary key for several spp. of *Quartinia*. *Q.* poecila* (p. 327), *Q.* punctulata (p. 329), and *Q.* niveopicta (p. 329). All new spp. from Cape Province, with types in Brit. Mus. *Q.* variegata* Brauns in litt. (=*Q. signata* Brauns).

5764. **SCHULTHESS, A. de, et al.** Voyage au Congo de S. A. R. le Prince Léopold de Belgique (1925). Hymenoptera. (Art. 1-3.) *Rev. Zool. Bot. Africaines* 17(2): 184-207. 7 fig. 1929.—This work includes reports by specialists in the various groups. The first 2 articles consist of annotated lists, with localities, dates, and (3rd article) new taxonomy. Art. 1. A. de Schulthess. Apides, Vespides, Sphérides, Chrysidides, Scoliides, Mutillides, Formicides. Twenty-one Apidae, 11 Vespidae, 7 Sphegidae, 4 Chrysididae, 5 Scoliidae, 1 Mutillidae, 5 Formicidae, including some undetermined. Art. 2. A. ROMAN. Braconides et Ichneumonides. Six Braconidae, 3 Ichneumonidae. Art. 3. H. HAUPT. Psammocharidae. Eight species are listed. Pepsinae: **TRICHONYX** (p. 195), erected for *Hemipepsis unguicularis* Kohl. There is a key to the 4 African genera of the *Mygnimia* group, including **PACHYNIMIA** (p. 197), type *P.* tinctor (Sauss.), n. comb. (p. 197); **MONODONTONYX** (p. 202), type *M.* helenae* ♀ (p. 204). Psammocharinae: *Paracyphononyx* apicalis* ♀ (p. 206). All from Belgian Congo.

5765. **SCHULTZ, VICTOR G. M.** Geheimnisvolles von den Schlupfwespen. *Internat. Ent. Zeitschr.* 21(40): 367-370. 1928.—Over 2000 specimens of a small ichneumonid (*Lithomastix truncatellus* Dahl.) were bred from a larva of *Plusia gamma*, a case of polyembryony.

5766. **SHESTAKOV, A.** Neue Cerceris Arten aus der Gruppe Cerceris tuberculata Vill. (Hym.) *Societas Entomologica* 42(8): 30-31. 1927.—*C.* gemmina (p. 31). Desert of Muganensia, type in author's coll.; *C.* hunchuz (p. 31), Manchuria, type in Zool. Mus., Russia Acad.; *C. tuberculata* ssp. draco (p. 31), China.

5767. **SMITH, M. R.** Two introduced ants not previously known to occur in the United States. *Jour. Econ. Ent.* 22(1): 241-243. 1929.—*Iridomyrmex iniquus* and *Wasmannia auropunctata*, tropical ants, have become established in the U. S. A., the former in a greenhouse at Urbana, Illinois, the latter on an estate at Miami, Florida. Synonymies are given for both spp. A key is presented for the determination of workers of all spp. of *Iridomyrmex* (both native and imported) known to occur in U. S. A.—*M. R. Smith.*

5768. **SONAN, J.** On Vespa from Formosa. [In Japanese.] *Trans. Nat. Hist. Soc. Formosa* 19(101): 136-149. 1929.—An annotated list of 11 spp., with a key, synonymy, and locality and date records. *Vespa magnifica* v. nobilis (p. 140), *V.* flavitarsus (p. 142), *V.* arisana (p. 147), *V.* karenkona (p. 148), *V.* 4-maculata (p. 148).

5769. **SONAN, JINHAKU.** Some wasps and bees of Hôkotô (Pescadores Islands) [Formosa]. [Partly in Japanese.] *Trans. Nat. Hist. Soc. Formosa* 19(105): 533-540. 2 fig. 1929.—*Odynerus* hôkotôensis (p. 534) and *O.* emma ♂ (p. 535), Pescadores and Formosa; *Nomia* (*Paronomia*) hôkotôensis* (p. 537) and *N.* (*P.*) rufopostiata ♂* (p. 538), Pescadores. Some previously known spp. are also recorded from Pescadores.

5770. **STUARDO O., CARLOS.** Notas entomológicas. Algunas observaciones sobre dos Afelininos parásitos de Aleurothrixus porteri Quaint. [Two Aphelinidae parasitic on A. porteri.] *Rev. Chilena Hist. Nat. Pura y Aplicada* 32: 154-157. 2 fig. 1928(1929).—Of 41 individuals of the homopteran *A. porteri* attacking the leaves of *Cestrum parqui* in February, 31 were parasitized by *Prospaltella conjugata*, 7 by *Cales noacki**, and 3 by *Eretmocerus corni*. Among 72 individuals obtained in April, 67 were parasitized by *C. noacki* and 5 by *P. conjugata*. These 2 parasites have not been recorded previously from Chile.

5771. **[SWEZEY, O. H.]** Amblyteles rufiventris (Brulle). *Proc. Hawaiian Ent. Soc.* 7(2): 216. 1929.—First record from Hawaii.

5772. **SWEZEY, O. H.** The hosts of Cremastus hymeniae Viereck in Hawaii (Hymenoptera). *Proc. Hawaiian Ent. Soc.* 7(2): 281. 1929.—The hosts, belonging to the Phycitidae (1), Pyraustidae (13), Tortricidae (4),

Eucosmidae (5), Carposinidae (1), Cosmopterygidae (2), Tineidae (2), and Cygnodidae (1), are listed.

5773. **TAKEUCHI, KICHIZO.** Descriptions of new sawflies from the Japanese Empire. (I). *Trans. Nat. Hist. Soc. Formosa* 19(105): 495-520. 1929.—*Siobla* metallica ♀ (p. 495); *S.* apicalis (p. 496); *S. ferox* hirasana ♀ (p. 497); *Macremphytus* deutziae ♀ (p. 498), the larvae feeding on *Deutzia* sp.; *M.* albilabris (p. 499); *M.* fasciatus ♀ (p. 500); *Allantus* (*Emphytus*) nakabusensis ♀ (p. 500); *Emphytina* geranii (p. 501), the larvae feeding on *Geranium nepalense; E.* longicornis ♀ (p. 502); *Taxonus* carbonarius (p. 503); *T.* japonicus ♀ (p. 504); *Parasiobla* autumnalis ♀ (p. 505); *P.* minomensis (p. 506); *P.* tenuicornis ♀ (p. 507); *P.* bella ♀ (p. 507); *Allomorpha* hirasana (p. 508); *Ametastegia* polygoni (p. 510), larvae feeding on *Polygonum reynoutria; A.* kirishimensis ♂ (p. 511); *Hemitaxonus* minomensis ♀ (p. 511); *Abeleses* satonis (p. 512); **HEMIBELESES** (p. 513), near *Abeleses*, type *H.* nigriceps (p. 514); *H.* athaliodes ♀ (p. 515); *Pseudotaxonus* secundus (p. 515), the larvae feeding on *Osmunda regalis* v. *japonica; Strongylogaster* blechni (p. 517), the larva on *Blechnum nipponicum; Aneugmenus* kiotonis (p. 518); *A.* maculatus (p. 519); *Nesoselandria* nipponica (p. 519). Types in author's coll. There is a key to the 4 Japanese spp. of *Macremphytus*.

5774. **TAVARES, JOAQUIM da SILVA.** Os Cynípides da Península Ibérica. *Brotéria Zool.* 25(2): 49-96. 14 fig. 1928.—This installment deals with *Biorhiza* and *Neuroterus;* and concludes the treatment of *Diplolepis. Biorhiza pallida* with sspp. codinae (p. 60), hispanica (p. 61), and lusitanica (p. 62); *Neuroterus* cardiguensis* (p. 91); *N. tricolor* ssp. ulysipponensis (p. 70). Keys to 3 European spp. of *Biorhiza*, to 5 subspp. of *B. pallida*, and to 25 European spp. and subspp. of *Neuroterus* are given.

5775. **UCHIDA, TOICHI.** Zweiter Beitrag zur Ichneumoniden-Fauna Japans. *Jour. Fac. Agric. Hokkaido Imp. Univ.* 21(5): 177-297. 3 pl. 1928.—A revision of the genera and spp. of the subfam. Ophioninae of the Japanese Empire, including Sakhalin, the Kurile and Riukiu Is., Formosa, and Korea, thus embracing portions of both palearctic and oriental zoogeographical regions. Five genera, 79 spp. and 23 vars. are described as new. The previously known ophionine fauna of Japan of 48 spp. and 5 vars. is increased to 164 spp. and 29 vars., of which 79 spp. and 23 vars. are new to science. Included in the total are 37 previously described spp. and one var. first reported here as occurring in Japan. A list of the known hosts is followed by brief discussion of the economic value of certain spp. Four pages are devoted to a review of the literature of Japanese Ophioninae. A chart showing the distribution of the spp. treated and a bibliography of 3 pages are appended. The classification includes keys to tribes, genera and species. **AMEBACHIA** (p. 198) (tribe Paniscini), near *Parabatus* Thoms., type *A.* baibarana* (p. 198), Formosa; **NIPPONOPHION** (p. 201) (Ophionini), near *Microphion* Szepl., type *N.* variegatus* (p. 201), Hokkaido, parasite of *Actias artemis;* **FORMOSANOMALON** (p. 240) (Anomalini), near *Habronyx* Foerst., type *F.* baibarensis* (p. 241), Formosa; **NOTHANOMALOIDES** (p. 273) (Campoplegini), near *Nothanomalon* Szepl., type *N.* matsuyamensis* (p. 273), Shikoku; **MELALOPHACHAROPS** (p. 280) (Campoplegini), near *Zacharops* Vier. and *Echthronomas* Foerst., type *M.* tamanukii* (p. 280), Hokkaido, parasite of *Melalopha anastomosis; Paniscus* nigrus* (p. 188), Hokkaido; *P.* takaozanus* (p. 189), Honshu; *Parabatus* maculifemoratus* (p. 193), *P.* baibarensis (p. 194), and *P.* kiuhabonus (p. 195), Formosa; *Amebachia* coreana (p. 199) and *Nipponophion* coreanus* (p. 203), Korea; *Ophion* nikkonis (p. 204), Honshu; *O.* hokkaidonis (p. 205), Sakhalin; *O.* takaozanus* (p. 206), Honshu; *O.* okunii* (p. 207), Hokkaido; *O.* castaneus (p. 208), Formosa; *O.* orientalis* (p. 208), Sakhalin; *O.* ainoicus (p. 209), Hokkaido; *Dicamptus* isshikii* (p. 212), Honshu; *Pleuroneurophion* longicornis* (p. 212), and *Henicospilus* mushanus* (p. 216), Formosa; *H.* fuscomaculatus* (p. 216), Honshu; *H.* shinkanus (p. 217), Formosa; *H.* yonezawanus* (p. 218), Honshu; *H.* pudibundae* (p. 219), Hokkaido, parasite of *Dasychira pudibunda* L.; *H.* maruyamanus* (p. 220), Sakhalin; *H.* triguttatus* (p. 221), *H.* bifasciatus* (p. 222), *H.* nigribasalis* (p. 222), *H.* formosensis* (p. 223), *H.* tainanensis (p. 225), *H.* kanshirensis (p. 226), and *H.* taiwanus* (p. 226), Formosa; *H.* yezoensis* (p. 227), Hokkaido; *H.* gyochiensis* (p. 229), Formosa; *Allocamptus* orientalis* (p. 230), Okinawa; *Schizoloma* coreanum* (p. 235), Korea; *Trichomma* cnaphalocrocis* (p. 239), Formosa; *Aphanistes* orientalis* (p. 242), Kawakami, Sakhalin; *A.* kankonis* (p. 244), Formosa; *Anomalon* moiwanum* (p. 245), Moiwa, Hokkaido; *A.* hirayamaeum (p. 246), Honshu; *A.* garugawense* (p. 246), Hokkaido; *A.* yanagiwaraeum* (p. 247), *Labrorychus* niikunii (p. 248) and *L.* nikkonis* (p. 249), Honshu; *L.* yezonis* (p. 249), Hokkaido; *Agrypon* kiushuense (p. 251), Kiushu; *A.* maruyamense (p. 252), *A.* japonicum* (p. 252), and *A.* sapporense (p. 253), Hokkaido; *A.* oyeyamense* (p. 254), Honshu; *A.* tamahonum* (p. 255), Formosa; *A.* daisetsuzanum* (p. 256), Hokkaido; *A.* elongatum* (p. 257), Honshu; *Gongropelma* tainense (p. 258) and *G.* kikuchii* (p. 258), Formosa; *Astiphromma* jezoense* (p. 260) and *A.* geniculatum* (p. 261), Hokkaido; *Mesochorus* iwatensis (p. 262), Honshu; *Tegona* bimaculata* (p. 263), Hokkaido; *Xenoschesis* crassicornis* (p. 266), Korea; *Exetastes* karafutonis* (p. 267), Sakhalin; *E.* miniatus* (p. 269), Kiushu; *E.* longigenus* (p. 270), Sakhalin; *E.* fukuchiyamanus* (p. 270), *E.* ishikawensis (p. 271) and *E.* longipes* (p. 271), Honshu; *Campoplex* subrubrus (p. 275), Hokkaido; *C.* sachalinensis (p. 276), Sakhalin; *C.* yezoensis* (p. 276), *C.* daisetsuzanus (p. 276), and *Trophocampa* teshionis* (p. 278), Hokkaido; *Casinaria* albibasalis* (p. 279), Honshu; *Limnerium* exartemae* (p. 282), Hokkaido, parasite of *Exartema mori* Mats.; *L.* ishiyamanum (p. 283) and *Pristomerus* rufiabdominalis* (p. 284), Hokkaido; *Diaparsis* coreanus* (p. 285), Kiushu; *Campoplex* matsumurae (*Mesochorus japonicus* Mats.) (p. 277); *Opheltes glaucopterus* v. fuscus (p. 187), Kurile; *Paniscus testaceus* v. nigronotatus (p. 191), *P. t.* var. nigrinotus (p. 191) and *Parabatus cristatus* v. japonicus* (p. 196), Hokkaido; *P. c.* var. kikuchii* (p. 197), Formosa; *Nipponophion coreanus* v. infuscus (p. 203), Shikoku; *Ophion sibiricus* v. japonicus (p. 206), Sakhalin; *Dicamptus nigropictus* v. fuscus (p. 211), Formosa; *Henicospilus combustus* v. shikokuensis (p. 224), Shikoku; *Nototrachys folicator* v. coreanus* (p. 231), Korea; *N. f.* var. japonicus (p. 231), Hokkaido; *N. f.* var. formosanus (p. 232), Formosa; *Schizoloma amictum* v. nigricoxalis (p. 234), Sakhalin; *S. a.* var. intermedium (p. 234), Honshu; *Exochilum circumflexum* v. nipponicum (p. 236), Hokkaido; *E. circumflexum* v. rufomaculatum* (p. 237), Formosa; *Heteropelma calcator* v. flaviscutellum (p. 238), Hokkaido; *H. c.* var. elongatum* (p. 238), Honshu; *Aphinistes jozankeanus* v. nigricans (p. 242) and *A. orientalis* v. asahidakeanus (p. 243), Hokkaido; *Agrypon suzukii* v. nigromaculatum (p. 251), Honshu; *Campoplex subrubrus* v. jozanus (p. 275, in key) (no locality); *Diaparsis coreanus* v. kondonis (p. 286), south Manchuria, parasite of *Nephopteryx pirivorella* Mats. New synonymy is as follows: *Thyreodon* Brulle (=*Coracophion* Shest.); *Eremotylus* Foerst. (=*Leptophion* Cam.); *Henicospilus* Steph. (=*Tripilus* Krchb., *Pterospilus* Krchb.); *Henicospilus flavocephalus* Kirby (=*H. similis* Mats. & Uchida); *H. semiopacus* Mats. (=*H. hariolus* Morley); *H. merdarius* Grav. (=*H. flavicaput* Mats. & Uch., nec Morley); *Exochilum circumflexum* L. (=*E. laricis* Mats.); *Banchus falcatorius* Fab. (=*Corynephanes sachalinensis* Mats., *Banchus sachalinensis* Mats.); *Exetastes ichneumoniformis* Grav. (=*E. scutellaris* Mats. ♂ non ♀); *Limnerium* Ashm. (=*Eulimneria* Schmiede.). The following new combs. appear: *Opheltes glaucopterus* v. major (*Opheltes m.* Cush.) (p. 187); *Dicamptus* nigropictus (*Ophion n.* Mats.) (p. 211); *Exochilum circumflexum* v. dendrolimi (*E. dendrolimi* Mats.) (p. 236); *Habronyx heros* v. matsukemushii (*Habronyx m.* Mats.) (p. 240); *Aphinistes*

jozankeanus (*Habronyx j.* Mats.) (p. 242); *Agrypon* **suzukii** (*Anomalon s.* Mats.) (p. 251); *Rhythmonotus* **takagii** (*Casinaria atrata* Takagi, nec Morley, =*Casinaria takagii* Mats.) (p. 279); *Dioctes* **lineatus** (*Anomalon lineatum* Ishida) (p. 282); *Diaparsis* **japonicus*** (*Temelucha j.* Ashm.) (p. 285).—*R. A. Cushman.*

5776. VERLAINE, L. Les reines fécondées des Hymenoptères sociaux peuvent-elles normalement engendrer des mâles? *Ann. et Bull. Soc. Ent. Belgique* 66(8/10): 287-318. 1926.—Author presents evidence that queens of bees, bumblebees, wasps, and ants which have mated and are still supplied with semen are incapable of laying at will either ♂- or ♀-producing eggs. ♂-producing eggs are laid only by individuals called neuters which do not mate because they are morphologically incapable, but which can oviposit when in nutritive condition, permitting development of reduced ovaries.—*P. W. Whiting.*

5777. VERLAINE, L. Le déterminisme de l'emplacement du nid chez la Vespa sylvestris Scop. *Ann. et Bull. Soc. Roy. Sci. Méd. Nat. Bruxelles* 1926(8/10): 9-22. 1926.—Et. Rabaud reduces the choice of the nesting site by a fertile queen to tropisms. The author refutes this interpretation. In his opinion tropisms are elements of the general psycho-physiological activity whose origin is often more complex than is generally believed and often starts from associative processes.—*L. Verlaine (transl. by J. Bequaert).*

5778. VUKASOVIĆ, PAVLE. Observations biologiques sur les Hyménoptères parasites. [Serbian, with French summary.] *Bull. Acad. R. Serbe Sci. et Arts* 119(54): 9-18. 1 fig. 1926.—*Trissolcus simoni** is an internal parasite of the eggs of *Eurydema ornatum**. Its biology was not studied previously. Females, unlike those of most Hymenoptera, display intense rivalry, not tolerating the presence of other ♀♀, but endeavoring to drive them from the group of *Eurydema* eggs selected for oviposition. Eggs are examined with the antenna by the ♀ before oviposition, those having marks of oviposition being avoided. The complete development of the parasite requires 13-16 days at a mean temp. of 22°-26°. In all cases observed where a group of *E. ornatum* eggs are infested at the same time, ♂♂ hatch before the ♀♀ and remain in the *E. ornatum* eggs to copulate with the ♀♀ as soon as the latter emerge. The ♀ is fecundated once in her life. Females are much more numerous than ♂♂. Eggs of *E. ornatum* may be parasitized in all stages of their development.—*French summary (transl.).*

5779. WATERSTON, JAMES. Two new parasitic Hymenoptera. *Ann. and Mag. Nat. Hist.* 5(26): 243-246. 2 fig. 1930.—*Thripoctenus* **maculatus*** (p. 243), Punjab, internal parasite on vine thrips; *Agriotypus* **gracilis*** (p. 244), Japan. The occurrence in Japan of *Agriotypus* denotes a considerable eastward extension of range of the genus; it is unknown in Russia.

5780. WATERSTON, JAMES. On the occurrence of Neorhacodes enslini, Ruschka (Hym. Ichneumonidae) near London. *Entomologist* 62(792): 97-99. 1 fig. 1929.—Netted with *Spilomena troglodytes*, which it was probably following. The systematic position of *N. enslini* is reviewed.

5781. WEYER, FRITZ. Die Eiablage bei Formica rufa-Arbeiterinnen. *Zool. Anz.* 84(9/10): 253-256. 1929.—According to Eidmann, the brood-rearing instinct in *F. rufa* devolves mostly upon egg-laying workers, since from the eggs of these emerge most of the ♂♂ in the colony. Weyer considers this view not tenable. Egg-laying by workers is almost non-existent in normal *F. rufa* colonies. Most eggs formed in the workers are abnormal; they degenerate and are resorbed by the body.—*F. Weyer (transl. by R. E. Danforth).*

5782. WÜLKER, G. Biologie der Blattwespen, besonders der wirtschaftlich wichtigen Arten. *Internat. Ent. Zeitschr.* 19(47): 374-376. 1926.—A discussion of various spp. of sawflies, with especial mention of *Pteronidea ribesii* and *Lygaeonematus pini*. The former has 4-5 broods, and, besides bi-sexual reproduction, frequently shows parthenogenesis. *L. pini* has but one generation. Both are very injurious to vegetation.

MACROLEPIDOPTERA

5800. REISSER, HANS. Aberrative Falter aus Niederösterreich. *Zeitschr. Österr. Ent.-Vereines* 15(2): 17-19. 1930.—An annotated list of 9 spp., including *Ptychopoda rufaria* ab. **purpurea*** ♂ (p. 17), type in author's coll.

5801. RÖBER, J. Über einige exotische Falter. *Internat. Ent. Zeitschr.* 23(27): 323-327. 1 fig. 1929.—Notes and comparative descriptions of some 10 spp.; **NAROPINA** (p. 326), n. gen., is proposed provisionally for *Narope* **pusilla** ♂ (p. 325), Bolivia; *Morpho achilles* ssp. **michaeli** (p. 326), Peru; *Hippotion* **leucocephalus** ♀ (p. 327), Africa?; *Astyloneura* **bicoloria** ♂ (p. 327), Abyssinia, type in coll. Kotzsch.

5802. RUPP, FRIEDR. Die Sammlung Dr. Philipps endgültig in deutschem Besitz! *Internat. Ent. Zeitschr.* 24(18): 210. 1930.—This palearctic butterfly collection, one of the largest in the world (some 25 cases), has been donated to the University of Coblenz.

5803. SCHNEIDER, CARL. Zusammenstellung der in Württemberg und Hohenzollern neu aufgefundenen Noctuiden. *Internat. Ent. Zeitschr.* 23(44): 505-509. 1930.—A list of 61 spp., among which *Apamea nickerlii* Frr. is new to Germany.

5804. SCHWINGENSCHUSS, LEO. Beitrag zur Heterocerenfauna von Korneburg in Niederösterreich. *Zeitschr. Österr. Ent.-Vereines* 14(9): 85-89. 1929; 15(2): 20-21; (3): 30-32. 1930.—A list of 312 spp. including: *Mamestra reticulata* ab. **decolor** (p. 88). *M. splendens* and *Plusia ni* are reported established in southern Austria.

5805. STICHEL, H. Eine neue Riodinide von Amazonas (Lep. Rhop.). *Internat. Ent. Zeitschr.* 24(24): 257-258; (25): 276. 1930.—*Euselasia* **scotinosa** (p. 276), type in coll. Pohl.

5806. THURNER, JOSEF. Ein Sammelausflug auf die Ascher-Hütte in den Paznauer-Alpen (Nordtirol). *Zeitschr. Österr. Ent.-Vereines* 14(1): 7-9; (2): 16-17; (3): 34. 1929.—A list of 68 spp.

5807. WARNECKE, G. Wo liegt in Deutschland die Nordgrenze des ständigen Vorkommens von Papilio podalirius L.? *Internat. Ent. Zeitschr.* 23(30): 357-368. *Map;* (31): 369-375. 1929.—The author refers to a number of works by various authors on the distribution of this sp. A map showing its occurrence is given. A list of place names within the northern limit concludes the paper.

5808. WARNECKE, G. Ist Miana captiuncula Tr. (Lepid. Noct.) ein "Glazialrelikt"? *Zeitschr. Österr. Ent.-Vereines* 13(4): 37-40; (5): 52-56. 1928.—The author reviews the distribution of this sp. in Europe, and finds that it occurs neither in the northern part of the Palaearctic region nor in the higher elevations of the mountains of central and southern Europe. Therefore it is doubtful if it can be considered a boreal-alpine form or a glacial relict.

P. Rockwood.*

5833. KARNY, H. H. Phylogenetische und tiergeographische Erwägungen zur Systematik der Rhaphidophorinen. (Orth. Fam. Gryllacridae.) *Arch. Klassif. u. Phylog. Ent.* **1**(2): 57-76. Map. 9 fig. 1930.—The distribution of the genera indicated that previous generic grouping was not natural. The paired spines of the metatarsus of the hind leg separate genera (Macropathini) of the Southern Hemisphere from all others. A key to the 6 tribes is given with figures. Macropathini and Rhaphidophorini are separate primitive branches from a hypothetical ancestral form resembling Anostostominae. Troglophilini (=Dolichopodini of table), derived from Rhaphidophorini and Tropidischiini, are an aberrant branch from the former earlier than Ceuthophilini. Daihiniini are an offshoot of Ceuthophilini. Rhaphidophorini occur in southern and eastern Asia, Japan, and the Malay Arch. (to New Guinea) with the center of development on the mainland; Troglophilini in Asia Minor and southern Europe in caves; Tropidischiini, Ceuthophilini, and Daihiniini in N. Amer., the ancestral forms coming over a north Atlantic land bridge. The subfam. is predominately of the temperate zone, only *Rhaphidophora* reaches the equatorial region. The Macropathini, most developed in N. Zealand, are separated from all others by a wide zone. One genus each is recorded from southern Chile, Patagonia, and the Falkland Is., and *Spelaeiacris tabulae* Peringuey from Capetown, S. Africa. This distribution indicates an Antarctic continent. S. American Anostostominae and Gryllacrinae show relationship with N. Zealand and Australian forms, those of Africa do not.—*L. P. Rockwood.*

5834. KARNY, H. H. On Malaysian katydids (Tettigoniidae). Represented in the collections of the Federated Malay States Museum (Kuala Lumpur) and the Raffles Museum (Singapore). *Jour. Fed. Malay States Mus.* **13**(2/3): 69-157. 2 col. pl., 48 fig. 1926.—Scaphurinae (=Phaneropterinae): *Elimaea signata* ssp. **siamensis** ♀* (p. 70), Siam. Key to the species of *Scambophyllum* included. *Scambophyllum* **basileus*** (p. 75), Negri Sembilan; *S.* **pendleburyi** ♂* (p. 77), Perak; *S.* **rarofasciatum** ♀* (p. 79), Siam; **STYLOMOLPA** (p. 82) near *Molpa* Walker, with *S.* **angustipennis** ♂* (p. 83), Selangor. The "Ancylecha-Holochlora-group" represents the most important group of the Malaysian Phaneropterinae: *Tapiena* **triangulata** ♀ (p. 91) and *Elbenia* **robinsoni** ♂* (p. 92), Selangor; *E.* **smedleyi** ♂* (p. 93), Sumatra; *E.* **pendleburyi** ♂* (p. 94), Perak; *Pseudopsyra* **bilobata** ♂* (p. 97) and *P.* **digitata** ♂* (p. 97), Selangor; *Parapsyra* **hyalina** ♂* (p. 101), no locality; *P.* **murice-tincta** ♀* (p. 101), Perak; *P.* **laticauda** ♀* (p. 102), Negri Sembilan; *Holochlora* **annulicornis** ♀* (p. 104), no locality; **PARANEROTA** (p. 105), type *P.* **gracilis** (*Phaneroptera g.* Burmeister); *Phaneroptera furcifera* Stål is also referred to *Paranerota; Isopsera* **chaseni** ♂* (p. 105) and *I.* **rotundata** ♀* (p. 107), Pahang; *Stibaroptera* **parvula** ♂* (p. 109), Pulau Pisang. Pterophyllinae (=Pseudophyllinae): *Pseudophyllus* **pomposus** ♀* (p. 112), Siam; *Cratioma* **oculatum** ♀* (p. 113), Pahang; *Phyllomimus* **boden-klossi** ♀ (p. 118), Singapore; *Olcinia* **pallidifrons*** (p. 123), Perak; *Typhoptera* **siamensis** ♀* (p. 126), Siam. Mecopodinae: Key to the species of the genus *Characta* included. *Characta* **kinabaluensis** ♂* (p. 127), Borneo. Meconeminae (=Meconeminae+Listroscelinae part): *Xiphidiopsis* **chaseni** ♂* (p. 130), Perak; *X.* **exigua** ♀* (p. 131), Pahang; *X.* **elaphocerca** ♀* (p. 132), Perak; *X.* **siamensis** ♀* (p. 134), Siam; *X.* **denticulata** ♀* (p. 135) and *Amytta* **subanalis** ♂* (p. 137), Selangor; *A.* **tribola** ♂* (p. 138) and *A.* **tahanensis** ♂* (p. 139), Pahang. Hexacentrinae (=Listroscelinae part+Tympanophorinae): **GLENOPHISIS** (p. 140), similar to the So. Amer. genera *Carliella* Karny and *Arachnoscelis* Karny, type *G.* **pretiosa** ♂* (p. 141), Perak. Agraeciinae: **PSEUDOSUBRIA** (p. 147), intermediate between *Subria* Stål and *Eppioides* Hebard, type *P.* **decipiens** ♀* (p. 147), Perak; *Scytocera* **laticauda** ♀* (p. 149), Perak, nocturnal. —*O. W. Olsen.*

5835. REHN, JAMES A. G. African and Malagasy Blattidae (Orthoptera),—Part I. *Proc. Acad. Nat. Sci. Philadelphia* **83**: 305-387. 4 maps, 5 pl. 1931.—*Ectobius* is considered by groups, and 4 maps present the known distribution of the African species, key to spp.; *E.* **kikuyuensis*** ♂ (p. 323), Kenya (type in Paris Mus.), Uganda, and Sudan, at altitudes 4000-5600 ft.; *E.* **kikensis*** ♂ (p. 328), Dahomey, type in Paris Mus.; *E. togoensis** ♂ redescribed; *E. aethiopicus** additional description, alpine and subalpine; *E. neavei** addit. descr.; *E.* **larus*** ♂ (p. 338), Belgian Congo, type in Belgian Congo Mus.; *E.* **makalaka*** ♂ (p. 340), So. Rhodesia, type in So. African Mus.; *E.* **insperatus*** ♂ (p. 343), Kenya (type in Paris Mus.), Uganda, Tanganyika, and Nyasaland; *E. africanus** Sauss. (=*Hololampra sjöstedti* Shelford), addit. descr.; *E.* **textilis*** (p. 354), Natal, type in Acad. Nat. Sci. Philadelphia; *E.* **leptus*** ♂ (p. 357), Belgian Congo, type in Belgian Congo Mus.; *E.* **darbandae*** ♂ (p. 358), French Equatorial Africa, type in Paris Mus.; *E. lineolatus** first description of ♀; *E.* **stanleyanus*** ♂ (p. 362), Tanganyika, type in Brit. Mus.; *E.* **nuba*** ♂ (p. 363), Sudan, type in Brit. Mus.; *E. rammei** redescription; *E.* **alleni*** ♂ (p. 367), Kenya, type in Mus. Comp. Zool.; *E.* **involutus*** (p. 369), Transvaal (type in Acad. Nat. Sci., Phila.), Brit. Bechuanaland and Orange Free State; Group **XOSABLATTAE** (p. 374) in Ectobiinae, next to group Maretae, based on **XOSABLATTA** (p. 374), type *X.* **natalensis** (*Chorisoblatta n.* Rehn) (p. 374); *Epilampra* **usambarensis*** ♂ (p. 375), Tanganyika, type in Berlin Zool. Mus.; *Panchlora* **stanleyana*** (p. 378), Cameroons (type in Acad.

Nat. Sci. Phil.), Gold Coast, and Uganda; *Oxyhaloa* **conia*** (p. 380), Uganda (type in Imp. Inst. Ent.) and Belgian Congo; *Zuluia* **lithostrota*** ♀ (p. 383), Portuguese E. Africa, type in Acad. Nat. Sci. Phil.

5836. UVAROV, B. North Caucasian species of the genus Paradrymadusa Herm. (Orthoptera, Tettigoniidae) and their zoogeographical importance. Ежегодник Зоологического Музея Академии Наук СССР. (*Ann. Mus. Zool. Acad. Sci URSS.*) 30(2): 331-337. 12 fig. 1929.—*P. beckeri** Adel., *robusta** Miram, and **picta*** (p. 334) (Daghestan) are closely related, the last also allied to *konowi* Bol. from Anatolia; *P.* **gracilis** ♀* (p. 331), Daghestan, is probably allied to *sordida* Herm. from Transcaucasia. Key to north Caucasian species only. *Paradrymadusa* is a typical representative of the ancient fauna of the dry mountainous regions of Mediterranean Asia. The relict occurrence of these species north of the isolating forest belt of western Transcaucasia is additional evidence of former continuous northward extension of the xeric Mediterranean fauna and flora. Such relicts extend much farther westward along the parallel ridges of the northern Caucasus than has been recognized. The relict xerothermic elements appear to be in a state of progressive development.—*T. H. Hubbell.*

5837. WU, C. F. A list of species of crickets from the China Coast. *Nat. Hist. Soc. Fukien Christian Univ. Foochow, China* 2: 25-26. 1929.—36 spp. are listed.

PROCHORDATA

(See also in this issue Entries 3024, 3044, 3295, 3306, 3310, 3313, 3314, 3315, 3317, 3320, 3322, 3329, 3331, 3332, 3333, 3334, 3339, 3345, 3352, 3353, 3762, 3922, 3947, 4219, 4268, 4315, 4340, 4345, 4349, 4384, 4520, 5254, 5255, 5259, 5261, 5302, 5344, 5352, 5372, 5375, 5384, 5393, 5473, 5493, 5496, 5574, 6048)

5842. BAILLY, M. PIERRE. Description d'un stomiatide nouveau de la région des Iles Canaries. *Bull. Mus. Nat. Hist. Nat. [Paris]* 2(4): 378-382. 1 pl., 6 fig. 1930.—**PAREUSTOMIAS** (p. 378) (Stomiatidae), with *P.* **chabanaudi*** north Atlantic, Lat. 28° 21′ N., 17° 40′ W. from a depth of 1900 meters; type in Mus. Nat. Hist. Paris.—*Evermann & Clark.*

5843. BOLTON, LLOYD L. Sockeye tagging on the Fraser River, 1928. *Bull. Biol. Board Canada* 16. 8p. Map. 1930.—Details are given of the tagging of 402 fish (*Oncorhynchus nerka*) in the lower Fraser River between July 28 and Sept. 8. At the time of writing the report, there had been returned 61 tags, 5 of which were accompanied by insufficient or obviously incorrect information so that the conclusions were drawn from only 56 fish. They are as follows: The fish normally transfer from salt water to fresh in a gradual and rather leisurely manner; any attempt to hasten this transfer is in general likely to be unsuccessful, the fish tending either to return towards the sea or remaining where liberated for some time before proceeding up stream. The handling necessary for the transportation of the fish is also a disturbing factor. The normal rate of movement up stream is slow, the average being probably about 4 miles a day.—*Evermann & Clark.*

5844. CHABANAUD, PAUL. Sur la taxonomie des soléidés du Nouveau-Monde. *Bull. Mus. Nat. Hist. Nat. [Paris]* 2(3): 260-268. 1930.—Following a discussion of early descriptions and an examination of types, the author gives a synopsis of the subfam. Soleinae including the genus *Achirus* and of the subfam. Trinectinae including the genera *Trinectes, Baeostoma,* and *Catathyridium.—Evermann & Clark.*

5845. CHABANAUD, PAUL. Sur quelques poissons de la famille des soléidés peints par Risso. *Bull. Mus. Nat. Hist. Nat. [Paris]* 2(3): 269-270. 1930.—Risso's descriptions were often not intelligible and his ichthyological collection was destroyed. However, the library of the Museum has an album entitled "333 fishes painted by Risso." Among the soles this enables us to determine what he meant by several of his species; for example: Plate 281, *Monochirus pegusa* Risso = *M. hispidus* Raf.; Pl. 282, *Solea oculata* Risso = *Quensella ocellata* (L.); Pl. 283, *Rhombus mangili* Risso = *Microchirus variegatus* (Donovan); Pl. 284, *R. theophilus* Risso = *Pegusa lascaris* (Risso) *juvenis;* Pl. 285; *Solea polus* Risso = *Pegusa kleini* (Bonaparte).—*Evermann & Clark.*

5846. CHABANAUD, PAUL. Description d'un nouveau Cubiceps (Pisces Stromateidae) de la mer Rouge. *Bull. Mus. Nat. Hist. Nat. [Paris]* 2(5): 519-523. 1930.—*Cubiceps* **dollfusi** (p. 519), closely related to *C. pauciradiatus* and *C. brevimanus,* Red Sea. Seven specimens were obtained in the Gulf of Suez.—*Evermann & Clark.*

5847. CHU, YUANTING T. Bibliography of Chinese fishes. *Peking Soc. Nat. Hist. Bull.* 4(4): 45-65. 1930.—This bibliography aims to include all known publications on Chinese fishes. The main list comprises 194 titles, while a supplement includes 50 papers which have some references to Chinese fishes.

5848. [FILATOV, D. P., and S. N. DUPLAKOV.] ФИЛАТОВ, Д. П., и С. Н. ДУПЛАКОВ. Материалы к изучению рыб Аральского моря. **[Study of fishes of the Aral Sea.]** Бюллетень Средне-Азиатского Государственного Университета. (*Bull. Univ. Asie Centrale [Tashkent]*) 14. 203-230. 1 pl. 1926.—Morphology, ecology, reproduction, geographical distribution, migrations, and industrial aspects of 24 spp., divided into 2 main groups based on character of the spawn and length of spawning period.

5849. FLEMING, R. A. Preliminary report on ex-

periments with marked fishes, 1929-1930. *Proc. and Trans. Liverpool Biol. Soc.* 44: 87-94. 1929/30.—Of 550 marked plaice liberated in the Irish Sea, 34 were recaptured within a few weeks. While some were taken on the same fishing grounds, others showed a general southerly movement through St. George's Channel, several having traveled for 150-200 miles in 9-12 weeks. One went 70 miles north in 5 days.

5850. FOWLER, HENRY W. A collection of fishes from the Texas coast. *Copeia* 1931(2): 46-50. 1 fig. 1931.—A list of 39 spp., with locality and date records and with descriptive notes on some spp.

5851. FOWLER, HENRY W. A synopsis of the fishes of China. Part I. The sharks, rays, and related fishes. Part II. The herrings and related fishes. [To be cont'd.] *Hong Kong Naturalist* 1(1): 24-34. 7 fig.; (2): 79-88. 5 fig.; (3): 129-138. 7 fig.; (4): 177-189. 5 fig. 1930. 2(1): 69-79. 7 fig.; 2(2): 111-123. 14 fig. 1931.—This is an account, by systematic groups, of the fishes reported from China. Brief diagnoses and keys are given for families and genera, and there are keys to the spp. of some genera. Under each sp. the original reference and type locality are cited, together with other references pertaining to China. These are followed by a brief description and a statement of general distribution. Chinese common names are supplied in some cases. Many of the spp. are figured.

5852. FOWLER, HENRY W. Fishes obtained by the Barber Asphalt Company in Trinidad and Venezuela in 1930. *Proc. Acad. Nat. Sci. Philadelphia* 83: 391-410. 6 fig. 1931.—A systematic list of 106 spp. from Trinidad and 37 spp. from Venezuela, with locality and date records, and with descriptive notes for some of the spp. *Tachysurus* **atroplumbeus*** (p. 394), Trinidad; **PELTATETRAOPS** (p. 396), n. subg. of *Anableps* Bloch, type *A. microlepis* Müller & Troschel; *Menidia venezuelae* Eigenm. (=*Kirtlandia beani* Meek & Hildebrand); **TIGRIGOBIUS** (p. 401), n. subg. of *Gobiosoma* Girard, type *G. macrodon* Beebe & Tee-Van; *Brannerella* **guttata*** (p. 401), Trinidad; **POROALTICUS** (p. 403), Blenniidae, related to *Blennius*, type *P.* **sewalli*** (p. 403), Trinidad; *Thalassophryne* **wehekindi*** (p. 404), Trinidad; *Anchoviella* **venezuelae*** (p. 406), Venezuela. Types of new spp. in Acad. Nat. Sci. Philadelphia.

5853. GOODRICH, E. S. On the relationship of the ostracoderms to the cyclostomes. *Proc. Linnean Soc. London* 142. 45-49. 1929/30(1931).—The author reviews some of the characters on which Stensiö based his claim of relationship between these groups. He concludes that the Petromyzontia and the Myxinoidea together form a single monophyletic group; and that, even if derived from some remote cephalaspidomorph ancestor, the modern cyclostomes must have acquired some of their most conspicuous special characteristics after they had diverged from the cephalaspidomorphs. The evidence for the theory that the cyclostomes are the degenerate descendants of the Palaeozoic cephalaspidomorphs is still weak.

5854. GRAY, J., and S. B. SETNA. The growth of fish. IV. The effect of food supply on the scales of Salmo irrideus. *Jour. Exp. Biol.* 8(1): 55-62. 1931.—*S. irrideus* fed continuously throughout the year exhibit on their scales no seasonal periodicity in the distance apart of their eccentric ridges or rings. Similar fish fed with abundant food form on a proportion of their scales abnormally wide rings even during the winter months. Fish fed with limited diet developed abnormally narrow rings. The width of the rings is probably closely associated with growth rate.—*J. M. Robson.*

5855. GUDGER, E. W. Fishes with two mouths. *Amer. Mus. Novitates* 444. 7p. 9 fig. 1930.—In a yellow perch (*Perca flavescens*) with 2 mouths, the second or lower mouth was formed by an accidental tearing away from the lower jaw of the whole floor of the mouth and the hyoid region. Figures and descriptions are also given of a similar 2-mouthed *Gadus luscus* from England, a *Salmo fario* and a *Thymallus vulgaris* from Sweden, and a *Lophius piscatorius* from Nice, France. Three of these 5 fishes were hooked in the lower mouth, whence it is inferred that this is functional and most used.—*E. W. Gudger.*

5856. GUDGER, E. W. Ichthyomyzon concolor in the Coosa River at Rome, Georgia, with notes on other lampreys in our south Atlantic and Gulf drainages. *Copeia* 4. 145-147. 1930.—Seven medium-sized adults (5 parasitic on one cat-fish) are described with measurements and tooth counts. This is the first record of these fishes in the Alabama River system and apparently the first for the Gulf of Mexico drainage. *Petromyzon marinus* is on record in the waters of both N. and S. Carolina, and from the east coast of Florida, but apparently not recorded from Georgia or the Gulf drainage.—*E. W. Gudger.*

5857. HARDENBERG, J. D. F. Some remarks on the genus Chirocentrus (Cuv.). *Treubia* 12(1): 51-65. 1930.—Statistical differences were found between the 2 spp. of *Chirocentrus*, i.e., *C. dorab* Forsk. and *C. hypselosoma* Bleeker, in respect to the length: height relation, length of head: height of head relation, caudalis-dorsalis: height of caudal peduncle relation, and the head: length relation. *C. dorab* has the larger scales, and one more ray in pectoral. Gill rakers of *dorab* usually 3-14/15; *hypselosoma* 5-16/17. *Dorab* has 2-4 more vertebrae. *Hypselosoma* has a longer maxillary. The samples studied may embrace more than one race of each species. The distributions overlap. There is evidence that ♂♂ of *C. hypselosoma* are much smaller than ♀♀.—*J. H. Wales.*

5858. HEINTZ, ANATOL. The anterior-lateral plate in Titanichthys. *Ann. and Mag. Nat. Hist.* 8(44): 208-212. 3 fig. 1931.—A specimen described by Claypole in 1893 as the "left premaxillary" of a new form, *Dinichthys clarki*, proves to be the anterior-lateral plate* of a *Titanichthys* sp. The development and specialization of this plate in various Arthrodira (*Coccosteus**, *Dinichthys**, *Titanichthys*, and *Heterostius**) are traced.

5859. HODGSON, WILLIAM C. Investigations into the age, length and maturity of the herring of the southern North Sea. Part III. The composition of the catches from 1923 to 1928. (A section on the hydrography of the area by J. R. LUMBY.) *Min. Agric. & Fish., Fishery Invest.* [*Gr. Brit.*] *Ser. II* 11(7): 3-75. 34 fig. 1929.—Data collected six consecutive years. A preliminary report was published by the author in 1925. Length data were taken by a method described by Wollaston and Hodgson in 1929; age estimates by the usual method of annual growth zones on scales. The stock of herrings in the western part of the southern North Sea forms a definite unit in the herring population of the North Sea as a whole. Return each year of the old stock is shown, and no indication of outstanding additions of fish from other areas where the length at a given age was different from that of the southern North Sea; nor has there been any noticeable migration from the stock. The composition of a "year-class" (fishes with the same number of growth zones) remains constant and is the same for northern and southern samples. Large proportions of winter, autumn, and summer-spawned fish enter into the make-up of big year-classes; lesser ones are composed mainly of one dominant brood. Data on changes in proportion from year to year between the several year-classes do not yet warrant conclusions. Whitebait samples show 3 characteristic groups of modal lengths corresponding to the groups of modes of l_4 found by calculations from the scales of adults; the commonest group in each case being 7-8 cm., a size derived from December–February spawning. Study of the vertebrae, in connection with the temp. and salinity of the water for this area during the spawning months, gives no consistent results, although the author is inclined to the previously advanced view that variation in number depends on temp. conditions at time of hatching. To discover what conditions are necessary to bring about good productivity of the various spawnings, it would be important to form an idea of the intensity of any one spawning season for

the whole North Sea by investigating the composition of the stock of herring in other areas.—*F. LaMonte.*

5860. **JORDAN, DAVID STARR, BARTON WARREN EVERMANN, and HOWARD WALTON CLARK.** Check list of the fishes and fishlike vertebrates of North and middle America north of the northern boundary of Venezuela and Colombia. U. S. Dept. Commerce Bur. Fisheries Report U. S. Fish Com. for 1928. Pt. II, Bur. Fish Doc. 1055. pp. 1-670. 1930.—A revision of the Jordan & Evermann Check-List of 1896, containing in as natural sequence as our present knowledge permits (1) the names of all species and subspecies that the authors admit as valid, (2) as many of the vernacular or common names for each species as have been readily obtainable, (3) the known geographic distribution of each species, (4) the reference to every real synonym. Thus, this work is really a check-list of all the scientific names that have ever been applied to any American fish. Three hundred eleven families are included, represented by 1490 genera, or 4137 species.—*Evermann & Clark.*

5861. **[KAGANOVSKIĬ, A.]** КАГАНОВСКИЙ, А. Гибрид между жерихом и язем. **Aspius aspius taeniatus n. iblioides × Leuciscus idus oxianus. [A hybrid between Aspius and Leuciscus.]** [English summary.] Бюллетень Средне-Азиатского Государственного Университета. (*Bull. Univ. Asie Centrale* [*Tashkent*]) 14. 63-64. 1 pl. 1926.—Description and table of dimensions of a specimen* from the Aral Sea.

5862. **LERICHE, MAURICE.** Les poissons du Crétacé marin de la Belgique et du Limbourg hollandais. (Note préliminaire.) Les résultats stratigraphiques de leur étude. *Bull. Soc. Belge Géol. Paléont. et Hydr.* 37(3): 199-318. 19 fig. 1927(1929).—Records from the Cretaceous of this region the following elasmobranchs (Selachii), *Acanthias appendiculatus; Squatina* **hassei*** (p. 206), Holland; *Ptychodus decurrens; P. mammillaris; P. rugosus; P. latissimus; P. polygyrus; Rhombodus binckhorsti; Corax falcatus; C. pristodontus; Pseudocorax laevis; P. affinis; Hybodus (Polyacrodus) woodwardi*; H.(?)dewalquei; Acrodus dolloi; Synechodus* **nerviensis*** (p. 230), Belgium; *S. faxensis; Cestracion rugosus; Ginglymostoma minutum; Scapanorhynchus rhaphiodon, S. (?) subulatus; Odontaspis macrorhiza; O. bronni; Lamna appendiculata; L. serrata; L. venusta; L. crassa; L. semiplicata; L. (?) arcuata; Oxyrhina mantelli; O. acuminata; O. angustidens; Ischyodus lonzeensis*; Edaphodon* **ubaghsi*** (p. 257), Belgium; *Elasmodus greenoughi; E.* **planus*** (p. 261), Holland. Teleosteii: *Coelodus* **glauconiensis*** (p. 264), Belgium; *Anomoeodus munsteri, A. subclavatus; A. fraiponti; A.* **foriri** (p. 268), Holland; *Athrodon tenuis; Acroteminus splendens; Protosphyraena ferox; Belonostomus cinctus; Portheus* sp.; *Enchodus faujasi; E. lemonnieri; Apateodus corneti; Climolichthys* sp.; and *Cylindracanthus cretaceus.* In addition to the above listed fishes the author records the presence of many echinoderms, a few brachiopods, pelecypods, and cephalopods, and the decapod, *Hoploparia muncki,* the chelonians *Glyptochelone suyckerbuyki* and *Allopleuron hoffmanni;* the plesiosaurian, *Plesiosaurus houzeaui;* and the mosasaurians, *Hainosaurus bernardi, Plioplatecarpus houzeaui, Prognathosaurus solvayi, P. giganteus,* and *Mosasaurus lemonnieri.*—*D. J. MacNeil.*

5863. **NICHOLS, J. T. Some Chinese fresh-water fish synonyms.** *Peking Nat. Hist. Bull.* 5(2): 15-26. 1930.—An attempt to correlate the nomenclature in 2 taxonomic papers on Chinese fresh water fishes published almost simultaneously in 1928 without possible reference to one another, namely by Rendahl, *Arkiv. für Zool.* 20A (I, No. 1). p. 1-194 [see B. A. 5(1): entry 3424], and Nichols, *Bull. Amer. Mus. Nat. Hist.* 58(1): p. 1-62 [see B. A. 4(1): entry 3072]; and to allocate names more or less current in recent literature. No new names are proposed.—*J. T. Nichols.*

5864. **NICHOLS, JOHN TREADWELL. Egg capsule of Scyliorhinus retifer.** *Copeia* 1931(2): 38-39. 1 fig. 1931.—Description of egg capsule*, presumably of *S. retifer,* taken from stomach of a sea bass off the Atlantic Coast of the United States.

5865. **PATTEN, WILLIAM.** New ostracoderms from Oesel. *Science* 73(1903): 671-673. 1931.—Ostracoderms from the Up. Silurian, Oesel Isl., Baltic Sea, with data showing their genetic relationship to sea scorpions: *Trematapis milleri* (p. 672), *Trematapis* **mammillata** (p. 672), **DARTMUTHIA,** representing a new family **DARTMUTHIDAE** (p. 672), in some respects intermediate between the Cephalaspidae and Trematapidae, with *D. gemmifera.*

5866. **PELLEGRIN, JACQUES.** Les barbeaux d'Espagne. *Bull. Mus. Nat. Hist. Nat.* [*Paris*] 2(5): 510-515. 1930.—The immense genus *Barbus,* which has 2 representatives in France, has 4 in Spain, the distribution of which is given in detail. Attention is called to 2 ♂ specimens of *B. bocagei,* which, during the breeding season, were provided with many nuptial tubercles or "pearl-organs," these being rare in this genus. The species of *Barbus* are exceedingly variable, and hybridism occurs, not only between different species of the genus, but even between *Barbus* and fishes of different genera; thus Steindachner described a hybrid between *Barbus bocagei* and *Chondrostoma polylepis.* For the purpose of comparison, the spp. of North Africa (Barbary, Morocco, and the Sahara) are discussed. In general, though there are exceptions, the more northern species have smaller scales, and therefore a greater number along the lateral line. An analytical key is given to 17 spp. of the genus.—*Evermann & Clark.*

5867. **[POPOV, A. M.]** ПОПОВ, А. М. К познанию ихтиофауны крымского побережья Черного моря. **[Ichthyofauna of the Black Sea coast of Crimea.]** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(9): 211-216. 1930.—Ecological distribution of 56 spp., of which *Spratella serdinka, Pomatoschistus minutus,* and *Syngnathus schmidti* are recorded near the Crimean shores for the first time, and *Box boops* is new for the Black Sea. The author also found a rare hybrid *Acipenser stellatus × A. guldenstaedti,* and a new hybrid *Atherina pontica × A. hepsetus.*

5868. **[POPOV, A. M.]** ПОПОВ, А. М. О новом роде рыб Davidijordania (Zoarcidae, Pisces) в Тихом Океане. **[A new genus of fishes, Davidijordania, in the Pacific Ocean.]** [English summary and diagnosis.] Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1931(8): 210-215. 1931.—**DAVIDIJORDANIA** (p. 212), compared with *Lycenchelys,* type *D.* **lacertina** (*Lycenchelys lacertinus* Pavlenko) (p. 213), including also *L. ornatus* Soldatov and *L. poecilimon* Jord. & Fowler. *Hadropareia* **brachyrhynchus** (*Lycenchelys b.* Schm.) (p. 211); *Lycodes* **fasciatus** (*Lycenchelys f.* Schm.) (p. 212). No true representatives of *Lycenchelys* are found in the Pacific, the genus being confined to the north Atlantic.

5869. **REID, MARGARET E. The distribution and development of the Cunner (Tautogolabrus adspersus Walbaum) along the eastern coast of Canada.** *Contr. Canadian Biol. and Fish.* 4(25/29): 433-441. 1929.—Data were obtained by examining tows taken at 5 points along the eastern coast of Canada. In the Gulf of St. Lawrence spawning probably begins early in June, but the most favorable season is from early July to early Aug. Somewhat similar conditions obtain in St. Mary Bay. In the Shelburne region and in Passamaquoddy Bay conditions were found to be unfavorable. Low temp. is believed to be the factor accounting for the lack of success in the latter 2 regions.—*J. R. Dymond.*

5870. **SANZ ECHEVERRÍA, JOSEFA. Investigaciones sobre otolitos de peces de Melilla. [Otoliths of the fishes of Melilla.]** *Bol. R. Soc. Españ. Hist. Nat.* 29(2): 71-80. 2 pl., 1 fig. 1929.—A study made at Melilla, northern Spain, of otoliths from 19 spp. of fishes. Measurements and a full description of the otoliths is given, but no measurements of the fishes from which they were taken. Attention is called in the résumé to possible use of the otoliths in the identification of families.—*L. A. Adams.*

5871. **SCHMIDT, P.** On the Pacific halibut. Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(8): 203-208. 4 fig. 1930.—The halibut of the Pacific coast of N. Amer., hitherto regarded as identical with the Atlantic species, *Hippoglossus hippoglossus** L., proves to be *H. stenolepis** Schmidt, 1904, described from the Sea of Okhotsk. The characters of the 2 spp. are compared in detail.

5872. **SCHMIDT, P., and G. LINDBERG.** On a new Japanese fish, Paracanthochaetodon modestus n. gen. et sp. (Chaetodontidae). Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(17): 468-470. 1930.—**PARACANTHOCHAETODON** (p. 469), near *Holacanthus*, type *P.* modestus (p. 469), Japan; type in Zool. Mus. Russian Acad. Sci.

5873. **SCHROEDER, WILLIAM C.** An account of the fishes dredged by the Albatross II along the continental slope south of New England in February and March, 1929. *Copeia* 1931(2): 41-46. 1931.—Little systematic dredging has been done in this area during the past 35 years. The present account records 22 spp. taken in 3 hauls between latitudes 37° and 41° N., at depths of 28 to 100 fms. It consists chiefly of descriptive and taxonomic notes. *Argentina striata*, first record outside of Gulf of Mexico; *Hypoclydonia bella* Goode & Bean, emended description; *Merluccius bilinearis* shows little growth during the first winter, and attains a length of about 250 mm. by the second winter.

5874. **SCHULTZ, LEONARD P.** Hermaphroditism in the striped bass. *Copeia* 1931(2): 64. 1931.—*Roccus saxatalis*.

5875. **SMITH, HUGH M.** A new name for a Siamese goby. *Copeia* 1931(2): 64. 1931.—*Rhinogobius* simulans (*R. similis* Smith, not Gill).

5876. **SMITH, HUGH M.** The osteoglossid fish Scleropages in Siam. *Copeia* 1931(2): 64. 1931.—First record of Osteoglossidae on mainland of Asia (*Scleropages formosus* in Siam).

5877. **WHITLEY, GILBERT P.** Studies in Ichthyology. No. 4. *Rec. Australian Mus.* 18(3): 96-132. 6 pl., 2 fig. 1931.—[See also B. A. 3(7/8): entry 16844; and 5(4): entry 13034.] Rajidae: **IROLITA** (p. 97), related to *Psammobatis* Günther, type *I.* waitii (*Raja v.* McCulloch) (p. 97); *Malacorhina* Garman replaces *Psammobatis* Günther, preoccupied by *Psammobates* Fitzinger. Dasyatidae: *Taeniura lymnia* halgani* (*Trygon h.* Less.) (p. 97); *Pastinachus sephen* ater (*Taeniura atra* Macleay=*T. mortoni* Macleay) (p. 99). Muraenidae: Bleeker's selection of *G. reticularis* as the type of *Gymnothorax* Bloch is upheld. Syngnathidae: *Phyllopteryx* lucasi* (p. 102), W. Australia. Myctophidae: *Lampanyctus* piabilis* (p. 103), Macquarie Isl. Hemiramphidae: **LOLIGORHAMPHUS** (p. 105), type *L.* normani* (p. 105), Queensland. Cobitidae: **ENOBARBICHTHYS** (*Enobarbus* Whitley, not *Aenobarbus* Temminck) (p. 107). Carangidae: **ZAMORA** (p. 108), type *Z.* hulliana (*Caranx hullianus* McCulloch) (p. 108); **PANTOLABUS** (p. 108), near *Alepes* Swainson, type *P.* parasitus* (*Caranx p.* Garman) (p. 108), redescribed; *Selene vomer* (L.) (=*Stromateus depressus* Perry). Chaetodontidae: *Microcanthus* joyceae* (p. 111), Queensland and New S. Wales; *M.* vittatus* (*Neochaetodon vittatum* Castelnau) (p. 112); *M.* howensis* (p. 112), Lord Howe Isl. Coridae: **HALINANODES** (p. 113), type *H.* leucostigma (*Halichoeres l.* Fowler & Bean) (p. 113), new to Australia (N. Australia); *Pseudanampses* Bleeker (=*Ampheces* Jordan & Snyder); *Anampses geographicus* Cuv. & Val., designated as type. Cheilinidae: *Cheilinus fasciatus* (Bloch) (=*Sparus bandatus* Perry). Callionymidae: **YERUTIUS** (p. 115), related to *Callionymus*, type *Y.* apricus (*Callionymus a.* McCulloch) (p. 115), including also *C. phasis* Günther and *C. rubrovinctus* Gilbert. Platycephalidae: *Neoplatycephalus castelnaui** (Macleay), emended description. **GLYPTAUCHENIDAE** (p. 117), erected for *Glyptauchen* Günther; *G. panduratus* deruptus (p. 117), S. Australia [type dep. not given]; *G.* insidiator* (p. 118), N. S. Wales; *G. i.* mirandus (p. 120), Tasmania. Notograptidae: *Notograptus* livingstonei (p. 120), W. Australia. Gobiidae: *Parvigobius* Whitley, first diagnosis; *P. immeritus* Whitley, emended description and first record for N. S. Wales. Aluteridae: *Navodon* Whitley, emended diagnosis. Diodontidae: *Allomycterus* McCulloch was based upon a specimen which was wrongly identified with *Diodon jaculiferus* Cuvier, and which is now made the type of a new sp., *A.* pilatus (p. 125), N. S. Wales; this sp. becomes the genotype of *Allomycterus;* **TRAGULICHTHYS** (p. 125), near *Allomycterus*, type *T.* jaculiferus* (*Diodon j.* Cuvier) (p. 126). Molidae: *Mola* ramsayi* (*Orthragoriscus r.* Giglioli) (p. 126) is removed from the synonymy of *M. mola* and revived for the Australian and New Zealand sp.; an emended description is given, and early records for N. S. Wales are reviewed. Except where otherwise given, types of new spp. are in Australian Mus.

5878. **WU, HSIEN-WEN.** Description de poissons nouveaux de Chine. *Bull. Mus. Nat. Hist. Nat.* [*Paris*] 2(3): 255-259. 1930.—*Parasilurus asotus* longus* (p. 255), from a mountain stream, Chekiang Province; *Amblyceps* marginatoides* (p. 256) (closely related to *A. marginatus* Günther), Szechwan Province; *Botia* tientainensis* (p. 258) from a mountain stream, Chekiang Province, is compared with *B. pratti* Günther.—*Evermann and Clark.*

AMPHIBIA AND REPTILIA

G. K. NOBLE, *Editor,* Amphibia

KARL PATTERSON SCHMIDT, *Editor,* Reptilia

(See also in this issue Entries 3024, 3044, 3312, 4067, 5260, 5265, 5303, 5308, 5330, 5353, 5378, 5383, 5387, 5388, 5425, 5862, 6013, 6043)

GENERAL

5879. **BURT, CHARLES E.** Herpetological results of the Whitney South Sea Expedition IV. Descriptions of new species of lizards from the Pacific islands (Scincidae). *Amer. Mus. Novitates* 427. 1-3. 1930.—*Emoia* murphyi (p. 1), Savaii Isl., Samoa; *E.* whitneyi (p. 1), *Sphenomorphus* taylori (p. 2), *Tribolonotus* blanchardi (p. 2) and *T.* schmidti (p. 3), Solomon Isls. Types in Am. Mus. Nat. Hist.

5880. **KINGHORN, J. R.** Herpetological notes. No. 2. *Rec. Australian Mus.* 18(3): 85-91. 3 fig. 1931.—Notes on taxonomy, distribution, and habits of various spp. *Chersydrus granulatus*, new to Solomon Isls.; *Egernia whitei* carnarae (p. 88) and *Tiliqua occipitalis* auriculare (p. 88), W. Australia, types in Australian Mus.; *Lygosoma albertisii*, new to Queensland; *Amphibolurus barbatus*, mating ceremonial described.

5881. **WU, HSIEN-WEN.** Herpetological notes from Hangchow. *Nation. Central Univ. Sci. Repts.* [*Nanking*] *Ser. B* 1(1): 51-58. 2 fig. 1930.—Annotated list of 6 Amphibia, 4 Sauria, and 2 Serpentes including *Takydromus septentrionalis** Guenth. and *Eumeces elegans** Blgr.

AMPHIBIA

5882. **ADAMS, L. A., and H. T. MARTIN.** An addition to the urodele fauna of Kansas from the Lower Pliocene. *Bull. Univ. Kansas, Sci. Bull.* 19(2): 289-291. 3 pl. 1930.—Descriptive notes on *Plioambystoma kansense** [See B. A. 4(4): entry 13640.] The associated vertebrate fauna is listed.

5883. BLANCHARD, FRANK N., and FRIEDA COBB BLANCHARD. Size groups and their characteristics in the salamander Hemidactylium scutatum (Schlegel). *Amer. Naturalist* 65(697): 149-164. 5 fig. 1931.—Evidence is presented in favor of the view that *Hemidactylium* attains sexual maturity near the end of its 3rd season of life, i.e., when it is approximately 2½ yrs. old. Juveniles in their 1st autumn can be recognized by their small size (about 26-41 mm. of total length) and by their short tails (less than the length of the body measured to the posterior insertion of the hind leg). There is practically no difference in length between the sexes at this age, but the mean for the ♀♀ is slightly, perhaps significantly, greater than that for the ♂♂. Juveniles in their 2nd autumn are distinctly longer than the yearlings, but as a group they overlap in length the shorter portion of the adult group. The ♀♀ average about 4 mm. longer than the ♂♂. The relative length of the tail is not significantly different between the sexes at this age. It is distinctly different, however, from that of the yearlings, for it is nearly always longer than the body. The adults are, of course, larger than the juveniles, except for some overlapping. The ♀♀ are longer by 9½ mm., on the average, than the ♂♂, and, when bearing eggs, have distinctly wider abdomens. The ♂♂ have relatively longer tails than the ♀♀, and are recognizable otherwise by differences in the shape of the head. There is some evidence that differences in local conditions may have a decided influence on the sizes attained by the different populations.—*Authors' summary.*

5884. FOSI, VITTORIA. L'ibernazione dei girini di Rana esculenta nel Senese. Nota preliminare. [Hibernation of tadpoles of R. esculenta near Siena, Italy. Preliminary note.] *Boll. Zool.* [*Napoli*] 2(2): 67-75. 1931.

5885. HSU, HSI-FAN. A new giant frog of Amoy. *Contrib. Biol. Lab. Sci. Soc. China. Zool. Ser.* 6(3): 19-23. 3 fig. 1930.—*Rana* **nantaiwuensis***.

5886. LANTZ, L. A. Description of two new salamanders of the genus Hynobius. *Ann. and Mag. Nat. Hist.* 7(38): 177-181. 1 pl. 1931.—*Hynobius* **hirosei*** (p. 177), Shikoku, and *H.* **longimanus*** (p. 178), Hondo, Japan; *H. peropus** Boulenger is described for differentiation.

5887. LATSKY, LULU. Die Sistematiese posiesie van Heleophryne met Betrekking tot die Klassifikasie van Noble (1922). [With English summary] *S. African Jour. Sci.* 27: 442-445. 4 fig. 1930.—According to Noble's classification of the Anura (1922), *Heleophryne* is considered a toothed bufonid (leptodactylid). The vertebral column, used by Noble to distinguish between the 4 suborders, is exactly the same in *Heleophryne* as in Diplasiocoela. The thigh musculature, considered by Noble of additional taxonomic value in subdividing the Anura, is useless in the case of *Heleophryne* in determining the suborder to which it belongs, since it does not agree with that of any of the suborders. Therefore, the vertebral column is the only characteristic which can be used for this purpose and *Heleophryne* should consequently be classified under the Diplasiocoela. The peculiar constitution of the breast-shoulder apparatus makes it practically useless for classificatory purposes. Since the adult form is firmisternous, it is not impossible to classify *Heleophryne* under the Diplasiocoela. According to the shape of the sacral vertebrae, the only anatomical characteristic used by Noble to distinguish between the 2 diplasiocoelous families, *Heleophryne* should be regarded as a ranid. *Heleophryne,* therefore, approximates more closely to the Ranidae than to any other family of the Anura.—*From author's summary.*

5888. LATSKY, LULU. A synopsis of researches relating to the validity of the South African Brevicipitidae as an autonomous family of the Anura. *S. African Jour. Sci.* 27: 451-455. 1930.—The author investigated the vertebral column, thigh musculature, breast-shoulder apparatus, ear region, and larval specializations of various species, in order to test the validity of the characters used by Noble in separating the families Ranidae and Brevicipitidae. The material included all the S. African and 3 foreign genera of Brevicipitidae and 2 S. African genera of Ranidae. The author concludes that the characters so far used in distinguishing the two families are unreliable; that the S. African Ranidae and Brevicipitidae can not be separated on either anatomical or embryological grounds; and that the Brevicipitidae in general are not an autonomic family.

5889. LIU, CH'ENG-CHAO. Secondary sexual characters and sexual behavior in Peping toads and frogs. *Peking Nat. Hist. Bull.* 5(2): 49-52. 1930.—The spp. treated are *Bufo bufo asiaticus, B. raddei, Rana nigromaculata, R. plancyi,* and *Kaloula borealis.* Secondary sexual characters of color and structure (more distinct in toads than in frogs) and sexual behavior of each are described. Female toads not ready for mating feign death if grasped by a ♂. Such a reaction is never seen in frogs. At the time of egg-laying the ♀ toad moves around with the ♂ on her back. A ♀ frog will not move around until all the eggs are discharged.

5890. LIU, CH'ENG-CHAO. Time table of the life history of North China frogs and toads. *Peking Nat. Hist. Bull.* 5(2): 53-58. 1930.—A brief summary of the life history and habits of the 8 common frogs and toads of North China, including data on size, color, hibernation, habitat, egg-laying, eggs, and tadpoles.

5891. MERTENS, ROBERT. Die von Dr. F. Kopstein auf den Molukken und einigen benachbarten Inseln gesammelten Froschlurche. *Zool. Mededeel.* [*Leiden*] 13(3/4): 141-150. 2 fig. 1930.—A systematic list of 10 spp. of Anura, with locality records and descriptive and taxonomic notes. A number of species are new to some of the islands. *Hylophorbus* **amboinensis*** (p. 145), Amboina; *H.* **kopsteini*** (p. 147), Sanana Isl.; types in Leiden Mus.

5892. MYERS, GEORGE S. Notes on some amphibians in western North America. *Proc. Biol. Soc. Washington* 43: 55-64. 1930.—Distributional data on some western amphibians, based on material in the collections of Stanford Univ. and on field work during the past 2 years, are given. *Bufo canagicus* **canagicus** (*B. boreas* Baird & Girard) (p. 61) for the common toad of the Pacific Coast; the change also involves the common toad of California, a southern subspecies, which must now be known as *B. c.* **halophilus** (B. & G.).—*S. C. Bishop.*

5893. MYERS, GEORGE S. The status of the Southern California toad, Bufo californicus (Camp). *Proc. Biol. Soc. Washington* 43: 73-78. 1930.—A careful comparison of *Bufo cognatus,* the Desert toad, with *B. cognatus californicus* together with observations on habitats, calls, and distribution has convinced the writer of the specific distinctiveness of the 2 forms and for the latter the name *B.* **californicus** (Camp) is proposed.—*S. C. Bishop.*

5894. NOBLE, RUTH CROSBY. Pine barren pixies. *Nature Mag.* 17(4): 225-228, 266. 11 fig. 1931.—A popular account of the voice and breeding habits of *Hyla andersonii* in New Jersey, with flashlight photographs of calling ♂♂.

5895. OKADA, YAICHIRO. Notes on Japanese frogs. *Annot. Zool. Japonenses* 11(4): 269-277. 1928.—This paper is based on the examination of the coll. of frogs in Mus. Zool. Inst., Tokyo Imp. Univ., containing the following: *Bufo vulgaris* **yakushimensis** (p. 269), Kagoshima Prefecture; *B. v.* **hokkaidoensis** (p. 269), Hokkaido; *Rana* **tagoi** (p. 271), Gifu Prefecture; *Rhacophorus schlegelii* v. *arborea* (Okada & Kawano) and *R. s.* var. *intermedia* (Okada & Kawano) are described; *Rana nigromaculata coreana* and *R. temporaria coreana,* originally described in Japanese (Jour. Chosen Nat. Hist. Soc. No. 6, March, 1928), are here described in English.

REPTILIA

5896. COCHRAN, DORIS M. New reptiles from Beata Island, Dominican Republic. *Proc. Biol. Soc. Washington* 44: 89-92. 1931.—*Anolis dominicensis* **wetmorei** (p. 89);

Uromacer wetmorei (p. 91); *Leimadophis parvifrons* lincolni (p. 91). Types in U. S. Nat. Mus.

5897. GILMORE, CHARLES W. A new species of troödont dinosaur from the Lance formation of Wyoming. *Proc. U. S. Nation. Mus.* 79(9): 1-6. 5 pl. 1931.—*Troödon* Wyomingensis* (p. 1), Up. Cretaceous, type in U. S. Nat. Mus. Figures are given of dermal skull bone and skull bone of 3 unidentified *Troödon* species, and of skull bone of *T. formosus* Leidy. Notes on these specimens are included.

5898. MARCH, D. D. H. Two deaths from one snake bite (Bothrops atrox). *Bull. Antivenin Inst. America* 2(4): 106. 1929.—The death is reported of 2 persons in consequence of one *B. atrox* bite: a man who received the bite of the snake and his wife who probably absorbed some venom through her lacerated finger tips while bathing her husband's punctures.—*A. do Amaral.*

5899. MILLER, N. C. E., and H. T. PAGDEN. Insect remains in the gut of a cobra, Naia tripudians. *Nature [London]* 127(3210): 706. 1 fig. 1931.—This snake, taken in the Federated Malay States, contained heteropterous, coleopterous, and hymenopterous insects.

5900. PING, C. Notes on the shell of a land tortoise from the ancient ruins of Annyang. *Bull. Fan Memor. Inst. Biol.* 1(13): 217-226. 3 fig. 1930.—Although the bones of the head and neck and appendages are missing, the essential characters of the shell enable the author to describe it as *Testudo* anyangensis*.

5901. [RĪABININ, A. N.] РЯБИНИН, А. Н. Mandschurosaurus amurensis nov. gen. nov. sp., верхнемеловой динозавр с р. Амура. (Mandschurosaurus amurensis nov. gen. nov. sp. A Hadrosaurian dinosaur from the Upper Cretaceous of Amur River.) [In Russian and English.] Русское Палеонтологическое Общество. Монографии. (Soc. Paléont. de Russie. Mém.) 2. 1-36. Map, 2 pl., 4 fig. 1930.—**MANDSCHUROSAURUS** (p. 15) (Hadrosauridae), erected for *M.* amurensis* (*Trachodon amurense* Riabinin) (p. 15). This genus is referred to the Hadrosaurinae, and is considered intermediate between *Kritosaurus* and *Orthomerus*. The complete skeleton is described. The deposits in which it was found are believed to be not older than the Belly River or the top of the Senonian—instead of the Lance formation, as formerly assumed. There is a detailed discussion of the classification of the Hadrosauridae and the Trachodontidae.

5902. SLEVIN, JOSEPH R. A note on the discovery of the genus Typhlops in the Hawaiian Islands. *Copeia* 1930(4): 158. 1930.—*Typhlops braminus,* new to Hawaii.

5903. THOMSON, DONALD F., [and C. H. KELLAWAY]. Observations on the venom of a large Australian snake, Pseudechis australis (Gray). I. DONALD F. THOMSON. Synonymy. II. KELLAWAY, and THOMSON. The venom yields and venom. *Australian Jour. Exp. Biol. and Med. Sci.* 7(3): 125-133. 1 pl., 6 fig.; 134-150. 1 pl. 1930.—I. A series of *P. australis* from Cape York Pen. and another of supposed *P. darwiniensis* in the Macleay Mus. exhibit a graduation in the character used for differentiation of these species, i.e., the proportions of the frontal shield. Similar variation in this character within a well-defined species of the same genus, *P. porphyriacus,* affords supporting evidence of its invalidity as a character for the differentiation of species. *P. darwiniensis* is a synonym of *P. australis. P. cupreus* Boulenger is also placed in the synonymy of *P. australis.* II. There seems to be little evidence of any neurotoxic action by this venom, the only hints of such action being afforded by the ptosis which occurs as an early symptom in monkeys, the effects on the blood pressure of rabbits, and the failure of respiration which in some species is the terminal event following its injection. Unlike most other Australian venoms it has a striking action on the heart muscle. Possibly the venom contains a haemorrhagin though this, if present, plays no striking rôle in causing death.

5904. WIMAN, C. Parasaurolophus tubicen n. sp. aus der Kreide in New Mexico. *Nova Acta R. Soc. Sci. Upsaliensis* 7(5): 1-11. 3 pl. 1931.—*P.* tubicen* (p. 1), based on a skull from the Ojo-Alamo formation; type in Univ. of Upsala. The author regards the casque of the Lambeosaurinae as a resonance organ, analogous to the avian syrinx.

(See also in this issue section Economic Ornithology; and Entries 3024, 3044, 3298, 3904, 5248, 5260, 5341, 5495, 5588, 6013)

Correction: In preceding issue (6(1):), last line of Entry 2895 should read "are reproduced. A bibliography is given."

GENERAL OR POPULAR

5905. BOETTICHER, H. von. Fr. v. Lucanus, "Das Leben der Vögel" und die Vererbungslehre. *Verhandl. Ornithol. Ges. Bayern* 18(1/2): 176-179. 1929.—Erroneous statements of v. Lucanus on inheritance of sex in birds are corrected in accordance with modern knowledge of heredity.—*H. von Boetticher (transl. by M. M. Nice).*

5906. DIEUZEIDE, R. Un cas d'albinisme incomplet chez un proyer d'Europe. (Miliaria calandra L.) *Actes Soc. Linnéenne Bordeaux, Proc.-Verb.* 80: 36-37. 1928.—Specimens taken in Gironde.

5907. GROEBBELS, FRANZ. Zur Physiologie des Vogelzuges. *Verhandl. Ornithol. Ges. Bayern* 18(1/2): 44-74. 1929.—Various physiological factors in bird migration are discussed. Its inception depends on inner secretions, especially from the sex and thyroid glands. The fat that birds acquire in autumn serves as a source of warmth, energy and food during migration. Temperatures of some birds on the night of migration or the day after proved to be strikingly low.—*M. M. Nice.*

5908. HARDING, Mr. and Mrs. RICHARD B. Juncos with diseased feet. *Bull. Northeastern Bird-Banding Assoc.* 2(2): 39-40. 1926.—Whitish lumps on the toes of several *Junco h. hyemalis.*

5909. HILDEBRANDT, HUGO. Von gemischten Vogelgesellschaften. *Mitteil. Ver. Sächs. Ornithologen* 2(4): 125-132. 1928.—A review of the literature reveals a diversity of opinion on the question of the leadership of mixed companies of such birds as tits, gold-crested wrens, tree creepers, nuthatches, and woodpeckers. The author doubts if there is any individual leadership, for these loose flocks break up readily because of the different requirements of the various species in respect to feeding areas, sleeping quarters, etc. The composition of the groups varies from day to day.

5910. HOFFMANN, BERNH. Aus Bernhard Hantzschs letztem Tagebuch. *Mitteil. Ver. Sächs. Ornithologen* 2(Sonderheft): 5-28. Map, 1 fig. 1929.—This German ornithologist started in 1909 on a voyage to Baffinland, where he died in June, 1911. His notes on the birds of Baffinland have already been published. This presents his ornithological observations during the voyage, including stays at Dundee, Scotland, and Blacklead Island, Baffinland. The notes on 42 forms refer chiefly to distribution and habits. The paper closes with a tribute to Hantzsch's personality.

5911. HOWARD, H. ELIOT. An introduction to the study of bird behaviour. xii+136pp. 11 pl. Macmillan Company. 1929. Pr. $14.00.

5912. LAMBERTON, C. Notes d'ornithologie malgache. Sur une variété albine de Coracopsis nigra Linné. *Bull.*

Acad. Malgache 10: 42. 1927 (1928).—An albinistic specimen from Madagascar is described.

5913. **LAVAUDEN, L.** Les oiseaux des Alpes Françaises. In: *Peuplement des Hautes Montagnes. Mem. Soc. Biogeogr.* [*Paris*] 2: 38-46. 1928.—A discussion of the distribution and particularly the origin of the birds of the high Alpine regions of France. A list of the typical Alpine birds includes 22 resident and 7 summer resident species. No water birds are included and it is believed that northern breeding shore birds taken in the high Alps during the summer belong to the "bandes de célibataries." Survivals of the pre-glacial period are the lammergeier (*Gypaëtus barbatus*) and the dipper (*Cinclus cinclus*) and perhaps the 2 species of chough (*Pyrrhocorax*). There are a number of survivals of this Arctic fauna, which reached the Alps during the glacial period, including the three-toed woodpeckers (*Picoïdes*) and nutcracker (*Nucifraga*). One form, the snowy owl (*Nyctea nyctea*), has probably disappeared since the retreat of the glaciers. The remaining forms have probably reached the Alps by way of central Asia and the Mediterranean. Man has caused the rarity of a few of the game birds, in particular, the rock partridge (*Alectoris graeca*) and the black cock (*Lyrurus*).—*J. Bond.*

5914. **LINSDALE, JEAN M.** A method of showing relative frequency of occurrence of birds. *Condor* 30 (3): 180-184. 3 fig. 1928.—A modification of Raunkaier's method for enumeration of plants by areas as recently quoted by Kenoyer is adapted to ornithology. Frequence of occurrence by days rather than by area is used and is expressed as a % of the number of days of field observation. Data on birds of an area near Geary, Doniphan County, Kansas, enumerated on 200 days in 1921-24 are summarized. Histograms show the distribution of field days by months and the number of species present on the area by months.—*T. I. Storer.*

5915. **LOFFBERG, LILA M.** Bird banding at Florence Lake, 7340 feet altitude [Fresno County, California]. *Condor* 30 (5): 308-314. 1 fig. 1928.—Seventeen species were banded, 1926-28. Data are given on dates of arrival and departure, % of returns, health and injuries in banded and unbanded birds, and habits about the traps. Facts of especial interest: The Clark nutcrackers bury surplus food in the manner of bluejays; 2 Blue-fronted Jays banded here were recovered in Eldorado and Tulare Counties respectively; only ♂♂ of the Cabanis woodpecker winter at this altitude; ♂♂ of the red-winged blackbird arrive on nesting grounds a month before the ♀♀, the latter arriving with the Brewer blackbirds. One Western mockingbird was trapped at this montane station.—*T. I. Storer.*

5916. **LOOS, KURT.** Vierzehnter Bericht über die Tätigkeit der ornithologischen Station des Lotos in Liboch a. d. Elbe für das Jahr 1927. [14th. report of the ornithological station of Lotos in Liboch, Czechoslovakia, for 1927.] *Naturwiss. Zeitschr. Lotos* 77 (5/12): 100-115. 1929.—During the year, 1215 birds of 63 spp. were banded by various collaborators in Czechoslovakia. Among the return records reported are: *Larus ridibundus* from Italy, Dalmatia, Hungary, Germany, and France; *Anas boschas* from Switzerland, Yugo-Slavia, and Italy; *Spatula clypeata* and *Anas crecca* from Italy; *Sturnus vulgaris* from Italy and France. The report also includes numerous detailed observations on the distribution, migration, and habits of various spp.

5917. **LOW, G. CARMICHAEL.** List of the vertebrated animals exhibited in the gardens of the Zoological Society of London, 1828-1927. Vol. 2. 832pp. Publ. by. the Society: London, 1929.—This volume aims to present the name of every bird exhibited alive by the Society from 1828 to 1927. Species to the number of 2330 (not including subspecies) are listed in 37 orders, beginning with the Passeriformes and ending with the Struthioniformes. The Sagittariiformes and the Cathartiformes are kept separate from the Accipitriformes; the names **BALEARICIFORMES** (p. 496) and **BALEARICIDAE** (p. 500), both apparently proposed as new, replace Gruiformes and Gruidae, respectively; and a new order, **MESOENIFORMES** (p. 658), has been added to include the Mesoenidae. Several family names are changed. The treatment of the species and subspecies includes the technical name, with reference to original publication, common English name or names, well-known synonyms, geographical distribution, references to colored plates when such exist, and, in the case of many species, lists of geographical races. The index includes technical names from order to subspecies, and common names as well.

5918. **MICHENER, HAROLD.** Where engineer and ornithologist meet: Transmission line troubles caused by birds. *Condor* 30 (3): 169-175. 5 fig. 1928.—Electric power transmission lines operated at 150,000 and later 220,000 volts in southern California, have experienced numerous "flash-overs," by establishment of an arc across an insulator. Excrement from birds, particularly large raptorial species, proved to be the cause; voiding of excrement on or even in the air near an insulator shortened the insulation distance sufficiently to initiate an arc. When saw-toothed strips of sheet metal were placed with points upward over the outer insulator supports and flat pans of sheet metal over the central insulators and spaces over the central insulators blocked in with wood the damage practically ceased. Approximately $100,000 has been spent in providing these protective devices.—*T. I. Storer.*

5919. **MILLER, LOYE.** The antiquity of the migratory instinct in birds. *Condor* 30 (1): 119-120. 1928.—Miocene shearwaters and gannets differ only in very unimportant details from their Recent representatives and many Pleistocene species are still present in California. With climate in the Pleistocene even milder than at present, the faunal complex, as indicated by marine beds of the Upper San Pedro and the freshwater assemblages of the McKittrick and La Brea asphalt deposits, suggests that migratory movements occurred during Pleistocene. Twelve species believed then to have been migratory are listed.—*T. I. Storer.*

5920. **MUNRO, J. A., et al.** From field and study. *Condor* 31 (2): 74-81. 1929.—By Munro.—"The Horned Owl an enemy of Barrow Golden-eye?" (p. 74). One adult ♀ *Glaucionetta islandiea* was seen, followed by a concentration of 43 downy young all of about the same age, on Rollings Lake northeast of Vernon, Brit. Columbia. Remains of this species have been found in adjacent woods. *Bubo virginianus,* which is common thereabout is suggested as the cause of the decrease in numbers of golden-eyes. The amphipod, *Gammarus limnaeus,* abounds in the lake and is a staple article of food for the ducks. "Male Tree Swallow feeding nestling robins." (p. 75-76). "Evidence of a barn swallow returning to the same nesting site." (p. 77-78). *Hirundo erythrogaster* at Okanagan Landing, Brit. Columbia. "On the courtship of the American bittern." (p. 79). A pair of *Botaurus lentiginosus* observed at Osooyos Lake, Brit. Columbia; the ♂ "pumped," then mated with the ♀. "Blackbirds feeding on the forest tent caterpillar." (p. 80). *Agelaius phoeniceus* and *Euphagus cyanocephalus* at Rollings Lake, Brit. Columbia, June 5, 1925. **A. D. HENDERSON.** "Bears and hawks' nests." (p. 74-75). Evidence cited for bears climbing after hawk nests is purely circumstantial. **WILSON C. HANNA.** "Vermillion flycatcher breeding in Coachella, California." (p. 75). *Pyrocephalus rubinus mexicanus* nesting April 15, 1928, the most westerly station known. **LOYE MILLER, WALTER P. TAYLOR, and H. S. SWARTH.** "Some winter birds at Tucson, Arizona." (p. 76-77). **J. STUART ROWLEY.** "California purple finch nesting in Alhambra, Los Angeles County, California." (p. 77). *Carpodacus purpureus californicus.* **ED. S. CURRIER.** "Least bittern near Portland, Oregon." (p. 78). *Ixobrychus exilis.* "Lesser yellow-legs in Willamette Valley, Oregon." (p. 80). *Totanus flavipes.* **MARGARET S. WYTHE.** "The E. B. Richards collection of birds: Changes in names." (p. 78-79). Four records based on this collection are corrected as to identification. **MARGARET M. NICE.** "Eight-mile censuses in 1927." (p. 79). Additions to bird censuses in

central Oklahoma. **WRIGHT M. PIERCE.** "Bird notes from Big Bear Lake, San Bernardino Mountains, during the summer of 1928." (p. 79-80). Six species. **CLARENCE COTTAM.** "A shower of grebes." (p. 80-81). At Caliente, Nevada, at about 2 a. m. of Dec. 13, 1928, several thousand American eared grebes (*Colymbus nigricollis californicus*) fell on houses, in streets and the surrounding territory. The previous evening the air was comparatively warm and still. By midnight a general and heavy snowstorm set in. The birds were probably on migration to the Pacific coast of southern California when overtaken by the storm. Others were forced down in Enterprise, Nevada, and Uvada and Modena, Utah.—*T. I. Storer.*

5921. **NAGY, EUGEN.** Die paläographische Entwicklung der europäischen Avifauna. *Congres Internat. Xe Zool. a Budapest 1927.* Part 2. pp. 1282-1292. 1929.—The author discusses first the general evolution of the birds, beginning with the Cretaceous and taking up the fossil birds of the Tertiary of Central Europe, and especially of Hungary, and makes deductions from this evidence concerning the climatic conditions of those times, when there were, of course, tropical species in that part of the continent. Later, as the Pleistocene came on, these species were forced southward, and an Arctic fauna occupied Central Europe. In the warmer interglacial intervals, the warmth loving southern species returned, and the Arctic fauna retreated northward or up into the higher, moister, and colder districts, where a few species have remained until today as relicts. The Hungarian fossil birds give evidence of these climatic changes. The author also described the evolution of bird migration, which could have been brought about only by the periodicity of the Pleistocene ages and the seasons of the year. The birds migrate southward and back each year just as they went southward and returned in the ages of the Pleistocene. This, and not hormone secretions, is the true cause of bird migration. That the migrations of today follow the original route of spread toward the north is clearly shown by such American species as *Dendroeca kirtlandi* and *Protonotaria citrea.* The extension toward the north is still going on, as in the case of *Serinus serinus;* and the contrary movement toward the south is also in progress, as witness *Syrnium uralense* or *Turdus pilaris.*—*E. Nagy (transl. by B. F. Howell).*

5922. **OORT, E. D. van.** Resultaten van het Ringonderzoek betreffende den vogeltrek, ingesteld door 'S Rijks Museum van Natuurlijke Historie te Leiden. [Results of bird-banding undertaken by the Leiden Museum.] *Zool. Mededeel.* 12(3/4): 217-247. 1929.—This report covers the years 1926, 1927, and 1928, giving return records for numerous individuals belonging to about 50 spp. The birds were banded in Netherlands and recovered in Netherlands, Germany, Belgium, France, England, Ireland, Portugal, Spain, Italy, Azores, Morocco, Tunisia, and Angola.

5923. **PALMER, T. S.** Notes on persons whose names appear in the nomenclature of California birds. *Condor* 30(5): 261-307. 5 fig. 1928.—A contribution to the history of west coast ornithology, comprising biographical information in varying amount on 183 persons who have described or whose names have been used in the description of birds found in Lower and Upper California. There is also an index to published portraits of 115 of the persons listed.—*T. I. Storer.*

5924. **SCHEFFELT, ERNST.** Die Vogelwelt unserer Heimat. [The bird life of our homeland.] (*Der Weg zur Natur. Gemeinverständliche Darstellungen aus dem Reich der Natur.*) 182pp. 2 col. pl., 51 fig. Herder u. Co.: Freiburg im Breisgau, 1928. $1.45.—This book aims to acquaint the beginner with the birds of central Europe, their habits, and their habitats. The first section describes some of the species characteristic of the various seasons of the year. Their structure, environment and adaptations to it, breeding, song, and migration are described. A third section of the book treats of a number of bird groups, arranged according to the types of landscape or habitat they frequent—forest, plain, mountain, vineyard, park and garden, river, marsh, and lake. The voices of some species are represented by musical notation. A list of reference works and a register of common and technical names complete the book.—*F. Harper.*

5925. **SCHMIDT-BEY, WILHELM.** Stösserjagden und Erkennung fliegender Raubvögel. [Hunting and recognition of birds of prey in flight.] *Ornithol. Monatsschr.* 54(10): 161-169. 1929.

5926. **SPRAWSON, EVELIN.** Concerning hooded parrakeets. *Avicult. Mag.* 4(9): 256-259. 1926.—A discussion of plumage variations.

5927. **UCHIDA, SEINOSUKE.** Bird-banding in Japan. *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 1: 1040-1041. 1926 (1928).—Abstract.

5928. **WHITTLE, CHARLES L., and HELEN GRANGER WHITTLE.** Some bird weights. *Bull. Northeastern Bird-Banding Assoc.* 2(2): 33-36. 1926.—Records of 11 species (chiefly Passeres) are given. In some spp., such as *Carpodacus p. purpureus,* adult ♂♂ seem to weigh more than ♀♀ or immature birds.

SYSTEMATICS

5929. **BOWEN, W. WEDGWOOD.** A new race of Heterotrogon vittatum from Mount Kenya: eighth preliminary paper on the birds collected during the Gray African Expedition—1929. *Proc. Acad. Nat. Sci. Philadephia* 82: pp. 265-266. 1 fig. 1930.—*Heterotrogon vittatum* keniensis* (p. 265), Kenya Colony, type in Acad. Nat. Sci. Philadelphia. A synopsis of the 4 subspp. of this bird is given.

5930. **BOWEN, W. WEDGWOOD.** Geographical variation in Poicephalus fuscicapillus. *Proc. Acad. Nat. Sci. Philadelphia* 82: pp. 267-268. 1930.—Three subspp. are recognized, including *P. f.* tanganyikae (p. 267), Tanganyika Terr., type in Acad. Nat. Sci. Phila.

5931. **CHASEN, F. N., and C. BODEN KLOSS.** On some birds of the genus Cyornis. *Bull. Raffles Mus., Singapore* No. 2. [23]-[42]. 1 col. pl. 1929.—This review is confined to the birds of Malaysia, Indo-China, India, and Ceylon. It conforms largely to Stresemann's earlier treatment of the genus, but gives additional information. There is a key to the several groups or "formen-kreise." The systematic list includes distributional data and taxonomic discussion. *Cyornis b. banyumas* (Horsf.) (=*C. b. limitans* Robinson). *C. b. cantatrix* (Temm.) is taken out of the synonymy of *C. b. banyumas. C. b.* montana (*C. whitei m.* Robinson & Kinnear) (p. 28). *C. turcosa* rupatensis (*C. elegans r.* Oberholser) (p. 39). *C. t. turcosa* (=*C. elegans antelia* Oberh.). The ♀♀ of *C. rufigastra sumatrensis* and *C. r. indochina* are figured on a colored plate.

5932. **CORTI, ULRICH A.** Beiträge zur Systematik der Goldhähnchen. *Ornithol. Beobachter* [*Bern*] 25(1): 6-8. 1927.—In plumage, nesting, voice, and habits the spp. of *Regulus* seem closer to *Phylloscopus* than to *Parus.* The author therefore follows Reichenow, rather than the majority of authors, in referring *Regulus* to the Sylviidae instead of to the Paridae. He does not recognize the family Regulidae nor even a subfamily Regulinae.

5933. **DICKEY, DONALD R., and ADRIAAN J. van ROSSEM.** Geographic Variation in Aulacorhynchus prasinus (Gould). *Ibis* 6(1): 48-55. 1 fig. 1930.—Synopsis of the races. *Aulacorhynchus prasinus* stenorhabdus (p. 52) and *A. p.* volcanius* (p. 53), El Salvador; types in D. R. Dickey coll.—*W. W. Bowen.*

5934. **FIGGINS, J. D.** Proposals relative to certain subspecific groups of Carpodacus mexicanus. *Proc. Colorado Mus. Nat. Hist.* 9(1): [1]-[3]. 1930.—*C. m.* smithi (p. 2), NE. Colorado; type in Colo. Mus. Nat. Hist. The name *obscurus* McCall is revived for the subspp. inhabiting SE. Colorado, New Mexico, Kansas, Oklahoma, Texas, and perhaps eastern Arizona. The name sayi is proposed for the subspecies west of the continental divide, replacing the name *frontalis* Say.

5935. **GYLDENSTOLPE, NILS.** On a new spine-tail

from East Ecuador together with some notes on the forms of the Synallaxis rutilans-group. *Arkiv. f. Zool.* [*Stockholm*] 21A(3, paper 25): 1-20. map. 1930.—*Synallaxis* cherriei cherriei (*S. rufogularis* Cherrie, not Gould) (p. 2); *S. c.* napoensis ♀ (p. 3), Ecuador, type in Royal Nat. Hist. Mus., Stockholm. The *S. rutilans* group is reviewed, and a key is given for the 6 forms recognized. The treatment of each form includes synonymy, citation of type, description, measurements, distribution, and taxonomic remarks. *S. r. amazonica* Hellmayr (=*S. r. caquetensis* Chapman).

5936. **HARTERT, ERNST.** Types of birds in the Tring museum. *Novitates Zool.* 35(1): 42-58. 1929.—Detailed notes on the synonymy and distribution of most of the 53 forms treated. The majority of the forms were described by Mathews, but there are 4 Bonaparte types, 2 of Stresemann, and 12 others by a single authority. In every case the modern name is given with the synonym. The Corvidae are treated exhaustively, and 19 forms are listed with annotations but are not given serial numbers in the list. Numerous names are reduced to synonymy, and others questioned.—*L. Jones.*

5937. **HENRY, G. M.** Coloured plates of the birds of Ceylon, with a short description of each bird by W. E. WAIT. Part 3. 16 col. pl. Publ. Ceylon Govt., Dulau & Co., 32 Old Bond St.: London, 1930.

5938. **JOUARD, HENRI.** Sous-espèces nouvelles de Passereaux paléarctiques (Paridae et Certhiidae). *Bull. Soc. Zool. France* 54: 245-252. 1929.—*Parus palustris* darti (p. 245), western France, type in coll. Louis Bureau; *Aegithalos caudatus* bureaui (p. 246), Pyrénées-Orientales, type in author's coll.; *A. c.* galliae (p. 247), western and northern France, type in coll. René d'Abadie; *A. c.* potyi (p. 248), central France; *Certhia brachydactyla* bureaui (p. 248), Brittany, type in coll. J. Rapine; *C. b.* parisi (p. 249), Pyrénées-Orientales, type in author's coll.; *C. familiaris* fatioi (p. 250), Switzerland, type in author's coll.; *C. f.* rufa (p. 252), Bavaria, type in Zoolog. Staatsammlung, Munich.

5939. **KISTJAKOVSKIJ, A., und G. KOTSHUBEJ.** Eine neue Lerche aus dem Ussurigebiet—Alauda arvensis nigrescens subsp. nov. Всеукраїнська Академія Наук, Труды Фізично-Математичного Віддилу (Збірник Праць Зоологічного Музею ч. 7). (*Acad. Sci. Ukraine, Mém. Cl. Sci. Phys. et Math.*) (*Trav. Mus. Zool. No. 7*) 13(1): 247. 1929.—*A. a.* nigrescens, Siberia.

5940. **MATHEWS, GREGORY M.** [New birds.] *Bull. British Ornith. Club* 50(338): 41-42. 1930.—Loriidae: DOREENIA (p. 41), type *Nestor notabilis* Gould. Motacillidae: *Anthus novaeseelandiae* taupoensis (p. 42), New Zealand; type in Brit. Mus. Psittacidae: *Cyanoramphus auriceps* novana (p. 42), New Zealand; type in Brit. Mus. Charadriidae: *Limnocinclus acuminatus* juva (*L. a. rufescens* Mathews, not Middendorff) (p. 42).

5941. **MEYER de SCHAUENSEE, RODOLPHE.** A new barbet from the Batu Islands. *Proc. Acad. Nat. Sci. Philadelphia* 81: 521. 1929.—*Mezobucco duvauceli* tanamassae, type in Acad. Nat. Sci. Philadelphia.

5942. **NEUMANN, OSKAR.** Die Formen von Pyrrhura perlata Spix. *Verhandl. Ornithol. Ges. Bayern* 17(4): 428-431. 1927.—Critical notes on the 4 forms recognized: *P. p. perlata,* range unknown; *P. p. lepida,* Para and Maranhão; *P. p. coerulescens,* Maranhão; and *P. p. anerythra,* Rio Tocantins.

5943. **OBERHOLSER, HARRY C.** Another new subspecies of Nannus troglodytes from Alaska. *Proc. Biol. Soc. Washington* 43: 151-152. 1930.—*Nannus troglodytes* stevensoni (p. 151), Amak and Amagat Isls.; type in U. S. Nat. Mus.

5944. **RILEY, J. H.** Four new forms of birds from Szechwan, China. *Proc. Biol. Soc. Washington* 43: 133-136. 1930.—*Columba rupestris* austrina (p. 133). *Yuhina nigrimentum* quarta (p. 134); *Y. gularis* omeiensis (p. 134); *Garrulax albogularis* laetus (p. 134). Types in U. S. Nat. Mus.

5945. **ROTHSCHILD.** [Remarks on birds of paradise.] *Bull. British Ornith. Club* 50(338): 38-40. 1930.—Among various forms discussed, the author considers *Cicinnurus goodfellowi* a hybrid between *C. regius* and *Diphyllodes guilelmi-tertii,* and *Falcinellus astrapioides* a hybrid between *F. fastosus* and *Astrapia nigra.*

5946. **SALOMONSEN, FINN.** Remarks on the European forms of Haematopus ostralegus L. *Ibis* 6(1): 56-66. 1 fig. 1930.—Three races are recognized on size and shape of bill; *H. o. ostralegus** L., *H. o. occidentalis** Neum., and *H. o.* malacophaga (p. 58), Thorsa, Iceland, type in Zool. Mus., Copenhagen. Wing and bill measurements of a large series are tabulated.—*W. W. Bowen.*

5947. **SHULPIN, LEONID M.** Pericrocotus roseus divaricatus (Raffles), seine Biologie und Verbreitung im russischen fernen Osten. *Jour. Ornith.* [*Berlin*] 78(1): 113-122. 1930.—Detailed description of distribution and notes on the ecology. With remarks upon moult, color, and dimensions of specimens.—*L. M. Shulpin.*

5948. **STEGMANN, B.** Zur Systematik der Rotschwänze. *Jour. Ornithol.* [*Berlin*] 76(3): 496-503. 1928. —*Phoenicurus phoenicurus mesoleucus* is regarded as a ssp. of *P. p. phoenicurus,* intergrading with it in the Caucasus. *P. ochruros ochruros* of the Caucasus is regarded as a mixture of *P. o. gibraltariensis* and *P. o. semirufa;* the extremely variable specimens from this region are thus accounted for by Mendelian variation. *P. o.* xerophilus (p. 501), Tibet, type in Zool. Mus. Russian Acad. Sci.

5949. **VAN ROSSEM, A. J.** The Sonora races of Camptostoma and Platypsaris. *Proc. Biol. Soc. Washington* 43: 129-132. 1930.—*Camptostoma imberbe ridgwayi* Brewster is revived from the synonymy of *C. i. imberbe,* and its range is given as northwestern Mexico and southern Arizona. *Platypsaris aglaiae* richmondi (p. 130), Sonora to southern Arizona, type in D. R. Dickey coll.

5950. **WETMORE, ALEXANDER.** The ground-dove of Navassa Island. *Proc. Biol. Soc. Washington* 43: 149-150. 1930.—*Chaemepelia passerina* navassae (p. 149), Navassa Isl., W. Indies; type in U. S. Nat. Mus.

LOCAL AND FAUNISTIC

5951. **BÄSSLER, FRIEDRICH A.** Das Haselhuhn, Tetrastes bonasia rupestris (Brehm), in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 2(4): 168-169. 1928.—Remains of one hazel hen was found in 1928.

5952. **BERNHARDT, P.** Kormorane, Phalacrocorax carbo (L.), in Moritzburg. *Mitteil. Ver. Sächs. Ornithologen* 2(3): 119. 1928.—Single records of Cormorants in May and Sept., 1919, and Nov., 1927; a number in Sept., 1927.

5953. **CHARLEMAGNE, M.** Matériaux de l'Ornithofaune de l'Ukraine. [Material on the ornithofauna of the Ukraïne.] 66p. Comité académique ukrainien pour la Coopération intellectuelle: Prague, 1927.

5954. **DANFORTH, STUART T.** Wilson's petrel in the West Indies. *Bull. Northeastern Bird-Banding Assoc.* 3(3): 59-60. 1927.—A sight record of *Oceanites oceanicus* on May 9 is the first one for Porto Rico, and one of very few for the West Indies.

5955. **DITTMANN, E.** Weitere Mitteilungen über den Brachpieper, Anthus c. campestris L., in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 2(1): 27-30. Map. 1927. —A map of the breeding localities of the tawny pipit shows that practically all are in northern Saxony below the 200 m. line. Each pair seems to require a breeding area of about 90,000 to 125,000 sq. m. Song and call-notes are represented syllabically.

5956. **HEYDER, RICH.** Von der Verbreitung des Schwarzkehlchens, Saxicola torquata rubicola (L.), in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 2(2): 57-62. Map. 1927.—A review of the records of the stonechat in Saxony shows that this species breeds in the valleys, for the most part below 200 m., and never above 500 m.

5957. **HEYDER, RICH.** Wann starb der Steinadler als Brutvogel in Sachsen aus? *Mitteil. Ver. Sächs. Ornithologen* 2(2): 68-69. 1927.—The last definite breeding

record of the golden eagle in Saxony was in 1642, not about 1825, as previously reported.

5958. HEYDER, RICH. Die Grenzen der Verbreitung des Schwarzkehlchens, Saxicola torquata rubicola (L.), in Mitteleuropa. *Mitteil. Ver. Sächs. Ornithologen* 2(3): 94-102. Map. 1928.—The northern limit of the breeding range of the stonechat, as shown on a map, extends from Schleswig-Holstein to Saxony, upper Silesia, and southwestern Poland. It is not clear what the barrier is to the further extension of its range.

5959. LANGE, R. Polarseetaucher, Colymbus arcticus L., in und bei Chemnitz. *Mitteil. Ver. Sächs. Ornithologen* 2(1): 23-24. 1927.—Six of these loons, apparently lost in a fog while migrating, came to earth during the night of Dec. 23, 1926, and were captured.

5960. MEYER, HORST. Vom Auerwild, Tetrao u. urogallus L., im Zittauer Gebirge. *Mitteil. Ver. Sächs. Ornithologen* 2(4): 158-160. 1928.—The capercaillie still exists in the Zittauer Mts., Saxony, in small numbers, in spite of numerous enemies.

5961. NEUBAUR, F. Ornithologische Miszellen aus der Rheinprovinz 1926 und 1927. *Sitzungsber. Naturhist. Ver. Preuss. Rheinlande u. Westfalens* 1927(A/F): 29D-38D. 1927(1928).—Notes on the occurrence of 52 spp., giving new breeding stations for many. *Numenius arquatus* and *Botaurus stellaris* still breed rarely in lower Schwalm valley despite drainage. *Circus cineraceus* has returned to the Elmpter Moor. *Falco peregrinus* is again nesting on Drachenfels. *Dryocopus martius* has increased in the last 10 years. *Emberiza cirlus* was first seen near Bonn in 1920; since 1923 it has been a regular breeder.—*M. M. Nice.*

5962. PEMBERTON, J. R. The American Gull-billed Tern breeding in California. *Condor* 29(6): 253-258. 5 fig. 1927.—*Gelochelidon nilotica aranea,* to the number of at least 500, were nesting on some small islands in Salton Sea, Imperial Co., California, May 20, where they had not been reported previously. Incidental notes are given on *Pelecanus erythrorhynchos* and a few other water birds, including 1 roseate spoonbill (*Ajaia ajaja*).—*T. I. Storer.*

5963. PETIT, L. Note sur l'arrivée des Hirondelles. *Bull. Soc. Zool. France* 53: 298. 1928.—In spring the swallows arrive in France when the temp. reaches a suitable point (say 14°-15°), and sometimes make a retrograde movement if the temp. drops too low.

5964. RÄSÄNEN, SULO. Columba oenas oenas Karjalassa. (In Finnish with German summary.) *Ornis Fennica* 4(4): 119. 1927.—This species, hitherto considered a very rare breeder in eastern Finland, seems to have become pretty generally distributed in southern Karelia.

5965. SALZMANN, WALTER, und HERBERT LINDNER. Einige Bemerkungen über die Vogelwelt der östlichen Umgebung Leipzigs, vor allem der Muldenaue. *Mitteil. Ver. Sächs. Ornithologen* 2(2): 62-68. 1927.—Notes on the occurrence of 16 spp.

5966. SCHLEGEL, RICH. Ornithologische Beobachtungen im Elstergebiet von Eythra; ein Beitrag zur Ornis des Leipziger Augebietes. *Mitteil. Ver. Sächs. Ornithologen* 1(7): 176-184. 1926.—The concluding part of an annotated list of 148 forms.

5967. SCHLEGEL, RICH. Zur Brutverbreitung der Uferschwalbe, Riparia r. riparia (L.), in der Leipziger Gegend nebst einem Ueberblick über ihr einstiges und gegenwärtiges Brutvorkommen in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 2(1): 16-23. Map. 1927.—Detailed records for various localities show that there has been a marked decrease in the numbers of this species.

5968. TATE, RALPH C. The American magpie in the Oklahoma Panhandle. *Condor* 29(5): 244-245. 1927. —*Pica pica hudsonia* in Oklahoma appeared in the Panhandle region in 1919 and nested in Cimarron County where it had not been observed in the preceding 18-20 years. Similar range extensions in western Kansas, Iowa, and N. Dakota are mentioned.—*T. I. Storer.*

5969. WEISSMANTEL, P. Der Fischadler, Pandion h. haliaëtus (L.), 1925 Brutvogel in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 2(1): 30-35. 1927.—This is the first record of the osprey breeding in Saxony since 1903. Notes on nest, young, food, voice, and general habits are given.

5970. WEISSMANTEL, P. Vom Gänsezug durch die sächsische Oberlausitz. *Mitteil. Ver. Sächs. Ornithologen* 2(3): 109-113. 1928.—Although there are few definite records, *Anser fabalis fabalis* evidently migrates regularly through this region in the fall, and sometimes winters, but rarely appears in spring. *A. anser* is a rare fall migrant, and *A. albifrons albifrons* is an accidental visitor. The direction of the fall migration is toward the southwest.

5971. WHITE, FRANCIS BEACH. Common and Arctic terns at Seabrook, New Hampshire. *Bull. Northeastern Bird-Banding Assoc.* 3(2): 36-37. 1927.—Notes on a breeding colony.

5972. ZIMMERMANN, RUD. Die Brutvorkommen der Graugans, Anser anser (L.), im oberlausitzischen Niederungsgebiet. *Mitteil. Ver. Sächs. Ornithologen* 2(1): 35-39. 1927.—Records for the past century are reviewed. Several recent records show that this goose still breeds in the Ober Lausitz lowland, Saxony, though irregularly and in small numbers.

5973. ZIMMERMANN, RUD. Zwei Wiederansiedlungen des Wanderfalken, Falco peregrinus Tunst., in der Oberlausitz. [Two reoccupied nesting sites of the peregrine falcon in Ober Lausitz, Saxony.] *Mitteil. Ver. Sächs. Ornithologen* 2(2): 70-71. 1927.

5974. ZIMMERMANN, RUD. Das Zwergsumpfhuhn, Porzana parva (Scop.), Brutvogel in der Oberlausitz. [The little crake as a breeder in Ober Lausitz, Saxony.] *Mitteil. Ver. Sächs. Ornithologen* 2(2): 71-72. 1927.—A definite record in 1927, the first one for nearly a century.

5975. ZIMMERMANN, RUD. Ueber die Einwirkungen von Unwetterkatastrophen auf die Vogelwelt. *Mitteil. Ver. Sächs. Ornithologen* 2(3): 120-124. 1928.—In 1926 rain, flood, and wind in Ober Lausitz, Saxony, were disastrous to the nesting of many birds. In 1927 *Sylvia communis* was visibly less numerous; *Acrocephalus arundinaceus* appeared in equal numbers; *A. scirpaceus,* which had suffered especially in 1926, was actually more numerous; *Motacilla flava, Anthus pratensis, Saxicola rubetra, Alauda arvensis, Vanellus vanellus, Tringa totanus,* and *Capella gallinago* were much scarcer.

LIFE HISTORY

5976. ASTLEY, A. Pied flycatcher eating worms. *British Birds* 24(2): 52. 1930.—*Muscicapa h. hypoleuca,* in England.

5977. BAUMGARTEN, A. Beobachtungen über die Heidelerche. *Aus der Heimat* 43(5): 129-134. 5 fig. 1930. The author has frequently found the wood lark* singing on the wing at night in Germany, once for at least 2½ hours continuously. The nesting habits are described.

5978. BROOKS, FRED E. White oven-bird's eggs. *Bird-Lore* 32(4): 275. 1930.—A set of 3, in W. Virginia.

5979. CARPARY, H. Tödliche Unglücksfälle in der Natur. *Aus der Heimat* 43(6): 187-188. 1930.—A young starling, held in its nest by an entangling horse hair, was fed by its parents long after the usual time for leaving the nest.

5980. CORLETT, GEOFFREY. Notes on Montagu's harrier. *British Birds* 24(4): 94-96. 1930.—Description of five nestings of *Circus pygarus* (presumably in Great Britain) and of plumage variations in young and adults. The ♀ incubates from the first egg laid, the eggs are laid at intervals of 36 hours to 3 days, each egg hatches on the 28th or 29th day of incubation, and the average clutch is 4.

5981. DAVIS, H. H. Food of tawny owl. *British Birds* 24(1): 30. 1930.—Remains of *Gallinula c. chloropus* and *Picus v. virescens* at nest of *Strix aluco sylvatica* in England.

5982. DOBBRICK, WALDEMAR. Zum Brachvogeldurchzug bei Oestlich Neufähr-Danzig, Herbst 1928 und 29. *Der Vogelzug* 1(2): 91-94. 1930.—Fall migration of

Numenius a. arquata here is in 2 distinct directions—westerly and southerly. It begins about mid-June and ends in early Sept. *N. p. phaeopus* is a rather uncommon migrant in this area, moving chiefly toward the west, but partly toward the south. The migration lasts from July to Sept. The calls of both species are described.

5983. **DOBBRICK, WALDEMAR.** Durchzug von Buntspechten und Tannenhähern bei Oestlich Neufähr. *Der Vogelzug* 1(2): 96-97. 1930.—The migration of *Dryobates m. major* continued from Aug. to Dec. A few nutcrackers, moving W. or SW., were seen on Sept. 30 and Oct. 1.

5984. **DROST, R.** Zur Invasion des Grossen Buntspechtes (Dryobates m. major) 1929. *Der Vogelzug* 1 (2): 97. 1930.—One banded on Helgoland in Sept., found near Bremen, Germany, in Dec.

5985. **DROST, R.** Zum Zugweg deutscher Rauchschwalben (Hirundo r. rustica). *Der Vogelzug* 1(2): 97. 1930.—One swallow banded in Germany in Aug., 1927, was taken in French Middle Congo in Nov., 1927.

5986. **ELLIOTT, J. S.** Starlings using a roost in summer. *British Birds* 23(10): 273. 1930.—Thousands of starlings frequented a roost in Bedfordshire in May and June. Each of 12 shot proved a ♂, the ♀♀ evidently being occupied with incubation.

5987. **GROSS, ALFRED O.** That bird the toucan. *Nature Mag.* 16(5): 291-294. 7 fig. 1930.—A popular account of the habits and life history of *Ramphastos brevicarinatus* in Central Amer.

5988. **HÄBERLE, G.** Spechtschmiede. [A woodpecker forge.] *Aus der Heimat* 43(3): 88. 1 fig. 1930.—A great spotted woodpecker in Germany brought pine cones to a groove in a pine trunk, for convenience in pecking out the seeds. Hundreds of discarded cones accumulated in a heap on the ground below.

5989. **HAMILTON, DAVID.** Black-headed gull feeding in trees. *Scottish Naturalist* 1930(183): 93-94. 1930.—Apparently on caterpillars, in Perthshire.

5990. **HEILFURTH, FRITZ.** Fortpflanzungsbiologische Notizen über einen Aufenthalt im mexikanischen Staat Veracruz. *Jour. Ornith.* [*Berlin*] 78(1): 39-46. 1 fig. 1930.—At the end of May—the beginning of the rainy season—a majority of the birds observed in the State of Vera Cruz, Mexico, were breeding. Insect food is especially abundant at this time. Breeding is believed to take place at the time when food is most easily obtainable.

5991. **HIBBERT-WARE, A.** Rooks collecting rubber objects. *British Birds* 24(1): 27. 1930.—This habit of *Corvus f. frugilegus* has been noted in an English rookery for over 20 yrs.

5992. **HINDWOOD, K. A.** The habits of cuckoos. *Australian Mus. Mag.* 4(1): 17-21. 3 fig. 1930.—A general account of the parasitic habits of these birds.

5993. **HOFFMANN, BERNH.** Die Stimmen der Saatkrähe, Corvus fr. frugilegus L. *Mitteil. Ver. Sächs. Ornithologen* 2(6): 284-287. 1929.—An intensive study of the calls of adults and young at a rookery in Saxony, with syllabic representation.

5994. **LEHMANN.** Der Schwarzpecht als Holzbearbeiter. *Naturforscher* [*Berlin*] 7(2): 53-55. 2 pl. 1930.—Descriptions and figures of excavations by the great black woodpecker in decayed trees in the Thuringian Forest, Germany.

5995. **MASSON, P. W.** Night soaring of swifts. *British Birds* 24(2): 48-50. 1930.—In Kent, England, the author has observed *Apus a. apus* ascending to great heights at twilight in summer. On July 14 a flock of 100 reached an estimated height of 1-1½ miles. There is speculation as to whether the birds spend the night in the air.

5996. **NAUMAN, E. D.** Cardinal vs. brown thrasher. *Bird-Lore* 32(4): 274-275. 1930.—A single nest in Iowa contained eggs of both species. Both species incubated at different times.

5997. **NICHOLS, J. T.** Trap-shy house sparrows. *Bird-Banding* 1(2): 80. 1930.—After a few birds from a flock of house sparrows had been trapped, banded, and released, no more could be trapped. How did these few communicate caution to their fellows?

5998. **OWEN, J. H.** Breeding-habits of the jackdaw. *British Birds* 24(2): 51-52. 1930.—In Essex, England, many nests contained only 3 or 4 eggs. Various nesting-sites are described.

5999. **PITMAN, C. R. S.** Eggs of the Bateleur Eagle. *Oologists' Rec.* 10(1): 3-4. 1930.—Measurements of eggs of *Terathopius ecaudatus* are given.

6000. **SMITH, WENDELL P.** A possible migrating family group. *Bird-Banding* 1(2): 77-79. 1930.—The presence of 6 young and 2 adults of *Zonotrichia l. leucophrys* in Vermont in Oct. suggest the continuance of the family bond through the southward migration.

6001. **WATSON, J. B.** Mortality amongst swifts caused by cold. *British Birds* 24(4): 107. 1930.—*Apus a. apus* in July in Suffolk.

6002. **WENNER, M. V.** Male ring-ouzel brooding. *British Birds* 24(1): 30. 1 pl. 1930.—*Turdus t. torquatus* in Wales, illustrated with photograph.

6003. **WILSON, ALEC. T.** Hen blackbird incubating thrush's eggs. *British Birds* 24(2): 52. 1930.—When a sitting *Turdus philomelos clarkei* was killed on its nest in Wales, a ♀ *T. m. merula* took its place, hatching and rearing the young.

6004. **WITHERBY, H. F.** Twenty-year-old ringed black-headed gull. *British Birds* 24(2): 55-56. 1930.—A *Larus r. ridibundus,* ringed as a nestling in Cumberland, England, in 1910, was recovered there in 1930. Only one other bird is known to have carried a ring for 20 years.

6005. **ZIMMERMANN, RUD.** Beobachtungen am Neste der Zwergrohrdommel, Ixobrychus m. minutus (L.) [Observations on the nesting of the little bittern.] *Mitteil. Ver. Sächs. Ornithologen* 2(5): 223-232. 1929.—In Saxony.

MAMMALIA

GERRIT S. MILLER, *Editor*

REMINGTON KELLOGG, *Associate Editor*

(See also in this issue Entries 3024, 3039, 3040, 3044, 3259, 3312, 3337, 3342, 3358, 3900, 3931, 5248, 5254, 5260, 5269, 5301, 5306, 5313, 5316, 5317)

6006. **AUBERT, EDMOND.** Etude des sinus chez les singes. *Ann. Mus. Hist. Nat. Marseilles* 22(1): 3-27. 3 pl., 12 fig. 1929.—Morphologic study of the sinuses of the various primates is of unequal value, varying according to the different families. In the anthropoids, especially the gorilla, it is of considerable value. Many features point to recent theories regarding the significance of the perinasal pneumatic cavities. The old hypothesis of their supposed part in olfaction and resonance of sound production is rejected. The study supports the mechanical function theory of the sinuses as put forth by Tillaux.—*B. Bickel.*

6007. **BLACK, DAVIDSON.** Notice of the recovery of a second adult Sinanthropus skull specimen. *Bull. Geol. Soc. China* 9(2): 97-98. 1 pl. 1930.—The new specimen yields information concerning some parts not represented in the first, more perfectly preserved, skull and shows some differences which may possibly be due to difference in sex.

6008. **[BORISIAK, A.]** БОРИСЯК, А. Ископаемый морж с Охотского побережья. [A fossil walrus from the Okhotsk coast.] [English summary.] Ежегодник Русского Палеонтологического Общества. (*Ann. Soc. Paléont. Russie*) 8: 1-8. 1 pl. 1928/1929(1930).—*Tri-*

chechus obesus v. **ochoticus*** (p. 7), Siberia, early (?) Quaternary. Type in Mus. Blagovyeschensk, Amur. region.

6009. **BUWALDA, JOHN P., and BERNARD N. MOORE.** The Dalles and Hood River formations [Oregon], and the Columbia River gorge. *Carnegie Inst. Washington Publ.* 404. Map. 11-26. 1930.—A horse tooth is reported, suggesting *Hipparion condoni*, which, with other evidence, points to Middle Neogene age for the Dalles formation.

6010. **COOLIDGE, HAROLD J. Jr.** Notes on the gorilla. In: The African Republic of Liberia and the Belgian Congo, based on the observations made and material collected during the Harvard Africa Expedition 1926-27. Vol 2. (*Contr. Dept. Trop. Med. & Inst. Trop. Biol. & Med.* no. 5) Part 3. XXXIII: Mammals. pp. 623-635. Map, 3 pl. Harvard Univ. Press: Cambridge, 1930.—Abbreviation of a longer paper (*Mem. Mus. Comp. Zool.* 50: 4, pp. 293-381. 1929).

6011. **EHRENBERG, KURT.** Neue Ausgrabungen in österreichischen Höhlen. *Verhandl. Zool.-Bot. Ges. Wien* 79(2/4): (71)-(75). 1929(1930).—The author compares the faunas of the Mixnitz, Schreiberwand, and Winden Caves, consisting chiefly of *Ursus spelaeus* and other mammals.

6012. **FURLONG, EUSTACE L.** Capromeryx minor Taylor from the McKittrick Pleistocene, California. Carnegie Inst. Washington Publ. 404. 49-53. 2 fig. 1930.—Specimens, presumably from one individual, include 2 upper* and 2 lower molars* and a calcaneum*, which are described, and measurements of dentition compared with those of a specimen from Rancho La Brea. *Capromeryx* was apparently less numerous in the Pleistocene than *Antilocapra*.

6013. **GAZIN, C. LEWIS.** A Tertiary vertebrate fauna from the Upper Cuyama drainage basin, California. Carnegie Inst. Washington Publ. 404. 55-76. Map. 4 pl., 4 fig. 1930.—The age of the fauna is probably Temblor (Middle Miocene). Fragmentary remains of Testudinidae, Aves, and the following Mammalia are included: canid sp.; **PROTOSPERMOPHILUS** (p. 64), n. subg. of *Citellus* [Rodentia], erected for *C.* (*P.*) **quatalensis*** (p. 64); *Perognathus* **furlongi*** (p. 66) [Rodentia]; *Hypolagus* ? **apachensis*** (p. 67) [Rodentia]; mastodon teeth; *Merychippus sumani*; Protohippus* sp.; *Hipparion* ? sp.; oreodont sp.; camelid sp.; and *Merycodus* sp.* Types are in California Inst. Tech.

6014. **GILES, F. H.** Curious behaviour of Thamin deer. *Jour. Siam Soc., Nat. Hist. Suppl.* 8(1): 55. 1929.—An adult ♂ *Cervus eldi platyceros*, reared from infancy by Siamese priests, remained tame, though unconfined and disappearing each year during the rutting season.

6015. **JEPSEN, GLENN L.** New vertebrate fossils from the Lower Eocene of the Bighorn Basin, Wyoming. *Proc. Amer. Philosoph. Soc.* 69(4): 117-131. 4 pl. 1930.—(Multituberculata: Ptilodontidae) **PARECTYPODUS** (p. 120) (near *Ectypodus*), with *P.* **simpsoni*** (p. 120) (type), and *P.* **tardus*** (p. 121); **NEOLIOTOMUS** (p. 122), similar to *Liotomus*, type *N.* **conventus*** (p. 122); (Insectivora; Leptictidae) *Diacodon* **tauri cinerei*** (p. 124); (Primates; Tarsiidae) *Tetonius* **tenuiculus*** (p. 126); (Primates ?; Plesiadapidae) **TEILHARDELLA** (p. 126), type *T.* **chardini*** (p. 126); (Creodonta; Oxyaenidae) *Dipsalidictis* **amplus*** (p. 128); (Amblypoda; Uintatheriidae) *Probathyopsis* **successor*** (p. 128). Types of all new genera and spp. in Princeton Paleontological Mus. Formerly the Wasatch horizon had been subdivided into the "Sand Coulee" on lower part and the Gray Bull on upper part, but the presence of *Homogalax* in the "Sand Coulee" beds invalidates this term and extends the Gray Bull downward, making it synonymous with "Wasatch" in the Bighorn Basin.—*G. L. Jepsen.*

6016. **JEPSEN, G. L.** Stratigraphy and paleontology of the Paleocene of Northeastern Park County, Wyoming. *Proc. Amer. Philosoph. Soc.* 69(7): 463-528. 2 maps, 10 pl., 1 fig. 1930.—From the Puerco level: (Multituberculata; Ptilodontidae) *Eucosmodon* **gratus*** (p. 499); (Creodonta; Oxyclaenidae) *Loxolophus* **nordicus*** (p. 501); (Triisodontidae) *Eoconodon* sp.* (p. 502); (Mioclaenidae) *Oxyacodon* sp.* (p. 503). From the Torrejon level: (Multituberculata; Ptilodontidae) *Ptilodus* sp.* (p. 503); (Insectivora; Pantolestidae) *Palaeosinopa* sp.* (p. 504); (Creodonta; Oxyclaenidae) *Chriacus* sp.* (p. 504); (? Primates; ? Plesiadapidae) **PLESIOLESTES** (p. 505), type *P.* **problematicus*** (p. 505). Princeton Quarry—Tiffany—Bear Creek level: (Amblypoda; Coryphodontidae) *Titanoides* **gidleyi*** (p. 506); (Multituberculata; Ptilodontidae) **MICROCOSMODON** (p. 508), type *M.* **conus*** (p. 508); (Insectivora; Leptictidae) *Leptacodon* **packi*** (p. 510); *Diacodon* **minutus*** (p. 511); (? Insectivora) **LITOLESTES,** type *L.* **ignotus*** (p. 513); (? Primates; Plesiadapidae) *Phenacolemur* **pagei*** (p. 514); *Pleisiadapis* **fodinatus*** (p. 515); (? Artiodactyla) **PHENACODAPTES,** type *P.* **sabulosus*** (p. 517); (Incertae sedis) *Carpolestes* **dubius*** (p. 520); upper jaw fragment with teeth proves *Litotherium complicatum*, a supposed multituberculate, to be based on an upper tooth of *Carpolestes*. Clark Fork level: (Creodonta; Oxyaenidae) **DIPSALODON** (p. 524), type *D.* **matthewi*** (p. 524); (? Primates; Plesiadapidae) *Plesiadapis* **cookei*** (p. 525). Types of new genera and spp. in Princeton Paleontological Mus. Three new Paleocene faunal horizons were discovered in the Fort Union of the northern part of the Bighorn Basin of Wyoming by the Princeton Scott Fund Expeditions of 1927, 1928, and 1929. The lowest is above the Lance dinosaur-bearing beds in the base of a heavy buff sandstone (heretofore regarded as Lance by the U. S. Geol. Surv.), and has afforded among other Puerco genera, *Oxyacodon, Eoconodon, Conacodon,* and *Loxolophus*. Two hundred feet higher a 2nd level yields Torrejon forms, such as *Chriacus, Tetraclaenodon,* and *Tricentes*. Above this a 3rd new horizon which was locally quarried contains among other genera *Carpolestes, Leptacodon,* and *Ectypodus,* which correlate it in part with the Montana Bear Creek and the Colorado Tiffany. The 4th and uppermost horizon of the Paleocene in this locality is the Clark Fork, described by earlier workers. From an erosional disconformity at the top of the Lance upward through the Paleocene to the locally angular unconformity between the Clark Fork and the Gray Bull, no pronounced structural or stratigraphic break has been observed. The sediments are a series of somber clays and sandstones. This single section contains representatives of all the Paleocene mammalian faunas previously known in North America, and is confined by the Lance below and the Gray Bull above. These two facts afford important new evidence of the relationships of the elements within and bounding the Fort Union.—*G. L. Jepsen.*

6017. **KLOSS, C. BODEN.** A note on Javanese monkeys. *Ann. and Mag. Nat. Hist. Ser. 10* 6(36): 697. 1930.—A translation from the Dutch of H. J. V. Sody's description of the new race proposed by him, *Pithecus aygula fredericae*, published in "De Tropische Natuur Orgaan van de Ned-Indische Natuurhist. Ver." xix. 1913, p. 68.

6018. **KOLLER, OTTO.** Die Soriciden des Zoologischen Museums in Buitenzorg auf Java. *Treubia* 11(3): 313-324. 1930.—This material comprises various forms of the genera *Suncus* and *Crocidura* from the Indo-Malayan region. Variations of *Suncus* in several characters had led to the description of many invalid spp.; 4 named froms (*müllleri, sumatranus, celebensis,* and *semmeliki*) are recognized as color varieties of *S. i. indicus*, a wild-living animal; and 3 forms described as spp. (*S. hosei, S. heterodon,* and *S. fuscipes*) are recognized as color varieties of *S. i. coeruleus*, an animal adapted to living in human habitations. A key is given to 13 recognized Indo-Malayan spp. of *Crocidura*, and there are tabular diagnoses of 27 described spp. Seven forms are treated further, with locality records and taxonomic remarks. Doubt is cast on the validity of various described forms of *Crocidura*.

6019. **KRAGLIEVICH, LUCAS.** Los más grandes

carpinchos actuales y fósiles de la subfamilia "Hydrochoerinae." (Conclusión.) [The largest Recent and fossil "carpinchos" of the subfam. Hydrochoerinae. (Concl.)] *Anal. Soc. Cient. Argentina* 110(5): 340-358. 9 pl. 1930.—*Neochoerus pinckneyi, N. robustus,* and *N. magnus** are discussed and compared in detail; the first 2 may prove to be synonyms of *N. magnus*. *N. giganteus* is redescribed. **PLIOHYDROCHOERUS** (p. 350), n. subg. of *Neochoerus,* erected for *N.* **tarijensis** (*Hydrochoerus t.* F. Amegh.) (p. 350), which is redescribed. A chart shows the author's conception of phylogenetic relationships of the various representatives of the subfamily Hydrochoerinae. There is a bibliography of 32 titles.

6020. KRAGLIEVICH, LUCAS. Nuevos Megalonícidos gigantescos de los géneros "Megalonychops" Kragl. y "Diheterocnus" Kragl. *Rev. Mus. la Plata* 32: 9-21. 7 pl. 1930.—*Megalonychops fontanai**, emended description; *M.* **carlesi*** (p. 14), Argentina, type in Mus. de la Plata; *Diheterocnus holmbergi**, emended descriptions; *Nothrotherium* **roverei** (p. 19), Argentina, type in Mus. Bernardino Rivadavia.

6021. LICENT, F. E. The Nan Ye Li Sanmenian fossiliferous deposit. *Bull. Geol. Soc. China* 9(2): 101-104. 2 fig. 1930.—Sixteen mammalian forms are represented, most of which are identified only generically. The deposit may be transitional between Upper Pliocene and Lower Pleistocene.

6022. LING, A. W., C. A. MacEACHARN, and E. C. READ. Mole destruction experiments. *Univ. Bristol Dept. Agric. and Hort. Bull.* 4. 1-14. 1 fig. 1930.—Baits prepared from Red Squill, liquid or powder, are satisfactory for ridding badly-infested areas of moles, when prepared and handled with care. Gassing also may be used to drive the moles from the runs, and the retreats of the moles under banks or in woods should be gassed as well. Trapping, with all its limitations, is quite satisfactory in the hands of an experienced person.—*From authors' summary.*

6023. LÓPEZ ARANGUREN, DOLORES J. Camélidos fósiles argentinos. [Fossil camelids of Argentina.] *Anales Soc. Cien. Argentina* 109(1): 15-35. 9 fig.; (2): 97-126. 13 fig. 1930.—Previous work on these forms is reviewed. Different interpretations of the dental formula have created confusion. Pm^3 is generally present, but pm_3 is lacking in all the specimens of the alpaca and the vicuña examined by the author, and is found in only a small % of specimens of the guanaco and the llama. Thus generic differences based on the presence or absence of the latter are without value. The form of the premolars, however, may have taxonomic value. The generic and specific names applied to fossil Argentinian Camelidae are reviewed. *Eulamaops* Ameghino, though not recognized by Burmeister, is considered valid. *Camelotherium medium* Bravard, a nomen nudum validated by Burmeister, nevertheless does not apply to a camelid. The systematic list of fossil spp. includes synonymies, descriptions, and taxonomic remarks. *Hemiauchenia major** (Liais) (=*H. paradoxa* H. Gervais & Amegh., *Palaeolama leptognatha* Amegh.); *Lama* **major*** (*Palaeolama m.* H. Gerv. & Amegh.) (p. 98); *L.* **angustimaxila*** (*Mesolama a.* Amegh.) (p. 101); *L.* **gigantea*** (p. 102), type in Mus. de la Plata; *L.* **ameghiniana*** (p. 105), n. n. for *Auchenia mesolithica* Amegh., preoccupied by *Palaeolama m.* H. Gerv. & Amegh., since both are referred to *Lama; L. guanicoe guanicoe** (Müller) (=*Palaeolama mesolithica* H. Gerv. & Amegh.); *L. guanicoe* **lönnbergi** (*Auchenia l.* Amegh.) (p. 109); *L. glama** (L.) (=*Auchenia intermedia* Gerv., *A. castelnaudi* Gerv., *A. cordubensis* Amegh., *A. ensenadensis* Amegh., *Palaeolama crequii* Boule); *L.* **gracilis*** (*Auchenia g.* H. Gerv. & Amegh., =*Hemiauchenia pristina* Amegh.) (p. 114); *L. pacos** (L.) (=*Auchenia lujanensis* Amegh.); *Vicugna vicugna** (Molina) (=*Auchenia frontosa* H. Gerv. & Amegh.). The fossil Camelidae of Argentina are represented by 5 distinct genera: *Palaeolama, Hemiauchenia, Lama, Eulamaops,* and *Vicugna. Eulamaops* alone is distinguished by well-marked cranial characters, the others chiefly by dental characters. None of the spp. is earlier than Post-Pliocene. They reached Argentina with the great immigration from the north in the Pleistocene. Fossil remains show that *Lama glama, L. guanicoe,* and *L. pacos* are distinct spp., the first 2 having coexisted during the entire Pleistocene. Only Post-Pampean remains of *L. pacos* are known. Historically 3 groups may be recognized: spp. which have existed in the wild state since the Pampean (*L. guanicoe* and *V. vicugna*); spp. extinct in the wild state but now domesticated (*L. glama* and *L. pacos*); and all the other spp., now extinct, which probably disappeared before the end of the Pleistocene. There is a bibliography of 24 titles.

6024. LULL, RICHARD SWAN. A remarkable ground sloth. *Mem. Peabody Mus. Yale Univ.* 3(2): 1-20. Map, 9 pl., 3 fig. 1929.—The specimen was found in an extinct volcanic fumarole, near Aden, Dona Ana Co., New Mexico, in a thick accumulation of bat guano at the bottom of the pit. Above this guano were bones of recent mammals, the pit acting as a natural trap. The ground sloth (probably Pleistocene) is referable to *Nothrotherium shastense**, a sp. occurring in the Rancho la Brea fauna. The preservation of the present specimen, however, suggests no great lapse of time since entombment. The skeleton is practically complete, and is held in articulation by the ligaments. Portions of hide, membrane, muscle fibre, and the claws are present, as well as a single coprolite. No other remains have been found at the same level. The skull is smaller than those described by Stock from the Rancho la Brea, and there are other differences in detail, but some of these may be due to the juvenile condition of the present specimen. The premaxillaries, not found at Rancho la Brea, extend well posteriorly, with wide articulations for the maxillaries. There is an ossicle at the mandibular symphysis, evidently with an incisor-like function. The malleus consists only of head and manubrium. The dentition differs from those of the Rancho la Brea specimens principally in the proportions of the teeth. The vertebrae differ slightly from those described by Stock. The number of thoracic vertebrae is definitely shown to be 17. The clavicles are larger than those from Rancho la Brea, but the other bones of the limbs are less rugged and robust, evidently a juvenile character. The distal end of the ulna has a concavity for the reception of the cuneiform. There are 5 digits in the manus, the 1st and 5th not bearing weight. The trapezium is fused with metacarpal I in the left manus but not in the right. The femur has 2 flabellae articulated with it, as well as a flattened ossicle below the outer condyle. In the pes only the outer margin, and mainly metatarsal V, was in contact with the ground. Digit I is represented only by the metatarsal fused with the entocuneiform. Digit IV is complete but relatively small. Digit V has 2 phalanges but no claw. The various patches of skin preserved show no traces of dermal ossicles. The hair is yellow in color, fairly coarse, straight, and subcylindrical. The claws are much larger than the inclosed phalanges. The restoration follows the pose of the skeleton closely. Plant remains in the coprolite include stems and roots of angiosperms of the "sagebrush" type; there is no trace of cactus-like plants. Stock's generic diagnosis may be modified somewhat from this specimen. The type of *Nothrotherium texanum* differs fom the present skull only in characters that may be ascribed to more advanced age. *N. texanum* and *N. shastense,* therefore, are conspecific.—*L. S. Russell.*

6025. NELSON, E. W., and E. A. GOLDMAN. Three new raccoons from Mexico and Salvador. *Proc. Biol. Soc. Washington* 44: 17-22. 1931.—*Procyon lotor* **shufeldti** (p. 17), Mexico, type in U. S. Nat. Mus.; *P. l.* **dickeyi** (p. 18), Salvador, type in Dickey coll.; *P. insularis* **vicinus** (p. 20), Maria Magdalena Is., off Mexico, type in U. S. Nat. Mus.

6026. PIGOT, R. A search for Schomburgk's deer. *Jour. Siam Soc., Nat. Hist. Suppl.* 8(1): 51-54. 1929.—

Wide inquiry through Siam failed to elicit any very definite information concerning *Cervus schomburgkii*, which is considered nearly or quite extinct.

6027. **ROBERTS, AUSTIN.** New forms of African mammals. *Ann. Transvaal Mus.* 13(2): 82-121. 1929.—Descriptions of 45 spp. and subspp. from southern Africa: *Sylvisorex* **angolensis** (p. 84), Angola; *Suncus* **warreni** (p. 84), Cape Province; *Nasilio brachyryncha* **tzaneenensis** (p. 85), Transvaal; *N. b.* **langi** (p. 85), Portuguese East Africa; *N. b.* **shortridgei** (p. 86), N. Rhodesia; *Macroscelides proboscideus* **hewitti** (p. 86), Cape Province; *Mungos mungo* **bororensis** (p. 88), So. Africa; *M. mungo* **rossi** (p. 89), N. Africa; *C.* **alticola** (p. 98), Transvaal; *Gerbillus paeba* **coombsi** (p. 98) and *Tatera afra* **gilli** (p. 100), Cape Province; *T.* **natalensis** (p. 101), Natal; *T. brantsi*, critical notes: *T. lobengulae* **pestis** (p. 103), Orange Free State; *T. l.* **mitchelli** (p. 103) and *T. l.* **pretoriae**, Transvaal; *T. l.* **limpopoensis** (p. 104), Cape Province; *T. l.* **tzaneenensis** (p. 105), Transvaal; *T. l.* **littoralis** (p. 105) and *T. l.* **beirensis** (p. 106), Portuguese E. Africa; *Parotomys brantsi*, critical notes; *Myotomys unisulcatus* **bergensis** (p. 108), Cape Province; *M. sloggetti* **jeppei** (p. 109), Jamestown; *M. s.* **basuticus** (p. 110), Cape Province; *Otomys laminatus* **mariepsi** (p. 110), Transvaal; *Otomys irroratus* **natalensis** (p. 111), Natal; *O. i.* **randensis** (p. 112), Transvaal; *O.* **tugelensis** (p. 113), Natal; *O. t.* **sabiensis** (p. 114), and *O. t.* **pretoriae** (p. 114), Transvaal; *O. t.* **saundersiae** (p. 115), Cape Province; *Dendromus* (*Poemys*) **angolensis** (p. 115), Angola; *D. melanotis* **chiversi** (p. 116) and *Steatomys krebsi* **orangiae** (p. 116), Orange Free State; *S. k.* **transvaalensis** (p. 117), Transvaal; *S.* **natalensis** (p. 117), Natal; *Pelomys fallax* **rhodesiae** (p. 118), N. Rhodesia; *Cryptomys* **langi** (p. 119), Natal; *Lepus saxatilis* **chiversi** (p. 119), Orange Free State; *L. capensis* **ochropoides** (p. 121), Cape Province.—*G. M. Allen.*

6028. **SANBORN, COLIN CAMPBELL.** A new Oxymycterus from Misiones, Argentina. *Proc. Biol. Soc. Washington* 44: 1-2. 1931.—*O.* **misionalis** (p. 1), Argentina, type in Field Mus. Nat. Hist.

6029. **SCHLAIKJER, ERICH MAREN.** Description of a new Mesohippus from the White River formation of South Dakota. *Proc. New England Zool. Club* 12: 35-36. 1931.—*M.* **barbouri** (p. 36) (nearly complete skeleton), type in Mus. Comp. Zool.

6030. **SCHREUDER, A.** Conodontes (Trogontherium) and Castor from the Teglian Clay compared with the Castoridae from other localities. *Arch. Mus. Teyler* [*Haarlem*] 6(3): 99-318. 4 maps, 16 pl., 12 fig. 1929.—A complete survey is given and all particulars of the remains of *Trogontherium cuvieri* found on the Sea of Asov and in Germany at Mosbach, Jockgrim, Hochsachsen, and Mauer, and of *Conodontes boisvillettii* found along the east coast of England, in France at Saint-Prest, Bligny, Chagny, St. Cosme and Curtil, and in the Clay of Tegelen in the Netherlands. They first appear in the later Pliocene and die out in the High-Terrace period. *Trogontherium minus* is a small forerunner known from the English Red Crag and from the fauna of Roussillon. All 3 genera were associated with *Castor*. Teeth and parts of nearly the whole skeleton of *C. boisvillettii* are abundant at Tegelen. A careful comparison is made with those of *Castor fiber, Castoroides, Palaeocastor,* and *Steneofiber* and with the parts known of *T. cuvieri*. Important characters found of *C. boisvilletti* are an alisphenoid canal in the skull; epistropheus and 3rd cervical are coössified like the 6th and 7th; tail vertebrae not flattened, humerus and femur are shorter, and ulna, radius and tibia-fibula longer than those of *Castor;* the fore-foot is smaller, the hind-foot much greater; very strong epicondylar tuberosity on the femur; fibula, completely coössified distally with tibia, articulates with calcaneum; tongue-shaped lateral process on the astragalus; metatarsale IV very stout and large. Conspicuous new characters of *T. cuvieri* are: large pterygoid fossae separated only by a plate consisting of the pterygoids lying against each other forming, with the similarly united maxillae, the base of a wide ductus pneumaticus cranii penetrating basi- and prae-sphenoid. The necessity of distinguishing *T. cuvieri* from *C. boisvilletti* is discussed. Their size does not surpass that of *Castor,* they were swifter movers and dug roots and tubers. A review of fossil Castoridae is given, but nothing can be affirmed yet regarding phylogenetic relationships, or migrations. *Cylindrodon fontis, Eutyponys,* and *Anchitheriomys wiedemanni* may belong to the Castoridae. *Castor subpyrenaicus* Gervais is identical with *Steneofiber jaegeri* Kaup. *Castor praefiber* Dép., *C. issiodorensis* Croiz. & Jobert, *C. plicidens* Major, *C. veterior* Lank., *C. rosinae* Major, and *C. californicus* Kell. cannot be separated from *C. fiber*. A diagnosis of the family is given, a bibliography, and an index.—*A. Schreuder.*

6031. **SLODKEWITSCH, W.** Zur Osteologie der Handwurzel von Elasmotherium caucasicum Borissiak. Ежегодник Русского Палеонтологического Общества. (*Ann. Soc. Paléont. Russie*) 8: 83-90. 1 pl. 1928/1929 (1930).—Fragments of the carpus and metacarpus of *E. caucasicum** from southern Russia are described for the first time. The author discusses the correlation between their structure and the probable habitat of the animal. He agrees with Ringström in separating *Elasmotherium* from the Rhinocerotidae.

6032. **SMITH, G. ELLIOT.** The subdivisions of the order Primates. *Nature* [*London*] 124(3136): 876-877. 1929.—As a compromise between the conflicting views of Haeckel and Hubrecht, Gadow divided the Primates into the suborders Lemures, Tarsii, and Simiae. Later Smith called these suborders Lemuroidea, Tarsioidea, and Anthropoidea. Now J. P. Hill divides the last-mentioned group into Pithecoidea (monkey) and Anthropoidea (apes and man).

6033. **SODY, H. J. V.** De Adjag (Cuon javanicus, Desmarest). *Natuurkundig Tijdschr. Nederlandsch-Indië* 89 (2): 210-380. 29 fig. 1929.—Extensive destruction of game by wild dogs (adjag or wolves of East Indies), is reported. Three spp. of *Cuon* are differentiated: *Cuon dukhunensis, C. javanicus,* and *C. alpinis*. *Canis familiaris sumatrensis* Hardw. is apparently synonymous with *C. javanicus*. The dentition of *Canis* and *Cuon* is compared. In Canidae, molars and premolars indicate a mixed diet; in *Cuon* a carnivorous one. Forehead line, configuration of trunk, ears, tail, etc. indicate plainly that *Cuon* is not an ancestor of the house dog. Crossing of the two has not occurred. Body of *Cuon* is larger, snout shorter than kampoeng dog. Nostrils, eyes, and ears all indicate keen sense receptors. Hair is thick and long, tail plumy, color a dirty brown. Adult male measures: body 85 cm.; tail (exclusive of hair) 28 cm.; shoulder height 48 cm.; weight 12.9 kg.; skull, widest part, 177 mm.; skull, zygomatic width, 106 mm. *Cuon* makes a sound quite different from *Canis*—a note of anguish is prominent. Its bark is infrequent. The widely prevalent idea that there are at least 3 varieties of *Cuon* has no foundation in fact. The adjag, although afraid of man, is curious, and unintelligent, and is easily caught in traps. Its habits are roving. Litters are of 1-3; groups few—50. Small litters, high death rate, and disease (mange), are causative factors in limiting numbers. On the other hand natives regard the adjag as sacred and do not kill it. The numbers of adjags in 1927 in the islands and many districts of the East Indies are compiled. Extermination of the adjag would mean increase in kidangs and wild hogs, which are destructive to crops and to mahogany forests. Shooting, traps, snares, poisoning, etc. are advocated as measures to reduce the number of adjags or exterminate them.—*J. van de Erve.*

6034. **STEPHEN, A. C.** True's beaked whale (Mesoplodon mirus) new to the Scottish fauna. *Scottish Nat.*

1931(188): 37-39. 2 fig. 1931.—Specimen stranded in 1931. Teeth and lower jaw figured.

6035. **STOCK, CHESTER.** Oreodonts from the Sespe deposits of South Mountain, Ventura County, California. *Carnegie Inst. Washington Publ.* 404. 27-42. Map, 1 pl., 1 fig. 1930.—The author records for the first time the presence of a type allied to *Promerycochoerus* west of the John Day region in central Oregon, and a member of the *Leptauchenia-Cyclopidius* group west of the Great Plains. SESPIA (p. 38), n. subg. of *Leptauchenia*, erected for *L. ?* californica* (p. 38); *Promerycochoerus ?* hesperus* (p. 39), upper part of Sespe (Lower Miocene). Types in Univ. California.

6036. **STOCK, CHESTER.** Carnivora new to the Mascall Miocene fauna of eastern Oregon. *Carnegie Inst. Washington Publ.* 404. 43-48. 1 pl., 2 fig. 1930.—*Leptarctus* oregonensis* (p. 45), based on fragments of a skull, type in Calif. Inst. Tech.; *Amphicyon* cf. *simapius**, description and measurements of a fragmentary mandible.

6037. **STOVALL, J. WILLIS.** The protoloph-ectoloph angle and its correlation with the geologic horizon of five genera of North American Equidae. *Jour. Geol.* 37 (8): 790-794. 1 fig. 1929.—The author has observed from a study of the dentition of the North American horses that the angle formed between an axis parallel to the center of the protocone-protoconule and a line parallel to the ectoloph, measured along the anterior and posterior cusps on the external side of the upper premolars and molars, shows considerable variation between the earlier and later species. He states that the protoloph-ectoloph angles for the various genera are directly related to their phylogenetic position, the more primitive having the larger angle; and that the average angle in all the horses of an epoch is directly related to their postion in the geologic column.—*D. J. MacNeil.*

6038. **TEILHARD de CHARDIN, P., and C. C. YOUNG.** Preliminary report on the Chou Kou Tien fossiliferous deposits. *Bull. Geol. Soc. China* 8(3): 173-202. Map, 2 pl., 8 fig. 1929.—A provisional list of mammalian remains (Lower Pleistocene) includes 6 Insectivora, 3 Chiroptera, 13 Carnivora, 22 Rodentia, 12 Ungulata, 1 proboscidean, and 2 Primates, including *Sinanthropus pekinensis*. Few are specifically identified. A table of geological formations, Lower Pliocene to Upper Pleistocene, with characteristic faunas, is appended.

6039. [TERÎAEV, V. A.] ТЕРЯЕВ, В. А. Был ли Elasmotherium трехпалым? (Has the Elasmotherium been tridactylous?) [English summary.] Ежегодник Русского Палеонтологического Общества. (*Ann. Soc. Paléont. Russie*) 8: 77-82. 1 fig. 1928/1929(1930).—*Elasmotherium* may have been tetradactylous, having digits II, III, IV, and V. This suggests a swamp habitat.

6040. **YOUNG, C. C.** Notes on the Mammalia remains from Kwangsi. *Bull. Geol. Soc. China* 8(2): 125-128. 1 pl. 1929.—A rodent, *Rhizomys sinensis**, and 2 spp. of deer from the middle Quaternary.

6041. **ZIMMERMANN, ÁGOSTON.** A Házinyûl Természetrajza Tenyésztése És Hasznosítâsa. [The rabbit, its natural history, breeding, and utilization.] *Magyar Természettudományi Társulat Kiadása.* [*Soc. Royale Hongroise des Sci. Nat., Budapest.*] 319p. 214 fig. 1927.—The first part, on the natural history of the rabbit, includes chapters on the place of the rabbit in the animal kingdom, on the varieties of species, on the life habits, ecologic and physiologic characteristics, and the systematic anatomy of the rabbit. The second part deals with the breeding and includes chapters on the economic significance of rabbit breeding, on the housing and care, on feeding, and on the most frequent and important diseases of rabbits. The third part is on the utilization of the rabbit as raw material (meat, skin, manure), as an experimental animal.—*B. Halpert.*

SYSTEMATIC ZOOLOGY

(GENERAL)

(See also in this issue Entry 3024)

6042. **BATHER, F. A.** Nomenclature at the Eleventh International Zoological Congress. *Nature* [*London*] 127(3192): 39-41. 1931.—An unofficial account, by a member of the International Commission, of the discussion and conclusions on nomenclature at this Congress, with particular reference to the question of "binary" vs. "binominal" nomenclature. The author points out that the revisers of the Code in 1901 really intended to give the phrase "binary nomenclature" what one may call the Tournefort sense, though that intention has never been clear to a large number of zoologists. The Horn resolution, supporting the Linnean interpretation and adopted by the 1930 Congress, apparently does not involve any alteration of the rules. The author proposes the acceptance of the Linnean interpretation, the formulation of a new opinion admitting the generic names of such authors as Brisson and Scopoli by *ad hoc* suspension of Article 25b, and the redrafting of Opinons 20 and 24.

6043. **BEIER, MAX.** Zoologische Forschungsreise nach den Jonischen Inseln und dem Peloponnes. I. [no subtitle]; II. Pseudoscorpionidea. Bearbeitet von MAX BEIER; III. Japygidae (Thysanura). Bearb. von F. SILVESTRI; IV. Myriapoda. Bearb. von KARL ATTEMS; V. Reptilia, Amphibia, Orthoptera, Embidaria und Scorpiones. Bearb. von FRANZ WERNER; VI. Pisces. Bearb. von MAXIMILIAN HOLLY; VII. Ixodoidea. Bearb. von PAUL SCHULZE; VIII. Coleoptera, I. Tenebrionidae. Bearb. von A. SCHUSTER. Cantharidae (=Malacodermata). Bearb. von R. HICKER. Coccinellidae. Bearb. von HANS STROUHAL; IX. Araneae und Opiliones. Bearb. von EDUARD REIMOSER und C. FR. ROEWER; X. Die schalentragenden Land- und Süsswassermollusken. Bearb. von FRANZ KÄUFEL; XI. Crustacea. Amphipoda, Bearb. von STANKO KARAMAN. Decapoda und Süsswasserproben. Bearb. von OTTO PESTA; XII. Die Ameisen der Jonischen Inseln. Bearb. von BRUNO FINZI; XIII. Hymenoptera parasitica. Bearb. von CH. FERRIÈRE. *Akad. Wiss. Wien Math.-Naturwiss. Kl. Sitzungsber. Abt. I.* 138(8): 425-443. 4 maps, 4 pl.; 445-456. 6 fig.; (9/10): 457-461. 4 fig.; 463-470. 6 fig.; 471-485. 1 fig.; 487-489. 2 fig.; 491-495. 4 fig. 1929; 139(3/4): 133-142; 143-154; 161-188. 2 pl., 6 fig.; 283-290. 2 fig.; (5/6): 309-319; 393-406. 4 fig. 1930.—The introductory installment (I) treats of the general character of the region (Corfu, Levkàs, Cephalonia, northwestern Peloponnesus), and of the problems under consideration, which were the collection of soil-bound [bodengebundenen] forms of significance in zoogeography, i.e., those tending to the development of endemism. (II) An annotated list of the 22 Pseudoscorpionidea of western Greece. Cheliferidae: *Chelifer* (*Lamprochernes*) *nodosus* v. moreoticus (p. 445); *C.* (*Trachychernes*) jonicus* (p. 446); *C.* (*Chelifer*) cephalonicus* (p. 448). Obisiidae: *Obisium* (*Blothrus*) odysseum* (p. 451). [(III.) See B. A. 5(4): entry 12950.] (IV.) Twenty-five spp. were taken, including *Chromatoiulus* leucadius* (p. 465). (V.) The reptilian fauna of Corfu and Levkàs appears significantly different from that of Ithaca, Cephalonia, and Zante, and more closely related to that of the adjacent mainland. A systematic list is given of 15 Reptilia and 7 Amphibia, with locality records and taxonomic remarks. A table shows their known distribution on the Ionian and Aegean Isls. and neighboring mainlands. There is also a systematic account of 18 Orthoptera, 1 Embidaria,

and 2 Scorpiones. (VI.) *Gobius* pygmaeus (p. 487). [(VII.) See B. A. 5(4): entry 12671.] (VIII.) Annotated lists. (IX.) Annotated lists, with tabulation showing the world distribution of each species. Most of the spp. are new for the Ionian islands. (X.) A systematic account of about 72 forms, with distributional data and taxonomic remarks. Important previous literature is mentioned. *Hyalacme* beieri* (p. 166); *Albinaria schuchi* ssp. interjecta* (p. 173); *A. s.* ssp. *interjecta* morpha pumilio* (p. 174); *Aegopis acies* ssp. jonicus* (p. 179). All new forms from Levkàs. A table shows the distribution of the various forms on the 5 larger Ionian Isls. and on the mainland. (XI.) Amphipoda: *Gammarus* beieri (p. 283). Decapoda and fresh water forms: *Potamon* (*Telphusa*) *fluviatile* (Latr.), at 800 m. altitude. (XII.) An annotated list of 60. The ♀ of *Camponotus aethiops* v. *concava* Forel is described. (XIII.) The author calls attention to the considerable proportion of terrestrial and wingless spp. of Hymenoptera on the Ionian Isls. A systematic list is given of 28 spp., with locality records and taxonomic remarks. Ichneumonidae: *Gelis nigritus* var. meridionalis ♀ (p. 394). Braconidae: ALYSIELLA (p. 397), related to *Alysia*, erected for *Alysiella* cursitans* ♀ (p. 398). Eurytomidae: *Harmolita* graeca (p. 399). Pteromalidae: *Trimicrops* Kieffer is transferred to this family from the Calliceratidae. Calliceratidae: *Calliceras* cephalonica ♀ (p. 405). All new forms are from the Ionian Isls. The following are new to Greece: *Gelis lichtensteini, Microbracon carinatus, Trimicrops claviger* ssp. *dorsalis, Acanopsilus clavatus,* and *Conostigmus multicolor.*—*M. Beier* (*transl.*).

6044. **FINZI, BRUNO, WOLFGANG ADENSAMER, FRANZ KÄUFEL, HANS STROUHAL, und HERMANN PRIESNER. Weitere Beiträge zur Kenntnis der Fauna Griechenlands und der Inseln des Aegäischen Meeres.** *Akad. Wiss. Wien Math.-Naturw. Kl. Abt. I.* 137(10): 787-798. 1929.—The ants of Greece and of the islands of the Aegean are dealt with in the section by Finzi. An annotated list of 26 spp. includes: *Messor barbarus varrialei* v. werneri (p. 789); description of the ♂ and ♀ of *Plagiolepis pallescens* Forel, apparently known hitherto only from the ☿. An article on the land and fresh water Mollusca, by Adensamer and Käufel consists of an annotated list of 36 spp., and a list in which those from the Aegean are arranged according to the islands in which they occur. The land isopods are dealt with by Strouhal, an annotated list being given. Priesner gives a list of the (32) Rhynchota collected in Greece.

6045. **HAGMEIER, ARTHUR. Die Züchtung verschiedener wirbellosen Meerestiere. In: EMIL ABDERHALDEN. Handbuch der biologischen Arbeitsmethoden. Abt. IX. Methoden der Erforschung der Leistungen des tierischen Organismus.** Teil 5, Heft 4, Lief. 326. p. 443-464. 7 fig. Urban u. Schwarzenberg: Berlin, 1930. Pr. 9 M.—A review together with much original material setting forth the importance of rearing marine animals from the early stages, places and apparatus for collection, methods for keeping them in the laboratory, their breeding dates and the general ecology of the more important marine invertebrates. Detailed descriptions and figures show methods of securing circulation, of feeding marine larvae and of securing pure cultures of food organisms. The accounts of small aquaria, of rearing jars and the wide use of celluloid in pipes and apparatus for sea water are particularly valuable.—*T. C. Nelson.*

6046. **HALLETT, H. M. Entomological notes, 1926.** *Trans. Cardiff Naturalists' Soc.* 59: 39. 1926(1927).—Three spp. in Hymenoptera, Aculeata; 2 in Hemiptera, Heteroptera, and 6 in Lepidoptera are added to the Welsh fauna.

6047. **SHERBORN, CAROLO DAVIES. Index animalium sive index nominum quae ab A. D. 1758 generibus et speciebus animalium imposita sunt. Sectio secunda a kalendis ianuariis, 1801 usque ad finem decembris, 1850.** Part 23: S littera-serratus. pp. 5703-5910; part 24: serratus-squamosus. pp. 5911-6118. Brit. Mus.: London, 1930.

6048. **STRAND, EMBRIK. Zoological and palaeontological nomenclatorical notes.** *Arbeiten Syst.-Zool. Inst. Lettländ. Univ.* 29. 1-29. 1929.—The author lists names, with biblographic data, of genera either omitted or incompletely cited in "Nomenclator animalium," and also erects the following new names for rejected homonyms. —Flagellata: CHRYSOCARNEGIA (*Carnegia* Pantocsek, not Holland) (p. 3); CATAROLA (*Echinopyxis* Pantocsek, not Claparède & Lachmann) (p. 4). Euflagellata: CYRTOPHORANA (*Cyrtophora* Pascher, not Simon) (p. 4). Nemathelminthes: Strongylidae, AMIROIDES (*Amira* Clayton Lane, not Girault) (p. 4); Spiruridae, SEUROCYRNEA (*Cyrnea* Seurat, not Deshayes) (p. 4), *Gongylonema* notosoedironis (*G. ingluvicola* Smit & Notos.) (p. 5); Acuariidae, *Dispharynx* smitiana (*Dispharagus* sp.? Smit & Notosoediro, 1926) (p. 4). Gastrotricha: DACTYLOPODOLA (*Dactylopodella* Remane, not Sars) (p. 5). Nomenclatural emendations in the Mollusca are confined chiefly to fossil forms (Ammonoidea) among which the following are noted: ACROCHORDICEROIDES (*Acrochordiceras* Waagen, not Hyatt) (p. 5); ARCTOCERODES (*Arctoceras* Hyatt, not Böhm) (p. 6); ASPIDITELLA (*Aspidites* Waagen, not Peters) (p. 6); CENTROCERATOS (*Centroceras* Wedekind, not Hyatt) (p. 7); CLIONITITES (*Clionites* Moijs., not Mantell) (p. 8); CYRTOCHILELLA (*Cyrtochilus* Meek, not Jakowlew) (p. 8); DAXATINA (*Dawsonites* Böhm, not Scudder) (p. 9); PARODICERELLUM (*Parodiceras* Wedekind, not Hyatt) (p. 9). Gastropoda, Cypraecea: CRIBRARULA (*Cribraria* Jousseaume, not Persoon) (p. 8). Crustacea, Copepoda: ANOPLOSOMELLA (*Anoplosoma* Sars (lap. cal. *Anaplosoma*), not Agassiz) (p. 9); ASPIDISCIFERA (*Aspidiscus* Norman, not Koenig) (p. 10); BRYAXONA (*Bryaxis* Sars, not Kugelann) (p. 10); CYCLOPINULA (*Cyclopina* Claus, not Agassiz) (p. 10). Arachnida: ABBOTIANA (*Abbotia* McCook, not Leach) (p. 10); ACANTHARANEA (*Acantharachne* Tullgren, not Lütken) (p. 11); ACHAEARANEA (*Achaea* Cambridge, not Hübner) (p. 11); AENIGMAARANEA (*Aenigma* Karsch, not Newman) (p. 11); ALTHEPODA (*Althepus* Thorell, not Rafinisque) (p. 12); PETRUNKEVITCHIUM (*Anaurus* Petrunkevitch, not Rafinisque) (p. 12); ANEPSION (*Anepsia* Koch. not Gistel) (p. 12); ASCURISOMA (*Ascuris* Simon, not Haeckel) (p. 14; ASTITUTA (*Astia* Keyserling, not Agassiz) (p. 14); ATKINIA (*Atkinsonia* Cambridge,, not Stainton) (p. 14); AULETTOBIA (*Auletta* Cambridge, not Schmidt) (p. 14); PELLOLESSERTIA (*Avakubia* Lessert, not Pilsbry) (p. 14); LESSERTIOLA (*Berlandia* Lessert, not Dalmas) (p. 15); BIZONELLA (*Bizone* Simon, not Walker) (p. 15); BOETHUOLA (*Boethus* Thorell, not Förster) (p. 15); CETONANA (*Ceto* Simon, not Gistel) (p. 16); CLADONOTULA (*Cladonotus* Thorell, not Saussure) (p. 17); CYCLOTHORACOIDES (*Cyclothorax* Mello Leitao, not Frauenfeld) (p. 17); DECETICA (*Decetia* Cambridge, not Walker) (p. 18; DEMADIANA (*Dema* Karsch, not Gistel) (p. 18); LEPTOFISCHELIA (*Leptostylus* Fischel, not Le Conte) (p. 18); IDA-STRANDIA (*Pseudamycus* Szombathy, not Simon) (p. 18). Orthoptera: ASEMOBLATTANA (*Asemoblatta* Hebard, not Handlirsch) (p. 18). Following are new names proposed for fossil Orthopteroidea.—Protoblattoidea: ANADYOMENELLA (*Anadyomene* K. v. Fritsch, not Gistel) (p. 19); Blattariae, SULCOBOLTONIA (*Boltonia* Handlirsch, not C. D. Koenig) (p. 20), COMPSOBLATTULA (*Compsoblatta* Handlirsch, not Saussure) (p. 21). Palaeodictyoptera: BOLTOPRUVOSTIA (*Boltonia* Pruvost, not C. D. Koenig) (p. 20). Rhynchota, Aphidae: Species described but not named by Takahashi in 1925 are named as follows: *Macrosiphum* tricholobicola, *M.* lactucicola, *Myzus* takahashii, *M.* siegesbeckicola, *Capitophorus* takahashii, *Amphorophora* stellariae, *Astegopterus* taka-

hashii, and *Tetraneura* **radicicola** (all p. 22). Diptera: **ASYNCRITULA** (*Asyncritus* Kertész, not Handlirsch) (p. 22). Coleoptera: **ALCINOETA** (*Alcinoe* Ménétriés, not Rang) (p. 23); **ANTHOBATULA** (*Anthobates* Le Conte, not Gistel) (p. 23); **IDA-STRANDIELLA** (*Apolites* du Val, not Schönherr) (p. 23); **TRIPOLICRYPTUS** (*Brachycryptus* Quedenfeldt, not Thomson) (p. 24); **CABIRUTUS** (*Cabirus* Mulsant & Rey, not Hübner) (p. 24); **OBENBERGERIA** (*Callicomus* Motsch., not Agassiz) (p. 24); **CARIDUA** (*Carida* Mulsant, not Rafinisque) (p. 24); **BEMBIDIONETOLITZKYA** (*Daniela* Netolitzky, not Koch) (p. 25). Lepidoptera: **OIKETICOIDES** (*Chalia* Moore, not Walker) (p. 25). Hymenoptera: **OBENBERGERELLA** (*Alienus* Bridwell, not Handlirsch) (p. 25). Pisces (fossil): **CRENILEPOIDES** (*Crenilepis* Dames, not Reis) (p. 27).

BIOLOGICAL ABSTRACTS

Editor-in-Chief, J. R. SCHRAMM; Associate Editors, FREDERICK V. RAND and MARY JONES FISHER; Assistant Editors, PERCY G. STILES, JOHN E. FLYNN, and FRANCIS HARPER

VOLUME 6 | MARCH, 1932 Entries 6049-9062 | NUMBER 3

GENERAL BIOLOGY

A. H. GRAVES, *Editor,* Plant

C. A. KOFOID, *Editor,* Animal

(See also in this issue Entries 6418, 6421, 6673, 6890, 7196, 8059, 8084, 8362, 8641, 8644)

GENERAL

6049. **COCKERELL, T. D. A. The designation of women biologists.** *Nature [London]* 126(3190): 957. 1930.—The author suggests that women authors of taxonomic papers retain their maiden names, to avoid confusion as to the authority for new names they propose.

6050. **DINGLER, HUGO. Das Experiment. Sein Wesen und seine Geschichte.** 263p. Ernst Reinhardt: München, 1928. Pr. 8.80 M.—This is an exposition of the underlying philosophy and logic of experimentation largely as applied to physics with a chapter on the development of experimental science.—*C. W. Dodge.*

6051. **DROOGLEEVER FORTUYN, A. B. A recent modification of the species-idea.** *Nature [Gr. Britain]* 1927: 1-4. 1927.—A review of the concepts of sp. of Darwin, Mendel, De Vries, Johannsen, the Hagedoorns, and Goodrich.

6052. **FESTA, E. Missione zoologica del Dr. E. Festa in Cirenaica. [Zoological excursion into Cirenaica, Tripoli.]** *Boll. Mus. Zool. ed Anat. Comp. R. Univ., Torino* 40(Paper 38): 1-85. Map, 12 pl. 1925(1926).—An account of trips made in 1921 and 1922, with notes on topography and brief lists of plants and animals (chiefly birds, mammals, and reptiles) observed in many localities.

6053. **HILL, A. V. Biology in education and human life.** *Nature [London]* 127(3192): 19-26. 1931.—In this address, stressing the importance of biology as a component of a general education, the general ignorance of biology is deplored.

6054. **MENGE, EDWARD J. v. K. A survey of national trends in biology.** 156p. Bruce Publ. Co.: Milwaukee, 1930. Pr. $2.—A questionnaire was sent to the head of the department of zoology and biology of every university outside of U. S. A. and of 20 universities in the U. S. A., inquiring as to (1) what they consider the most important biological work done in their respective countries, particularly in the last 30 yrs.; (2) what biological problems have been solved during that period; (3) what field of study has been pursued by most workers in their respective countries; (4) what they consider the most fundamental biological problems of today; (5) the attitude of the ablest biological workers in their respective countries in regard to vitalism vs. mechanism; (6) what biological work has had the most profound influence on the life and thought of their respective countries; etc. Based on the replies received, and on a survey of the literature of biology, the author presents an analysis of current endeavor in biology. In chapter III, "A cross section of present-day biological thought," he lists those findings of biology which seem to have had the greatest influence on mankind: (1) progress in medicine and public health, parasitology, and disease prevention; (2) application of bacteriological and parasitological findings to commercial processes, insect and plant control, the food supply, and work on applied genetics; (3) the beginnings of human biology, and the findings of comparative psychology which lead toward a better understanding of human relations; (4) organic evolution; and (5) the virtual establishment of the non-inheritance of acquired characteristics. Few biologists were willing to go on record either as mechanists or as vitalists; the opinion that both philosophies are in some respects inadequate, or that either view, alone, is insufficient as a statement of the nature of life, is presented as one of the commoner attitudes toward the question. Chapter IV, "Provocative biological theories," reviews briefly the organismal, organization-centrum, axial or metabolic gradients, metabolic determination of sex, plasmogeny (Herrera), and emergent evolution theories. These are regarded as the most important by the outstanding workers in all lands. Chapter V discusses the major programs and enterprises regarded by the respondents as most important, and some of the biologists regarded by them as most eminent in their respective countries. A bibliography (25p.) and an index are given.

6055. **MITCHELL, PETER CHALMERS. Materialism and vitalism in biology. [The Herbert Spencer Lecture delivered at Oxford, 1930.]** 30p. Oxford Univ. Press: New York, 1930. Pr. 70c.—Materialistic monism is more, not less, credible than when Spencer wrote, regardless of the recrudescence of esoteric and mystical doctrines following in the wake of post-war revulsion. The element of surprise, as in the discovery of x-rays, is still a warrant for external reality. A 2nd warrant is permanence with change as shown in the progress of science. We are more positive than Spencer about the immediate data of consciousness, but more skeptical than he about the validity of scientific laws. Cause and effect, united by an implied time relation, have lost their meaning; but mind is still anchored to matter by Planck's constant, and the velocity of light suggests an objective world, as do also the irreconcilable theories as to the nature of radiation. This stubborn externality appears in 2 contrasting sets of phenomena grouped under the words matter and life, materialism and vitalism. The advances of science have made matter a more, rather than a less, probable substratum for life. Every step in the analysis of living phenomena has been a step towards their resolution into material processes, chiefly phenomena of colloid systems. Vital action is chemical action in a colloid system. Even photosynthesis can take place in the absence of any peculiar vital principle. Structure is not a principle peculiar to life. It prevails in all organizations of substance. Life, amazing as it is in its more complex and higher forms, fades down as it is traced back to its simplest types until it passes into a set of processes of the inorganic world. The evolution of structure and accompanying function is largely determined by mechanical conditions. Growth and form have their antecedents. Life abounds in meaningless by-

products, as for example the aroma of the intestines of petrels, the shapes of the pellets of conies, and the colors of deep-sea animals. Nerves regenerate when cut, whether or not the limb has been amputated. Genes, hormones, and plague germs bring solutions to the mysteries of heredity, behavior, and disease. Under vitalism should be grouped many proposals of imaginary principles made in order to refer the phenomena of life or of living matter to some principle different in kind from the agencies and processes observed in matter that is not alive. The vis essentialis of Wolff and the nisus formativus of Blumenbach reappear as O. Hertwig's embryonic control, Driesch's entelechy, Smut's holism, Bergson's creative evolution, McDougal's purposive striving, Lloyd Morgan's emergent evolution, Cope's bathmism, and Osborn's unknown law of hereditary diaposition. Knowledge and control over man's fate have come about by the materialistic way of science.—*C. A. Kofoid.*

6056. MORGAN, C. LLOYD. Novelty throughout nature. *Nature [London]* 127(3205): 519-520. 1931.—In reference to inorganic as well as to organic nature, the author defends the thesis that events take place and "novelties" come into being which are entirely unpredictable before the event.

6057. MOTTA, MARIO. L'origine della materia vivente. La storia fisico-naturale del mondo. [Origin of living matter.] 155p. Giovanni Bolla: Milano, 1930. Pr. 12 L.—The topics considered are:—the living matter; creative evolution (of Bergson); irritability of protoplasm; ferments and diastases; pathogenic ferments; neovitalism and stereochemistry (Pasteur); chemical equilibrium; panspermia; Pasteur's ideas of fermentation, spontaneous generation, and the origin of life; synthesis of biochemical substances; oxidations; reversible processes; protoplasm; ultra-violet rays; photosynthesis; the cell and its chemistry; appearance of life on the earth; chemical unity of life; irritability; nutrition; and the missing link, the cyanogen of Pflüger.—*C. A. Kofoid.*

6058. NEWMAN, H. H. An orientation course. *Jour. Higher Education* 2(3): 121-126. 1931.—The origin, development, arrangement of subject-matter, and results, as well as criticisms of the general-survey course, "The nature of the world and of man," given for several yrs. at the Univ. of Chicago, are described by the director of the course since its inception in 1925.

6059. PINCHOT, GIFFORD. To the South Seas. The cruise of the schooner "Mary Pinchot" to the Galapagos, the Marquesas, and the Tuamotu Islands, and Tahiti. xiv+500p. 3 maps, 1 col. pl., 247 fig. John C. Winston Co.: Philadelphia, 1930. Pr. $3.50.—This is a popular account of a combined sporting and naturalist's collecting cruise in the South Seas March-Dec., 1929, with the assistance of A. K. Fisher and H. H. Cleaves, ornithologists, and H. A. Pilsbry, conchologist. The book has much on the natural history of porpoises, sharks, giant rays, tunnys, mackerel, guahu, swordfish, and other pelagic fishes of the tropics. Observations were made on the birds of the Galapagos, especially the doves, albatrosses, tropic birds, boobies, fork-tailed gulls, and hawks. Notes on the habits and behavior of the giant lizards were made at Indefatigable Island, and on the giant tortoise of Duncan Island. There are also accounts of the robber crab (*Birgus latro*) and of pearl fishing at Hikueru Island in the Tuamotu Archipelago.—*C. A. Kofoid.*

6060. PINEY, A. (editor) Recent advances in microscopy. Biological applications. 260p. 83 fig. P. Blakiston's Son & Co.: Philadelphia, 1931. Pr. $3.50.—This member of the "Recent Advance Series" contains 4 sections: "Medicine" by the editor (30p.); "The living eye," **BASIL GRAVES** (57p.); "Zoology," **E. W. MacBRIDE and H. R. HEWER** (80p.); and "Botany," **E. C. B.-WRIGHT** (87p.). Under "Medical sciences" are brief discussions of recent observations on a variety of tissues and organs. "Microscopy of the living eye" contains a discussion, largely clinical, of instruments and methods applied to pathological conditions of the anterior half of the eye. "Zoology" deals almost entirely with cytoplasmic structures. "Botany," on the other hand, has much about nuclear elements, with particular emphasis upon chromosome numbers. There is no unity of treatment beyond that afforded by consideration of recent topics. There is a helpful summary on yolk formation in the section "Zoology."—*C. E. McClung.*

6061. PLUNKETT, CHARLES R. Outlines of modern biology. viii+711p. 198 fig. Henry Holt & Co.: New York, 1931. Pr. $3.75.—The subject is treated from the standpoint that the living organism is a physico-chemical mechanism, with emphasis on general principles rather than factual details. The book falls into 5 parts: Protoplasm, Nutrition, Response, Reproduction, and Evolution. Appendices contain an outline of the classification of organisms, a discussion of chemical symbolism and nomenclature, and a classification of chemical compounds. There is also a brief bibliography of important books.—*C. A. Kofoid.*

6062. PRÉAUBERT, E. La place de la biologie dans le plan mondial. *Bull. Soc. Études Sci. Angers* 58: 1-52. 1928(1929).—The 3 chief interpretations of life are here discussed briefly, and the attempt is made to appraise spiritualism, vitalism, and materialism. Spiritualism is said to approach reality most nearly when it abandons belief in the immateriality of the soul. The relations of chemistry and biology lead to the conclusion that the vital principle is lodged in the atom. Biological processes are intimately related to intraatomic energy with the energy itself supplied from electrons and protons. Other chapters deal with a theory of a granular ether, and biology in infinite space together with a note on the nature of cancer.—*A. M. Chickering.*

6063. RANC, ALBERT. L'organisation d'un service national de la recherche scientifique en France. *Rev. Scient.* 68(22): 688-693. 1930.—The question of the organization of a national service for scientific research has been placed before the Chamber of Deputies by M. Herriot, and the Acad. of Sci. of the Inst. of France by M. Jean Perrin. Research professors should be paid by the state. These workers would not be employees of the state but would be given a more stable position than would be possible in private enterprise alone. A superior council of research will direct the organization of the service. A certain number of members less than 40 yrs. old will comprise the service, and an effort will be made to obtain free expression of all current ideas.—*A. Ranc (transl. by A. M. Chickering).*

6064. SLEVIN, JOSEPH R. Log of the schooner "Academy" on a voyage of scientific research to the Galapagos Islands 1905-1906. *Occasional Papers California Acad. Sci.* 17: 1-162. Map, 16 pl. 1931.—Includes voluminous observations on the general natural history of the Galapagos Isls., Cocos Isl., various islands along the coast of Mexico, and the Pacific Ocean.

6065. TERROINE, E. F., et M. M. JANOT. Données numériques de biologie. pp. i-xix+1604-1671 of Vol. VII (1925-1926) of: Tables annuelles de constantes et données numériques. Gauthier-Villars et Cie: Paris, 1930. Pr. 55 F.—Numerical data and contents taken from biological literature of 1925-1926 are tabulated with the citation of the original paper. Titles and explanations are in French and English. The tables are classified according to subject matter: general properties of living beings, animal biology, and vegetable biology. Molecular wts. and volumes of proteins, lipids, etc.; composition of various proteins, carbohydrates, fats, and other organic compounds; optical rotatory power of many compounds; absorption spectra of many; cardinal points of temp. and of pH for many organisms; potency of enzyme preparations; toxicity or disinfectant power of many compounds; chemical composition of organisms and of parts or tissues of organisms; composition of secretion products; data on metabolism (calorie production per kgm. of various foods, metabolic quotients, etc.); composition of foods; changes in such properties as blood composition during pregnancy and other states of the organisms; wts. and dimensions of seed; variation in

respiratory intensity of plants under many conditions of life; and many other topics are included.

6066. **WOODRUFF, LORANDE L. Foundations of biology.** [4th ed.] 501p. 297 fig. Macmillan Co.: New York, 1930. Pr. $3.50.

PLANT

6067. **BATES, JAMES C. A method for clearing leaves.** *Amer. Naturalist* 65(698): 288. 1931.—In chloral hydrate (sat. solution) 48 hrs.; then in $KClO_3$ plus HNO_3 for 10-30 min.; then in $KClO_3$ plus chloral hydrate for a week.

6068. **BENEDICT, RALPH C. A laboratory lesson in variation.** *Torreya* 30(6): 145-152. 3 fig. 1930.—For class study of evolution, a demonstration of specimens of *Nephrolepis* spp. and varieties, showing their wide variation, is excellent.

6069. **BONNIER, G., et LECLERC du SABLON. Cours de botanique.** Vol. II. Fasc. VI. Part 2.; Fasc. VII. Part 1. Librairie générale de l'enseignement: Paris, 1928.

6070. **BRAUNER, L. Die Pflanze. Eine moderne Botanik.** 294p. 17 pl., 40 fig. Deutsche Buch-Gemeinschaft: Berlin, 1930.—This book deals with plant phenomena in a manner that should make the subject attractive to the layman. The arrangement of chapters places the ontogeny of plants first, followed by discussions of the cell types, mechanical structure of plants, growth, and response to photoperiods. A chapter on alternation of generations and sexual forms is followed by one on the biology of flowers. Water intake, assimilation of nutrients, symbiosis, and respiration are dealt with briefly. Tropisms are given considerable space. The final chapter deals with the economic relation of plant products, especially vegetables and cereals, to the diet of different peoples.—*O. E. Street.*

6071. **CHAMBERLAIN, C. J. Elements of plant science.** 394p. 321 fig. McGraw-Hill Book Co.: New York, 1930.—This is a text-book for secondary schools. Part I deals with the structure and functions of seed plants; Part II with the structure and the development of plants. Particular emphasis is placed on life histories, and the evolution from lower to higher forms. Directions for laboratory work, including suggestions for collecting, preserving, and studying materials, with practical methods for making permanent microscope slides, are appended. The outstanding feature of the book is the illustrations, which are new and original.—*M. Halushka.*

6072. **CHIPP, T. F., L. DIELS, and E. D. MERRILL, committee in charge. International address book of botanists, being a directory of individuals and scientific institutions, universities, societies, etc., in all parts of the world interested in the study of botany.** xv+605p. Published for the Bentham Trustees by Baillière, Tindall and Cox: London, 1931.—The low price at which this invaluable aid to working botanists is sold ($3.25, in the U. S. A. and Canada, 13 shillings in England) was rendered possible by a grant made by the Carnegie Corporation of New York, and a loan from the Bentham Trustees, London. The project was initiated by the International Botanical Congress, Cambridge, England, which at its final plenary session in August, 1930, recommended the preparation and publication of the work. The special committee appointed charged with assembling the data and providing for publication consisted of T. F. Chipp, Kew, Chairman, L. Diels, Berlin, and E. D. Merrill, New York. The work contains in excess of 13,000 entries, the data being arranged alphabetically by countries. Under each country appears: (1) societies, academies, etc.; (2) institutions arranged under the towns or cities in which they are located; (3) individuals, alphabetically arranged. In the latter category, initials, degrees, title, post office address and field of special interest are given. The volume contains an index of countries, list of abbreviations used, and an alphabetic list of all individuals included.—*E. D. Merrill.*

6073. **CZAJA, A. TH. Die Analyse der metachromatischen Färbungen von Pflanzengeweben mit organischen Farbstoffen.** *Ber. Deutsch. Bot. Ges.* 48: (100)-(104). 1930.—Preliminary paper; detailed report to appear in Planta.

6074. **FEDDE, FRIEDRICH. Über die Ursachen des Rückganges der systematischen Botanik und der pflanzengeographischen Forschung in Deutschland. II.** *Rep. Spec. Nov. Reg. Veg.* [*Berlin*] *Beihefte* 56: 205-212. 1929.—The older academic teachers of physiology have sufficient knowledge of systematic botany but the younger instructors do not possess any appreciable knowledge of plants. The students of botany at present show very little interest in systematic botany and plant geography. Correspondence with several German botanists attests the precarious state of systematic botany. In some cases there has been difficulty in filling the vacancies of teachers in this subject. While in former days herbaria at the universities were kept up by private collections, such interest is now rapidly vanishing. In zoology similar conditions seem to prevail.—*T. R. Swanback.*

6075. **GATES, R. RUGGLES. Adaptations in cell structure.** *Jour. Roy. Microsc. Soc.* 51(1): 1-13. 3 pl., 3 fig. 1931.—The extreme specializations of structure found in such Protozoa as *Diplodinium, Euplotes, Paramecium,* and *Cycloposthium* are described. Brief comparison of cilia in plant and animal cells is made, and mitosis is treated as an adaptive mechanism which reaches a high state of perfection in higher organisms. This mechanism possibly was evolved long before evolution could make more than a limited use of it. The adaptations of plant cells are concerned chiefly with the cell wall. In this connection is discussed the evolution of the capillitium of Mycetozoa and of the spiral elaters in liverworts, *Equisetum,* etc. The coiled suspensors of Cycads and Conifers are treated as an example of overspecialization of growth in length of the cell wall, resulting from the sharp competition involved in polyembryony. The real origin of the variations thus selected remains unknown. Mutations do not follow the laws of chance but occur repeatedly in certain directions, frequently giving rise to parallel mutations in related forms. Why different variations recur in unrelated lines is unknown.—*R. R. Gates.*

6076. **GRAVES, ARTHUR HARMOUNT. Forms and functions of roots.** *Brooklyn Bot. Gard. Leaflets* 18 (8/10): 1-8. 2 fig. 1930.—This guide to the study of roots of seed plants was prepared for teachers and students of botany and biology who visit the Brooklyn Botanic Garden, using for illustrations, as far as possible, specimens growing in the conservatories and outdoor plantations of the Garden.—*A. H. Graves.*

6077. **HANNA, G. DALLAS. Hyrax, a new mounting medium for diatoms.** *Jour. Roy. Microscop. Soc.* 50(4): 424-426. 1930.—This synthetic resin, a product of naphthalene, has a pale straw color, not noticeable in the slides; and an index of refraction of 1.82248. Diatoms mounted in it have kept perfectly for over 3 yrs.

6078. **HITCHCOCK, A. S. A botanical trip to South and East Africa.** *Sci. Monthly* 31(6): 481-507. Illus. 1930.—This is a popular account of a trip from Cape Colony to Kenya, with stops at the Canary Isls. and St. Helena. There are many notes on botanical institutions and on the vegetation of the region with special reference to grasses.

6079. **KOENIG, PAUL. Neue Verfahren zur Herstellung von Pflanzen-Präparaten für Krankheitsforschung und Züchtung.** *Angewandte Bot.* 12(5): 348-351. 1930.—By means of a new method, it is possible to prepare plant material (leaves especially, but also flowers) in such a way that it retains its natural form and color. The material is pressed in flexible paste-board (drying paper, water-color paper, etc.), at a fixed temp. and humidity. In good preparations, it is possible to preserve with exactness the natural condition of even the most difficult color combinations, such as the pathological manifestations on leaves. For demonstrative work, it is important that the form and size of the leaves should be exactly preserved. Further, a method is given, the so-called ozalid method, with which, in a most inexpensive way, large images of leaves in natural sizes and with

considerable venation detail can be produced.—*P. Koenig (transl. by A. G. Plakidas)*.

6080. **LAWRENCE, WILLIAM E. A laboratory manual for the study of general botany prepared for use at the Oregon State College.** [4th ed.] 226p. Frontispiece, 19 fig. State College Press: Corvallis, Oregon, 1930.—A rearrangement and revision of the 3rd edition, which appeared in 1927, and the addition of 6 new study charts of plant life histories.—*W. E. Lawrence.*

6081. **LOWNDES, A. G. Marlborough College practical botany note-book: elementary.** 37p. W. G. Maynard: Marlborough, 1931.

6082. **LU, PAUL K. Y.** [General Botany.] [In Chinese.] 400p. 129 fig. Publ. by the author: 56 Shih Chia Hutung, East City, Peking, 1930.—This text devotes 152p. to structure and life processes of higher plants, and most of the remainder to a survey of the plant kingdom,—structures and life histories. The Thallophyta are divided into "subphyla" Myxomycetes, Schizomycetes, **EUPHYCETES** (Algae), Eumycetes (Fungi), Lichens, and Charales. The last few pages are on heredity. The index, in both Chinese and English, is really a glossary of equivalents, many of which are here published for the first time. The many illustrations are adapted (and mostly improved) from the usual sources.—*H. S. Conard.*

6083. **RIGG, GEORGE BURTON. College botany. With special reference to liberal education.** 442+xviii p. 157 illus. Lea & Febiger, Philadelphia, 1930.—Botany is presented from the viewpoint of its place in general college and university education. The parts are (1) The structure of the higher plants from the functional viewpoint; (2) The functions of plants; (3) The relationships of plants from the viewpoint of form and structure; (4) Plants in relation to their environments; and (5) Some general phases of botany, including (a) the relation of botany to other fields of knowledge, (b) some important periods in the history of botany, (c) the part played by scientific method in the progress of botany, (d) plants in relation to human welfare.—*G. B. Rigg.*

Silver, Burdett & Co.: Newark, New Jersey, 1930. Pr. 96c.—Elementary text for secondary schools and adapted to Philippine conditions.

6085. **RYDBERG, P. A. Scylla or Charybdis.** *Proc. Internat. Congress Plant Sci. Ithaca, N. Y.* 1926. 2: 1539-1551. 1929.—This paper is in the main a criticism of "the purpose and the principles" set forth in the preface to the "Phylogenetic method in taxonomy" by Hall and Clements, and "the inconsistency in carrying out the plan" as presented. Splitting of spp. and the use of binomials throughout is defended as a more desirable and more consistent mode of procedure than the lumping of spp. accompanied by the affixing of trinomials, quadrinomials, and polynomials to indicate ssp., var., sub-var., subform, proles, lusus, mutans, and similar categories, ad infinitum. The author emphasizes the difficulties confronting the taxonomist who would be consistent in sailing through the Messina of systematic botany: the splitter is liable to be headed for the rocks of Scylla and the lumper may be lost in the whirlpool of Charybdis.—*P. D. Strausbaugh.*

6089. **SPRAGUE, T. A. Principles and problems of plant nomenclature.** *Proc. Internat. Congress Plant Sci. Ithaca, N. Y.*, 1926. 2: 1422-1426. 1929.—Instability of plant nomenclature retards progress, and a closer agreement among the workers is necessary to insure progress. The author attempts to define the object and basic principles of nomenclature, as a common basis for such agreement. The object is a ready means of indicating accurately the identity of any taxonomic group that other workers may thus be enabled to make use of the data recorded. The 3 principles are: (1) unambiguity of names, (2) definition of groups, and (3) fixity of names. These are explained and methods of carrying them out are indicated. The rules of nomenclature are criticised, and suggestions are made to indicate the procedure necessary to effect a world-wide agreement on nomenclature. It is the author's opinion that the agreement proposed "would combine the best features of the International Rules and the American Code."—*P. D. Strausbaugh.*

6094. **BRANT, IRVING. Compromised conservation. Can the Audubon Society explain?** 15p. Issued by the Emergency Conservation Committee: New York, 1930.—The policies of the administration of the National Assoc. of Audubon Soc. are said to reflect the views of gunners rather than those of true conservationists. Its opposition to a reduction of the federal bag-limits on ducks and geese is cited as an example.

6095. **HERTWIG, R. (transl. by C. PARONA, and C. del VECCHIO). Trattato di zoologia.** p. 16-732. Vallardi: Milan, 1928.

6096. **HUNT, H. R. Some biological aspects of war.** 118p. Galton Publ. Co.: New York, 1930.—The purpose of the investigation was to determine, as far as possible, whether war is a selective agent in human evolution. Enlistment and death rates in the World War were studied for the continental U. S. A. and among the students and former students of Harvard Univ. Some Civil War data also were analyzed. In the World War about 83% of American drafted men who possessed defects of a probably more or less hereditary character were rejected for military service. Holders of Harvard degrees showed higher enlistment rates than the ♂ of the continental U. S. A. and suffered a higher mortality rate than the ♂ population of the U. S. A. These enlistments and mortalities were probably dysgenic.—*H. R. Hunt.*

6097. **MATHEWS, GREGORY M.** [Comments on **Opinion 115 of the International Commission on Zoological Nomenclature.**] *Bull. British Ornith. Club* 51 (348): 66-69. 1931.—Inconsistency is charged.

6098. **MILLER, W. DeWITT, WILLARD G. van NAME, and DAVIS QUINN. A crisis in conservation. Serious danger of extinction of many North American birds.** 15p. Privately printed: New York, 1929.—The authors charge bird-protection organizations with lack of earnestness and efficiency, especially in protecting spp. in danger of extermination. They list 4 spp. as already extinct and 6 others as beyond saving, and point out the menace of game clubs and sportsmen.

6099. **VAN CLEAVE, HARLEY JONES. Invertebrate zoology.** [2nd ed.] 282p. 126 fig. McGraw-Hill Book Co.: New York, 1931. Pr. $3.

6100. **YUAN, I-CHIN. Life tables for a Southern**

Chinese family from 1365 to 1849. *Human Biol.* 3(2): 157-179. 1931.—Based upon the age distribution of mortality from the genealogical record of a southern Chinese family of 3,748 ♂ and 3,752 ♀ born 1365-1849, life tables have been constructed for each quinquennial age from 20 to 75. The outstanding finding is the trend of gradually rising death rates among the young adult and middle-aged persons of both sexes over a period of 485 yrs. The same trend holds in the survivorship as well as in the expectation of life. This indicates that in the past several centuries the most energetic and productive persons were dying faster and faster and their expectation of life becoming shorter and shorter.—*I-Chin Yuan.*

6101. ANONYMOUS. The United States Biological Survey. Destruction, not scientific investigation and conservation, now its chief activity. 23p. Issued by the Emergency Conservation Committee: New York City, 1930.—It is claimed that the wholesale poisoning and trapping operations of this bureau are one of the biggest factors in the extermination of the animals and birds of the western U. S. A. Particular protest is made against the indiscriminate destruction of predatory and fur-bearing mammals, without adequate scientific investigation of any need for such action.

TECHNIQUE

6102. CHASE, SAMUEL WOOD. Device for prolonged continuous change and agitation of fluids. *Anat. Rec.* 46(1): 41-43. 1 fig. 1930.—A device for prolonged washing, fixing, or decalcification consists of a large flask with a delivery tube passing through a 1-hole stopper inverted over a small Stender dish, so that the opening of the delivery tube is alternately sealed and opened by the rising and lowering of the fluid in the dish when the latter is drained by a capillary siphon or wick delivering at the desired rate. This rate can be varied to cause emptying of the flask in any time between a few min. and several weeks by selecting the proper ratio of size between siphon and flask.—*Author (courtesy Wistar Bibl. Serv.).*

6103. HAUSER, E. A. Étude sur la technique des micromanipulations. *Rev. Gén. Colloides* 8(80): 358-361. 3 fig. 1930.—The difficulties so far encountered when applying dark field illumination to microdissection are enumerated. A new dark field condenser especially devised for microdissection experiments by E. Leitz, Wetzlar, is described and experiments carried out on latex of *Hevea brasiliensis* given as example. A new instrument (also put on the market by E. Leitz) for drawing micro needles automatically is discussed.—*E. A. Hauser.*

6104. HOLMES, W. C., and A. R. PETERSON. Absorption ratios of biological stains. *Stain Tech.* 5(2): 65-72. 1930.—Absorption ratios are supplied for most of the dyes used as biological stains. The use of these ratios will enable the analyst to identify the stains conveniently, and will also frequently afford information of considerable value respecting their purity.—*Author (courtesy Wistar Bibl. Serv.).*

6105. MARGOLENA, LUBOV A. Feulgen's reaction applied to protozoa and small worms, mounted in toto in Venetian turpentine. *Stain Tech.* 6(2): 47-49. 1931.—Permanent mounts of certain protozoa and small worms are obtained as follows: Kill suspensions of the organisms with Feulgen's fixative for 3-24 hrs. Pipette off fixative, add successively 70% iodized alcohol; ditto, 30 min. later; 50%, then 35% alcohol; 2 baths distilled water; normal HCl. Transfer to cold water and heat to 60° C. for 4-5 min. or longer. Cool under running water; and wash in distilled water. Stain 1-3 hrs. in Feulgen's fuchsin H_2SO_3. Pass through 3 baths of 200 cc. distilled water with 10 cc. normal HCl and 1 gm. $NaHSO_3$ and alcohol grades. Counterstain with fast green FCF, orange G, or eosin Y in 95% alcohol. Pass through 2 changes of absolute alcohol. Transfer to 10% Venetian turpentine and place in a desiccator; mount after the turpentine has become concentrated. For sections go to paraffin of M.P. 56° C. with 3% beeswax.—*Author (courtesy Wistar Bibl. Serv.).*

6106. NAVILLE, ANDRE. L'emploi du micromanipulateur de Peterfi: Fabrication et montage des microinstruments. I, II. *Bull. Histol. Appl. Phys. et Path.* 7(9): 273-299; (10): 311-332. 9 fig. 1930.—Manufacture and manipulation of micro-pipettes, needles, and pincers; micro-cautery; natural objects serving as special tools; micromanipulation with the ultramicroscope; ultracondensers; colorimetric pH determinations; microelectrodes; and continuous change of media are the subjects considered.—*J. G. Sinclair.*

6107. PETROFF, S. A. A useful coverslip holder. *Jour. Lab. & Clin. Med.* 16(3): 314-315. 1 fig. 1930.

6108. SASS, J. E. A wire holder for staining slides. *Stain Tech.* 5(1): 29-30. 1 fig. 1930.—A slide holder is made of 20-gauge Cu wire. It is bent into shape around 1-in. brads driven into a hardwood block. In this way, loops are made inside which the slides can rest. Two pieces of wire, thus bent and formed into a square, are soldered to a piece of 18-gauge wire the right size to fit a Coplin jar and extended to form a handle.—*Author (courtesy Wistar Bibl. Serv.).*

6109. SPIERER, CH. Über Dunkelfeld-Mikroskopie bei mehrseitiger Beleuchtung. [Dark field microscopy with multilateral lighting.] *Kolloid Zeitschr.* 53(1): 88-90. 1 fig. 1930.

6110. STANLEY, JOHN. A method of copying biological reconstructions with any desired factor of magnification. *Anat. Rec.* 47(1): 13-18. 3 fig. 1930.—As an aid to the making of greatly enlarged copies of paraffined-paper or wax models from serial sections, an instrument was constructed for the accurate measurement of original models in 3 dimensions. The copies were made in plasticine, minor structures being fitted by examination of the original sections. Detailed directions for the construction of the instrument from simple and readily accessible materials, many of them from the "Meccano" toy, and for the method of using it are given.—*Author (courtesy Wistar Bibl. Serv.).*

6111. STIER, T. J. B. A cooling unit for low-temperature thermostats. *Science* 73(1889): 288-289. 1 fig. 1931.—Details of construction of a unit which maintains a constant temp. within ± 0.01° C. between 0° and room temp.

6112. ANONYMOUS. The Leakey-Harper drawing machine. *Nature [London]* 126(3171): 220-222. 3 fig. 1930.—An instrument for preparation of full-size drawings of objects (e.g., specimens in zoology, paleontology, anatomy, anthropology, etc.) is described. It is made by the Cambridge Instrument Co., London.

GENERAL

6113. AJREKAR, S. L. A simple method of illustrating Mendelian mono-hybrid and di-hybrid ratios. *Jour. Indian Bot. Soc.* 9(1): 62-64. 1930.—Equal numbers of two colors of beads are mixed in a bag, then drawn out in pairs to illustrate mono-hybrid ratios. For di-hybrid ratios, equal numbers of beads are first tied together in pairs: small colored-large colored; small colored-large white; small white-large colored; and small white-large white. They are then mixed in a bag, and drawn

out two pairs at a time. The method is easy to use, and strikingly illustrates chance union of gametes.—*W. Dudgeon.*

6114. **BRIDGES, CALVIN B. Chromosome aberrations and the improvement of animal forms.** *Jour. Heredity* 19(8): 349-354. 1928.—Chromosome aberrations are classified according to genic balance into those with normal balance and those with an unbalanced relation. The difficulties and advantages of aberrations of these two kinds are discussed. Animal and plant material are contrasted in desirable characteristics.—*C. B. Bridges.*

6115. **STOMPS, THEO. J. Fünfundzwanzig Jahre Mutationstheorie. (Vortrag, Wiss. Ges. Diligentia im Haag.) [Twenty-five years of the theory of mutation.]** 68p. 2 fig. Gustav Fischer: Jena, 1931.

PLANT

6116. **BHALERAO, S. G. The grain-shedding character in rice plants, and its importance.** *Imp. Inst. Agric. Res. Pusa Bull. 205.* 36p. 9 pl. 1930.—A general description is given of wild forms of *Oryza sativa* L., referred to as wild rices, found in the Ghat areas of the Belgaum, Dharwar, and up-Ghat Kanara Districts of the Bombay Presidency, India. The seed of these rices shatter readily. Cross-fertilization appears to be more common among wild rices than among cultivated varieties. Mixed with cultivated types there are rices possessing many characteristics of cultivated rices and yet completely shedding their grain. These self-sown rices are known as "gonags." The relation of wild rices and the gonags is considered. Variations in the sheath color, position of panicle branches and awns of the cultivated rices grown in the Bombay Ghat areas are described. A study of the grain-shedding rices in line-culture for several years shows that many pure-breeding wild gonags occur in the cultivated crop. It is suggested that they are the pure breeding recessives of natural crosses of wild rices with cultivated varieties. The cultivated gonags seem to be crosses which have not so far reached a fixed condition. Methods for the control of grain-shedding are discussed. It is estimated that loss of grain due to shedding varies from 3 to 30% of the crop, depending upon care of the seed and the field.—*C. E. Chambliss.*

6117. **BLAKESLEE, ALBERT F. Cryptic types in Datura due to chromosomal interchange, and their geographical distribution.** *Jour. Heredity* 20(4): 177-190. 16 fig. 1929.—Cryptic types induce special chromosome configurations and definite proportion of pollen abortion in hybrids with other lines. It is shown that they are widespread in nature within the species *D. stramonium* and that their origin is best explained by segmental interchange between non-homologous chromosomes. Such interchanges must have played a part in differentiating species of *Datura* and in the origin of geographical races of plants.—*L. M. Dickerson.*

6118. **BLEDSOE, R. P. Multiple kernels in wheat-rye hybrids.** *Jour. Heredity* 20(3): 137-142. 4 fig. 1929.—Double and triple kernels were found in a strain of selfed rye, and also in an F_3 wheat × rye cross. Pistillody as described by Leighty and Sando (1924) was present with this variation. Also, some of the rye flowers showed a multiplication of flower parts. The multiple kernels are normal, except that they are smaller. Plants have been grown from multiple kernels and these plants always produce multiple kernels. As pistillody has been found in a number of wheat × rye crosses, it is suggested that hybridization may have been the cause of this variation.—*Author's abstract.*

6119. **BREDEMANN, G., und W. HEUSER. Beiträge zur Heterosis bei Roggen.** *Zeitschr. Zücht. Reihe A, Pflanzenzücht.* 16(1): 1-56. 1 fig. 1931.—In the complete experiment comparisons were made as follows: (1) original seed of variety A; (2) original seed of variety B; (3) mixture of (1) and (2); (4) intrapollinated seed of (1); (5) same of (2); (6) hybrid of (1) and (2) (F_1); (7) — (9) F_2 — F_4. As a variation of the above, (1) and (2) were grown in alternate rows and separately harvested. The experiment left no doubt of the possibility of increased yields through the combination of certain rye varieties. Four F_1 hybrid combinations outyielded each of the 4 parent pairs, as an average for the 6 trial years. Favorable results were not secured from 2 other combinations. The excesses in yield in grain of the F_1 in the 4 favorable combinations over the best yielding parent ranged from 9.2 to 12.7%, while the excesses over the poorer parent were from 13.8 to 21.9%. With regard to straw, similar figures were 0.4 to 11.9% and 7.0 to 28.9%. These excess yields continued into the F_2 nearly unchanged, but the F_3 and F_4 yields showed marked declines. Heterosis was manifest even in the young plants. Increased yields were pronounced in 4 out of the 6 years but markedly less in 2 of the years. This loss of heterosis effect may be due to unsuitable fertilization relations in the previous generation or to an unsuitable environment of the year of low yield. Analyses of yields showed 3 factors contributing to the excesses: thickness of stand, weight per 1,000 kernels, and number of seeds per ear; the contributions of these factors were unequal, and varied distinctly from year to year, depending upon environmental conditions.—*G. Bredemann (trans. by L. R. Waldron).*

6120. **BREGGAR, THOMAS. Waxy endosperm in Argentina maize.** *Jour. Heredity* 19(3): 111. 1931.—Record of the appearance of waxy endosperm in maize in the Argentine Chaco, found in an orange-yellow, flinty variety called Cuarenton. Whether this case is the result of mutation or importation is not known.—*L. M. Dickerson.*

6121. **BRIEGER, FRIEDRICH. Selbststerilität und Kreuzungssterilität im Pflanzenreich und Tierreich. [Self-sterility and cross-sterility in plant and animal kingdoms.] (Vol. 21 of "Monographien aus dem Gesamtgebiet der Physiologie der Pflanzen und der Tiere.")** xi+395p. 118 fig. Julius Springer: Berlin, 1930. Pr. 32M. —This volume is devoted to "Parasterilität," a term employed to include the many limitations in functioning of organs and sex cells inherently potent and able to function in certain relations. Parasterilities are surveyed in the higher plants, metazoa, thallophytes and protista. The main classes discussed are dichogamy, herkogamy, self-parasterility (self-incompatibility) and cross-parasterility, incomplete parasterility (various types of selective fertilization), heterostyly, and the sterilities in hybridization. The various phenomena of reproduction and of sexual processes are assembled under these classes and discussed as to physiology, genotypic and phenotypic determination, specificity, and theories of the effects of inbreeding.—*A. B. Stout.*

6122. **BRINK, R. A., and P. H. SENN. Ragged, a dominant character in maize linked with A_1, TS_4 and D_1.** *Jour. Heredity* 22(5): 155-161. 3 fig. 1931.—This new character is described. The plant at maturity is characterized by the torn appearance of the foliage. The seedlings are indistinguishable from the normal. Ragged plants produce pollen abundantly but only occasionally set ears. *Rg* designates this dominant gene; *rg* its normal allelomorph. Thirteen families, resulting from backcrossing heterozygous ragged to normal, gave 919 ragged and 914 normal plants. Normal, from progenies segregating ragged, gave only normal offspring. *Rg* was inherited independently of *c, sh, wx, gl_1, f, j, bt,* and *bm_2*. In backcross progenies 1.7% crossing over was found between *Rg* and *ts_4*; 11.9% between *Rg* and *d_1*; and in two backcross families of 520 plants 41.9% recombination was observed between *Rg* and *a_1*. The evidence supports the conclusion that the two linkage groups *a_1-ts_4* and *d_1-pg_2*, which have been tentatively recognized heretofore as distinct, are in reality one.—*P. H. Senn.*

6123. **CLARKE, ALFRED E. Inheritance of the dwarf branching habit in sweet clover.** *Scientific Agric.* 11(6): 326-332. 1931.—The dwarf branching habit in the strains studied results from one or the other of two genes, bunched dwarf (*bd*) and spreading dwarf (*sd*). Both are recessive to normal sweet clover. Two genes, *pg_1*

and pg_2, for the development of the pale green seedling character are described. Pg_1 is linked with *sd*. About 21% crossing-over occurs between these two genes. Evidence is presented to show that the dwarf branching strains have arisen from gene mutations and not from a cross between Arctic sweet clover and alfalfa.—*Author's summary.*

6124. **COLBY, A. S. The inheritance of anthracnose resistance in certain raspberry hybrids.** *Jour. Heredity* 19(8): 377-381. 2 fig. 1928.—The differences in anthracnose resistance found in the large number of varieties tested is believed to be evidence of physiological individuality of the several plants. The data show that it is inherited to a greater or less degree. The range in susceptibility suggests that it is determined by more than a single genetic factor.—*L. M. Dickerson.*

6125. **CONDIT, IRA J. Other fig chimeras.** *Jour. Heredity* 19(2): 49-52. 3 fig. 1928.—Several chimeric variations in Adriatic, Calimyrna and Panachee figs are described. In some cases both fruit and foliage are affected.—*L. M. Dickerson.*

6126. **CURRENCE, T. M. A new pod color in snap-beans.** *Jour. Heredity* 22(1): 21-23. 1 fig. 1931.—A new pod color, White (*S-s*), was obtained from crosses between "Crystal White Wax" and yellow wax field beans (*Phaseolus vulgaris*). White segregates as a Mendelian recessive independent of yellow (*Y-y*) and normal green (*G-g*). The white pods are attractive and the variety may be of commercial importance.—*L. M. Dickerson.*

6127. **EINSET, O. Cross-unfruitfulness in the apple.** *New York State [Geneva] Agric. Exp. Sta. Tech. Bull. 159.* 24p. 1930.—Presenting a general survey of experimental work on cross incompatibility in the apple, the author discusses the results of experiments on various factors, such as experimental technic, which may bear on the problem. Comparing the effect of removing the sepals, petals, and stamens with simply removing the petals and stamens, it was found that in certain varieties the removal of the sepals apparently interfered greatly with fruit setting; hence it is concluded that in certain reported cases of incompatibility, for example, crosses on Delicious, the negative results obtained may have been due to an injurious type of emasculation. No significant difference was noted between translucent and white opaque paper sacks as covers for emasculated blooms, but only light sets were secured without cover. Much of the incompatibility reported is believed due to zygotic abortion caused by irregularities in the reduction division of the generative cells. Irregular chromosome behavior in triploid varieties is deemed the cause of xygotic abortion and suggests the inadvisability of interplanting triploid varieties. In the Gravenstein apple, fruit weight was directly correlated with a combined number of both empty and filled seeds.—*J. W. Wellington (courtesy Exp. Sta. Rec.).*

6128. **EYSTER, W. H. Heritable characters of maize—male sterile$_2$.** *Jour. Heredity* 22(3): 99-102. 2 fig. 1931.—Male sterile$_2$ is inherited as a simple Mendelian recessive, and is the expression of a gene which has its locus in chromosome I. Tests with shrunken endosperm indicate that crossing over between the genes for shrunken endosperm and male sterility$_2$ amounts to about 30%. The anthers of male sterile$_2$ plants are empty when mature, and are usually not exserted from the spikelets.—*W. H. Eyster.*

6129. **EYSTER, W. H. Heritable characters of maize—male sterile$_3$.** *Jour. Heredity* 22(4): 116-119. 2 fig. 1931.—Male sterile$_3$ is inherited as a simple Mendelian recessive, and is the expression of a gene which has its locus in chromosome VII, as indicated by its linkage with crinkly. Preliminary tests indicate approximately 30% crossing over between these genes.—*W. H. Eyster.*

6130. **FROST, HOWARD B. Chromosome-mutant types in stocks. II. Putting a tramp chromosome to work.** *Jour. Heredity* 19(3): 104-111. 3 fig. 1928.—Trisomics of *Matthiola* prove useful in selecting double-flowered plants and in genetics teaching.—*R. C. Cook.*

6131. **GUILLAUMIN, A. Les "Phalaenopsis" hybrides autres que ceux issus du "P. amabilis" Bl.** *Arch. Mus. Hist. Nat. [Paris]* 6: 75-80. 2 col. pl. 1930.—A continuation of work reported in the same periodical, 4: 33-36. 1929. The author concludes: (1) that the characters of *P. amabilis* are clearly recessive to those of *P. rosea* and *P. mannii;* (2) that they are dominant to those of *P. schilleriana* and *P. stuartiana;* (3) that, in crosses between *P. amabilis* and hybrids of *P. rosea,* the latter exercises a perceptible influence when present to the extent of only $\frac{1}{4}$ or $\frac{1}{8}$; and (4) that hybrids of *P. amabilis* with *P. luddemaniana* or *P. violacea* present absolutely new characteristics.—*A. Guillaumin (transl. by P. Weatherwax).*

6132. **GURNEY, H. C. The inheritance and linkage relations of xantha seedlings in maize.** *Australian Jour. Exp. Biol. and Med. Sci.* 7(4): 215-221. 1930.—Colored and colorless endosperm seeds from a hybrid which was segregating xantha seedlings were grown and carried through several generations. The presence of 2 duplicate genes, xn_1 and xn_2, determining the xantha seedling character, was confirmed. Plants showing evidence of linkage between the endosperm color factor *R* and one of the factors xn_1, for xantha seedling, were carried on through several generations and a number of back-crosses for endosperm color made. A definite linkage between *R* and xn_1 was found, an average of results giving a cross-over value of 23.4%. The linkage was found in both coupling and repulsion series, and for 1:1 and 3:1, 3:1 and 3:1, and 9:7 and 3:1 ratios. Omitting a very low result of 11% for the repulsion series of 9:7 and 3:1 ratios, the cross-over percentage is raised to 26.4, which seems a better average of the results than 23.4%.—*Author's summary.*

6133. **HARRISON, GEORGE J. Trellising cotton.** *Jour. Heredity* 19(7): 324-326. 2 fig. 1928.—A trellis of simple construction for supporting large cotton plants is described. It is especially adapted to cotton breeding work.—*L. M. Dickerson.*

6134. **HARTMANN, MAX. Verteilung, Bestimmung und Vererbung des Geschlechts bei den Protisten und Thallophyten.** In: **E. BAUR, und M. HARTMANN. Handbuch der Vererbungswissenschaft Band II, Lief. 9.** 115p. 83 fig. Gebrüder Borntraeger: Berlin, 1929. Pr. 12 M.—Every organism, every cell, has the potentiality for development of either sex, determination occurring during development. If both sexes are developed on the same individual or clone, no specific inheritance factors but internal or external development conditions are responsible for the differentiation of sex. This is phenotypic sex determination. In cases of separate sexuality, sex determination is genotypic, or due to genes. Various nomenclatures are discussed. Four types of sex-determination are discussed: phenotypic in haplophase and in diplophase, genotypic in haplophase and in diplophase. Examples are cited from Algae, Fungi, and Protozoa. Sex is also regarded as manifested wherever copulation occurs, even where isogamy is apparently present. Capacity for copulation itself indicates sex differentiation, even when all other criteria fail. In many cases of isogamy, genotypic differentiation has been demonstrated, and in other cases morphological or physiological differences have been demonstrated where isogamy has been reported. Evidence of bisexual potentiality from Algae, Fungi, and Protozoa is presented, including the phenomenon of "relative sexuality" in Algae and Fungi. In this condition, gamete A may act as female relative to gamete B, but as male to more strongly feminine gamete C. The evidence here is meager but suggestive. One observation, heretofore unpublished, is that of Belar and Hartmann, in 1924, of copulation between macrogametes of *Bryopsis.*—*G. M. Robertson.*

6135. **HAYES, H. K., and H. E. BREWBAKER. Heritable characters in Maize. XXXII. Sorghum tassel.** *Jour. Heredity* 19(12): 560-567. 4 fig. 1928.—A recessive variation called sorghum tassel, (*sg sg*), which appeared in a selfed line of Rustler White Dent, is described. It resembles sorghum in the appearance of the tassel, which contains both ♂ and ♀ florets. The linkage rela-

tion for (*sg*) and 18 other characters in known linkage groups were studied in F_2. No definite indications of linkage were obtained. In a cross between sorghum tassel and tunicate homozygous for (*sg*) and (*Tu*), ears of "cauliflower" type were obtained. Plants homozygous for (*sg*) and heterozygous for (*Tu*) also gave evidence of cauliflower tissue on some of the plants. (See *Ibid.* 20(4): 166 for corrections.)—*Author's summary.*

6136. **HIORTH, G. Die Anwendung elektrischer Beleuchtung für Vererbungsversuche mit Pflanzen.** *Züchter* 1(7): 204-209. 1 fig. 1929.—Several species were grown under artificial light. On a 4 × 2 meter table, four 750 watt lamps were compared with one 1500 watt lamp as the sole source of illumination. The plants grew better under the four 750 watt lamps. An early variety of barley ripened in 47 days after seeding. In another experiment, crosses were made between *Collinsia* varieties, and F_2 generations were successfully produced under the artificial light. Precautions to be observed and uses of artificial light in breeding work are discussed. Experiments were performed in a greenhouse as well as in dark chambers. As many as 5 generations of certain plants could be grown in 1 yr. by the use of artificial light.—*F. V. Owen.*

6138. **HOOVER, M. M. Wheat-rye hybrids.** *Jour. Heredity* 20(4): 170-171. 1 fig. 1929.—Natural hybrids from a plot of Fultz 7 wheat are described as resembling wheat rather closely but intermediate in most characters. All were completely sterile.—*L. M. Dickerson.*

6139. **HUME, A. N. The possibility of utilizing selfed strains in practical corn improvement.** *South Dakota Agric. Exp. Sta. Bull.* 245. 22p. 1930.—Corn continuously selected for yield for 17 years by mass selection averaged 48.1 ± 2.2 bu. per acre; by systematic ear-row selection with detasseling of alternate rows (Illinois system), 49.2 ± 2.2 bu.; and by selection of high-yielding ear remnants (Ohio system), 52.5 ± 2.5 bu. The last 2 systems furnished a more rapid process of adaptation than the 1st. Evidently continuous selection by such methods is a means of selecting superior strains, although not of itself adequate for genetic improvement. The progeny of ear-row selections long continued by the above methods were observed to possess a degree of close breeding and appeared capable of serving as a parent when hybrid vigor is desired. Row yields in 1929 from near hybrids (S_5 strains selfed for 5 generations × Selection 1210, a close-bred selection) were 35% higher than yields from selected strains. Similarly, 5 of 6 of the same near-hybrid strains outyielded the standard variety. A system of corn improvement outlined proposes to continue to utilize ear-row selection and thus maintain adapted strains and varieties now generally recognized and to utilize the principle of hybrid vigor and prevent losses from close breeding.—*H. M. Steece (courtesy Exp. Sta. Rec.).*

6140. **IMAI, YOSHITAKA. Linkage studies in Pharbitis Nil. II.** *Zeitschr. Indukt. Abstamm.- u. Vererb.* 58(3/4): 317-331. 1 fig. 1931.—The recombination frequencies, 14.9% for variegated and crumpled-1, 17.8% for crumpled-1 and blown-1, and 30.8% for variegated and blown-1, which were determined by backcross experiments, are also applied to the F_2 data, and show almost complete agreement. Data showing weak repulsion between creased (allelomorphic to feathered) and crepe are presented. This gives additional proof that crepe is located in the cordate chromosome. The recalculated recombination frequency for margined-1 and tube-white is 5.0%. From available data, the recombination for interaxil-green and contracted is estimated to be 6.6%. The 5.6% of recombination for interaxil-green and contracted, calculated by the other linkage relations, agrees perfectly with the repulsion data. Flecked is linked closely with margined-1 and contracted, the recombination in the former relation being 1.2%. Flecked also shows linkage with interaxil-green. Expanded is closely linked with contracted. Further data on the independent relations of the ten linkage groups are given. Two loci, maple (willow) and polymorphic, seem to be situated in other chromosomes. Two new cases showing linkage were detected. Purple is linked with crisscrossed, recombination frequency being 19.0%. Light-2 and ivory show close linkage. The proof of independence of these and the linked lined-striated genes in respect to the ten linkage groups and the two independent genes (maple and polymorphic) is incomplete. New data giving proofs of independence of certain genes are presented.—*Author's summary.*

6141. **ISENBECK, KARL. Vererbungsstudien an einigen Weizenkreuzungen in Bezug auf die Widerstandsfähigkeit gegenüber Puccinia glumarum tritici und Puccinia triticina.** *Zeitschr. Zücht. Reihe A, Pflanzenzücht.* 16(1): 82-104. 1931.—Selections for rust resistance were made during the unusually dry seasons, 1929 and 1930. Efforts to induce an epiphytotic of *P. glumarum* in the field made excellent headway until in June; unusual heat and drought terminated the artificial epiphytotic. Rust readings from plants artificially inoculated in the greenhouse from 1 to 3 times and field readings are given. Four races of *P. glumarum* were used. Selections were made from later generations from 3 crosses already reported. [Phytopath. Zeitschr. 1: 465-525. 1929.] 6 types of resistance were used in judging. In a cross using parent type reactions 0-3 × 4, no 0-type reactions were found. From a 1921 cross, an immune Chinese wheat × the susceptible squarehead, 41 selections were made, but none of these was either type 0 or immune (type 1), yet immunity was probably dominant. The assumption was made that in this cross immunity was linked with undesirable characters, e.g., weak straw, and that the immunes had been eliminated by natural and artificial selection. In another group from the same cross, immunity was found combined with cold resistance. In crosses with spring wheats, the *P. glumarum* resistant parent was Normandie (type 0). From a study of the F_2 it was considered that resistance was recessive and conditioned by a single factor. Half-resistant forms were fewer with the more pronounced separation of the parents. One cross carried to F_3 confirmed the above. Only 2 crosses were concerned in the study of resistance to *P. triticina*. From a study of F_2 and F_3 it was concluded that the resistance of the Normandie parent was dominant and due probably to 1 factor, although the number of heterozygotes in F_2 was definitely in excess. Attention is called to the importance of confirming greenhouse (seedling) inoculation results with field readings.—*L. R. Waldron.*

6142. **KIRK, L. E. Inheritance of dwarf branching habit in a new variety of sweet clover and its potential economic value in breeding.** *Scientific Agric.* 11(6): 315-325. 3 fig. 1931.—An inheritance study of crosses between a variety of typical common white-flowered biennial sweet clover known locally as Arctic and a new variety of white-flowered biennial sweet clover, Alpha, is reported. The character complex which consistently differentiated the 2 varieties which were intercrossed is the fine-stemmed, dwarf, branching habit designated as the "Alpha" character. Forty-three F_2 families, with an average of 78 plants in each, were grown. The proportion of typical to Alpha was a good approximation to 3:1, Alpha being recessive. While the majority of Alpha-type plants in F_2 could be recognized as such in greenhouse flats, the two types could not be classified accurately in the field until they had attained considerable size. Field counts were made toward the end of the first season.—*From author's summary.*

6143. **KIRK, L. E., and T. STEVENSON. Seed color markings in white flowered sweet clover, Melilotus alba Desr.** *Scientific Agric.* 11(9): 607-611. 1 fig. 1931.—Purple flecking or spotting of sweet clover seed has been regarded as a reliable indication that such seed belongs to yellow sweet clover (*M. officinalis*). Sweet clover seed with color markings indistinguishable from those of

M. officinalis has been found in the white-flowered species, *M. alba*. The arctic variety of white-flowered sweet clover had about 1% spotted seeds, and a strain of dwarf, white-blossom sweet clover had 100% of spotted seeds. The character of "color markings" on sweet clover seed appeared to be dominant over the absence of "color markings." Color markings on sweet clover seed cannot be regarded as conclusive evidence that the seed belongs to *M. officinalis*.—*Author's summary.*

6144. **[KOBRANOV, N. P.] КОБРАНОВ, Н. П. К вопросу о происхождении разновидности белой акации v. monophylla Kirchn. (A contribution to the question of the origin of the Robinia pseudoacacia var. monophylla Kirchn.** [English summary.]) Труды по прикладной Ботанике, Генетике и Селекции. (*Bull. Appl. Bot., Genet. and Plant-Breed. Leningrad, USSR.*) 20: 435-457. 6 fig. 1929.—In 1912 the author discovered in a plantation of *R. pseudoacacia* in the Veliko-Anadolsk forest district two single-leaved white locust trees which had grown from the same trunk as fresh growth. In that year the tree blossomed in summer and autumn. In autumn only the single-leaved form blossomed. Thus, during 1 vegetative period, cross pollination took place in summer, self pollination in autumn. The resulting seeds were collected separately and sown in different beds. In 1928 it appeared that the seedlings and progeny of the 15 yr. old plants of the autumn crop belonged to the typical form, while from the seeds collected in winter, formed through self pollination, resulted 32% of the variety *monophylla*, and 68% of the common form. It is concluded that the single-leaved form is a recessive.—*Author's summary.*

6145. **KOSTOFF, DONCHO. Ontogeny, genetics and cytology of Nicotiana hybrids.** *Genetica* 12(1): 33-119. 10 pl. 1930.—This paper discusses compatibility, embryo-development and vigor in *Nicotiana* species-crosses; the slow growth of the hybrid embryos and the behavior of the starch in ovules when the egg is fertilized by sperm of foreign species; other abnormalities in ovules carrying hybrid endosperm and hybrid embryo; gamete formation in the hybrids; cytology and physiology of the tapetum; irregularities in nuclear and cell division; incompatibility and sterility and certain physiogenical aspects connected with hybridization and reproduction. It treats problems of hybrid cytology from a biophysical and biochemical point of view.—*M. J. Sirks.*

6146. **LESLEY, J. W., and M. M. LESLEY. The "Wiry" tomato, a recessive mutant form resembling a plant affected with mosaic disease.** *Jour. Heredity* 19 (8): 336-344. 7 fig. 1928.—In F_2 from a cross between 2 tomato varieties, 7 among 187 plants had characteristics suggesting severe mosaic-disease of the shoestring or tendril type. Because of the appearance of the leaves, the new type is called "wiry." It is hereditary and probably due to a gene mutation. Wiry (*w*) is completely recessive to normal (*W*) and in the authors' cultures has been completely sterile.—*Authors' abstract.*

6147. **LI, H. W. Heritable characters in Maize XXXVII—Brevis.** *Jour. Heredity* 22(1): 14-16. 1 fig. 1931.—Brevis, a recessive factor for semi-dwarf plant, was found to be linked with *pr* and v_3 of the *pr*-v_3 linkage group. The data suggest the order *pr-bv*-v_3. The recombination percentage between *bv* and *pr* was $21.7 \pm .80$. Gene *bv* was inherited independently of *C, sh, wx, g, R, su, Tu, B, lg, Y, Pl, j,* ts_2, *ra, cr, A,* and ts_4.—*Author's summary.*

6148. **LINDSTROM, E. W. A haploid mutant in the tomato.** *Jour. Heredity* 20(1): 23-30. 5 fig. 1929.—A haploid plant carrying genes *PdORY* is described. During 5 generations of cuttings no further mutations have appeared and no fruit has set except under open pollination. From seed of such fruits 3 plants were obtained. A few diploid cells have been found in root-tip sections.—*L. M. Dickerson.*

6149. **LOVE, H. H., and W. T. CRAIG. A note on yellow fatuoids.** *Jour. Heredity* 20(4): 172. 1929.—Recording the observation of yellow fatuoid oats by the authors.—*L. M. Dickerson.*

6150. **MacARTHUR, JOHN W. A spontaneous tomato chimera.** *Jour. Heredity* 19(7): 331-334. 3 fig. 1928.—An F_2 tomato plant, 5 generations pedigreed, produced a chlorophyll-deficient, albinoid, branch sport, and subsequently developed (1) green (normal); (2) albinoid (parasitic); and later, (3) chimeric portions, in which green and white tissues occur in adjacent sectors in all chlorophyll-bearing parts. Inheritance is apparently maternal; seedlings are all green, or white (dying early), never, as yet, chimeras.—*J. W. MacArthur.*

6151. **MACAULAY, T. B. The improvement of corn by selection and plot-inbreeding.** *Jour. Heredity* 19(2): 57-72. 5 fig. 1928.—The plot method of selection and inbreeding is described and compared with selfing and backcrossing. It is claimed that corn can be inbred, even to an extreme degree, without loss of vigor or impairment of yield, under proper conditions, and that strains can be developed which are superior to the open pollinated ears from which they originate.—*L. M. Dickerson.*

6152. **McCLELLAND, C. K., and GEORGE JANSSEN. Multiple ear character in maize.** *Jour. Heredity* 20(3): 105-109. 3 fig. 1929.—A new character appearing in an inbred strain of Jarvis Golden Prolific corn is described. Enlarged ears in this strain are each made up of several ears, some fertile and some infertile, and these enveloped as follows: (a) each in its own husk, (b) 2 or 3 grouped within a 2nd husk, and (c) all ears then encased in a common outer husk. Since other strains of this variety do not show this character, and since all the divergent strains of the given strain do, it is probable that the character is heritable.—*Author's abstract.*

6153. **MALINOWSKI, EDMUND. Variegation and chromosomes in Petunia.** *Jour. Heredity* 19(11): 521-526. 5 fig. 1928.—The opinion is expressed that the variegation accompanying purple flower color in a strain of *Petunia violacea* is due to unknown factors located in the cytoplasm. This conclusion is based on cytological data. There are differences in size and shape of chromosomes in normal and in variegated flowers of the above strain. The differences therefore which exist between normal and variegated flowers and accompanying the color distribution cannot be determined by genes or "gene elements" located in the chromosomes. The variegated strain behaves as a recessive when crossed with any normal uniform variety, and the variegation may be transmitted independently of other characters.—*E. Malinowski.*

6154. **MALINOWSKI, EDMUND. A case of linkage of a higher order.** *Proc. Internat. Congress Plant Sciences, Ithaca, N. Y.*, 1926. 1: 833-836. Geo. Banta Publishing Co.: Menasha, Wisconsin, 1929.—A discussion of the genetics of spikelet and glume characters in *Triticum* crosses in which the results are interpreted as "linkage of a higher order due possibly to an association between the chromosomes."—*O. E. White.*

6155. **MANGELSDORF, P. C. The effects of a lethal on the heterozygote in maize.** *Jour. Heredity* 19(3): 123-131. 2 fig. 1928.—The effects of a recessive lethal in the heterozygous condition, with all other genetic factors held constant, were studied in hybrids of an inbred strain which had mutated to defective seeds in the 13th generation and which was apparently homozygous for all other genetic factors. In homozygous condition, this recessive is completely lethal, reducing the development of the embryo and endosperm and rendering the seeds incapable of germination. In heterozygous condition, its effects, though very slight, were significant and measurable. Plants lacking the lethal factor were slightly superior to those which carried it, in stature, earliness of blooming, length and weight of ears. It is concluded that deleterious factors having only a slight effect in the heterozygote could accumulate in the germ-plasm without becoming associated with particularly favorable factors for growth and development, and that their elimination during inbreeding is sound practice.—*P. C. Mangelsdorf.*

6156. **MANGELSDORF, P. C., and G. S. FRAPS. A direct quantitative relationship between vitamin A**

in corn and the number of genes for yellow pigmentation. *Science* 73(1887): 241-242. 1931.—Four lots of corn having, respectively, 0, 1, 2, or 3 genes for yellow pigment in the cells of the endosperm were found to have a vitamin A content of 0.05, 2.25, 5.00, 7.50 units of vitamin A per gm. of material, showing that the gene for yellow endosperm color is directly associated with vitamin A. It is also shown that white-seeded varieties of corn which contain little or no vitamin A are capable of forming it in their seeds when the gene for yellow color is introduced by pollinating with a yellow-seeded variety.—*P. C. Mangelsdorf.*

6157. **MENDES, CARLOS TEIXEIRA. A biometria nos estudos de genetica. [Biometry applied to genetics.]** *Rev. Agric.* [*Saõ Paulo*] 6(1/2): 3-20. 1931.—No correlation was found in maize, rice, *Manihot* and bananas between the purity of the variety and the frequency curve of the individuals.—*J. R. Miner.*

6158. **NEBEL, B. "Über einige Obstkreuzungen aus dem Jahre 1929" und "Zur Cytologie von Malus II." ("Fruit crosses in 1929" and the cytolgy of Malus II.)** *Züchter* 1(7): 209-217. 2 figs. 1929.—This is chiefly a summary of previous publications on sterility among varieties of fruit trees. Observations on frost resistance among varieties of pears, apples and plums are also included. Crosses are reported among varieties of peaches, apricots, cherries, plums, pears and apples; and the relationships are indicated. The discussion on the cytology of the apple is a summary of what appeared previously in "Gartenbauwissenschaft Vol. 1. No. 6." The chromosome number of all apple varieties fell in two groups, either $2n=34$ or $2n=51$. Particular attention is given to the Gravenstein variety ($2n=51$) and its mutations.—*F. V. Owen.*

6159. **PHIPPS, I. F. Heritable characters in maize XXXI. Tassel seed-4.** *Jour. Heredity* 19(9): 399-404. 3 fig. 1928.—A tassel-seeded strain isolated originally from White Cap Yellow Dent is described. Breeding behavior indicates that tassel seed-4 (ts_4) is independent of tassel seed-1 and tassel seed-2 and is recessive to normal. The data suggest linkage between ($Ts_4 - ts_4$) and the ($A - a$) factor for anthocyanin color in the kernels, but this has not been confirmed.—*L. M. Dickerson.*

6160. **SCHULL, J. M. Mutations of Zinnia and Aster.** *Jour. Heredity* 19(2): 83-84. 2 fig. 1928.—Two unusual mutations are described.—*L. M. Dickerson.*

6161. **SMITH, W. K., and J. B. HARRINGTON. Wheat albinos.** *Jour. Heredity* 20(1): 19-22. 1 fig. 1929.—In a cross between Vernal (*T. dicoccum*) and Marquis (*T. vulgare*), 38 albino seedlings appeared in an F_2 of 2,229 plants. In F_3 there were 13 non-segregating families and 5, 9 and 4 families that gave green and white seedlings in the ratios 63:1, 15:1 and 3:1, respectively. The results showed that Vernal and Marquis carry 3 recessive genes for albinism, 2 of them being in 1 variety and the 3rd in the other.—*J. B. Harrington.*

6162. **SPINKS, G. T. Families of strawberry seedlings bred for resistance to aphis.** *Ann. Rept. Agric. & Hort. Res. Sta. Univ. Bristol* 1929: 17-27. [1930].—Aphis-resistant varieties of strawberries were crossed with varieties of desirable market quality: Royal Sovereign and Stirling Castle. The families of seedlings resulting from each cross are described.—*W. H. Chandler.*

6163. **STANTIAL, HELEN. The persistence of acclimatization to fluoride, after sporulation of the yeast.** *Trans. Roy. Soc. Canada, Sect. 3* 22(2): 263-265. 1928.—Yeasts acclimatized to HF, or fluorides, ordinarily retain their tolerance for some time (up to more than 190 hrs.) when cultured in a F-free medium. Spores formed in F-tolerant yeast are more tolerant of F than normal spores; the progeny of asci picked out, individually, in strains rendered F-tolerant by prolonged culture in media containing fluorides, were much more resistant to F than the progeny of normal asci. The author is inclined to interpret this as a case of the inheritance of an acquired character.

6164. **STANTON, T. R., and F. A. COFFMAN. Yellow-kerneled fatuoid oats.** *Jour. Heredity* 20(2): 66-70. 2 fig. 1929.—Yellow-seeded fatuoids were found in the distinctly yellow-kerneled varieties Richland and Iogold. These occurred under a wide range of climatic and other environmental conditions.—*Author's summary.*

6165. **STEIN, EMMY. Weitere Mitteilung über die durch Radiumbestrahlung induzierten Gewebe-Entartungen in Antirrhinum (Phytocarcinome) und ihr erbliches Verhalten. (Somatische Induction und Erblichkeit.)** *Biol. Zentralbl.* 50(3): 129-158. 27 fig. 1930.—Plants in early embryonic stages were subjected to radium treatment, resulting in induced, somatic gene mutations in localized regions. Tissues developed from these regions were subject to carcinoma-like growths. Germ cells produced from tissue carrying the mutated genes were capable of passing on to the F_1 an inherited tendency toward cancerous growths. Lesions occur in any part of the body in F_1 and F_2, however, in contrast to the parental plants, in which they occurred only in tissues derived directly from regions of the embryo in which gene mutations had been induced. That the induced mutations were rather complex is indicated by the presence of several different types of inherited abnormality in F_1 and F_2. This is not a case of the inheritance of acquired characters, but of true inheritance of somatically induced gene mutations.—*R. E. Cleland.*

6166. **STRONG, W. J. Breeding experiments with the cucumber (Cucumis sativus L.).** *Scientific Agric.* 11(6): 333-346. 2 pl., 5 fig. 1931.—Seven characters showed complete dominance: regular length of internode, dominant to irregular; grooved and ridged stem, dominant to smooth and round; mottling of fruit, dominant to non-mottling; dullness of fruit, dominant to glossiness; wartiness of fruit, dominant to non-warty; thick tough skin, dominant to thin tender; black spines, dominant to white. Nine characters lacked dominance and 3 of these appeared to be inherited on a 1-factor basis, giving approximately a 1:2:1 ratio: color of fruit, color of spines, number of spines. The other 6 had a multiple factor basis: size of leaves, color of leaves, length of internodes, length of fruit stalks, length of fruits, size of spines. The non-clustering fruiting habit appeared to be dominant to clustering in some cases, partially dominant in others. Shape of fruit appeared to depend on several size- and shape-factors, but its mode of inheritance was not determined. There appeared to be linkage between the fruit characters mottled, dull, warty, thick and tough, and non-mottled, glossy, non-warty, thin and tender.—*Author's summary.*

6167. **SWANSON, ARTHUR F., and JOHN H. PARKER. Inheritance of smut resistance and juiciness of stalk in the sorghum cross, Red Amber × Feterita.** *Jour. Heredity* 22(2): 51-56. 3 fig. 1931.—Susceptibility (*K-k*) to covered kernel smut (*Sphacelotheca sorgi*) is inherited as a single factor difference dominant to resistance in a cross, Red Amber × Feterita. Dry stalks are dominant to juicy, showing a single factor difference. No conclusive evidence of genetic linkage between the factors for reaction to smut and those for dry or juicy character of the stalks was obtained in F_3 populations, although in subsequent generations there was a tendency for the hybrid selections having juicy stalks to be the more susceptible.—*L. M. Dickerson.*

6168. **TIRELLI MARIO. Sulla predeterminazione funzionale. Influenza dell'ambiente sul germe. Selezione ambientale delle razze di grano e ipernatalità umana in Gennaio. [Functional predetermination. Influence of environment on the germ. Environmental selection of races of grain and excess of human births in January.]** *Italia Agricola* 68(1): 52-57. 1931.—Tallarico found that some races of wheat, usually cultivated on the plains, if cultivated under unfavorable, alpine conditions furnish seed that will produce, if sowed under usual lowland conditions, more than that produced by an equal weight of seed of the same race grown exclusively on the plains. Tallarico says that the unfavorable, alpine conditions have reinforced the race. The author finds this interpretation incorrect. The seeds are composed of embryo and endosperm. The embryo probably has the same size

in the same race, whether cultivated under favorable or unfavorable conditions. The unfavorable conditions may decrease the weight of the endosperm, but this reduction would not influence the genetic potentiality of the seed, the genetic factors being contained in the embryo. For this reason a given weight of seed cultivated under favorable conditions contains a smaller number of seeds than the same weight from the same stock cultivated under unfavorable conditions; but the embryos of the 2 kinds are genetically identical. Hence, the product of the former lot of seed will be smaller than that of the latter.—*M. Tirelli.*

6169. **TROLL, HANS-JÜRGEN. Untersuchungen über Selbststerilität und Selbstfertilität bei Gräsern.** *Zeitschr. Zücht. Reihe A, Pflanzenzücht.* 16(1): 105-136. 3 fig. 1931.—Twenty-five spp. and varieties of grasses were tested for self fertility. Panicles were isolated singly or in groups by parchment bags upon several or many plants for each variety or species tested. A total of 3368 tests were made upon 1576 plants. The grasses tested may be placed in 4 groups relative to self fertility: (1) with seed production from 1 to 5%; (2) from 5 to 10%; (3) from 10 to 20% and (4) with seed production above 20%, of florets present. The spp. and vars. assigned to the 4 groups are as follows: to group (1) *Agrostis alba, Bromus inermis, Beckmannia eruciformis, Dactylis glomerata, Lolium muliflorum westerwoldicum, Phalaris arundinacea, Phleum pratense,* and *Tristum flavescens;* to group (2) *Avena elatior, Festuca pratensis, Lolium perenne* and *Lolium multiflorum;* to group (3) *Alopecurus pratensis, Cynosurus cristatus, Festuca arundinacea, F. ovina, F. rubra, Poa compressa, P. fertilis, P. pratensis,* and *P. trivialis;* to group (4) *Bromus arvensis, B. mollis, Glyceria fluitans,* and *Poa nemoralis.* No complete self sterility was found. A variation in a species of as much as 4% was found between strains differing in geographical origin. Biological notes on flowering are given for many of the species.—*L. R. Waldron.*

6170. **TSCHERMAK, ERICH. Neue Beobachtungen am fertilen Artbastard Triticum turgidovillosum.** *Ber. Deutsch. Bot. Ges.* 48(9): 400-407. 1930.—This hybrid is the result of crossing *Triticum turgidum* and *T. villosum.* It is constant, fertile and shows no evidence of Mendelian segregation. The constancy and fertility are correlated with the "chromosome addition" hypothesis previously formulated for *Aegilotricum.* Zygotes of F_2 and following generations show di-diploid chromosome condition, as distinct from tetraploid; gametes, the dihaploid complements of the 2 parental species independent throughout.—*H. D. Hill.*

6171. **TSCHERMAK, ERICH. Über Zenien bei Leguminosen.** *Zeitschr. Zücht. Reihe A, Pflanzenzücht.* 16 (1): 73-81. 2 fig. 1931.—A critical analysis is made of the various phases of xenia with special reference to legumes. Attention is called to the fact that the phenomena can be utilized in breeding operations and therefore becomes of practical as well as of theoretical importance.—*L. R. Waldron.*

6172. **WAGNER, S. Topinambur als Ersatz für Zuckerrüben. [The artichoke as a substitute for sugar beets.]** *Züchter* 1(6): 190-193. 3 fig. 1929.—Summary of existing information regarding *Helianthus tuberosus.* Attention is called to sterility of flowers and mechanical difficulties in making crosses. Mention is made of several contributions towards improvement in artichokes, especially the efforts of the De Vilmorin Seed Company of France. *H. doronicoides* is said to have a higher inulin content than *H. tuberosus,* and a cross between these 2 spp. is reported. Literature citations are not given.—*F. V. Owen.*

6173. **WATKINS, A. E. The wheat species: a critique.** *Jour. Genetics* 23(2): 173-263. 15 fig. 1930.—The 3 groups of wheat were distinguished on the basis of morphology, serum reactions and disease resistance, before chromosome numbers were determined. The 1st, characterized by 14 chromosomes, is easily defined, but in the 2nd and 3rd groups it is difficult to fix upon any one character carried exclusively by the 28 or 42 chromosome group. Of the 13 wheat spp., 7 belong to the 28, and 4 to the 42 chromosome group. *T. vulgare* is the most diverse of the 13 spp. Percival suggested a hybrid origin of the *vulgare*-group wheats with *Aegilops,* one parent, furnishing hollow straw, awnlessness or short awns, rounded back of glume, and other *vulgare* characters. Vavilov has shown, however, that groups 2 and 3 have distinct geographic dispersal centers. The origin of groups 2 and 3 took on new significance with a recognition of polyploidy in *Triticum.* When wheats of 28 and 42 chromosomes are crossed, 14 bivalents and 7 univalents, the latter undoubtedly from *vulgare,* are found in heterotypic division. The univalents split in this phase, the new units lagging more or less. During homeotypic division the bivalent elements behave normally, but the univalents merely segregate at random, with a possibility that some are excluded at the poles at either phase. Chromosome number thus varies considerably in the F_2. In crosses involving parents with 14 and 28 chromosomes, behavior is still less methodical and sterility more pronounced. When *Aegilops cylindrica* ($2n=28$) is crossed with *T. vulgare,* 7 bivalents and 21 univalents generally appear, but when *T. durum* participates, pairing at the heterotypic division rarely takes place. This affords evidence that *vulgare* (and its allies) is differentiated from *durum* by 7 chromosomes similar to those of *A. cylindrica.* No bivalents seem to be formed when *A. ovata* is crossed with *T. vulgare,* and bivalency is nearly lacking when *T. durum* or its allies enter into the cross. In pentaploid hybrids, F_2 and later plants produce mega- and microspores with 14 to 21 chromosomes, $2n=28$ to 42. When 14 bivalents assemble in company with 0 to 7 univalents, fertile plants result, with a tendency in later generations to form 28-chromosome plants. In plants with more than 35 chromosomes, fertile plants are in evidence when bivalents + univalents = 21. In this case true breeding fertile 42-chromosome plants usually result. It has been found that in F_2 pentaploids, many more 28-chromosome plants are found than if random assortment took place. Sterility associated with this disparity may be due (1) to lack of grain germination, (2) to failure to set grain (due to pollen or egg cell failure), (3) to elimination of zygotes, and (4) to pollen sterility. The genetics of pentaploid wheats are complex, and only a few characters show monohybrid ratios. New and abnormal types often appear. Type is obviously associated with chromosome number. It has not been shown conclusively that specific *vulgare* genes are carried by the 7 univalents thought to belong peculiarly to *vulgare.* In certain crosses 28 and 29 chromosome plants varied in resistance and were sometimes susceptible to rust; no resistance was found in the high chromosome extractives in a *durum* × *vulgare* cross.—In 1 pentaploid, *turgidum* × *vulgare,* both parents waxy, waxless plants appeared in the F_2, of *turgidum* type. The F_1, back-crossed to *turgidum,* gave waxy which bred 1:1 but when F_1 was back-crossed to *vulgare* only waxy appeared. Assumption of a dominant waxy unpaired gene located in a univalent explains the facts. Allosyndesis is of usual occurrence. Other *turgidum* × *vulgare* crosses lead to the conclusion that both the paired and unpaired chromosomes carry a similar set of factors represented by A_1A_2 and $A_1a_2A_3$, A_3 being carried by the unpaired chromosomes and A_1a_2, when segregated out, giving a new character, say waxless or speltoid (new type). A_2 and A_3 may represent groups of linked factors.—Speltoid mutants are explained by Winge by assuming that among the hexaploid chromosomes of *vulgare,* irregular pairing may take place to form gametes *ABB* and *ACC* resulting in the heterozygous speltoid of, say, *ABC/ABB.* Winge's hypothesis, carried through, does not account for certain linkage phenomena nor for the origin of part mutations. Nilsson-Ehle's hypothesis of factor mutation accounts for the foregoing, but does not account for the fact that speltoids can be formed by the addition or loss of an entire chromosome. Factor mutation seems to account for some of the speltoid phenomena.—The phenomenon of

"shift," in glume length, observed in *T. polonicum* × *T. durum*, when the parent characters are not recovered, is explained by Darlington by autosyndesis, in which *Ww* would be the gamete formed from pure *WW WW* and *ww ww* parents. Modifying factors segregating normally would prevent intermediacy.—If, generally, the 3 sets of 7 chromosomes in *vulgare* carry similar factors, then inheritance in hexaploid wheat crosses should show corresponding cumulative effects; and such inheritance should be limited to polyploid organisms.—*L. R. Waldron.*

6174. **NOGUCHI, YOSHIKCKI.** A few fundamental findings for breeding rice plants. (Translated [from the Chinese] by C. P. KWAN.) *Jour. Agric. Assoc. China* 78/79. 13-20. 1930.

ANIMAL

6175. **ASDELL, S. A., and A. D. BUCHANAN-SMITH.** Inheritance of color, beard, tassels and horns in the goat. *Jour. Heredity* 19(9): 425-430. 1 fig. 1928.—From an examination of the Kid Register of the British Goat Society, entries from 1884 to 1923, some indication of the inheritance of color was obtained. Black appeared to be the lowest in a series of black, chocolate, fawn, and cream, in that order. Brown appeared to be dominant to all colors save true white; red and tan seemed recessive to the black series. Gray and roan appeared to be dominant to all colors save brown, to which it seemed to be recessive. True white is dominant to all colors. From other records beard is inherited in a simple sex-limited manner, being dominant in the male and recessive in the female. Tassels are inherited as a simple dominant, but there may be complications apart from that of the inheritance of misplaced tassels. Further evidence of the dominance of polled is found.—*S. A. Asdell and A. D. B. Smith.*

6176. **BLUHM, AGNES.** Zum Problem "Alkohol und Nachkommenschaft." *Arch. Rass.- u. Ges.-Biol.* 24: 12-82. 1930.—Starting with highly inbred albino mice, the ♂♂ of 114 pairs were treated with alcohol; 114 similar pairs were carried as controls, and all were bred through 8 generations, covering more than 32,000 offspring. The lines which started with alcoholized ♂♂ showed a somewhat higher mortality of offspring, both before and at most ages after birth, somewhat diminished vigor of growth, greater variability, and an increased proportion of sterile individuals. Male descendants were more affected than ♀, indicating that genes in the X and Y-chromosome had been damaged by the alcoholization. There was no increase in abnormalities or degenerative conditions. It is concluded that definite mutations (sublethal genes) were induced by the alcohol.—*P. Popenoe.*

6177. **CASTLE, W. E.** The rex rabbit. *Jour. Heredity* 20(5): 192-200. 5 fig. 1929.—A recessive mutation has given rise to a new variety which, because of its short plush-like coat without clearly differentiated guard hairs, is of economic interest to the furrier. A study has been made of its linkage relations with other known genes of the rabbit with negative results. Confirmation is made of the fact discovered by Pease that yellow fat in rabbits is a recessive mutation, the gene for which is closely linked with the color gene and its albino allelomorphs. The occurrence of crossing-over between these genes has been observed with a frequency estimated at 5-10%.—*Author's abstract.*

6178. **COLTON, HAROLD S.** "High Brow" albino rats. *Jour. Heredity* 20(5): 225-227. 2 fig. 1929.—In a colony of white rats several have been born with this peculiar hydrocephalic condition. These births were among close relatives. Most of the "High Brow" rats died before or shortly after weaning. One was raised and mated with his normal sister and the offspring mated inter se. All offspring of F_1, F_2, and F_3 were normal. The highbrow condition, therefore, either is not inherited or, if inherited, is due to more than a single factor difference.—*From author's abstract.*

6179. **COMAS, MARGARITA.** Contribución al conocimiento del determinismo del sexo en Paramermis contorta v. Linzt. [Determination of sex in P. contorta.] *Mem. R. Soc. Españ. Hist. Nat.* 15(1): 47-52. 1929.—The sex of this parasitic nematode, when only 1 occurs in a *Chironomus* larva, is usually (85% of cases) ♀. Genotypic ♂♂ apparently have changed into phenotypic ♀♀ (intersexes). When many of the parasites enter, presumably not simultaneously, the first 1 or 2, responding to favorable nutritive conditions, become ♀♀, others arriving later become mostly phenotypic ♂♂ (intersexes) or genotypic ♂♂. From these and other facts it appears that instability of genotype in sex-determination is fairly common in Mermithidae.—*Author's conclusions.*

6180. **DAVIS, FREDERICK ALLISON, and HARVEY M. SMITH.** The rôle of lens antigen and uveal pigment in the production of hereditary anomalies of the eye. *Arch. Ophthalmol.* 4(5): 672-690. 4 fig. 1930.—Spontaneous occurrence of coloboma was observed in 5 out of 12 eyes in a litter of 6 rabbits the mother of which had normal eyes. In 61 experiments on pregnant rabbits (44 receiving lens antigen, 5 having 1 or both lenses needled, 12 receiving uveal pigment injections), 41 pregnancies came to term, resulting in 263 offspring among which only 2 showed any ocular defect. Many of the offspring have been subsequently mated without the appearance of a defective eye. The authors conclude that the anomalies described by Guyer and E. A. Smith are not due to the effect of injected lens substance, but are probably hereditary defects of unknown origin. They believe that, while coloboma may occur as a recessive (colobomatous offspring from normal-eyed parents), it is not a simple recessive, since it may appear in F_1 from the mating of a rabbit with defective eyes with a rabbit with normal eyes.

6181. **DUNN, L. C., and B. F. GLESSING.** The genetics of the domestic fowl. *Jour. Heredity* 19(11): 511-519. 1928.—The occurrence of 3 unhatched chicks without down plumage is reported from the Central Genetical Station, Moscow, U. S. S. R. All originated from matings between close relatives belonging to the same pedigree. The downless condition is ascribed to mutation.—*L. C. Dunn.*

6182. **DUNN, L. C.** The genetics of the domestic fowl. Part II. The genetics of leg feathering. Memoirs of the Anikowo genetical station. *Jour. Heredity* 20(3): 111-118. 3 fig. 1929.—The author presents a digest of translations from the original papers. The breeding behavior of 7 types of leg feathering is reported. Genes for "heel tufts" (*susti*) and recessive leg-feathering (*asuso*) are here described and established for the first time. Descriptions used are all based on leg feathering in the baby chick. Each type is an average around which fluctuations occur. See also *Ibid.* 20(7): 322 for corrections of errors in some of the tables and percentages.—*L. M. Dickerson.*

6183. **FORD, E. B., and J. S. HUXLEY.** Genetic rate-factors in Gammarus. *Zeitschr. Wiss. Biol. Abt. D. Roux' Arch. Entwicklungsmech. Organ.* 117(Festschr.): 67-79. 7 fig. 1929.—Mutations in *G. chevreuxi* (Amphipoda) which influence the color of the facets of the eyes act by modifying the time-relationships governing the deposition of melanin. In the normal black eye (*RR*), which is at first red, melanin is deposited so rapidly that a dense black color is attained by the time of extrusion from the maternal brood-pouch. In red (*rr*) eyes the time of onset and rate of melanin formation is always slower. It may be modified by a factor "*s*" slowing it down considerably, and a factor "*m*" slowing it down to a less degree. A factor "*d*" has also been found which delays onset of rapid pigment development until sexual maturity. Melanin formation is also influenced by temperature and eye-area. In *rr* eyes melanin is formed rapidly at 28° C. and very slowly at 14° C. Large eyes are lighter than small, since a given quantity of melanin has to be spread over facets of greater area. Growth, and consequently eye color, is controlled both phenotypically and genotypically. In

the latter case a single factor "*g*" reduces the growth rate, though not final size.—*E. B. Ford.*

6184. **FRETS, G. P. Keimgifte. [Germ-plasm poisons.]** *Arch. Rass.- u. Ges. Biol.* 24: 83-96. 1930.—Review of literature indicates that lead, thallium, iodine, nicotine, chloral hydrate, methylene blue and other chemicals are real germinal poisons. The evidence as to alcohol is conflicting.—*P. Popenoe.*

6185. **GODBEY, C. B., and D. H. REID. A hen with variable plumage color.** *Jour. Heredity* 22: 59-62. 3 fig. 1931.—A Barred Plymouth Rock pullet after completing her first moult in 1927, was practically white in appearance and remained so until after the moult in 1930. Following this moult, she again took on the plumage color of a normal Barred Rock. Her genetic constitution, as determined by breeding tests, is that of a normal Barred Rock hen.—*C. B. Godbey.*

6186. **GONZALEZ, B. M., and VALENTE VILLEGAS. "Bighead" of horses a heritable disease.** *Jour. Heredity* 19(4): 159-167. 4 fig. 1928.—In experimental matings of horses in the Philippines, a supposedly homozygous osteoporotic stallion was the progenitor of osteoporotic stock. In all, 14 successful matings are reported, and it is concluded that osteoporosis is a heritable constitutional disease. A hypothesis is provisionally advanced that it is a simple dominant, autosomal Mendelian character, and that the disease may be caused by the failure of an organ or organ system to function properly.—*B. M. Gonzalez.*

6187. **GORDON, MYRON. Pigment inheritance in the Mexican killifish. Interaction of factors in Platypoecilus maculatus.** *Jour. Heredity* 19(12): 551-556. 5 fig. 1928.—There are 2 types of melanophores, each controlled by a dominant gene. The gene *Sp* for black spotting is sex linked but *St* for stippling (graying) is autosomal. When the killifish is spotted + stippled the *Sp* factor has a partial inhibitory effect upon *St;* but at the same time the *St* factor enhances the effect of *Sp.* The inhibitory power that *Sp* has over *St,* however, is not so great as the power *St* has in increasing the effect of *Sp;* for while *Sp* may reduce the effectiveness of *St* only about 30%, *St* increases the effectiveness of *Sp* about 70%.—*M. Gordon.*

6188. **GREEN, C. V. Size inheritance and growth in a mouse species cross (Mus musculus × Mus bactrianus). I. Litter size. II. Birth weights.** *Jour. Exp. Zool.* 58(1): 237-258. 1930.—I. Large series of litters showed that an inbred strain of dilute brown non-agouti *Mus musculus,* averaging 5.4 ± .04 young per litter, differs significantly in litter size from a stock of *M. bactrianus* which averaged 4.6 ± .11 young. When *musculus* females were mated to *bactrianus* and to F_1 males, the average litter sizes remained very nearly the same (5.4 ± .20 and 5.3 ± .14 offspring, respectively) as when mated to *musculus* males. The reciprocal back-cross (F_1 females × *musculus* males) produced litters averaging 6.4 ± .12 young. These results indicate that in mice the litter size is determined entirely by the female. The genetic constitutions of the offspring in the two types of back-cross are the same, the marked difference in litter size being a manifestation of heterosis of the hybrid mother. II. Newborn weights of a strain of large inbred *M. musculus* (dilute brown non-agouti), a stock of small *M. bactrianus* (intense black agouti), F_1 animals from both types of matings, and animals from 2 types of back-cross matings were investigated statistically. The average newborn weight is specifically constant, the mean weight of young from all litters, irrespective of size, apparently giving as true a picture of the genetic basis of birth weight as that of young from modal litters only. Males in all types of matings tend to be heavier at birth than females. The results of reciprocal crosses indicate that the genetic complex of the growing fetus is more important than the mother in determining the weight at birth. Although the back-cross generations consisted of mice of 8 color classes, no evidence of linkage between factors controlling weight at birth and any of the 3 qualitative factors investigated was detected.—*Author (courtesy Wistar Bibl. Serv.).*

6189. **GROTH, A. H. A fertile mare mule.** *Jour. Heredity* 19(9): 413-416. 4 fig. 1928.—An aged mare mule gave birth to 3 offspring, 2 of which lived (the 3rd was a cyclopean monster). One of these two was sired by a Jack, the other by a Saddle Stallion. The ♂ colt sired by the Saddle Stallion has proved fertile. Efforts to breed the mare sired by the Jack have been futile. The mule and her offspring are owned by the Animal Husbandry Department of the Agricultural and Mechanical College of Texas.—*A. H. Groth.*

6190. **HÄMMERLING, J. Dauermodifikationen.** In: **E. BAUR und M. HARTMANN. Handbuch der Vererbungswissenschaft.** Bd. 1, Lief. 11. 70p. 31 fig. Gebrüder Borntraeger: Berlin, 1929. Pr. 6 M.—A brief summary of general conclusions regarding heredity and variation, modifications, and the effects of selection in Protozoa, is followed by a review of the investigations on *Paramecium* and *Arcella* which led Jollos to advance the conception of Dauermodification (an induced non-genotypic change which recurs in subsequent generations for a shorter or longer time after return to normal conditions). Increased resistance to As, increased division rate (induced by Ca), change in size, increased resistance to temp. are discussed. The longer the treatment, the more elevated in grade is the modification, although a certain high point cannot be exceeded, and the longer does the modification persist in vegetative reproduction under normal conditions. The return may be accelerated by sudden change of cultural conditions, more so by endomixis, still more by conjugation. The part of the cell affected is in some cases the plasma; in others (which show no return to normal in vegetative reproduction), the macronucleus also is involved. The significance of bacterial factors is discussed. Results interpreted as possible effects of selection within a clone (Jennings and others) may be consistently interpreted as dms. (Dauermodifications). Stein's work on radiomorphs in *Antirrhinum* is reviewed. Dms. in bacteria, fungi, cormophytes, probable cases in cladocera, rotifers, lepidoptera and rats are briefly mentioned. Their peculiar inconstancy forbids them to be classified as mutations. Known dms. have no evolutionary significance. The return of the plasma to normal condition may possibly be caused by the action of the unchanged nuclear genes or genetically independent elements in the plasma, or by the change of outer factors to the normal. Difficulties in regard to these three possibilities are pointed out in a critical examination of the relationship of plasma and nucleus in inheritance, especially in connection with the work of Harder and of von Wettstein. The latter's conception of the plasmon is contrasted with Jollos' plasmotype.—*A. H. Hersh.*

6191. **HANCE, ROBERT T. Detection of heterozygotes with x-rays. Difference in strength of genetic character resulting from single or double genes shown in case of color in the mouse.** *Jour. Heredity* 19(11): 480-485. 3 fig. 1928.—When given a certain exposure to x-rays the pigmented hair of colored mice falls out and is replaced with uncolored or white hair. The hair of mice pure for pigmentation becomes on the whole darker, while hybrid mice almost completely lose their color. A tentative explanation based on the observed increase of oxidative activity of tyrosinase following x-radiation is suggested.—*Author's summary.*

6192. **HAWORTH, ERASMUS. A mule colt from Nebraska.** *Jour. Heredity* 19(9): 412. 1 fig. 1928.—A letter reporting a mule which has given birth to a foal sired by a jack and is believed to be again in foal.—*L. M. Dickerson.*

6193. **IBSEN, HEMAN L., and L. D. BUSHNELL. Eye defects in rabbits.** *Jour. Exp. Zool.* 58(1): 401-421. 1 pl. 1930.—Two methods used by Guyer were employed in attempting to induce eye defects in rabbits: (1) Hens were injected with rabbits' lenses in order to produce lens antibody, and the serum from such hens was injected into pregnant rabbits. (2) The eyes of rabbits,

both males and females, were needled for the purpose of allowing the animals to produce their own lens antibody. The percentage of eye defects in the descendants of treated animals was much lower than that obtained by Guyer. Several very noticeable eye defects were found in untreated stock. The difference between the per cent of defectives in the treated stock and the untreated was not significant statistically. It seems highly probable that a modification of a third method used only to a slight extent by Guyer would be of a more critical nature than the two mentioned above, i.e., injecting lenses directly into rabbits of both sexes until the antibody content was found to be high in at least some of the animals, mating them, and continuing to inject the females during pregnancy.—*Authors (courtesy Wistar Bibl. Serv.).*

6194. **JULL, MORLEY A., and JOSEPH P. QUINN. Inheritance in poultry. Data on the genetics of vulture hocks, hen feathering and crooked neck in the domestic fowl.** *Jour. Heredity* 22(5): 147-153. 5 fig. 1931.—Vulture hock is recessive to its absence and due to a single factor. Hen-feathering is dominant to cock-feathering and is the result of a single factor, with the probability that modifying factors are involved. Crooked neck does not appear until the birds are about half grown and apparently is inherited on a monofactorial basis. The defective condition becomes progressively more serious as the birds mature, unfitting them for breeding.—*L. M. Dickerson.*

6195. **KEELER, CLYDE E. Thelytoky in Scleroderma immigrans.** *Psyche* 36(1): 41-44. 1929.—In this mutilloid wasp, wingless ♀♀ × winged ♂♂ produced 6 winged ♂♂, 1 wingless ♂ and 84 wingless ♀♀. Wingless ♀♀ × wingless ♂♂ gave one wingless ♀. Virgin wingless ♀♀ produced 33 wingless ♀♀. The author queries whether he could have been dealing with a parthenogenetic strain, or whether change of conditions produced a functional difference in mode of reproduction.

6196. **KISLOVSKY, D. A. Naked—a recessive mutation in the rabbit.** *Jour. Heredity* 19(10): 438-439. 2 fig. 1928.—This defect in hair growth is described and illustrated. All the mutants were observed in the progeny of a normal "champagne" ♂ N. 89 and resulted from mating him with his daughters and granddaughters. Matings of heterozygous individuals gave 17 normals to 7 mutants, a ratio near to the expected 3:1. The hair defect is associated with defects in teeth. Pure recessives could not be mated, as all the mutants died early.—*D. Kislovsky.*

6197. **KNOX, C. W. Color chimeras in the domestic fowl.** *Jour. Heredity* 22(4): 133-134. 1 fig. 1931.—A skin-color mutation resulted in a "half and half" mosaic. In another case, a small, yellow area developed on one shank of a white-shanked bird. Another mutation—probably a loss of the gene for melanic pigment—produced a bird having one yellow and one green shank; the green shank might also be due to a dominant mutation, the other retaining the recessive yellow color.—*L. M. Dickerson.*

6198. **KROON, H. M., en G. M. van der PLANK. Enkele sub-letaalfactoren bij huisdieren in Nederland. [Sublethal factors in domestic animals in Holland.]** [With French, German, and English summaries.] *Tijdschr. Diergeneesk.* 58(13): 681-694. 5 fig. 1931.—The factors are: albinism in cows, epitheliogenesis imperfecta neonatorum in cows, absence of a part of the limbs in sheep, and dwarf form in the Frisian horse. All are recessive sub-lethals which came to light in inbreeding.

6199. **LAMBERT, W. V. A "Half and Half" skin-color mosaic in the chicken.** *Jour. Heredity* 20(4): 167-169. 1 fig. 1929.—Attention is called to a chicken of which half of the body had white skin and half yellow skin. Possible causes of the mosaic are discussed.—*W. V. Lambert.*

6200. **LANDAUER, WALTER. The morphology of intermediate rumplessness in the fowl.** *Jour. Heredity* 19(10): 453-467. 4 fig. 1928.—This new heritable character is marked by the absence of one or two synsacro-caudal vertebrae and all vertebrae of the pygostyl except the last two. The 5 free caudal vertebrae as a rule are present, but show a widely varying degree of differentiation. A graded series leads from pelves in which the first two caudal vertebrae are almost normal to those in which all caudal vertebrae and the remaining part of the pygostyl are fused in a very irregular fashion. Males on the average show a longer and better developed free caudal segment than females. Sex has no influence, however, upon the number of vertebrae present in the synsacro-caudal region. Size and degree of differentiation of the synsacro-caudal region and of the free caudal part of the vertebral column appear to be correlated, pelves with a greater reduction in free caudal vertebrae usually showing a smaller number of vertebrae in the synsacro-caudal region. A discontinuous suppression of vertebrae may take place in a segment of the vertebral column without affecting the normal appearance of the remaining vertebrae in this region.—*W. Landauer.*

6201. **LANDAUER, WALTER, and L. C. DUNN. Studies on the creeper fowl. I. Genetics.** *Jour. Genetics* 23(3): 397-413. 1 pl. 1930.—This breed is characterised by extreme shortness of the long bones of the extremities, bending of the tibia, and a highly differentiated fibula. Breeding experiments with four different strains, obtained from America, Germany, Scotland, and the Marquesas Islands, led to these conclusions: creeper traits are determined by a single dominant Mendelian gene; in homozygous condition the creeper gene is lethal. The lethal nature of the homozygous creeper condition is demonstrated: (a) by the fact that only heterozygotes exist (breeding tests); (b) by the segregation of two creepers to one normal in inter se matings of creepers; (c) by the fact that approximately 25 per cent. more embryos die during the first six days of incubation in inter se matings than in out-crosses. Homozygous embryos, at the age of 72 hours, show a striking retardation in growth and differentiation. A small percentage of homozygous embryos in inter se crosses of the original stocks, and, apparently due to hybrid vigor, a considerably larger number in crosses between different creeper lines and in inter se crosses of F_1 creepers from matings with normal fowls, survive the lethal period. Such embryos exhibit a malformation closely resembling, if not identical with, phokomelia in humans and other mammals. They usually die during the last week of incubation, but in rare instances are still alive at hatching time; they never hatch. The fact that in back-crosses as well as in inter se matings the proportions of creepers to normals show a deficiency of creepers among the hatched chicks, and a surplus of creepers among the chicks which failed to hatch, demonstrates that even the heterozygous creeper condition is slightly semi-lethal. Crosses between the different creeper lines yielded essentially the same results with regard to segregation and embryonic mortality as did intra-line crosses. Thus the creeper condition in all four lines is evidently due to one and the same mutation.—*Authors' summary.*

6202. **LI, JU-CH'I. A new food for laboratory cultures of Drosophila.** *Peking Soc. Nat. Hist. Bull.* 5(4): 29-31. 1931.—The new formula consists of 75 cc. water, 1.5 gm. agar, 10 gm. corn-meal, 13.5 cc. red sugar seeded with a few drops of yeast culture.

6203. **MacDOUGALL, MARY STUART. Another mutation of Chilodon uncinatus produced by ultraviolet radiation, with a description of its maturation processes.** *Jour. Exp. Zool.* 58(1): 229-236. 12 fig. 1930.—This appeared in a culture which had had 3 exposures to ultraviolet rays—one of 30 seconds and two of 15 seconds each. The main difference from *C. uncinatus* is that there is a prolongation of the convex dorsal portion of the body, resembling somewhat a form described by Stokes as *C. caudatum*. There is also a change in the ciliation and body shape. In the beginning of the work one large exconjugant, with a conspicuous tail, was isolated and allowed to multiply. In this line more

than 20 conjugations have occurred without any sign of reversion to the original form. This line appears to be homozygous. Five out of 75 pairs of conjugants isolated from other lines obtained from the original mass culture have reverted to normal. These normals have never shown any sign of a caudal appendage.—*Author (courtesy Wistar Bibl. Serv.).*

6204. **MOHR, OTTO LOUS.** Dödbringende arvefaktorer i storfé. [Lethal hereditary factors in cattle.] *Tidsskr. Norske Landbruk* 1(2-13) : 5 fig. 1929.—A study was made of 4 series of hereditary lethal factors in cattle discovered in certain districts of Norway and Sweden. In 1 series the calves may be designated as "bulldog-faced," in a 2nd as "hairless," in a 3rd as "legless," and in a 4th as "elk-like." In each series the calves were strikingly similar. They die either shortly before, or at birth, but in a few cases they may live for a few hrs. or days (sublethal). The factors are all recessive and appear only on inbreeding. In each case the factor was quite widely spread in the district before detected. All of the 4 factors were traced back to introduced bulls of extraordinary qualities in other respects. Methods in backcrossing are suggested for testing such animals for unfavorable recessive traits before the factors are allowed to spread.—*P. Okkelberg.*

6205. **NABOURS, ROBERT K. Mutations and allelomorphism in the grouse locusts (Tettigidae, Orthoptera).** *Proc. Nation. Acad. Sci. U. S. A.* 16(5) : 350-353. 1930.—Extremely close linkage prevails. The 70 dominant, elementary, color patterns may have resulted, respectively, from aggregations of mutants too closely linked to allow of crossing over. Only one of the mutants has occurred (once) under observation.—*R. K. Nabours.*

6206. **POPOVA-WASSINA, E. T. A naked lamb.** *Jour. Heredity* 22(3) : 90-92. 1 fig. 1931.—A male lamb, naked except for a small amount of hair on the dorsal surface of the hind tibiae and some hair on the tip of the tail, was born in a flock of highly inbred sheep. Its skin is black and shiny. A twin sister had normal wool. The animal has been kept for breeding tests.—*L. M. Dickerson.*

6207. **ROBERTS, ELMER, and W. E. CARROL. The inheritance of "hairlessness" in swine. Hypotrichosis II.** *Jour. Heredity* 22(4) : 125-132. 6 fig. 1931.—A study of the inheritance of a hypotrichotic condition found in the so-called "hairless" swine of Mexico is reported. The difference between normal and "hairless" is due to a single factor. The normal is only partially dominant, the heterozygotes being intermediate in the amount of hair. The cause of "hairless" is not known. The hair follicles, though much less numerous in the "hairless" individuals than in either normal or heterozygotes, are normal. The administration of cystine gave negative results, and iodine deficiency seems not to be a causative factor.—*Authors' abstract.*

6208. **ROBERTSON, W. R. B. Hybrid vigor—a factor in tettigid parthenogenesis?** *Amer. Naturalist* 65(697) : 165-172. 1931.—Partheno-reproducing lines of Tettigidae descended from hybrid ♀♀ may continue to be heterozygous, since, on account of pre-synapsis splitting, there are four strands in each tetrad concerned in crossing-over and with this the giving off of but one polar body. If hybrid vigor, through heterozygosis, may be expressed in parthenogenesis, it should continue, though in diminishing amount, as homozygosis is approached.—*W. R. B. Robertson.*

6209. **SEREBROVSKY, A. S., and S. G. PETROV. A case of close autosomal linkage in the fowl.** *Jour. Heredity* 19(7) : 305-306. 1928.—A cross of a cock heterozygous in the autosomal genes for rose comb and creeper legs by doubly recessive hens (single comb, normal legs) produced 1 rose creeper, 22 rose normal, 33 single creeper, and 4 single normal chicks. It is concluded that the genes rose and creeper are linked with a crossover value of 8 ± 3.5. (See also *Ibid.* 9(8) : 376. for correction.)—*A. S. Serebrovsky and S. G. Petrov.*

6210. **TIMOFEEFF-RESSOVSKY, N. W. Reverse genovariations and gene mutations in different directions II. The production of reverse genovariations in Drosophila melanogaster by x-ray treatment.** *Jour. Heredity* 22(2) : 67-69. 1931.—X-rayed males from *white, ycvvf, scw^{e}ec, X-ple, III-ple* and *"rucuca"* stocks were crossed with virgin females from the same stocks and the F_1 flies examined for reverse gene mutations of these recessive genes. Reverse mutations of $sc > Sc$, $w^e > W$, $cr > Cc$, $f > F$, $h > H$, and $p^p > P$ were found. "Direct" mutations also had been produced by x-ray treatment at most of these loci previously.—*Author's abstract.*

6211. **TURNER, C. L. A wing mutation in a Borborid fly.** *Jour. Heredity* 22(1) : 35-38. 1 fig. 1931.—The life history and culture methods are described for *Leptocera fontinalis* Fullen, a fly not used before in experimental work in genetics. The life cycle is completed in 18 to 25 days. A variable, notched-wing mutation is also described and its genetics discussed. The mutation appears to be dominant, autosomal, existing only in heterozygous condition. Preliminary examination indicates that $2n = 6$ or 8.—*L. M. Dickerson.*

6212. **WASSIN, BORIS. Linkage studies in sheep.** *Jour. Heredity* 22(1) : 9-13. 3 fig. 1931.—In sheep the 3 dominant characters, additional nipples (*N-n*), presence of wattles (*W-w*) and piebaldness or "necklace" (*Pn-pn*) are inherited independently. Expression of (*N*) is completely inhibited in the presence of gene (I^n). Weak repulsion is suggested between white coat color (*C*), (*w*) and (*n*). Gene (P_n) is expressed visibly only in black sheep.—*L. M. Dickerson.*

6213. **WHITNEY, LEON F. The inheritance of a ticking factor in hounds.** *Jour. Heredity* 19(11) : 498-502. 5 fig. 1928.—Ticking (*T*), called roaning (*R*) by some authors, is apparently inherited as a simple dominant. It appears at about 4 weeks of age, must be associated with white and does not affect other colors.—*L. M. Dickerson.*

MAN

6214. **ADAMS, MARY. Six talks on heredity: a handbook to the cradle.** 104p. Frontispiece. 20 fig. W. Heffer & Sons, Ltd.: Cambridge, 1929.—A series of radio talks on heredity and eugenics.—*S. Wright.*

6215. **BANKER, HOWARD J. Genealogical correlations of student ability.** *Jour. Heredity* 19(11) : 503-508. 1928.—Having derived a numerical index based on the ability of students to meet the curriculum requirements of the common public school, correlations for this index are determined in the case of various consaguineous relationships, such as father and mother, parents and children, and combinations of sibs. These give in nearly all cases positive and significant correlations strikingly similar in value to like correlations in physical characters obtained by others.—*H. J. Banker.*

6216. **BLAINE, EDWARD S. Congenital radio-ulnar synostosis. With report of case.** *Amer. Jour. Surg.* 8(2) : 429-434. 3 fig. 1930.—Two fairly distinct types of this defect may be distinguished; (a) the type in which the radial head is absent, the proximal end of the radius being fused with the ulna, and (b) the type in which the head of the radius is displaced toward the flexor side of the arm. The extent of the bony union varies from about 2 to 6 cm. The radius and ulna develop out of the same precartilage plate, and, at a later stage, the perichondrium of the 2 bones is continuous at their proximal ends. The abnormal developmental impulses which lead to synostosis are indicated by other bony defects in the propositus or his family. Among the commonest of these are; exostoses, clubfoot and clubhand, flatfoot, abnormally diminished growth of long bones, short stature and bowlegs; in general, dyschondroplasia. There are genotypical differences in families, but synostosis is always dominant. Males are twice as likely to be affected as females; and this holds for bone defects in general. Frequent lack of symmetry in the defect suggests imperfection of dominance. Radio-ulnar synostosis appears to be a dominant, partially sex-limited trait, which varies in degree of expression.—*Author's summary.*

6217. **BUTT, N. I., and LOWRY NELSON. Education**

and size of family. *Jour. Heredity* 19(7) : 327-330. 1928.—The authors base their statistical analysis on the results of field studies including every household in 2 communities with populations of approximately 2000 and 3000 inhabitants respectively. They conclude that education is of minor importance in determining the size of the family, being far outweighed by vocation, social attitudes of groups, inherent physical vigor, economic conditions and other factors.—*L. M. Dickerson.*

6218. **CHAMBERLAIN, HERBERT D. The inheritance of left-handedness.** *Jour. Heredity* 19(12) : 557-559. 1928.—A résumé of a survey made of the handedness of 2177 students entering Ohio State University in 1927, together with the handedness of their parents and sibs. Also a record of 33 cases in which both parents were lefthanded. Lefthandedness increases from 2.1%, when both parents are righthanded, to 46%, when both parents are lefthanded.—*H. D. Chamberlain.*

6219. **CLEMENTE, LEOPOLDO S. A claw-fingered family.** *Jour. Heredity* 19(12) : 529-536. 6 fig. 1928.—A new abnormal nail mutation which resembles a "claw" was discovered in a certain Philippine family. No such case was ever found before among the immediate relatives of the first affected individual. This abnormality is due to a single factorial, autosomal, mutation, which affects only the nails of both hands and feet. It behaves as a simple Mendelian dominant.—*L. S. Clemente.*

6220. **CLOUSTON, H. R. A hereditary ectodermal dystrophy.** *Canadian Med. Assoc. Jour.* 21(1) : 18-31. 13 fig. 1929.—Six generations having a dystrophy of hair and nails. Hair has tendency to thin out and disappear in places of friction. Both toe and finger nails are only partly developed. There is some evidence that abnormalities of other ectodermal organs, such as teeth, nervous system and endocrines, may be involved. In this family there was not a large percentage of mental or moral defectives.

6221. **CUTTER, RAY T., and W. M. NELSON. A short-toed family; brachydactyly in the feet of humans.** *Jour. Heredity* 22(5) : 163-166. 4 fig. 1931.—In a case of brachydactyly of the human foot, 3 men and 1 woman were affected, during 3 generations. A radiograph showing absence of one set of phalanges is given.—*Authors' abstract.*

6222. **DAVENPORT, CHARLES B. Crime, heredity and environment.** *Jour. Heredity* 19(7) : 307-313. 1928.

6223. **DAYTON, NEIL A. Order of birth in mental defectives. A survey of 10,455 retarded children in the public schools of Massachusetts.** *Jour. Heredity* 20(5) : 219-224. 2 fig. 1929.—By means of examinations covering 10 fields, including mental, physical, pedagogic, psychologic and social aspects of retardation, retarded children were studied in families of different size. The order of birth of the retarded or mentally defective was found to be of little importance. Families having a mentally defective child (mean = 6.24 ± 30 S. D.) are larger than families having a retarded child (mean 5.71 ± .04 S. D.). These figures include both complete and incomplete families.—*Author's abstract.*

6226. **FANTHAM, H. B., and ANNIE PORTER. Some further cases of physical inheritance and of racial admixture observed in South Africa.** *S. African Jour. Sci.* 27: 391-405. 3 fig. 1930.—Particulars are given of inheritance of the following physical characters:—Brachydactyly appearing in 4 generations in family of Russian origin, both males and females being affected; supernumerary fingers in 3 generations of a Cape colored family, confined to males; supernumerary big toe in Cape colored family in males of 2 generations; white forelock in 4 generations of European family, males and females affected; white forelock in natives, affecting men belonging to three generations; premature whiteness of hair in 4 generations of European women. Details of the cases of racial admixture involving European, Chinese, and native Hindoo are set forth.—*H. B. Fantham.*

6227. **FISCHER, EUGEN. Erbschädigung beim Menschen.** *Das Kommende Geschlecht Band 5, Heft 6.* 27p. 1930. Pr. 2 M.—A review of recent successful attempts to induce mutations in lower organisms by x-rays, emphasizing the danger from possible induction of hereditary abnormalities in man by x-rays.—*H. R. Hunt.*

6228. **FISCHER, WERNER. Beitrag zur Frage der Gültigkeit der Bernsteinschen Blutgruppenerbformel. [Validity of the Bernstein theory.]** *Zeitschr. Rassenphysiol.* 2(4) : 153-171. 3 pl. 1930.—Six formulae are derived for the frequency of the genes determining the incidence of the 4 blood groups in the population of Frankfort a/M. These were made both for the Bernstein theory and the von Dungern and Hirschfeld theory. A comparison of the observed values on the one hand, and the derived formulae on the other, shows a much better fit in favor of the Bernstein theory.—*P. Levine.*

6229. **GARDNER, W. JAMES, and CHARLES H. FRAZIER. Hereditary bilateral acoustic tumors.** *Jour. Heredity* 22(1) : 7-8. 4 fig. 1931.—A study of bilateral deafness in man due to acoustic-nerve tumors indicates that this condition is inherited as a Mendelian dominant. The study includes 5 generations. The average age at death is decreasing with each generation.—*L. M. Dickerson.*

6230. **GATES, R. RUGGLES. Triplets in a relatively homozygous family.** *Jour. Heredity* 20(5) : 209-212. 3 fig. 1929.—Triplet sons 8 yrs. of age are described in a family of 12. The parents are nordics with fair hair, the father having blue eyes, the mother hazel. The sibs of these triplets all agreed with them in eye color and hair characteristics, being intermediate between the parents who differed but slightly and were nearly pure recessives. The triplets were probably identical but certain differences in ears and palms were noted.—*Author's abstract.*

6231. **HALDANE, J. B. S. Prehistory in the light of genetics.** *Proc. Roy. Inst. Great Britain* 26(3) : 355-370. 3 maps. 1931.—A lecture. The distribution of blood group factors (genes A, B, and R) over the world shows that group B has a maximum in Central Asia; and it seems probable that its distribution elsewhere is due to migration of peoples therefrom. It seems absent among the aborigines of America and Australia. Vavilov's work on the origin and evolution of cultural plants is also reviewed.

6232. **HARPER, ROLAND N. Some lights on the inheritance of longevity.** *Jour. Heredity* 22(3) : 93-98. 2 fig. 1931.—Differences in the average longevity of different social groups are here shown in several ways. The members of an aristocratic church that has separate cemeteries in two Florida cities live longer on the average than other white people in the same communities; and this seems to be true not only for the complete expectation of life (in which the difference might be ascribed to the smaller proportion of children among the aristocrats), but also for persons above any selected age. There is some evidence that long-lived men tend to pick long-lived wives, and vice versa, and this is consistent with the theory of differences in longevity in different social strata.—*Author's abstract.*

6233. **HIRSCH, N. D. M. Twins: Heredity and environment.** 159p. Harvard University Press: Cambridge, 1930.—A book written for "the educated public as well as the specialist." The first four chapters deal with the theory of twinning and with previous studies of twins from the standpoint of evaluation of the rôles of heredity and environment. The remaining six chapters present new data and their interpretation. The author selected 58 pairs of twins on the basis of similarity in appearance, voice, etc., and in school work. For comparison, 38 pairs

of twins were selected for dissimilarity in these respects. The mean difference between the dissimilar twins was from two to six times as great as that between the similar twins (head width 2.2, cephalic index 2.6, weight 2.7, height 4.7, head length 4.9, I. Q. 6.0). The correlation between similar twins was +.97 in I. Q. and +.95 in cephalic index, between the dissimilar twins +.53 and +.59 respectively. Five pairs of similar twins which had been separated for several years and which were not included above showed approximately the same mean differences as those continuously together.—*S. Wright.*

6234. **HOLCOMB, D. Y. A fragile-boned family.** *Jour. Heredity* 22(4): 104-115. 6 fig. 1931.—A family is described in which bone fragility occurred in a number of individuals in five generations. None of the affected individuals have the bluish coloring of the sclerotic coat of the eye often found in connection with the brittle-bone condition, but they all show other peculiarities which have been frequently described as associated with osteopsathyrosis, such as shortness of stature, abnormally rapid healing of broken bones and cessation of fractures at puberty. The cause of the bone fragility is unknown. The condition is apparently inherited as a Mendelian dominant, and is transmitted with equal frequency by mother or father.—*Author's abstract.*

6235. **HUMPHREY, J. H. HARE. Premature whitening of the hair.** *Jour. Heredity* 20(1): 31-32. 1 fig. 1929. —Evidence is presented to show that premature whitening of the hair in human beings probably behaves as a simple Mendelian dominant.—*L. M. Dickerson.*

6236. **JENKINS, RICHARD. The occurrence of a skin papillus through four human generations.** *Jour. Heredity* 19(4): 174. 1928.—A skin papillus located just in front of the external meatus of the left ear appears to be a simple Mendelian recessive. Fifteen individuals spanning 4 generations are recorded.—*L. M. Dickerson.*

6237. **LEVIT, S. On the heredity of atheroma.** *Jour. Heredity* 22(1): 3-5. 1 pl. 1931.—Case studies of five generations of a family of Russian peasants indicate that atheroma—a type of sebaceous cyst—is inherited as a simple autosomal recessive instead of a dominant as previously reported. F_4 and F_5 data indicate that certain population areas may be well saturated with this gene.—*L. M. Dickerson.*

6238. **LÓPEZ AYDILLO, NICOLÁS. La herencia de la epilepsía y de sus equivalentes. [The inheritance of epilepsy and its equivalents.]** *Arch. Neurobiol.* 10 (1/2): 124-137. 1930.—Family histories of 252 epileptics indicated the existence of an hereditary constitutional base for epilepsy, features of which are headaches, night terrors, eclampsia, enuresis, etc. These epileptic equivalents may give rise to true epilepsy or vice versa. Headaches in the mother appear to be the most strongly predisposing factor in the hereditary transmission of the epileptic genotypic factor.

6239. **MUCKERMANN, HERMANN. Wesen der Eugenik und Aufgaben der Gegenwart.** *Das Kommende Geschlecht.* Band 5. Heft 1/2. 48p. Ferd. Dümmler: Berlin, 1929. Pr. 2.50 M.—A history of the modern eugenics movement is given, including the contributions of Galton, Ploetz, Schallmayer, Lenz, Bauer, and Fischer. The objectives, philosophy, and methods of eugenics are discussed.—*M. Plum.*

6240. **NEWMAN, H. H. Mental and physical traits of identical twins reared apart. Case I. Twins "A" and "O".** *Jour. Heredity* 20(2): 48-64. 3 fig. 1929.—"A" and "O" were born in London, and were separated at 18 months, "A" continuing to live in London and "O" being brought to a small town in Ontario, Canada. They were separated for over 17 years, living in as different environments as are likely to be encountered by such twins. The evidence that they are monozygotic, and therefore genetically identical, is abundant and conclusive. Mental tests indicate that they are intellectually nearly three times as different as the average of fifty pairs of identical twins reared together. Temperamental and emotional tests bring out above all else a very striking similarity between the two girls. No generalization as to the relative potency of heredity and environment should be attempted on the basis of a few cases.—*Author's abstract.*

6241. **NEWMAN, H. H. Mental and physical traits of identical twins reared apart. Case II. Twins "E" and "G."** *Jour. Heredity* 20(3): 96-104. 1 fig. 1929.—These monozygotic twin girls were separated at 18 months of age and were unknown to each other for 19 years. Ten mental tests were given. In every test of mental capacity, the better educated twin has the superior mind, the difference between the two being from 3 to 6 times as great as the average difference between 50 pairs of identical twins reared together. In temperamental-emotional characteristics the twins are strikingly similar but with significant minor differences. Many of the temperamental peculiarities appear to have a genetic basis.—*L. M. Dickerson.*

6242. **NEWMAN, H. H. Mental traits of identical twins reared apart. Case III. Twins "C" and "O."** *Jour. Heredity* 20(4): 153-166. 6 fig. 1929.—This pair of twin boys, although reared apart, experienced a similar environment in so far as could be determined. In native mental ability they are nearly identical; their "personalities" entirely different. Twin "C" has had a slight advantage in formal schooling and registers, accordingly, slightly higher in testing. Proof of monozygotic origin is given in detail.—*L. M. Dickerson.*

6243. **NEWMAN, H. H. Palm-print patterns in twins. On the use of dermatoglyphics as an aid in the diagnosis of monozygotic and dizygotic twins.** *Jour. Heredity* 22 (2): 41-49. 6 fig. 1931.—Reply to H. Cummins, who concludes that dermatoglyphics have little value in twin diagnosis.

6244. **PEARL, R. Studies on human longevity. IV. The inheritance of longevity. Preliminary report.** *Human Biol.* 3(2): 245-269. 1931.—This preliminary report is based upon (a) an examination of extensive genealogical data analyzed by the method of correlation; and (b) an actuarial study of data derived from family history records. The defects of genealogical material for the study of the problem of the inheritance of duration of life are discussed and earlier work is critically examined. Correlations of the duration of life of fathers and offspring derived from extensive genealogical material are not as a whole essentially different from zero and could not, if they stood alone, be regarded as giving evidence of any sensible or regular parental inheritance relative to this character, duration of life. Life tables embodying, in total, well over a half million life years of exposure to risk are discussed. They indicate that: (1) the expectation of life of the parents (either father or mother) of children dying at 50 and over years of age is, at all ages from 20 on, greater, by amounts varying from about 7 to 20 percent, than the expectation of life of parents of children dying under 50 years of age; (2) the expectation of life of grandparents (either grandfather or grandmother) of grandchildren dying at 50 and over years of age is, at all ages from 20 on, greater, by amounts varying from about 7 to 59 percent, than the expectation of life of grandparents of grandchildren dying under 50 years of age; (3) the expectation of life of fathers of children dying (or living) at 80 and over is, at all ages from 20 on, greater, by amounts varying from about 26 to over 50 percent, than the expectation of life of fathers of children dying under 5 years of age; (4) the expectation of life of mothers of children dying (or living) at 80 and over years of age is, at all ages from 20 on, greater, by amounts varying from 23 to 36 percent, than the expectation of life of mothers of children dying under 5 years of age. These studies also indicate that the expectation of life of sons of fathers dying (or living) at 80 and over years of age is greater, at all ages from birth on, than the expectation of life of sons of fathers dying at age 50-79 years, and is still greater than the expectation of life of sons of fathers dying under 50 years of age. These

differences are regular and considerable in amount.—*R. Pearl.*

6245. **POPENOE, PAUL. Eugenic sterilization in California.** *Jour. Heredity* 19(2): 73-82. 1 fig. 1928.—From a study of hospital records and completed families it is concluded that in general a group of insane women of the type studied will not wholly reproduce itself even if unsterilized. Men are less fecund. Among the married insane, fecundity is reduced by abortion, still births and infant deaths, contraception, separation of husband and wife and physiological sterility. There are no significant differences between the sizes of families of sterilized women with different types of psychoses. Insane women who had the largest number of living children also had the largest number of dead children.—*L. M. Dickerson.*

6246. **POPENOE, PAUL. Eugenic sterilization in California. 14. The number of persons needing sterilization.** *Jour. Heredity* 19(9): 405-411. 1928.—Group tests of school children, army tests and the experience of institutions for the care of defectives indicate that there must be in the U. S. nearly 10,000,000 people who are definitely subject to mental disease of a serious nature. The great number of affected persons makes it imperative that the state take an immediate and active interest in voluntary as well as in compulsory sterilization.—*L. M. Dickerson.*

6247. **POPENOE, PAUL. Some prodigies.** *Jour. Heredity* 20(5): 233-238. 1929.—That phenomenal achievement is based on heredity is illustrated by the cases of lightning calculators. Mathematical ability is considered to be mainly due to inheritance because (1) it runs in families, as the lack of it also does; (2) parent-offspring correlations are about the same as for other inherited traits, and the expected segregation is found; (3) it appears at an early age; (4) it behaves independently in transmission; (5) it comes out in spite of an unfavorable environment; and (6) it is little influenced by training.—*Author's abstract.*

6248. **ROWE, E. C. The resemblance of triplets.** *Jour. Heredity* 19(4): 175-176. 2 fig. 1928.—A set of triplets, descended through the mother from twinning stock, have maintained the same I. Q. order, sequence in teething, walking and general traits of development from infancy to adolescence. They appear to be identical twin sisters and a brother.—*L. M. Dickerson.*

6249. **SJØGREN, TORSTEN. Die juvenile amaurotische Idiotie. Klinische und erblichkeitsmedizinische Untersuchungen.** *Hereditas* 14(3): 197-425. 22 fig. 1931.—The author describes 85 cases of juvenile, amaurotic idiocy in 4 institutions for the blind, 30 cases in their families and 5 others. The patient develops normally until an age of 6-9 years when characteristic changes in the eyes appear, progressive decrease in sight, yellow-brown pupil, thin veins, degenerative changes of the retina with fine-grained pigment. Later, fits of epilepsy occur with an increasing demens and disturbances of walking and other movements, mainly extrapyramidal. The disease ends with blindness, high degree of idiocy and marasmus; on an average, death occurs at 18 years of age. The families of the abnormal individuals have been examined very carefully, the study comprising 4500 persons and being carried back to the 7th generation from the patients. The disease behaves as a monohybrid recessive. A geographic study has also been made of the districts from which the ancestors have come, especially the probable heterozygotes, in the hope of finding a heterozygote centrum from which they have spread. A single "heterozygote focus" was not found; the author delimits 23 different "heterozygote foci." The affected families show a higher degree of inbreeding than the population in general.—*G. Waaler.*

6250. **SNYDER, LAURENCE H. Studies in human inheritance. V. Multiple allelomorphism as opposed to linkage in blood group heredity.** *Amer. Naturalist* 65 (699): 332-342. 1931.—Bauer's hypothesis of linked factors as the basis for the inheritance of the blood groups is analyzed and shown not to be tenable. On a statistical basis, as well as on the basis of individual family histories, the hypothesis of triple allelomorphs is shown to be the only correct explanation of the heredity of the groups.—*L. H. Snyder.*

6251. **SNYDER, LAURENCE H. A recessive factor for polydactylism in man. Studies in human inheritance III.** *Jour. Heredity* 20(2): 73-77. 4 fig. 1929.—Polydactylism, consisting of an extra finger on each hand, was found among the negro population of Pamlico County, N. Carolina. The 3 family histories given include 171 individuals, 54 of whom show the polydactylism. The character appears to be inherited as a recessive. The possibility of imperfect dominance does not seem to apply. There was no indication of sex linkage. Blood group determinations were made on 120 of the individuals. The gene for this type of polydactylism seems to be inherited independently of the blood groups.—*Author's abstract.*

6252. **THURSTONE, L. L., and RICHARD L. JENKINS. Order of birth, parent-age, and intelligence.** 132p. University of Chicago Press: Chicago, 1931. Pr. $3.—Study of records of 1500 children from the Institute of Juvenile Research, Chicago, indicates that there is a steadily increasing advantage, with each succeeding child, in I. Q. This seems to be a function of birth-rank and not of parental age. The second part of the book is a review of other studies on the subject.—*P. Popenoe.*

6253. **WEISS, FREEMAN. Heredity in adherent tongue.** *Jour. Heredity* 20(4): 171-172. 1929.—A family is reported in which there is an inherited abnormality preventing the elevation of the tongue, which results in defective speech. Only males are affected.—*L. M. Dickerson.*

6254. **WILSON, P. T. A study of like-sexed twins. Part II. Their health and disease records.** *Human Biol.* 3(2): 270-281. 1931.—The disease histories of 161 pairs of like-sexed twins (69 prs. identical, 72 prs. fraternal and 20 prs. "undetermined") were secured by interviews with the mothers. The incidence of contagious diseases among twins resembles closely the incidence tables which have been published for the single born. The fraternals showed more intra-pair differences than the identicals in most traits of general health; they also showed more intra-pair differences in the incidence and severity of most children's diseases. Although the effect of heredity is not established in quantitative terms, there is strong indication that it plays an important part in these phenomena. Intra-pair differences in general health (as estimated by the mothers) are about equal in the two types of twins at the time of the interview; during the first year of life, however, such differences are much more numerous among the fraternals. In the combined experience of the mothers, a discriminable health difference during infancy bears no relationship to discriminable health differences during the school period. A weight superiority shown in one member of a twin pair at birth, tends to be retained in the second period.—*P. T. Wilson.*

6255. **WOODS, F. A. Successful men have larger families. Further evidence for mental evolution.** *Jour. Heredity* 19(6): 271-279. 1928.—The author concludes that a real mental and moral evolution is going on, at least within certain classes of society, and that human strains of greatest moral worth tend to perpetuate themselves.—*L. M. Dickerson.*

6256. **WOODS, F. A. Perpetuation of old families. Inheritance of the parental instincts and "social conification."** *Jour. Heredity* 19(9): 387-398. 1928.—The history of the royal families shows no general degeneracy of the group as a whole. Evidence from the British peerage, here presented for the first time, confirms the conclusions drawn from royalty. In general, families that once acquire high social position will retain it. Old families do not become decrepit because of their age nor does wealth and power lead to idleness, sterility and mental degeneracy. The same is probably true of nations.—*L. M. Dickerson.*

GENERAL

6257. **BOURN, WARREN S. The destruction of aquatic duck food plants in Back Bay and Currituck Sound.** *Trans. 16th Amer. Game Conference* p. 46-53. 1930.—Back Bay, Virginia, and Currituck Sound, No. Carolina, with an area of about 300 sq. miles of inland waters, was until recently one of the few and one of the most important winter feeding grounds for migratory wildfowl. With the destruction of the locks and the enlargement of the Chesapeake and Albemarle Canal all spp. of duckfood plants have been disappearing. The Boyce Thompson Inst. for Plant Res. undertook a thorough study of the causes, and made careful studies both in the field and laboratory. The destruction of the once rich flora is due to increased salinity, turbidity, and pollution, all attributable to the removal of the locks. Salinity has been accompanied by a great growth of hydroids also destructive to plants; 90% of the area is now barren of plants and the catch of fish is reduced to 10% of what it once was. The only way of restocking the area is by replacement of the dam and locks. Prompt action is needed, and efforts are being made to obtain action by Congress.—*W. E. Praeger.*

6258. **BROWN, MARY J., and L. O. JACKSON. Some biotic data at the edge of a snowslide.** *Proc. Oklahoma Acad. Sci.* 10: 29-38. 1930.—The growth of *Veratrum speciosum* at Gothic, Colorado (alt. 9,474 ft.), began while it was still covered with snow. The highest growth rate was during the 1st and 2nd weeks after its appearance, with a decided decline in rate after the 4th week. The rate was greater during the afternoon than in the morning or at night. The average daily growth in height was 1.19 in. The insect population of the soil and herb stratum of the area increased with the advance of summer. The Thysanoptera, Diptera, and Heteroptera dominated the early summer, followed by a reduction in numbers of Thysanoptera, and a note-worthy increase in Heteroptera, Diptera, and Coleoptera in the herb stratum. A period of abundance of the Miridae, followed by a marked decline in numbers with a later and greater increase, and the presence of nymphs seemed to indicate 2 generations during the season. There was little correlation between the rate of growth of *V. speciosum,* the insect population, and the meteorological data, except during the early part of the season, when with an increase in the temp. there was an increase in the rate of growth of the *Veratrum* and the insect population, which indicated the coming out of hibernation of the insects.—*M. J. Brown.*

6259. **FRASER, W. M. Notes on a visit to Three Kings Islands.** *New Zealand Jour. Sci. & Tech.* 11(3): 148-156. 5 fig. 1929.—Great Isl., the largest of this group, lies 38 miles northwest of New Zealand. The principal trees are white tea-trees (*Leptospermum ericoides*), pohutukawas (*Metrosideros tomentosa*), and cabbage-trees (*Cordyline*). There are also shrubs, ferns, grasses, and other plants. The bird life includes *Cyanorhamphus novae-zealandiae, Anthornis melanura, Halcyon sanctus, Ninox novae-zealandiae, Rhipidura flabellifera, Anthus novae-zealandiae, Larus novae-hollandiae, Pelecanoides urinatrix,* and *Coturnix novae-zealandiae.* The last had been considered extinct. Lizards, a centipede, an endemic snail (*Placostylus bollonsii*), and introduced goats also occur.

6260. **FRITSCH, KARL. Beobachtungen über blütenbesuchende Insekten in Steiermark, 1910.** *Akad. Wiss. Wien Math.-Naturwiss. Kl. Sitzungsber. Abt. 1.* 139(8/10): 601-639. 1930.—A long list of insect flower visitors arranged according to the classification of the plant hosts.

6261. **HOOPER, CECIL H. Insect visitors to fruit blossoms.** *Jour. So.-Eastern Agric. Coll. Wye, Kent* 28: 211-215. 1931.

6262. **KELLERS, HENRY C. Biological collecting on "Tin-can Island."** *Smithsonian Inst., Explorations & Field-Work of Smithsonian Inst. in 1930.* Publ. 3111. 67-82. Map, 10 fig. 1931.—General notes on the plant and animal life of Niuafoou Isl. in the Tonga Archipelago.

PLANT

6263. **ADAMSON, R. S. The vegetation of the south-west region.** *Jour. Bot. Soc. So. Africa* 1929(15): 7-12. 1929.—The winter rainfall area of the southwest Cape has a well characterised vegetation. Two main types are recognized, bush and forest, the latter being confined to the more sheltered ravines and river banks. Bush is subdivided on topographic lines into a more xerophytic (at the lower levels) and an ericoid bush (at higher altitudes with greater rainfall). The salient features of the successions are outlined and some of the changes produced by fire and by human activity. Such a community as that dominated by the rhenosterbush (*Elytropappus rhinocerotis*), is secondary. Marsh vegetation is mentioned.—*R. S. Adamson.*

6264. **AICHINGER, ERWIN, und RUDOLF SIEGRIST. Das "Alnetum incanae" der Auenwälder an der Drau in Kärnten.** *Forstwiss. Centralbl.* 52(20): 793-809. 5 fig. 1930.—Among the characteristic plants of this association

are *Alnus incana, Prunus padus, Berberis vulgaris, Rubus caesius, Brachypodium silvaticum, Aegopodium podragraria, Festuca gigantea, Agriopyrum canninum, Geum urbanum, Circaea lutetiana, Thalictrum exaltatum, Viola riviniana, Veronica chamaedrys, Ajuga reptans, Geranium robertianum, Struthiopteris germanica, Urtica dioica, Stachys silvatica, Salvia glutinosa,* and *Mnium undulatum.* The appearance of certain other spp., such as *Paris quadrifolia, Maianthemum bifolium, Asarum europaeum,* and *Adoxa moschatelina,* indicates a transition to spruce mixed forest, which tends to replace the alder type as the ground-water level is lowered through channel-deepening of the river. Pasturing hinders this transition to an economically more valuable type by packing the soil and thus reducing its air capacity considerably below the normal 8-14%, which is favorable for plant growth. Around alder clumps where the soil is not trampled the air capacity may reach 23%. For optimum productivity the soil must contain a fair proportion of fine particles, besides being porous and sufficiently moist.—*W. N. Sparhawk.*

6265. **BLATTER, E., C. McCANN, and T. S. SABNIS. The flora of the Indus Delta. III. Physical aspects.** *Jour. Indian Bot. Soc.* 6(3/4): 115-132. 4 fig. 1927.—The area is low-lying land, cut by active or silted-up branches of the Indus River, or by old channels utilized as canals. The south-east corner is a salt waste. The Indus changes channels frequently, because of the soft soil and the enormous volume of water when the river is in summer flood. The river carries much silt, and the coast is increased about 3 sq. mi. each yr. Rice, leguminous crops, and wheat are grown under irrigation. The entire delta is alluvial except for a few limestone hills and some sand dunes. Physical and chemical properties of various types of soil in the Delta are given. There are 3 seasons: rainy, cold, and hot. Temp. ranges from a mean min. of 50°F. in Jan. to a mean max. of about 101° in June (hot season). Annual rainfall is about 6 in., mostly falling June-Aug., with the max. in Aug. Soil water is provided mainly by inundation. Humidity is comparatively high, due to the large expanse of streams, and the prevailing westerly winds coming from the sea. Rel. humidity varies from a mean min. of about 40% in Jan. to a mean max. of about 85% in July-Sept. Dew is heavy, especially in Oct., and probably provides considerable moisture for the vegetation. There is little cloud, except during June-Aug. The Delta is beautiful during the cold season, but a dreary waste of river and tidal water during the monsoon.—*W. Dudgeon.*

6266. **BLATTER, E., C. McCANN, and T. S. SABNIS. The flora of the Indus Delta. IV. Plant-geographical considerations.** *Jour. Indian Bot. Soc.* 7(1): 22-43. 8 fig. 1928.—The Indus Delta flora comprises 279 indigenous and 53 introduced spp., belonging to 220 genera and 73 families. Dicots number 139 genera and 211 spp.; monocots, 44 genera and 67 spp. Out of 61 indigenous families, 36 are represented by 1 genus only, and 28 by 1 sp. only. The largest families are Gramineae, 40 indigenous spp.; Leguminosae, 23; Compositae, 18; Convolvulaceae, 13; Euphorbiaceae, Amarantaceae, and Cyperaceae, each 11; and Malvaceae, 10 spp. The largest families are compared with those from other Indian areas. 265 of the indigenous spp. are classified according to their geographical distribution: endemic, 6; Indian element, 29, found in various parts of India and sometimes extending into Ceylon; Indo-Malayan element, 16, some extending to Australia and Polynesia; North African-Indian Desert element, 60; Tropical and North African-Indian Desert element, 37; common to tropical Africa and India, 13; common to the Old World tropics, 39; common to the tropics generally, 19 spp.; and a few smaller groupings. Three well-marked elements can be distinguished in the flora: 16 spp. belonging to the eastern element (Indo-Malayan); 118 to the western element; and 131 to the "general element." Of the 279 indigenous spp., 226 are found in other parts of Sind. The possible origins of some of the 54 spp., not yet found in other parts of Sind are: 6 from Cutch; 6 from the Rajputana Desert; 4 from the Punjab; and 4 from Baluchistan. A long table compares the flora of the Indus Delta with that of the Sundribuns (delta of the Ganges-Brahmaputra).—*W. Dudgeon.*

6267. **BLATTER, E., C. McCANN, and T. S. SABNIS. The flora of the Indus Delta. V. A comparison of the vegetation of the Indus Delta with that of the Sundribuns.** *Jour. Indian Bot. Soc.* 7(2): 70-96. 12 fig. 1928.—From the Sundribuns (Ganges-Brahmaputra Delta) are recorded 304 indigenous spp., belonging to 230 genera and 72 families; the corresponding figures for the Indus Delta are 279, 184 and 61. But the Indus Delta flora may exceed that of the Sundribuns when adequate explorations are made. The 2 Deltas are similar in many respects: at the north corner of a sea; near the Tropic of Cancer; formed by large rivers rising in close proximity in the Himalayas; topography; exposure to similar ecological and physiological influences; and open to plant immigration from vast areas. But the difference in plant-geographical position has produced "2 vastly different floras." Hooker's statement that "The Indus Delta repeats the vegetation of the Sundribuns of Bengal, with a greatly reduced number of spp." is refuted. In spite of more favorable situation for immigration, the Sundribuns have a flora that is comparatively poor, perhaps because of unfavorable soil and water conditions. Of the total of 87 families found in both Deltas taken together, 15 are found only in the Indus Delta, and 26 only in the Sundribuns. The largest families in the Sundribuns stand in the following order: Leguminosae, Gramineae, Cyperaceae, Euphorbiaceae, Orchidaceae, Convolvulaceae. Of the total of 336 genera in the 2 Deltas taken together, only 67 are common to both; 113 have been found in the Indus Delta only, and 156 in the Sundribuns only. 48 of the spp. common to the 2 Deltas also have mostly a very wide distribution. The Indus Delta flora contains 6% of eastern element, 44% western element, and 50% general element; the corresponding figures for the Sundribuns are 12, 7, and 81%. The purely eastern element is small in both, while the Indus Delta receives a distinctive character from the western element. The mangrove group is surprisingly small in the Indus Delta, suggesting that a number of spp. have been overlooked. —*W. Dudgeon.*

6268. **BLATTER, E., C. McCANN, and T. S. SABNIS. The flora of the Indus Delta. VI. Some ecological notes.** *Jour. Indian Bot. Soc.* 7(3/4): 168-175. 10 fig. 1928.—More important ecological habitats are described, and lists of plants are given for such different conditions as sand dunes; various kinds of soil; canal, river, and lake banks; ditches and tanks; salty soil; field and garden crops; ruderals; rocky banks and low hills; and mangrove swamps.—*W. Dudgeon.*

6269. **[BUSCH, N. A., and E. A. BUSCH.]** БУШ, Н. А., и Е. А. БУШ. Ботаническое исследование Юго-Осетии в 1928-1930 гг. **[Botanical study of South Osetia in 1928-1930.]** Известия Академии Наук СССР., Отделение Математических и Естественных Наук. (*Bull. Acad. Sci. URSS., Cl. Sci. Math. et Nat.*) 1931(3): 439-448. 1931.—The flora is naturally divided into 2 parts by the watershed of Kura-Rion. The general aspects of each region are described, with detailed lists of sp. for each locality.

6270. **CYRENS, OTTO. Vegetationsbilder aus Portugal.** *Vegetationsbilder* 21(3/4): 1-9. 12 pl. 1930.—A sketch of the geographical, geological, and climatic conditions of the country is followed by a description of the principal types of vegetation. The illustrations include forests of *Pinus pinaster, Erica arborea,* and *Arbutus unedo;* and habitat studies of *Iberis welwitschii, Rhododendron ponticum; Quercus lusitanica, Q. suber, Q. coccifera, Cupressus lusitanica, Asphodelus lusitanicus, Drosophyllum lusitanicum,* varieties of *Cistus ladaniferus,* scrub of *Juniperus communis nana* and *Erica australis aragonensis,* and grassland of *Festuca ovina* and *Poa bulbosa.*—*G. D. Fuller.*

6271. **DENGLER, ALFRED. Ökologie des Waldes mit**

besonderer Berücksichtigung des Wirtschaftswaldes. [Ecology of forests, with special reference to forestry.] 272p. 2 pl. Julius Springer: Berlin, 1930. Pr. 25 M.

6272. **DIELS, LUDWIG.** Pflanzengeographie. [3rd. ed.] 160p. Map. Walter de Gruyter & Co.: Berlin, 1929. Pr. 1.50 M.—A concise presentation is given of the relation of the vegetable kingdom to the earth, from 3 points of view: the floristic concept, grouping unit elements of the flora in reference to systematic relationships and considering the extent of these units as to their range and their relations to other units; the ecologic concept, which includes a survey of plant communities and considers the dependence of these plant societies in reference to habitats; and the genetic concept, which includes a study of plant distribution in reference to the phylogeny of plant communities, comparing fossil forms, their communities and relationships with existing ones. On the basis of these studies, 6 major areas are defined under the following terms: Holarktis, Neotropis, Palaeotropis, Capensis, Australis, and Antarktis.—*G. L. Wittrock.*

6273. **DOMIN, KAREL.** Trinidad and the West Indies. [In Iltis: Totius orbis flora photographica arte depicta. Vol. 1.] 50p. 100 fig. 1 map. 1928. B. R. Rohrer: Brünn. Pr. 29 M.—Trinidad and Tobago are floristically allied to S. America rather than to the West Indies. Brief descriptions summarized from existing literature are given of the vegetation of the Bahamas, Porto Rico, Hispaniola, the American Virgin Islands, and the Dutch West Indies. The vegetation of Dominica and Trinidad is described largely from the author's own observations. In the former are distinguished 4 main types: the lowland tropical forest, the mountain rain-forest, the mossy forest of higher altitudes, and the scrub of the highest volcanic peaks. The most important types of Trinidad are the palm forest, the mixed rain-forest, and the mora (*Dimorphandra*) forest, but various other types exist. A chapter devoted to economic plants presents observations on limes, sugar cane, coconut, bay rum, calabash, cacao, vanilla, and banana. A useful but brief bibliography of 26 titles and an index of plant names conclude the descriptive portion. The photographs, 9 × 12 cm., illustrate the lowland forests (4), the higher forests (18), the Barbados forest (1), the rain-forest (9), palm forest (2), and mora forest (1) of Trinidad; the mossy mountain forest (2), the vegetation of volcanic peaks (2), littoral forests (2), coastal vegetation (5), xerophytic vegetation (5), epiphytes (6), lianas (6), and cultivated and otherwise useful plants (45).—*H. A. Gleason.*

6274. **DUFF, MARY.** The ecology of the Moss Lane region, Lough Neagh. *Proc. Roy. Irish Acad. Sect. B.* 39(22): 477-496. 5 pl. 1930.—In this area are 3 distinct plant formations: aquatic, fen, and moor. The aquatic formation is divided into 4 associations: submerged leaf, floating leaf, open reed swamp, and closed reed swamp. The fen formation is represented by 3 associations: fen, fen carr, and swamp carr associations. The moor formation is represented by the *Molinia* zone in transition stage, mixed *Carex* zone with *Calluna,* and *Calluna* on bank below Moss Lane.—*V. O. Graham.*

6275. **DU RIETZ, G. EINAR.** Algbälten och vattenståndsväxlingar vid svenska Östersjökusten. [Algal belts and changes of water-level at the Swedish coast of the Baltic.] [*English summary.*] *Bot. Notiser* 1930(6): 421-432. 1930.—The following maritime and marine vegetation belts at the eastern coast of Sweden are suggested: (1) the aerohalophyte (or aerohaline) belt, beyond the reach of the ocean water; (2) the hygrohalophyte (or hygrohaline) belt with groups of plants intermittently under water (through waves or extremely high water level), its lower limit marked by the lower limit of *Verrucaria maura;* (3) the hydrohalophyte belt (or the belt of hydrohaline water plants), a belt divided into 3 distinct sub-divisions: the division of summer-annual filiform algae, whose lower limit is determined by low water periods in the spring; a *Fucus-Pylaiella* division, whose upper limit may vary from yr. to yr. but is determined by the limit of drying-out during periods of low water, and whose lower limit is about 7 m. or less; and the *Furcellaria* division; and (4) the belt of true zoocoenoses. The boundaries between this and the previous belt are not definitely known, but it may sometimes reach a depth of 40 ft.—*T. R. Swanback.*

6276. **FABER, FRIEDRICH CARL von (transl. by HOWARD C. ABBOTT).** The crater-plants of Java in physiological and ecological aspect. 160p. Illus. Economy Publishers: Seattle, Washington, 1931. Pr. $1.60.—The crater associations are described in their natural solfatara habitat, on dry talus slopes of active volcano peaks, and on the soil of old inactive volcano crater peaks. Many correlations are made of the many factors that affect the plants in these habitats. Under climate are given facts concerning atmospheric pressure, temp., humidity, wind velocity, light intensity and composition, and air content of CO_2 and SO_2. Soil reaction, composition, origin, nutrient salts, and the kinds of root systems found are discussed. Mycorhiza occur on a large number of sp. A study of root systems and anatomical investigations of leaves of various crater-plants show that representatives of the crater association do not possess homogeneous characters. Transpiration activity, power of absorption, intensity of CO_2 assimilation, and chlorophyll content are presented in numerous tables and discussions. Birds and wind are important dissemination factors. Crater-plants are oligotrophs. Germination of seed and establishment of plants are closely related to soil composition and temp. The factor of competition plays a leading rôle in the distribution of crater-plants in various habitats. Crater-plants are so closely adjusted to the original agronomic conditions that they exclude the competition of other plants. Should the agronomic habitat factors change in an unfavorable sense for the crater vegetation, they would gradually succumb to the competition of other plants so that a new crater association would appear.—*H. G. Baker.*

6278. **FENAROLI, L.** Clima e flora alpina. Sintesi ecologica. Le vie d'Italia. 16p. Illus. Touring Club. Ital.: Milano, 1929.—The character of the alpine flora is determined by the climate. It is adapted especially to low temp., intense light, and partially lessened moisture, i.e., it is a hekistothermous, heliophilous, and partially xerophilous flora.—*M. Onno.*

6279. **GARSIDE, S., and S. LOCKYER.** Seed dispersal from the hygroscopic fruits of Carpanthea (Mesembryanthemum) pomeridiana N. E. Br. *Ann. Botany* 44(175): 639-655. 1 pl., 15 fig. 1930.—The complex capsules of *C. pomerideana* consisting of 10-20 carpels are known to remain closed until wetted by rain. An investigation of their structure reveals a hygroscopic mechanism neatly adjusted to a type of seed dispersal effected by falling rain. The capsules are not emptied slowly and gradually as others have hitherto believed, but within 10-20 min. A saturated atmosphere or even a fine mist will not suffice to bring about the ejection of the seed; the smallest droplets capable of inducing ejection had a radius of 0.0644 cm.—a size corresponding to medium rain in nature. During a heavy rain the seed were distributed to a distance of 1 m. from the capsule. The rate of opening of the capsule decreases with rise of temp., and increases until the valve is half open, after which it decreases until the fully opened condition is attained.—*P. D. Strausbaugh.*

6280. **GÁYER, J.** Die Meidung des Wettkampfes. *Magyar Bot. Lapok* 29: 276-283. 1930.—Examples are given to show that in some cases the elimination of competition among different spp. of plants may be a geographical factor, e.g., the ephemeral therophytes do not occur except where the struggle with other spp. is excluded, and the maintaining of some relict-spp. is due

to the same circumstance. Also the occurrence of some spp. in great quantities may be due to this fact.—*C. Schermann.*

6282. **GRAY, EDWARD F. Leif Eriksson discoverer of America, A. D. 1003.** xxxii+188p. 17 pl., 5 fig. Oxford University Press: New York, 1930.—Various references are made to original vegetation of No Man's Land, Martha's Vineyard, and Cape Cod, which is discussed in relation to its bearing on the location of the land discovered and visited by Eriksson in 1003 and by other Norsemen in later voyages. Cape Cod was "originally covered with woods at the time of early British settlers, except in patches cultivated by Indians." No Man's Land is said to have been found in 1602 "full of wood, vines, gooseberry bushes, wortleberries, raspberries, eglantines, etc." The trees were beech and cedar. There are no trees now growing on the island, and the only shrubs are found in the bogs, which alternate with grassy ridges and pastures strewn with stones and boulders. No Man's Land is identified as the place where Leif Eriksson built his house, cut trees, and gathered grapes to take back to Greenland in 1003.—*W. E. Lawrence.*

6284. **HEUSER, W. Effetto dei fattori meteorologici sulla struttura delle foglie. [Effect of meteorological factors on the structure of leaves.]** *Ann. Tecn. Agrar. [Rome]* 4(2): 213-216 [Latin summary p. 239]. 1931.—Study of the 2 upper leaves in 3 varieties of summer wheat grown in Bengasi, Imola, Rastatt, Svalöf, and Ultuna, showed that the structure, although characteristic for individual varieties, was greatly affected by external factors. Length of stomata increased and number per unit area decreased with increase of leaf surface.—*N. E. Pfeifer (from abstract by Boekholt).*

6285. **HEYWARD, JEAN. Flowering periods of Victorian plants.** *Proc. Roy. Soc. Victoria* 43(2): 154-165. 1931.—Records, chiefly presented in a chart covering 7 pages, are given for all native Victorian genera except *Eucalyptus*. They fail to substantiate Illichevsky's hypothesis that the order of flowering throughout the season is the same as the order of phylogenetic evolution. In the following arbitrary groups: (1) all Dicotyledons; (2) Dicotyledons with inferior ovaries; (3) Sympetalae (Dicotyledons); and (4) Compositae, the mo. of maximum flowering is Nov. For (5) all Monocotyledons; (6) Monocotyledons with inferior ovaries; and (7) Gramineae, it is Dec. For (8) Liliaceae, it is Oct.; and for (9) Orchidaceae, maximum flowering is prolonged through Sept., Oct., and Nov. It is concluded that other factors than temp. (regarded by Illichevsky as the main one) affect the period of flowering. Rainfall seems of prime importance; habitat, phenology of the pollinating insects, soil composition, etc. are also considered.

[Plant associations and their successions on the bare sandy forest floor of the plains of the Elbe R.]** [German translation.] *Věstník Československ. Akad. Zem.* 7(1): 21-24. *Sborink Československ. Akad. Zem.* 6(2): 277-302. 1931.—On the middle plains of the river Elbe, ancient river terraces and original dunes were covered with pines. After the denudation, opening of the sand pits presented the opportunity to observe the plant successions. Three stages can be differentiated: an initial phase,—loose porous sand with scanty humus content and high air capacity, i.e., the stage with *Carex hirta;* the optimum phase with the *Festuca psammophila-Koeleria glauca* association; and a degeneration phase characterized by *Calluna* and lichens, in which the accumulated humus increased the difficulty of competition by other sp. and in which physical changes in the soil reduced the virility of the leading psammophytes. A mixed pine and birch forest is the climax association of the sands, while a mixed oak forest is the climax in more moist and humus richer soil. Individual stages in succession serve as good soil indicators, which makes their study of value in forestry.—*F. Detmers.*

6288. **[KOVALEVSKIĬ, GEORGIĬ.]** КОВАЛЕВСКИЙ, ГЕОРГИЙ. Вертикальное распространение главнейших культурных растений в республиках и автономных областях Кавказа. [Vertical distribution of the main cultivated plants in the republics and autonomous territories of the Caucasus.] Труды по Прикладной Ботанике, Генетике и Селекции. (*Bull. Appl. 6290. **LÄMMERMAYR, LUDWIG. Vergleichende Studien über die Pflanzendecke oststeirischer Basalte und Basalttuffe. 1.** *Akad. Wiss. Wien Math.-Naturwiss. Kl. Sitzungsber. Abt. 1,* 139(8/10): 567-599. 1930.—The vegetation is outlined of several East Styrian areas of basalts and basaltic tuffs, for some of which (Gnas, Auersberg, Edelsbach, Pertlstein, and Steinberg) there were no previous botanical reports, while the known flora of other areas (Klöch and Kapfenstein) is enriched by the discovery of additional sp. The flora of these areas is in general of a mixed character, although the calcicoles strongly predominate over the silicicoles. There appears to be no important difference between the vegetation of the basalts and that of the basaltic tuffs, yet the latter, owing to their slighter decay and the lack of crevices, are unfavorable for occupation by typical chasmophytes and are thus often poor in sp. The abundance of olivine in many tuffs (Kapfenstein, Auersberg, Unterweissenbach) has no formative effect on the ferns growing there, *Asplenium viride* and *A. adiantum nigrum,* in the sense of a transformation into *A. adulterinum* or *A. cuneifolium.* The flora of the basalts and the tuffs stands in sharp contrast to its surroundings, owing to the almost constant occurrence of *Fagus silvatica* and many of its associates. The basalts and the tuffs are especially favorable to the colonization of thermophilous sp.; in many cases they furnished special refuges for Tertiary relicts in the Glacial Period and for xerothermous relicts in later times. The meeting there of subalpine and thermophilous elements is observed repeatedly. The pH value of the basalts and the tuffs was in general 7.6-8.0.—*Author's summary.*

6291. **LITARDIÈRE, R. de, et G. MALCUIT. Contributions à l'étude phytosociologique de la Corse. Les hêtraies de l'Incudine.** *Arch. Bot. Mém.* 3(4): 1-12. 2 pl. 1929.—A subalpine forest of *Fagus silvatica* exists on the slopes of the massif of l'Incudine, Corsica, at 1200-1800 m. The beech is the only tree of the forest and at its upper limits it becomes dwarfed, twisted, and distorted by the wind. Phytosociological analyses of various stands are presented showing the shrubby and herbaceous vegetation to be poor in sp. and in places to be almost completely absent. A biological spectrum shows 73% hemicryptophytes and only 2.5% geophytes due to the compact rocky siliceous soil. Clearings in the forest are usually occupied by scrub dominated by *Juniperus communis nana* and *Berberis vulgaris aetnensis.* Due to pasturing by goats and swine as well as cutting by the shepherds, reproduction of the beech is prevented and the limits of the forest are being narrowed.—*G. D. Fuller.*

6292. **[MALEEV, V. P.]** МАЛЕЕВ, В. П. Методы акклиматизации в применении к фитоклиматическим условиям ю. Крыма. [Methods of acclimatization and their application to the phytoclimatic conditions of south-

ern Crimea.] [English summary.] Записки Государственного Никитского Ботанического Сада. (*Jour. Gov. Bot. Gard. Nikita, Crimea*) 10(4): 3-40. 1929.—The study of acclimatization of plants includes not only knowledge of climatology and plant geography, but also of genetics and plant physiology. A knowledge of protoplasmic colloids and plant biochemistry is essential. In southern Crimea, such American sp. as *Magnolia grandiflora, Liriodendron tulipifera,* and *Taxodium distichum* are well adapted to the moister regions although they may suffer at times from summer drought. Southern Crimea is divided into 5 principal zones: the 0-200 m. zone corresponds to the cold Lauretum; the 200-400 m. zone corresponds to the warm Castanetum; the 400-700 m. zone to the oak zone of France; the 700-1000 m. zone to the oak zone of Germany; and the 1000-1200 m. zone to the coniferous timber zone of Norway. The lower zones include many exotic agricultural and horticultural plants, introduced principally from southern countries, while the upper zones are mainly timber zones. —*L. J. Pessin.*

6293. **PALM, BJÖRN. Pinus and Boletus in the Tropics.** *Svensk Bot. Tidskr.* 24(4): 518-523. 3 fig. 1930. —*Boletus pallidus* (?) is listed as a mycorhiza former on *Pinus merkusii* in Sumatra.—*A. B. Hatch.*

6294. **RAMSBOTTOM, J. Orchid mycorrhiza.** *Proc. Internat. Congress Plant Sci., Ithaca, N. Y., 1926.* 2: 1676-1687. 24 fig. 1929.—Practically all orchids either growing wild or cultivated have the mycelium of a fungus present in their roots. The fungus enters the suspensor end of the seed and almost invariably at the same spot. The mycelium has a peculiar manner of growth and its distribution is characteristic for any given sp. of orchid, but always confined to certain cortical layers. It is evident that there are different strains of these orchid fungi and the constant association of the same fungus and orchid under natural conditions seems to be of some special significance. Does the special fungus supply the "stimulus" necessary for germination (symbiotic), or does it merely have a "stimulative action" in developing in the substratum some form of sugar necessary for germination (non-symbiotic)—Knudson's view? To secure non-symbiotic germination the seed are sterilized before planting to suppress a growth of moulds that would otherwise prevent germination, but in nature one cannot postulate sterilized seed falling on either sterilized media containing sugars in the appropriate amount or on one which has been satisfactorily prepared by the haphazard occurrence of fungi capable of bringing about changes in the substratum similar to those necessary for successful germination in the laboratory. The killing of the seedlings by the orchid fungus has been too much stressed.—*P. D. Strausbaugh.*

6295. **RIGG, GEORGE B., and E. S. HARRAR. The root systems of trees growing in sphagnum.** *Amer. Jour. Bot.* 18(6): 391-397. 4 fig. 1931.—The root systems of *Pinus contorta, P. monticola, Tsuga heterophylla, Thuja plicata, Picea sitchensis,* and *Pseudotsuga taxifolia* growing in bogs whose surface layer is composed of sphagnum peat show striking peculiarities. The roots are all close to the surface, the depth of penetration being largely controlled by the water table though in some cases lack of O, abundance of CO_2, and high acidity may be factors. The root systems spread far more widely than those of the same sp. growing in firmer soils, and mat-like pedestals often develop. Excessive root fusion occurs. The roots show marked eccentricity of growth and enlargement, the cross sections conforming to general types: oval, T-girder, and I-beam. These combined effects increase the mechanical efficiency of the anchorage and are largely responsible for the lack of wind-falls in the bogs of the north Pacific coast.—*G. B. Rigg.*

6296. **ROMELL, LARS-GUNNAR. Blodriskan, en Granens Följesvamp. [Lactarius deliciosus, a fungus following spruce.]** [German summary.] *Svensk Bot. Tidsk.* 24(4): 524-530. 1930.—The literature associating *L. deliciosus* with trees, in the main, supports the author's observations that at least in parts of Sweden this fungus is a mycorhizal fungus with spruce (*P. abies,* Karst.) exclusively. It commonly produces sporophores along the margins of coniferous woods where grasses are abundant, since it prefers good humus soils to acid raw humus soils.—*A. B. Hatch.*

6297. **ROMELL, L.-G., and S. O. HEIBERG. Types of humus layer in the forests of northeastern United States.** *Ecology* 12: 567-608. 1931.—This paper represents a 1st systematic effort to apply outside Europe the principles and method laid down by P. E. Müller in his classical studies on natural types of humus layer. It is also a contribution to the question of classification and nomenclature of forest humus layers in general. A fundamental point of Müller's system is that the classification applies to the entire humus layer. The authors strongly oppose the tendency inaugurated by Ramann to classify the humus alone, which is only one constituent of the biological unit. Müller's 2 main types, mull and duff, are retained. Specific types listed are crumb mull, grain m., twin m., detritus m.; root duff, leaf d., greasy d., and fibrous d. The crumb mull is the classical prototype of the mull group, inhabited by large earthworms. The types greasy and fibrous duff have been taken over from the Danish forester, Juncker. The distribution of the types within the region is discussed. Groundwater conditions seem to be a particularly important factor locally. Some plants are listed as indicators of mull and of duff. The most valuable hardwoods of the region seem to prefer mull. Data are presented on nitrification, pH, and lime content of the different types. Contrary to European experience, nitrification was found in the laboratory within all types, even pronounced duffs, and down to a pH of 2.9, which was close to the lowest pH value encountered in any sample, whether nitrifying or not. Still, a great difference was found between the types, the mull samples being practically all nitrifying, whereas the majority of samples of pronounced duffs did not nitrify.—*L. G. Romell.*

6301. **SINCLAIR, JESSE D., and ARTHUR W. SAMPSON. Establishment and succession of vegetation of different soil horizons.** *Hilgardia* 5(7): 155-174. 4 fig. 1931.—The soil horizons are delineated according to Glinka: horizon *A*, the upper region of the soil containing decomposed organic matter and from which materials have been removed by leaching; horizon *B*, the horizon of deposition; and *C*, the lower unweathered substratum. Six plants were used in the study, 2 representing the climax stage, and occurring where horizon *A* is well developed. The 3rd and 4th plants, *Bromus hordeaceus* and *B. rubens*, are annual native grasses common throughout the uncultivated areas of California and characteristic of low seral communities. *Triticum vulgare*, a variety known as Sonora wheat, was used as a check in each soil horizon studied. In all instances the growth in soil from horizon *A* was greater and more rapid than from horizon *B*, and also greater and more rapid in soil from horizon *B* than in that from horizon

C. This study points out the importance of keeping soil horizon *A* intact because it is richer in nitrate-N and total N than the underlying horizons; furthermore the removal of this horizon not only decreases but retards the luxuriance of plant growth if it does not actually prevent the reestablishment of subclimax and climax vegetation. Where horizon *A* has been removed by erosion it would be useless to attempt to establish a cover of perennial grasses in order to prevent further erosion. Such pioneer stands should consist of annual plants.—*V. O. Graham.*

6304. **WERDERMANN, E. Die Pflanzenwelt Nord- und Mittelchiles.** *Vegetationsbilder* 21(6/7): 1-12. 12 pl. 1931.—The vegetation of the arid coastal region and foothills, and of the northern high cordilleras is described and illustrated. The photographs include those of desert with *Cereus spinibarbis, C. coquimbanus, C. acidus, Echinocactus cinereus,* and *Skytanthus acutus;* scrub of *Aextoxicum punctatum, Eugenia thalassica,* and *Polylepis tarapacana;* sclerophyll and deciduous forests, the latter with *Nothofagus dombeyi;* tussocks of *Ephedra americana* and *Stipa frigida;* and cushions and polsters of *Donatia fascicularis, Drosera uniflora, Adesmia* spp., *Verbena uniflora, Oriastrum sphaeroidale,* and *Cajophora coronata.*—*G. D. Fuller.*

6305. **WIŚNIEWSKI, T. Les associations des Muscinées (Bryophyta) épiphytes de la Pologne, en particulier celles de la forêt vierge de Bialowieża.** *Bull. Internat. Acad. Polonaise Sci. et Lettr. Cl. Sci. Math. et Nat. Sér. B. (I) [Bot.]* 1929(8/10): 293-340. 9 pl. 1929. The associations of mosses on tree trunks and at their bases were studied by means of modern phytosociological methods. Attention was given to the quantity, sociability, density, constancy, and fidelity of the various sp. Statistical data are tabulated. The associations are: I. Epiphytic—(a) *Anomodon viticulosus* and *Leucodon sciuroides,* (b) *Drepanium cupressiforme* var. *filiforme* and *Orthodicranum montanum;* II. at bases of tree trunks—(a) *Eurhynchium striatum,* (b) *Pleurozium schreberi.* The relations of the associations to climatic factors (light, temp., rain, dew, snow, and atmospheric humidity) are analyzed and biological adaptations are discussed. Geographically, the mosses involved are grouped as Holarctic (15 spp., 48.4%), Atlantic (10 spp., 32.3%), Cosmopolitan (4 spp., 12.9%), and Eurasiatic (2 spp., 6.4%).—*G. B. Rigg.*

PLANKTON

6306. **[ADOVA, A. N., and M. I. RAVICH-SHCHERBO.]** АДОВА, А. Н., и М. И. РАВИЧ-ЩЕРБО. Соотношение между окисляемостью и содержанием органических веществ в болотно-горфных водах. [Correlation between the degree of oxidation and the content of organic matter in sphagnous waters.] [French summary.] Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии. [*Russ. Jour. Trop. Med., Med. & Vet. Parasitol.*] 7(4): 278-284. 1929.—Between the content of organic matter and the degree of oxidation of acid waters in sphagnous regions there exists a direct relationship. To obtain the index of organic matter content, oxidation (mgm. O per liter) must be multiplied by the coefficient $K = 1.44 \pm 0.02294$. In waters coming from *Carex* soil, this parallelism is not so clear, and their degree of oxidation is weaker. The higher the degree of oxidation of sphagnous waters, the less favorable they are for the development of the larvae of *Anopheles.*—*B. Van Rosen.*

6307. **BRAARUD, T., B. FÖYN, und H. H. GRAN. Biologische Untersuchungen in einigen Seen des östlichen Norwegens August-September, 1927.** *Avhandl. Norske Videnskapsakad. Oslo Mat.-Naturvidensk. Kl.* 1928 (Paper 2): 1-37. 1 fig. 1929.—Observations on temp., pH, O, plankton, and large aquatic plants were made on 10 lakes. The shallower lakes yielded the larger plankton crops since their waters were in complete circulation and all of the dissolved food materials were made available to the phytoplankton. The major part of the plankton consisted of relatively few forms; the largest crop was found in a typical eutrophic lake.—*C. Juday.*

6308. **BRANDT, K. Phosphate und Stickstoffverbindungen als Minimumstoffe für die Produktion im Meere.** [English abridgement.] *Cons. Perm. Internat. Explor. Mer, Rapports et Proc.-Verb. Réunions* 53: 5-35. 1929.—Regional and seasonal fluctuation in number of spp. and abundance of individuals of plankton are regarded as due chiefly to fluctuations in the quantity of plankton algae, since these serve as the primary food of the other forms; hence a study of the effect of the nutritional factors governing the growth of these algae seemed desirable. Earlier studies had indicated that most of the factors significant for plankton growth (light, temp., CO_2, most inorganic substances) are present in ample amount, except N and P, which are present in very small quantities and are probably limiting factors. Necessity of quantitative methods suitable for analysis of the scarcely perceptible traces of N and P present, and of analysis of water at and near the bottom (since the nutrient salts are renewed from the bottom upward), is stressed. The assumption that the N cycle, as known on land, is valid also for sea, has been sustained by the discovery of nitrifying and denitrifying bacteria (Baur & Brandt, 1901) in bottom samples; and it is probable that the great acceleration of denitrification at high temp. is responsible for the depletion of nitrates in the warmer parts of the sea. Hence, the importance of chemical study of N and P content of water at different levels. There is given a comprehensive critical review of the development of methods of estimating N and P_2O_5 in sea water. In the euphotic layers, photosynthesis is active and the disappearance of free N and P compounds from water is rapid. Replacement of these elements is from the bottom, and the source is, to a great extent, the disintegrating bodies of plankton (and large) animals which fall to the bottom at death. Diffusing upward slowly, often passing through many cycles of utilization by organisms and release on the death of these, the N and P may, in the course of yrs., reach the neighborhood of the euphotic layer. Among the important agencies which hasten this upward movement are (1) "stream currents," as where a strong wind, blowing from shore, clears away the surface layer of water and "sucks up" cooler and richer water from deeper layers—an important factor in the richness of plankton near coasts; and (2) convection (vertical) currents brought about by differences in the specific gravity of upper and lower layers of water. The effect of thermic stratification in retarding the ascent of nutrients, and thus limiting plankton growth, is referred to, and the periodicity of plankton in the temperate zone, as related to the disturbance of a stratified condition of the water by vertical currents, is stressed. Continuous thermic stratification in the tropics is regarded as one of the causes of the relative poverty of phytoplankton there.

6309. **BREHM, V. Einführung in die Limnologie. (Biologische Studienbücher, Bd X.)** 261p. 88 fig. Julius Springer: Berlin, 1930.—The 1st part of this book deals with the physics and chemistry of freshwater. The 2nd section discusses the special position of freshwater biology in contrast to marine biology, including the hypothesis that freshwater is an older habitat for life than the sea. A short history of hydrobiological researches in central Europe since the middle of the 19th

century is given. Examples of oligotrophic, eutrophic, and dystrophic lakes are described. A large part of the book is taken up with a discussion of the plankton; the seasonal changes in the quantity of plankton and in the form (cyclomorphosis) of many of the organisms are considered, along with various other plankton problems, such as nutrition, distribution, and periodicity. A special discussion of Baikal and Tanganyika lakes is included. The cuts are mainly original and represent largely the unusual forms that are met with in freshwater. An extended bibliography is given.—*V. Brehm (transl. by W. L. Tressler).*

6310. **[BUKHALOVA, V. I.]** БУХАЛОВА, В. И. Биологическое обследование реки Воронежа в районе города Воронежа. **[Biological study of the river Voronezh in the region of the city of Voronezh.]** [German summary.] Воронежский Государственный Университет, Бюллетень Общества Естествоиспытателей. (*Bull. Soc. Nat. Voroneje*) 2(3/4): 123-150. 1929.—The degree of pollution of the river was determined by Kolkwitz and Marson's method. In the water above the city oligosaprobic and β-mesosaprobic forms were found, which are characteristic of swamp ponds. Among the water edge forms of this region the forms most frequently found were *Dinocharis pocillum, Euchlanis dilatata, Monostyla lunaris, M. bulla, Metopidia lepadella, Pterodina patina, and Brachionus bakeri.* The population of the water in the city, on the whole, was not different from that above the city; β-mesosaprobic forms were found more frequently, especially *Cocconeis pediculus, Rhoicosphaenia curvata, Diatoma vulgare,* etc. The presence of α-mesosaprobic forms observed in some localities of this region showed only local pollution, as *Thorea ramosissima,* which is characteristic of pure water. In the river below the city the population was more varied, especially on the bed of the river; the presence of *Ilyodrilus hammoniensis* showed that the water below the city was not more polluted than that in the city. Winter samples of the water from the 3 regions of the river proved that the water was more polluted in winter than at any other time of yr.—*G. A. Lebedeff.*

6311. **BULL, H. O. Resistance of Eurytemora hirundoides Nordquist, a brackish water copepod, to oxygen depletion.** *Nature [London]* 127(3202): 406-407. 1931.—*E. hirundoides* is one of the most abundant and most hardy of the few estuarine organisms able to withstand the low O content of the water of the River Tyne estuary,—a consequence of industrial pollution. Analysis of the estuary water for O at various times from May 23 to Sept. 5 gave readings of 0.14-0.76 gm. per 100,000 gm. of water. On incubation for 7 days at air temp., the O content was depleted (nil in 4 samples; 0.004-0.45 in 4 samples; 0.45 in the remaining), and *Eurytemora* was found surviving except where the O had entirely disappeared.

6312. **[CHIGIRIN, N. I., and P. T. DANILCHENKO.]** ЧИГИРИН, Н. И., и П. Т. ДАНИЛЬЧЕНКО. Азот и его соединения в Черном море. **[N and its compounds in the Black Sea.]** [French summary.] Труды Севастопольской Биологической Станции Академии Наук СССР. (*Trav. Sta. Biol. Sebastopol*) 2: 1-15. 1930.—Frankland and Armstrong's method (modified by Winkler) was used for determination of NH_3; Tillman and Suthoff's for determination of nitrates; Griess' method—for determination of nitrites; and both Hempel's and Krogh's apparatus were used to determine the O dissolved in the water. Down to a depth of 200 m. 0.05-0.17 mgm. of nitrate N per liter was found, the quantity increasing near the mouth of big rivers. Below 200 m. the amount of nitrate decreases progressively, disappearing at 300 m. The amount of nitrite N in the upper layer was 0.0004-0.0025 mgm. per liter, the quantity increasing with depth, reaching a maximum at 300 m. and disappearing in the lower layers. The NH_3 content in the upper layer was similar to that of other seas (0.04-0.15 mgm. of ammonia N per liter). The amount increased with depth, reaching 1.10-1.46 mgm. per liter at 1500-2000 m. The amount of N in the upper layer was 97-100% of the possible solubility. The amount increased with depth, reaching an average value of 6% per liter in excess of saturation. The denitrification process in the depth of the Black Sea seems to be more chemical than bacterial in origin.—*S. A. Corson.*

6313. **[CHIGIRIN, N. I.]** ЧИГИРИН, Н. И. Фосфор в воде Черного моря. **[Phosphorus in the water of the Black Sea.]** [English summary.] Труды Севастопольской Биологической Станции Академии Наук СССР. (*Trav. Sta. Biol. Sébastopol*) 2: 143-163. 2 fig. 1930.—Using Denigès' method, the amount of P_2O_5 at a depth of 75-100 m. was 30-80 mgm. (depending on season) per cu. m., increasing constantly with depth. This layer contained most of the phytoplankton. Below 100 m. the increase of P_2O_5 was more marked, reaching an average value of 370 mgm. per cu. m. at 175-200 m. Below 200 m., after an immediate slight decrease, the quantity of P_2O_5 increased progressively, but not constantly, reaching a value of 625-635 mgm. per cu. m. at 2000 m. The phosphate content in the upper layer was at a minimum in May, when higher temp. and a minimal plankton content were observed. The amount of phosphate increased during Dec. The phosphate content at the same depth increased with distance from shore. This particular distribution of phosphates is explained by the absence of vertical circulation of the water below 150 m. —*S. A. Corson.*

6314. **EGGLETON, FRANK E. A limnological study of the profundal bottom fauna in certain fresh-water lakes.** *Ecol. Monogr.* 1(3): 231-331. 63 fig. 1931.—Most of the investigation concerned 2 Michigan lakes in which the profundal benthic habitat was studied in relation to bottom deposits and physicochemical conditions of superimposed water. Qualitative-quantitative counts of bottom animals showed the presence of 2 ecological groups: (1) a typical profundal bottom fauna comprising representatives of *Corethra, Chironomus, Protenthes, Limnodrilus, Pisidium, Musculium,* and *Hydromermis;* (2) a heterogeneous group consisting of about 50 spp. Seasonal variations of the typical profundal bottom fauna within the true profundal zone showed marked periodicity with annual midsummer minima and midwinter maxima. Following the midsummer minimum the total population increased only slightly until late fall, when a sudden large increase occurred in the deepest regions of the lake. A zone of concentration of profundal bottom animals occurred in the upper profundal and lower sublittoral regions during the summer. This zone shifted downward in autumn and upward in spring. The number of sp. and of individuals varied: with the season, in different lakes, and in different depressions of the same lake. Factors affecting qualitative-quantitative variations and distribution were: bottom characteristics, physicochemical nature of superimposed water, and certain biological phenomena. The profundal benthic fauna forms a very distinct ecological association, qualitatively limited, but becoming quantitatively very rich at certain seasons. The evidence indicates that members of this fauna are facultative rather than obligatory "anaerobes." —*Author (courtesy Wistar Bibl. Serv.).*

6315. **GESSNER, FRITZ. Die Biologie der Moorseen. Untersucht an den Moortalsperren des Isergebirges.** *Arch. Hydrobiol.* 20(1): 1-64. 4 pl., 9 fig. 1929.—The author studied 3 kinds of waters in the granite basins of the Iser Mts. in lower Silesia: (1) bog lakes with high acidity, dark brown water, limited plankton (chiefly *Dinobryon);* (2) recently formed backwater lakes (behind dams), with lower acidity, less highly colored water, rich zooplankton (especially *Ceriodaphnia*), very little phytoplankton; (3) older backwater lakes with neutral to alkaline clear water, rich phytoplankton. It is concluded that the degree of acidity in a bog lake depends on age of the lake and amount of water flowing through it. Evidence shows that dystrophic lakes change rather rapidly into oligotrophic or eutrophic lakes, hence their present scarcity. The transparency of the water decreased with decreasing acidity to about pH 6.5 at which

point the phytoplankton became so numerous as to affect the color and opacity in neutral and alkaline lakes. —*L. E. Noland.*

6316. **HAEMPEL, O. Fischereibiologie der Alpenseen.** In: *Die Binnengewässer* 10: 1-259. 15 pl., 47 fig. Schweizerbart'sche Verlagsbuchhandlung: Stuttgart, 1930.—Lakes situated in Savoy, Bavaria, Switzerland, eastern Austria, and northern Italy are discussed in this volume. The 1st chapter deals with the lakes as a habitat, discussing the inflow and outflow of water; seasonal changes in the temp. of the water, with the resulting summer and winter periods of stagnation separated by the spring and autumn overturning and circulation of the water; color and transparency; chemistry; the bottom zones and their population; and the food cycle. The 2nd chapter deals with the economic importance of the alpine lake fisheries. The lakes are classified on the basis of the predominant fishes; and an extended survey of the fish population of many of the more important lakes is given. The 3rd chapter deals with the fish productivity of the lakes. In general the production is relatively small (2-10 kgm. of fish per ha.); some of them, however, yield up to 25 kgm. per ha. With proper regulation and culture methods, the fish production of many of these lakes could be greatly increased.—*C. Juday.*

6317. **HARVEY, D., and C. B. SYMES. Oxygen absorption of natural waters in Nairobi with reference to Anopheline mosquitoes.** *Bull. Ent. Res.* [*London*] 22(1): 59-64. 1931.—Tests of mosquito infested and mosquito free waters were made weekly in 5 areas for O absorption by the organic matter in the water. With some exceptions, the organic indices were higher in waters containing *Anopheles.*

6318. **ISELIN, C. A report on the coastal waters of Labrador, based on explorations of the "Chance" during the summer of 1926.** *Proc. Amer. Acad. Arts. & Sci* 66(1): 1-37. Map, 13 fig. 1930.—Data on the temp., salinity, and density of the coastal waters of Labrador and Newfoundland, and on the possible sources of the Labrador Current, are followed by an annotated list of the phytoplankton collected: 34 diatoms, 1 silicoflagellate, 5 peridinians, and 3 infusorians. Many of these have been reported from the Gulf of Maine and the Norwegian fiords, and relatively few are definitely arctic forms. Thus temp. and salinity are evidently of minor importance in the distribution of these organisms. The surface microplankton of Labrador coastal waters was relatively poor during July and August.

6319. **JENKIN, PENELOPE M. A double releasing mechanism and other apparatus for quantitative plankton collecting.** *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 25(1/2): 33-45. 7 fig. 1931.—Detailed specifications are given of the double release, messenger wts., and modified net and depth gauge, all home-made from standard materials at low cost. The combination is light enough to use single-handed from a row-boat for horizontal plankton hauls at measured depths. The length of haul is measured by surface buoys, the net being opened after lowering and closed again before hauling up.—*P. M. Jenkin.*

6320. **JOHNSON, MARTIN W., and THOMAS G. THOMPSON. The sea water at the Puget Biological Station from September 1927 to September 1928.** *Publ. Puget Sound Biol. Sta.* 7(1): 119-128. 1929.—Observations on air temp., water temp., pH, chlorinity, O content, and state of plankton are tabulated for approximately weekly intervals and briefly discussed. Temp. and salinity conditions were in general similar to those for 1926-1927. Average surface temp. ranged from 6.8° (Jan.) to 11.3° (July), extreme variation being 7.4°; average chlorinity ranged from 15.82‰ (June) to 17.00‰ (Oct.), extreme variation being 3.36‰ pH was quite constant except during time of freshets (surface value 7.8-8.5) while dissolved O of surface water showed a general increase during spring and summer (4.28-10.83 mgm. per liter), dilution of surface water was accompanied by a decided increase of dissolved O. The seasonal distribution of plankton was much the same as in the previous year, the seasons of greatest abundance coinciding with each other. The greatest production of diatoms occurred on July 28, 1928. —*H. R. Seiwell.*

6321. **LENZ, FR. Chironomiden aus norwegischen Hochgebirgsseen. Zugleich ein Beitrag zur Seetypenfrage.** *Meddelel. Zool. Mus. Oslo* 12: 111-192. 5 pl., 30 fig. 1928. —The 4 primary lake types, based on relative amounts of organic food present and characterized by the Chironomid genera best adapted to them, are *Tanytarsus* or *Lauterbornia, Stictochironomus, Sergentia,* and *Chironomus* lakes. The 1st, corresponding to Naumann's ultra-oligotrophic lakes, includes *Lauterbornia coracina* and other members of the *Tanytarsus* group as the dominant forms, with *Stictochironomus* as the principal associate. These waters are low in nutritive substances. The dominant genus of the 2nd group is *Stictochironomus* with *Tanytarsus* and *Sergentia* as principal associates. Most of the waters formerly designated as *Tanytarsus* lakes, i.e., oligotrophic, belong here. The 3rd group has as principal associate of the dominant *Sergentia,* members of the genus *Stictochironomus.* Such sp. of *Chironomus* as occur here belong to the group which lack ventral blood gills, since the waters have a higher O content than those of the next group. The dominant form of the 4th primary lake type is *Chironomus.* The waters of this type are rich in organic food. The principal associates, though sublittoral and not bottom forms, are *Microtendipes* and *Polypedilum.* The Norwegian lakes are alpine with elevations of 810-1380 m. above sea level and depths from 1½ to over 24 m. Statistics regarding O and pH values have not yet been published. The faunas of individual lakes are described with the larval and pupal stages of *Stictochironomus histrio, Sergentia longiventris,* and *Fournieria norvegica.* Also the pupal stages of *Micropsectra insignilobus* and *Calopsectra bathophila* are described.—*O. A. Johannsen.*

6322. **LINDEMANN, E. Über eine limnologische Bedeutung der freien Kohlensäure. [Limnological significance of free carbonic acid.]** *Naturwiss.* 18(51): 1113. 1930.

6323. **LÖNNERBLAD, GEORG. Über die Sauerstoffabsorption des Bodensubstrates in einigen Seentypen.** *Bot. Notiser* 1930(1): 53-74. 1930.—In general, ooze in the deeper zones of calcareous lakes in Sweden consists of "gyttja," derived from planktonic sedimentation; but in nutritionally-poor non-calcareous waters the bottom is composed of "dy," formed from humus products. Still another type, "dygyttja," is intermediate and forms the bottom in light-colored humus waters and in clear upland lakes. The effect of O absorption by ooze on the O content of the adjacent water has been little studied. The author studied both "dy" and "dygyttja." By dredging apparatus (Lundquist, type E) ooze was obtained from various depths, and allowed to settle out in the glass tubes of the apparatus. A light brown upper layer and a dark lower layer are formed, the latter presumably due to S-Fe compounds formed by putrefactive organisms where O is excluded. In 2 of the tubes *Isoetes lacustre* was found. After standing 5 weeks, precipitation of $Fe(OH)_3$ occurred only in the tubes with *Isoetes.* A circulation of O from metabolism of plants with concomitant oxidation of Fe may perhaps explain "Roströhren." The O content immediately above the "dy" was undoubtedly greater than in nature, but no O transport could be observed. Absorption of O by the "dy" is complete only at the point of contact, the resulting compounds forming an O barrier. Both colorimetric and titration methods were used. 20 gm. of ooze placed in 150 cc. flasks was covered with water rich in O; some of the flasks were treated with 3 drops of 0.3% indigo solution, and kept in the dark till decolorized. Equal masses of bottom-material (about 30 gm.) were placed in 150 cc. flasks, one of them sterilized. To the samples was then added sterile water of known O content. Most rapid O absorption occurred in specimens from Grunnen Lake; 6 hrs. afterward all traces of O had disappeared, due perhaps to the large amounts of saw dust dumped

into the lake. The greatest O content was found in small lakes surrounded by high-moor. For complete reduction of the O in samples of equal quantity, "dy" required 12-18 hrs., "dygyttja" 60 hrs. or more. True "gyttja" is not found in the Aneboda region but material from southern Sweden showed strong O absorption only (12 hrs. required); sterilized material on the other hand showed O even after 4 days. Sterilization of material was also carried out with ether, which was unsatisfactory, and by Zn and Pb chlorides, a concentration of 0.1% of the latter causing death to micro-organisms in 24 hrs. Sterilized samples showed great variations in O absorption. Only in clear peat was there uniformity. The acid "dy" contains reducing substances which take up the O rapidly so that the presence of micro-organisms is unimportant. In the "gyttja" however the micro-organisms are the most important factors.—*H. K. Svenson.*

6324. **LOTZ, HELLMUT. Beiträge zur Hydrobiologie des oberen Allgäu.** *Arch. Hydrobiol.* 20(4): 531-634. Map. 3 pl., 19 fig. 1929.—The temp., pH, O and CO_2 content, and the biology of several small alpine lakes situated near the southern boundary of Bavaria are discussed, with lists of the phytoplankton and zooplankton forms obtained.—*C. Juday.*

6325. **NAUMANN, EINAR. Einführung in die Bodenkunde der Seen.** In: **Die Binnengewässer Vol. 9.** 1-126. 3 maps, 7 pl., 25 fig. Schweizerbart'sche Verlagsbuchhandl.: Stuttgart, 1930.—This is a detailed presentation of methods of studying slime, Ca, Fe, and Mn deposits. The presentation is according to regions; interrelations with other fields of science (biology, geology) are discussed.—*E. Naumann (transl. by R. A. Muttkowski).*

6326. **NAUMANN, EINAR. Limnologische Terminologie.** 776p. 158 fig. Urban und Schwarzenberg: Berlin, 1931. Pr. 46.40 M.—Limnology is a relatively new science and its rapid growth during the past 1-2 decades has brought forth a great variety of terms. These terms, widely scattered in the literature, are brought together in this book, which, however, is more than a limnological terminology because the various terms are not only defined, but in many cases are discussed at some length and illustrated with figures. References are given to the original literature and the original definitions of the terms are quoted in many cases. A large % of the terms refer to ecological phases of limnology, which makes the book useful to those who are interested in freshwater ecology and in methods and apparatus for carrying on such studies.—*C. Juday.*

6327. **NEEDHAM, JAMES G. The fresh water life of a dry island.** *Jour. Pan-Pacific Res. Inst.* [*Honolulu*] 5(4): 10-11. 1930.—Various insects and an ostracod are recorded from pools on San Clemente Isl., California. The cosmopolitan character of many of the forms is striking.

6328. **RYLOV, V. Das Plankton des Kardywatsch-Sees (Nordwest-Kaukasus).** [Preliminary paper.] Доклады Академии Наук СССР, Сер. А. (*Compt. Rend. Acad. Sci. URSS, Sér. A.*) 1930(14): 376-380. 1930.—In 2 tables the vertical distribution is given for the prevailing forms: *Diaptomus acutilobatus, Cyclops strenuus,* copepod nauplii, *Daphnia pulex, Chydorus sphaericus, Synchaeta* sp., *Polyarthra platyptera, Notholca striata, Alona affinis, A. quadrangularis,* and *Alonopsis elongata.* The 1st named is the dominant sp.

6329. **SHEPPARD, GEORGE. Plankton changes on the coast of Ecuador.** *Nature* [*London*] 127(3208): 629-630. 1931.—During Feb., 1931, patches of turbid, yellowish-brown masses of plankton material (mostly marine algae), emitting a disagreeable fetid odor, appeared along the coast of Ecuador.

6330. **STANGANELLI, MARIO. La misura della concentrazione idrogenionica nelle acque.** [Measurement of the pH of water.] *Boll. Pesca, Piscicolt. e Idrobiol.* 6(3): 370-387. 13 fig. 1930.—This is a practical guide for the measurement of pH of water with annotations on the technic in use.—*M. Stanganelli (transl. by A. Canzanelli).*

6331. **THOMPSON, THOMAS G., and MARTIN W. JOHNSON. The sea water at the Puget Sound Biological Station from September 1928 to September 1929.** *Publ. Puget Sound Biol. Sta.* 7: 345-368. 1930.—Weekly observations showed that chlorinity increased during the winter and decreased markedly for a short period in late summer due to accumulation of Fraser River water. Silicates and phosphates also decreased during the summer due to depletion by diatoms and dilution by fresh water. Dissolved O increased during the winter and fluctuated considerably in the summer; pH varied but little; and temp. range was about 6° C. In general zooplankton was richest in the spring and summer, with increases in larval forms in spring and fall. Phytoplankton, especially filamentous diatoms, predominated in summer, with maxima in late spring and autumn.—*T. G. Thompson.*

6332. **WORTHINGTON, E. B. Vertical movements of fresh-water macroplankton.** *Proc. Linnean Soc. London No.* 142. 67-69. 1929/30(1931).—In Lake Lucerne vertical hauls for plankton showed that most sp. of Crustacea begin to descend at dawn, reaching their lowest level (50-60 m.) before noon. Then a slow upward movement starts, accelerating at and continuing after dusk. Light forces them down into the lower layers during the morning. Hunger causes them to reascend to the upper layers, where the nanoplankton on which they feed is most abundant.

6333. **YOSHIMURA, S. Seasonal variation of silica in Takasuka-numa, Saitama.** *Japan Jour. Geol. & Geog. Trans.* 7(3/4): 101-113. 2 fig. 1930.—For the estimation of silica the colorimetric method of Diénert and Wandenbulcke was used, taking the color of a solution of picric acid 36.9 mgm. per liter as equivalent to that produced by 50 mgm. per liter of silica with the reagents. The pond had an area of 32,600 sq. m. and mean depth 3.1 m., maximum 6.0 m. After April the water shows thermal stratification. During circulation the water is at pH 7.6, rising to 8.7 in spring and summer at the surface, the bottom being at pH 6.5-7.0 and the intermediate layer at pH 6.1-6.9. The bottom water contains H_2S during summer. The silica content also shows stratifications during the existence of temp. stratification, and data are given for each meter. For the surface a minimum of 6.9 mgm. per liter was found in June, 1928, with 6.7 in June, 1929, and 6.3 in July, 1929. The maximum, 13.1, was observed in Feb. At the bottom a minimum 9.5 was observed in May, when the vertical column was nearly uniform; and the next value was 9.8 on Jan. 14, with again a uniform column. The maximum observed was 20.2 mgm. per liter SiO_2 on Oct. 14. Ten Japanese lakes varied in silica content from 2.3 to 27.3 mgm. per liter SiO_2 for the surface in summer and from 8.3 to 33.9 for the bottom. Of these, 4, poor in silica, were oligotrophic and 6 eutrophic. The silica stratification occurs in those with an abundant growth of diatoms.—*W. R. G. Atkins.*

DISEASES CAUSED BY FUNGI

6335. **AGOSTINI, ANGELA.** Cladosporiosi, causa di seccume in Ficus magnolioides Borzi. [Cladosporiosis, the cause of withered leaves in F. magnolioides.] *Riv. Patol. Veg.* 19(7/8): 155-163. 1 fig. 1929.—In March, 1929, the leaves, bracts, and tips of twigs of *Ficus magnolioides* were found withering. On the leaves the spots started at the tips or margins, were grayish yellow in color on the upper surface, brownish yellow on the lower. *Cladosporium epiphyllum* was found on these spots, and cultures from diseased tissue gave only this fungus. A review is given of similar diseases previously recorded and of other diseases caused by species of *Cladosporium*. A description of morphological and anatomical changes caused by the disease is given.—*F. M. Blodgett.*

6336. **BOYCE, J. S.** Decay in Pacific Northwest conifers. *Yale Univ., Osborn Bot. Lab., Bull.* 1. 1-51. 34 fig. 1930.—The important decays in commercially valuable conifers of the Pacific Northwest are discussed in popular style, particularly with reference to their detection and estimation in living trees and in logs. General facts are given on stages, types, indications, spread, rate and control of decay. Decay in down timber and stains and discolorations in wood are briefly mentioned. Wood destroying fungi considered are *Echinodontium tinctorium, Fomes annosus, F. applanatus, F. juniperinus, F. laricis, F. pinicola, F. roseus, Polyporus amarus, P. ellisianus, P. schweinitzii, P. sulfureus, Polystictus abietinus, Poria weirii* and *Trametes pini.*—*J. S. Boyce.*

6337. **BRANDENBURG, E.** Onderzoekingen over ontginningsziekte. [Experiments on the reclamation disease.] *Tijdschr. Plantenziekten* 37(2): 17-48. 4 pl. 1931.—The disease, once thought to be physiological, resulting from injurious chemical constituents of the soil, is here treated from a phytopathological standpoint. In pots with diseased soil the roots of oats became yellow and died, while in sterilized soil the roots remained healthy. In the former secondary roots did not develop or died soon, the leaves showing the symptoms of the disease. The mycelium of a Phycomycete was detected in diseased roots. An *Aphanomyces,* the oospores of which resembled those found in the roots, was isolated. No satisfactory results have as yet been obtained in infection experiments. In pot culture, with diseased soil, healthy plants were grown by treating the soil with $CuSO_4$, Uspulun or formalin, or by drying it. Sugar beets also showed leaf and root symptoms and the vessels turned brown. A *Pythium* was isolated from roots. Infection experiments in pot and water cultures gave positive results. The symptoms are caused largely by toxic substances produced by the fungus; they may appear in 24 hrs. after inoculation. After part of the root is killed the toxic effect ceases and new, nearly normal leaves are formed. The toxic effect was also shown by the use of filtrates of pure cultures, the symptoms on the leaves being less prominent, but discoloration of the vessels distinct. The toxic property of the filtrate was lost after boiling for ½ hr. The disease was observed in 25 widely separated fields, the fungus isolated from roots, and infection experiments performed. Symptoms on peas resemble those on beets. *Vicia* spp. did not show distinct symptoms on the leaves but these turned yellow and died. The vessels in both hosts became brown, and a *Pythium* was isolated from the roots. Infection experiments produce diseased plants with typical symptoms. In this case also the discoloration of the vessels is a result of toxic substances. The *Aphanomyces* and *Pythium* from oats and peas did not produce the disease on beets, nor those from beets and peas on oats. The *Pythium* from *Vicia* when inoculated into peas produced typical symptoms.—*H. L. G. de Bruyn.*

6338. **BRATLEY, CYRIL O.** Decay of sweet cherries from California. *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(7): 73-74. 1931.—[Mimeographed.] —Note on the comparative pathology of decays produced by species of *Cladosporium, Rhizopus, Penicillium, Botrytis* and *Aspergillus,* and *Sclerotinia fructicola.* —*W. A. Whitney.*

6339. **COOK, MELVILLE T.** La Roña de la Toronja en Puerto Rico. [Citrus scab in Porto Rico.] *Gob. Puerto Rico Dept. Agric. y Trabajo Estac. Exp. Insular, Circ.* 92. 5-15. 2 pl., 1 fig. 1931.—A popular paper dealing with citrus-scab on grapefruit in Porto Rico. The author points out the risk of planting a grapefruit orchard in the highlands, where conditions are favorable for scab infection and the nature of the terrain does not permit the use of high power sprayers. Control of the disease is discussed.—*A. Roque.*

6340. **DILLON-WESTON, W. A. R.** Virulency of Tilletia caries on wheat varieties. *Nature [London]* 127 (3204): 483-484. 1931.—Physiological forms of *T. caries* exist, and their distribution has an important bearing on smut resistance. Although Martin wheat is, in England, resistant to bunt spores from Little Joss, a sample of Martin wheat, from England, grown in Denmark, was readily infected with spores from the Danish wheats.

6341. **FEISTRITZER, W.** Merkmale zum Erkennen flugbrandkranker Pflanzen bei Winter- und Sommergerste vor dem Ährenschieben. *Pflanzenbau, Pflanzenschutz u. Pflanzenzucht* 8(1): 16-17. 1 fig. 1931.—In winter barley the leaves of smut-infected plants are yellowish green or yellowish white; in spring barley they are ochre yellow or brownish. In healthy plants the leaves are a bright green. In diseased plants the upper part of the sheath surrounding the head is light green and translucent; in healthy plants it is dark green and not translucent. This method of distinguishing infected plants does not apply to wheat.

6342. **FOEX, E., et E. ROSELLA.** Sur les diverses formes du pietin. *Rev. Path. Vég. et Ent. Agric.* 17(2): 41-51. 1930.—In wheat fields around Paris *Leptosphaeria herpotrichoides* causes brown spots about the first basal node of the wheat stem, and is mostly responsible for foot rot. Some oval spots, however, may result from infection by an undetermined sterile fungus often associated with *Cercosporella herpotrichoides. Ophiobolus graminis,* infecting the base of wheat stems, inhibits grain formation. Ascospores (from perithecia overwintering in the field) were germinated and proved pathogenic to wheat seedlings. *O. herpotrichoides,* though causing "penetration phenomena" in infected wheat cells, seems to be a weaker pathogen.—*J. Dufrenoy.*

6343. **FRON et MONCHOT.** Contribution à l'étude du pourridié du "Jasmin." *Ann. Inst. Nation. Agron. [Paris] Sér.* 2(23): 173-187. 2 pl. (1 col.), 10 fig. 1930.—Decay of jasmine is due to the simultaneous action of *Roselinia necatrix* and *R. aquila,* although the precise influence of each has not been determined. Lime inhibits the development of both species, particularly *R. aquila.* The practice of hilling up the plant at the foot to prevent freezing during winter may favor invasion of the tissues at this point by retaining moisture and preventing aeration. Possibly the application of sufficient lime in each hillock would be advantageous. The need for nitrogenous fertilization is indicated.—*Authors' conclusions (transl. by F. A. Wolf).*

6344. GIOELLI, F. Sopra un caso di cascola dei frutti di mandarino. [Fruit drop of mandarin orange.] *Riv. Patol. Veg.* 20(3/4): 73-77. 1930.—In the province of Palermo where the culture of the mandarin orange is very extensive, some trees have small, pale colored fruit that falls prematurely. This is most common where the trees are close together and shaded. After falling, the fruit develops a brown lesion starting from the point of insertion of the peduncle and gradually enlarging over the whole rind. *Penicillium digitatum* was isolated from the internal and external epicarp at the edge of spots and also from parts that showed no signs of the disease. Fruits were successfully inoculated by injection, by wounding and spraying a spore suspension on tissues exposed by the removal of the peduncle.—*F. M. Blodgett.*

6345. GOODING, L. N. Didymosphaeria oregonensis, a new canker organism on alder. *Phytopath.* 21(9): 913-918. 2 fig. 1931.—Distributed in Oregon, Washington, and Idaho, this new canker of *Alnus rubra, A. tenuifolia,* and *A. sinuata* is characterized by zonate bands ½-24 inches wide around the trunks and branches. The disease has not been found on *Betula glandulosa* growing in stands of affected *Alnus.* The organism is described as *D.* oregonensis* (p. 916).—*W. A. Whitney.*

6346. [GOMOLIAKO, N. I.] ГОМОЛЯКО, Н. И. Наблюдения над развитием порошистой парши у картофеля. [Powdery scab of potatoes.] [German summary.] Болезни Растений. [*Bolezni Rastenii*] 19(1/2): 79-88. 1930.—The disease is reported at the White Russian Potato Station and its distribution in U.S.S.R. discussed. The morphology and biology of *Spongospora subterranea,* and the influence of certain agricultural factors on the development of the disease, are discussed. The selection of resistant varieties is considered possible.—*From author's summary (transl. by K. H. Fernow).*

6347. GUYOT, A. L. De l'influence de quelques operations culturales sur le developpement du pietin du ble en 1928-1929. *Rev. Path. Veg. et Entomol. Agric.* 17 (2): 52-62. 1930.—Fertilizing with a mixture of KNO_3 and ammonium phosphate increased the yield, although it made foot rot diseases more severe. Spraying with H_2SO_4 always decreased the percentage of affected wheat stems; it may decrease or increase yields, depending on time of spraying.—*J. Dufrenoy.*

6348. KERLEROUX, L. Quelques observations sur le piétin du blé. [Foot rot and take-all of wheat.] *Rev. Path. Vég. et Ent. Agric.* 17(2): 36-40. 1930.—*Leptosphaeria herpotrichoides* first infects a leaf sheath. In wet weather it may grow into the stem cells in the vicinity of infected sheath cells, or it may grow down into the node. Dry weather checks stem infection from the sheath.—*J. Dufrenoy.*

6349. LINDEGG, GIOVANNA. Marciume del colletto di piantine di cotone appena germinanti. [Collar rot of cotton seedlings.] *Riv. Patol. Veg.* 20(1/2): 9-17. 4 fig. 1930.—A damping off of seedlings was found in a plant bed at Turin where cotton was grown following tomatoes which were similarly affected. The roots and stem up to the ground level were discolored and flaccid. Later the whole plant turned yellow, wilted, and dried up. Fungous hyphae present in the tissues grew out and produced spores in a moist chamber. The fungus (described) agreed in all characters with *Fusarium vasinfectum.* The disease was apparently favored by frequent watering and covering with glass and was arrested by removing affected plants, thinning the remainder and distributing a mixture of equal parts of quicklime and iron sulphate between the rows.—*F. M. Blodgett.*

6350. LINDEGG, GIOVANNA. La golphe bianca del culmo di grano. [White blight of wheat culms.] *Riv. Patol. Veg.* 20(3/4): 79-85. 4 fig. 1930.—Wheat plants (variety Mentana) were found infected in the upper nodes affected by the conidial stage of *Gibberella saubinetii.* The spike was withered but not invaded by the fungus and the lower part of the culm and the roots were healthy.—*F. M. Blodgett.*

6351. MITTER, J. H., and R. N. TANDON. A note on Sclerospora graminicola (Sacc.) Schroet. in Allahabad. *Jour. Indian Bot. Soc.* 9(4): 243. 1930.—About 45% of the *Pennisetum typhoideum* in low-lying fields was severely attacked by *S. graminicola.* Infected plants produced no grain.—*W. Dudgeon.*

6352. MONTEMARTINI, LUIGI. Note di fitopatologia: 6. Osservazioni e considerazioni sopra l'Erysiphe graminis D. C. 7. Un'epidemia di Sphaerotheca pannosa (Wallr.) Lév. su Prunus laurocerasus L. *Riv. Patol. Veg.* 20(1-6): 1930.—It is stated that in central Italy *E. graminis* can probably pass the entire yr. in the conidial condition, perhaps never forming perithecia. The form which attacks barley, and does not normally pass to oats or brome grass, appears to attack them when they are severely rusted. A severe attack of *P. laurocerasus* by *S. pannosa* is described.—*L. Montemartini (transl. by B. F. Lutman).*

6353. MOORE, W. D. Pod blight of lima beans in North Carolina and Virginia. *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(11): 113-114. 1931. [Mimeographed].—The disease resembles that produced on snap beans by *Colletotrichum caulicolum* in Texas and the Georgia lima bean disease attributed to *Vermicularia polytricha.* The organism attacks the pods, and affects the branches in much the same manner as *Macrophoma phaseoli* or *Diaporthe phaseolorum.*—*W. A. Whitney.*

6354. MOORE, W. D. Ashy stem blight on lima beans in North and South Carolina. *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(11): 114-115. 1931. [Mimeographed].—First report of *Macrophoma phaseoli* in these states.

6355. PASSALACQUA, T. Sopra la "Alternariosi" del garofano. [Alternariosis of carnation.] *Riv. Patol. Veg.* 20(5/6): 133-135. 1930.—*Alternaria dianthi* was found at Mondello on the leaves and stems of carnations which were introduced from Riviera Ligure, where this disease was first found in Italy in 1915. Associated with the *Alternaria* was a perithecial fructification which closely resembled *Pleospora herbarum* except the asci reach a length of 130μ. Cultures of *Alternaria* were obtained from *Pleospora* spores but not vice versa. The fungus appeared to be a weak parasite, as inoculations succeeded only on older basal leaves and plants were attacked only under very humid conditions, and recovered when the weather became dry.—*F. M. Blodgett.*

DISEASES CAUSED BY BACTERIA

6356. ELLIOTT, CHARLOTTE. Manual of bacterial plant pathogens. ix+349p. Williams & Wilkins Co.: Baltimore, 1930.—This is an alphabetical list of bacterial plant pathogens with a description of each organism and list of synonyms, and much of the available information on each disease arranged under symptoms, hosts, geographical distribution, methods of control and literature. A 2nd list of non-pathogenic organisms associated with bacterial diseases and included in the literature is added. To facilitate comparison, the morphological, cultural and physiological characters of the pathogenic organisms have been arranged in the form of a chart.—*C. Elliott.*

6357. EMERY, M. H. Étude sur les tumeurs de l'orme. *Bull. Mens. Soc. Nation. Hort. France* 4(July): 352-353. 1931.—*Bacterium tumefaciens* was isolated from elm tumors and, when trees were inoculated with the bacteria, tumors were again produced.

6358. LINDEIJER, E. J. Een bacterieziekte van de wilg. *Tijdschr. Plantenziekten* 37(3): 63-67. 1931.—The external and internal symptoms of a disease on willow caused by *Bacterium salicis* are described. In Holland the disease is found on pollard trees of *Salix alba,* on willow coppice of a variety of *S. viminalis* and a variety of *S. alba.* The use of healthy cuttings for propagation is recommended.—*H. L. G. de Bruyn.*

6359. ROSEN, H. R. Is the honeybee responsible for the spread of the fireblight germs? Part II. The

work of the Arkansas Agricultural Experiment Station. *Amer. Bee Jour.* 71(7): 320-321. 2 fig. 1931.—In the Ozark district oozing from overwintered cankers in early spring has little or nothing to do with the 1st blight infections. Since earliest infections were practically always in pear blossoms, and bees are the commonest visitors, many samples of material from hives located in an infected orchard were examined and cultures of the fireblight organism obtained. Healthy pear shoots were inoculated and typical fireblight was produced.

6360. **THORNBERRY, H. H., and H. W. ANDERSON. Bacterial leaf spot of Viburnum.** *Phytopath.* 21(9): 907-912. 4 fig. 1931.—Bacterial spot of *Viburnum* was discovered May 25, 1929, on the University of Illinois campus, and is apparently of local distribution. The pathogene lives over winter in cankers, in infected buds, and possibly in infested leaf debris in the soil. Primary infection, in all cases observed, developed from infected buds. Artificial inoculations produced typical lesions and the organism, which is described as *Phytomonas* **viburni** (p. 912), was reisolated in pure culture.—*Authors' summary.*

DISEASES CAUSED BY PHANEROGAMS

6361. **NUESSLE, FRIEDRICH. Wachstumsschwund durch Parasitismus.** *Aus der Heimat* 43(10): 313-314. 2 fig. 1930.—Observations were made on 5 similarly situated branches of a medium-sized red fir tree. One of the branches, which carried a heavy growth of mistletoe, became devitalized upon reaching a length of only 80 cm. and was bare of needles, while the healthy branches measured 150 cm.—*F. Nuessle (transl. by F. F. Halma).*

6362. **ZABORSKI, M. Sur l'autoparasitisme foliaire chez Viscum cruciatum Sieb.** *Bull. Soc. Sci. Nat. Maroc* 9(1/6): 96-98. 1 pl. 1929.—Parasitism of *V. cruciatum** on plants of the same sp. is described as occurring in the Moroccan Atlas Mts.

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

6363. **BINKLEY, A. M. Correction on psyllid-yellows.** *Science* 74(1907): 72. 1931.—Note clearing the confusion that exists on the original association of the Psyllid with the new yellows disease of solanaceous plants.

6364. **STEINER, G. Two interesting findings of Tylenchus dipsaci, the bulb or stem nema.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(9): 92-93. 1931 [Mimeographed].—*Plantago maritima* in Oregon and onion bulbs in New York are reported as hosts in the U. S. A. for the first time.—*W. A. Whitney.*

6365. **STEINER, G. Tylenchus pratensis de Man on tobacco, tomato and strawberry.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(10): 106-107. 1931 [Mimeographed].—Tobacco in North Carolina, tomato in Massachusetts, and strawberry in Massachusetts and Florida are reported as new hosts for this nematode.—*W. A. Whitney.*

6366. **STEINER, G. A nematosis of yams caused by a new species of Hoplolaimus.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(11): 121. 1931. [Mimeographed.]—Disease of *Dioscorea* sp. in Jamaica, due to an undescribed sp. of *Hoplolaimus.*

INFECTIOUS CHLOROSES (MOSAIC, YELLOWS, CURL, ROSETTE, ETC.)

6367. **DUNLAP, A. A. Carbohydrate variations accompanying the mosaic disease of tobacco.** *Amer. Jour. Bot.* 18(5): 328-336. 1931.—Mosaic leaves of tobacco were found to contain smaller amounts of certain carbohydrate materials (hexoses, disaccharides, dextrin, starch, and pentosans) than comparable healthy leaves. The greatest reduction occurred in the amounts of sugar and starch. Comparative studies were also made of the carbohydrates in mosaic and healthy plants which had been kept in the dark for several days, and also of plants kept at low temp.—*A. A. Dunlap.*

6368. **FENNE, S. B. Field studies on the ring-spot disease of burley tobacco in Washington County, Virginia.** *Phytopath.* 21(9): 891-899. 1931.—Steam sterilization of tobacco-plant beds did not prevent ring-spot infection in the field planted from these beds. Negative results were obtained in all cases in attempts to transmit ring-spot virus by means of tobacco flea beetle, cucumber flea beetle, leaf hopper, aphis, firefly, and the tobacco horn worm. Stick weed (*Verbesina alternifolia*) and sweet clover (*Melilotus alba*) were found naturally infected with ring spot. Infection was readily obtained on tobacco with the juice expressed from these plants. 25 other species of weeds were tested for ring spot, with negative results. The percentages of ring-spot infection in 10 counties in Virginia in 1927 was 2.5. In Washington County, in 1928, it was 3% and, in 1929, 7.6%. There was an average injury of 43% to the affected plants. It is estimated that ring spot caused a total loss of $27,384 in Washington County in 1929.—*Author's summary.*

6369. **ILLINGWORTH, J. F. Yellow spot of pineapples in Hawaii.** *Phytopath.* 21(9): 865-880. 10 fig. 1931.—A new disease of pineapples appeared in Hawaii during 1926. It was usually characterized by necrosis of the tissues at the base of one or more leaves, the stem soon bending over in the direction of the injured part, and the whole plant at length collapsing. This led to the name side rot. A subsequent discovery that an initial yellow spot on one or more leaves usually preceded the rotting at the base, caused the name to be changed to yellow-spot. The disease was most troublesome on newly planted tops because of their open structure, which may be attacked while still attached to the fruits. All attempts to control the disease with sprays proved futile. The disease increased each year and became widespread in Hawaii. During the dry season of 1929, it increased more than 10-fold. The disease was assumed to be of virus nature, but it was not possible to transmit it by artificial means. The search for an insect vector narrowed down to a species of thrips. (See Entry 6372.) —*Author's summary.*

6370. **KIRKPATRICK, T. W. Preliminary note on leaf-crinkle of cotton in the Gezira area, Sudan.** *Bull. Ent. Res.* [*London*] 21(2): 127-137. 1930.—A description is given of the symptoms of leaf-crinkle, its spread in the Gezira, and its effect on the cotton plant. Efforts to induce mechanical transmission of the disease were unsuccessful. Transmission was not effected by thrips, aphids or jassids, but strong indications were found that the aleurodids are the principal and possibly the only vectors of this cotton disease in the Sudan.—*E. F. Grossman.*

6371. **KOCH, KARL. The potato rugose mosaic complex.** *Science* 73(1901): 615. 1931.—Rugose mosaic is due to a combination of 2 distinct viruses. The "mottle" virus, normally present in apparently healthy potatoes of most if not all standard American varieties, is one of the viruses in the complex and is readily transmitted by plant extract but not by aphids. The other virus is readily transmitted by aphids and by plant extract.

6372. **LINFORD, M. B. The transmission of yellow-spot by Thrips tabaci.** *Pineapple Quart.* 1(2): 53-61. 1931.—Yellow-spot [see Entry 6369] is a virus disease transmitted to pineapple by *Thrips tabaci* from several wild hosts, among which the red *Emilia* is one of the most important in areas where the disease is prevalent. Larvae from a non-infective colony become infective after feeding upon a diseased plant; but adults treated similarly do not. The virus survives pupation, and insects, which feed upon a source of virus while larvae, may be infective as adults. There is an incubation period of approximately 10 days after first feeding upon a diseased plant before thrips transmit infection. A single insect, larva or adult, may transmit the virus to *Emilia.* The minimum incubation period in *E. sagittata* is about 8-9 days, mean about 14.6 days. In young pineapple plants the minimum is 7 days and the mean about 12.2 days. *Thrips tabaci* transmits the virus to and recovers it from several other plants in addition to pineapple and *Emilia.*—*Author's summary.*

6373. **LÜDTKE, MAX. Untersuchungen über Viruskrankheiten. (9. Mitteilung.) Beiträge zur Kenntnis des Stoffwechsels mosaikkranker und gesunder Tabakpflanzen.** *Phytopath. Zeitschr.* 2(4): 341-359. 1930.—The accumulation of starch in mosaic tobacco plants does not depend upon a decreased efficiency of the diastase. The latter is even more active in the diseased organism. A cane sugar- and a peptone-splitting enzyme were found equally active in healthy and mosaic plants. Enzymes of pepsin and papain-like nature, as well as a dipeptidase giving rise to glycyl-glycine were lacking, at least during the time of these investigations. That this mosaic disease is due to a disturbance of the activity of the enzyme and, therefore, can be called an enzymic disease, is not claimed. The leaf albumen of the tobacco leaves cannot develop from albuminous forms present in pepsin and papain. The gelatin was not split by the leaf enzyme; in only 2 cases was there a minimum increase of the NH_2 constant found. Isoamylamin produced no symptoms like mosaic. This so-called albinism cannot, therefore, be considered in connection with virus diseases. The pectin substance of mosaic diseased leaves in all probability experiences no changes when compared with the normal individual.—*Author's summary (transl. by W. B. Tisdale).*

6374. **McKINNEY, H. H. Differentiation of viruses causing green and yellow mosaics of wheat.** *Science* 73(1902): 650-651. 1931.—Wheat mosaic represents a mixture of types which can be resolved into distinct yellow and green forms. The yellow type was concentrated in relation to the green type and was rendered very severe in its expression on Harvest Queen wheat, which shows only slight traces of it in combination with green mosaic when infections occur naturally from soil or when artificial inoculations are made with virus from plants which became infected from soil. Rosette is evidently not associated with yellow mosaic on Harvest Queen, whereas it is with green mosaic on this variety. The nature of the association is unknown.

6375. **TAKAHASHI, WILLIAM N., and T. E. RAWLINS. Electrophoresis of tobacco mosaic virus.** *Hilgardia* 4(15): 441-463. 1930.—The various types of evidence as to the nature of a virus are considered in some detail. Electrophoresis should be very helpful in purifying a virus and in giving evidence as to its nature. Using the Todd U-tube electrophoresis apparatus and adjusting the pH to desired points, it was found that the tobacco mosaic virus migrated to the anode during electrophoresis between pH 4 and 9. No migration of the virus was detected between pH 3 and 1.2.—*J. Johnson.*

6376. **VERPLANCKE, G. Expériences sur la transmission des maladies de dégénérescence de la pomme de terre.** *Ann. Gembloux* 37(2): 65-69. 1931.—The results of transmission studies of various degeneration diseases, as affecting 27 varieties of potatoes, carried out in the field during 1930, at the Gembloux experimental station, are noted.—*G. Verplancke.*

6377. **ZELLER, S. M. A witches' broom of ocean spray (Holodiscus discolor).** *Phytopath.* 21(9): 923-925. 1 fig. 1931.—The disease has been found in the foothills of the western slope of the Cascade Mts. from Linn to Wasco Counties in Oregon and in Thurston County in Washington. Budding of diseased nodes into healthy stems and the transfer of *Aphis spiraeae* from diseased to healthy plants have both apparently induced the disease. The symptoms and performance of the disorder lend evidence to its virus nature.—*From author's summary.*

NON-PARASITIC DISEASES AND TERATOLOGY (INCLUDING DISEASES OF UNKNOWN CAUSE)

6378. **HEPPNER, MYER J. Pear black-end and its relation to different rootstocks.** *Proc. Amer. Soc. Hort. Sci.* 24: 139-142. 1927.—In true black-end fruits, the calyx end turns black, the discoloration first appearing at the ends of the lobes and spreading backwards into the flesh. Some fruits do not show the discoloration but instead become hard and gritty around the calyx end. In practically all cases where the abnormal fruit is evident, a rootstock relation exists. Black-end fruit is found on trees growing on the Japanese root, *Pyrus serotina,* and rarely on the French root, *P. communis. P. ussuriensis* and Kieffer are 2 other rootstocks with which black-end fruit is associated. No abnormally developed fruit is associated with the quince root, *Cydonia oblonga.*—*Author's summary.*

[The origin of tissue abnormalities and the initiation of nodules in consequence of infiltration of special cell groups in X-rayed plant tissue.]** *Proc. Imp. Acad. [Tokyo]* 7(3): 117-120. 2 fig. 1931.

6380. **PLAGGE, H. H. Effect of storage temperature on soggy breakdown of Golden Delicious apples.** *Proc. Amer. Soc. Hort. Sci.* 25: 298-300. 1928.—Apples became very susceptible to soggy breakdown at the usual cold storage temp. employed, unless the fruit went into storage immediately after picking. Since immediate storage is not always practicable and other factors, as time of picking and season, may alter the susceptibility to soggy break-down, 36° F. is considered the most desirable storage temp. The susceptibility to soggy breakdown increased in a rather definite proportion to the lowering of storage temp. and also to the length of the period preceding cold storage. No disadvantages of storing at 36° F. were evident when the fruit was sound and wrapped in oiled paper.—*Author's conclusions.*

6381. **PLASSCHE, A. W. van der. Proefneming bij roode bessen (Duitsche zure) met verschillende kalibemestingen in verband met de aantasting door randjesziekte.** *Tijdschr. Plantenziekten* 37(6): 131-134. 1931. —In the beginning of summer red currants (var. German Sour) on the plots manured with patent potash (1200 and 2400 kg. per ha.) or with K sulphate (600 and 1200 kg. per ha.) did not show leaf edge disease, while those on the plots manured with 40% K salt (750 and 1500 kg. per ha.) and those on the control plots were badly diseased. In August the disease developed in all the plots though in less degree in the first two series of plots.—*H. L. G. de Bruyn.*

DISEASE RESISTANCE AND PARASITISM

6382. **BAMBERG, R. H. Bacteria antibiotic to Ustilago zeae.** *Phytopath.* 21(9): 881-890. 2 fig. 1931.—Ten cultures of bacteria were found to have a deleterious effect on the development of *U. zeae* in culture, while 5 others had no observable like effect. Sporidia apparently failed to multiply in the presence of a culture of bacteria isolated from corn plants which failed to produce galls when inoculated with *U. zeae.* Evidence of disintegration of sporidia by the bacteria was obtained. A combination of monosporidial lines was made less virulent in its attack on the host by association with these bacteria. The injurious effect on the development of smut in the host persisted when the bacteria were injected into the corn plant at least 3 days before inoculation with *U. zeae.* Apparently the bacteria are able to live in or on the corn plant at least that long. The virulence of the smut seemed to be significantly reduced also when injection of the bacteria followed by 3 days the inoculation with *Ustilago.* Smut galls were disintegrated and spore formation was prevented even after distinct galls more than ½ inch in diam. had been formed. The destructive action seems to be directly associated with the presence of the bacteria, as the filtrate from bacterial cultures had no appreciable effect on the fungus in culture or on the development of smut galls in inoculated plants.—*Author's summary.*

6383. **BUISMAN, C. Overzicht van de soorten van iepen, in verband met het iepenziekteonderzoek.** *Tijdschr. Plantenziekten.* 37(5): 111-116. 3 pl. 1931.—A list is given of various species of elms and their characters described, with special reference to their susceptibility to *Graphium ulmi.*—*H. L. G. de Bruyn.*

6384. **DRAGHETTI, ALFONSO. L'importanza dello**

studio dell'internodo superiore del culmo di frumento nella costituzione di varietà agrariamento refrattarie alle Puccinie. [Importance of studying the upper internodes of wheat culms in designation of varieties resistant to Puccinia.] *Riv. Patol. Veg.* 20(5/6): 121-131. 2 fig. 1930.—Short version of a paper already noted: *Ann. R. Staz. Sper. Agraria di Modena* N. S. 1: 69-121. 3 pl. 1930.—A study was carried out on 40 progenies of F_2 hybrids derived from 12 crosses between varieties of varying grades of resistance. The plants were artificially infected from rusty culms and allowed to grow to maturity. A table of results is presented which shows, by grading the degree of infection, that the upper parts both of the culms and leaf sheaths are more resistant. In progenies of the different crosses 3 types of segregation were found based on studies of the upper internodes and leaf sheaths: (1) a 1:2:1 ratio from crossing a resistant with a susceptible variety; (2) crossing resistant with resistant gave 71.8% resistant, 23.6% intermediate, 1.6% susceptible; (3) a cross between 2 susceptible lines gave no resistant, 74.2% intermediate, 25.8% susceptible.—*F. M. Blodgett.*

6385. **GRAVES, ARTHUR H. The present status of the chestnut in North America.** *Northern Nut Growers Assoc. Rept. Proc. Ann. Meeting* 20: 48-63. 1929.—Blight-resistant American chestnuts (*Castanea dentata*), as noted by the author in New York in 1918, owed their resistance rather to favorable environmental features than to inherent resistance. The large number of chestnut sprouts in blight-infected regions is due to the fact that the roots and root collar of the American chestnut show greater resistance to *Endothia*, as proved by experimental inoculations. Vigorous, prolific, and disease-resistant Japanese (*C. crenata*) and Chinese (*C. mollissima*) chestnuts now growing in the vicinity of New York City are described. The desirability of crosses between these and the American chestnut is emphasized.—*A. H. Graves.*

6386. **ITO, SEIYA, and SHOICHI SHIMADA. On the nature of the growth promoting substance excreted by the "Bakanae" fungus.** *Ann. Phytopath. Soc. Japan* 2(4): 322-338. 1 pl. 1931.—Experiments with the filtrate from a species of *Fusarium*, the causal fungus of "Bakanae," gave the following results: The optimum concentration of the filtrate producing "Bakanae," or overgrowth of the rice seedlings, seems to be between 10 and 1%. The principle producing the symptom is not common to all *Fusarium* spp., e.g., is absent in *F. lini* with which the "Bakanae" fungus was compared. The growth-promoting substance is thermostable, neither enzymic nor volatile and is adsorbed completely by animal black. It diffuses through a semipermeable membrane. Filtrates from cultures in Richards' sol. without KH_2PO_4 or $MgSO_4$, or both, cause no overgrowth of rice-seedlings, but check normal growth.—*Authors' summary.*

6387. **JOHNSON, DELIA E. The antibiosis of certain bacteria to smuts and some other fungi.** *Phytopath.* 21(9): 843-863. 6 fig. 1931.—4 types of bacteria are noted which are antibiotic to certain rusts and other fungi. They consist of a coccus; a motile, non-spore-bearing rod-like bacterium; a motile, spore-bearing, rod-like bacterium; and a *Myxobacterium*. A study of the enzymes of these bacteria was made to determine whether they can break down the cell wall of the sporidia and so destroy the smut growth. Sporidia of *Ustilago zeae* were stained to determine the chemical constituents of the cell wall. Some of the bacteria contain enzymes with which they may be able to dissolve the corresponding constituents of the cell walls of sporidia. However, certain other bacteria, with the same types of enzymes do not affect the sporidia of the same smuts. Probably other factors are involved in the antibiotic property. The cultures become avirulent after long cultivation upon artificial media. The results of experiments to determine the effect upon infection of corn plants by smut, indicate that the bacteria may inhibit infection to some extent. The suggestion is advanced that antibiotic processes occur in nature.—*Author's summary.*

6388. **SCHLUMBERGER. Prüfung von Kartoffelsorten auf ihr Verhalten gegen Schorf im Jahre 1930. [Testing of potato varieties for reaction to scab (Actinomyces) in 1930.]** *Mitteil. Deutsch. Landwirtsch.-Ges.* 46(12): 229-232. 1 fig. 1931.

6389. **SNELL, WALTER H. The Kelm Mountain blister-rust infestation.** *Phytopath.* 21(9): 919-921. 1931.—History of this Warren County, New York, station and observations on the progress of white pine blister rust (*Cronartium ribicola*). 147 trees (about 13% of the original stand) seem to be immune even though exposed constantly to natural infection.—*W. A. Whitney.*

6390. **STEHLÍK, V., und FR. NEUWIRTH. Ökologie der aufgehenden Rübe mit Berücksichtigung ihrer Krankheiten. Anfängliche Entwicklung der jungen Pflanze.** *Zeitschr. Zuckerindust. Čechoslovak. Republ.* 55(9): 95-102. 6 fig. 1930.—A discussion of the anatomy and the physiology of germination of beet seed from sprouting to greening of the cotyledons with special reference to seedling diseases, is given.—*V. Stehlík.*

6391. **STOUGHTON, R. H. The influence of environmental conditions on the development of the angular leaf-spot disease of cotton. II. The influence of soil temperature on primary and secondary infection of seedlings.** *Ann. Appl. Biol.* 17(3): 493-503. 1930.—Naturally-infected cotton seed delinted with H_2SO_4 and treated with $HgCl_2$ sol. was grown in comparison with artificially infected seed and with untreated naturally-infected seed, in soil regulated to a range of temp. while the air temp. was kept uniform in automatically controlled closed chambers. Seed derived from diseased plants may give rise to infected seedlings but *Bacterium malvacearum* is carried only on the outside of the seed and on the fuzz. Thorough disinfection of the exterior of the seed results in healthy plants. The amount of primary infection resulting from infected seed decreases with rise of soil temp. above 30°C., but infection is not inhibited at 40°. Copious seedling infection occurred at 15°, the lowest soil temp. employed. Soil temp. has little or no effect on secondary infection. Plants diseased in the seedling stage out-grow the disease if no further inoculation occurs. No evidence of internal seed infection or systemic infection was disclosed.—*V. H. Young.*

6392. **WESTERDIJK, JOHA., M. LEDEBOER, and J. WENT. Mededeelingen omtrent gevoeligsheidsproeven van iepen voor Graphium ulmi Schwarz gedurende 1929 en 1930. [Susceptibility of elms to G. ulmi during 1929 and 1930.]** *Tijdschr. Plantenziekten* 37(5): 105-110. 1931.—Different species and varieties of elms were artificially inoculated with a spore suspension of *G. ulmi*. 6 proved resistant, 2 somewhat resistant, and 22 were susceptible. The resistance of seedlings from different sources was also investigated. The best method of inoculation was injection of the twigs with a spore suspension in June or July.—*H. L. G. de Bruyn.*

DISEASE CONTROL (SEED TREATMENT, SOIL DISINFECTION, FUNGICIDES, AND SPRAYING)

6393. **ARNAUD, G., et M. GAUDINEAU. Le traitement de la carie du blé. 2.** *Ann. Agron.* [*Paris*] 1(1): 5-81. 1931.—Seed treatments for control of *Tilletia tritici* gave results during the mild winter of 1929-30 similar to those secured in the spring of 1929, but differing from those obtained in the fall of 1928. Dust treatments were more effective than copper in acid solution effected without preliminary washing, but inferior to treatments with liquids which depend on wetting (Produit G, caseinated bordeaux mixture), or on vaporization (formol). Mere washing with water diminished infection appreciably and should precede liquid treatments. For practical control a preliminary washing with water is advised, then a 1-hr. treatment with 0.5% $CuSO_4$ solution followed by dusting with lime. Cu chloride and oxychloride gave erratic results but merit further trial.—*Authors' conclusions* (*transl. by Helen Hart*).

6394. **BICHET, R. Poudres cupriques et rots du raisin en Beaujolais.** *Progrès Agric. et Vitic.* 96(34): 181-185.

1931.—While copper dusts cannot replace sulphur entirely, one such treatment may be given between 2 applications of S, thus reducing the cost of mildew protection, especially in years when mildew is not very serious.

6395. **CARTER, WALTER. Tobacco dust and yellow spot control.** *Pineapple Quart.* 1(2): 99-104. 1931.—Results indicate the superiority of tobacco dust; 7 other nicotine forms tried were valueless in reducing infestation. Incidence of the disease was conditioned by growth and succulence of the plant, being less in the poorer areas of the field. The reduction of infestation by tobacco dust is attributed to changes induced in the plant by the dust application; agronomic variations between areas may modify this effect.

6396. **DURUZ, WILLIS P. Coryneum of apricots and its control.** *Proc. Amer. Soc. Hort. Sci.* 24: 176-179. 1927.—For general protection, it is best to apply 5-5-50 bordeaux just before or soon after the first fall rains, and again as the buds swell or the petals just show in the spring, and 2-3-50 bordeaux immediately after the husks have been shed from the young fruits.—*From author's summary.*

6397. **FAES, H., et M. STAEHELIN. L'apparition et le développement de la tavelure tardive sur les pommes de garde.** *Ann. Agric. Suisse* 32(2): 167-201. 1931.—Although apples may seem sound when put in storage, scab may develop during storage, the incubation period being 1-1½ mo. Wrapping in oiled paper or silk is of no avail. Washing in alcohol or in ordinary solutions of fungicides does not stop this development of scab, *Venturia,* in the infected apples. Control must be effected while the fruit is still on the tree.—*From authors' summary (transl.).*

6398. **FRANSEN, J. J. Enkele gegevens omtrent de verspreiding van de door Graphium ulmi Schwarz veroorzaakte iepenziekte door de Iepenspintkevers, Eccoptogaster (Scolytus) scolytus F. en Eccoptogaster (Scolytus) multistriatus Marsh in verband met de bestijding dezer ziekte. [Dissemination of G. ulmi by the elm bark beetles, in relation to disease control.]** [German summary.] *Tijdschr. Plantenziekten* 37(3): 49-62. 3 pl. 1931.—*S. scolytus* appears early in spring (first seen in March) and can be found till late autumn. The different generations overlap. The ♂ and ♀ beetles have a feeding period (*reifungsfrass*) of about 10 days. This is done with preference on healthy trees. The beetles attack the trees often on old wound scars. Trees other than elm are not generally attacked; on prune and apple trees the feeding was superficial. Infection by *Graphium* probably occurs during the *reifungsfrass.* The wood is discolored extending from these areas. The bark is not directly infected from the wood, but by beetles laden with spores which enter it. Spores of *G. ulmi* were found in the galleries of the mother beetle; the fungus existing on the residues, and the pupal chamber furnishes excellent conditions for its sporulation fructification. *G. ulmi* was reisolated from a twig artificially infested with beetles during their *reifungsfrass* and which died afterwards. Spraying with bordeaux mixture and lead arsenate gave no satisfactory results. Better results were obtained with trap trees. The bark of these must be burned before 5 weeks have elapsed. During the summer it is thought the infected twigs of diseased trees should be destroyed every 6 weeks. From bark containing larvae which was buried 40 cm. in the soil, a part of the beetles developed normally and emerged. Placing felled trees in water did not kill all the beetles. One of the most important parasites of the beetle was *Coeloides scolyticida;* in some places 89% of the beetles were parasitized. The nematode, *Rhabditolaimus leuckarti,* was found in larvae. Woodpeckers and tomtits destroy many beetles.—*H. L. G. de Bruyn.*

6399. **GLOYER, W. O. China aster seed treatment and storage.** *New York State [Geneva] Agric. Exp. Sta. Tech. Bull.* 177. 1-41. 5 fig. 1931.—Several seed-borne fungi that in the past have been epiphytotic on the China aster (*Callistheplus chinensis*) have proved amenable to a chemical seed treatment. A brief summary is given of the botanical characteristics of the China aster, as well as some cultural practices, with special reference to parasitic diseases. The nature of the aster achene is such that fungi readily infect the surface or scurf. The following pathogenic fungi are seed-borne: *Septoria callistephi, Ascochyta asteris, Fusarium conglutinans* var. *callistephi, Botrytis cinerea* type, *Pleospora herbarum,* and *Alternaria* spp. Of various chemicals tested as seed disinfectants, $HgCl_2$ proved most satisfactory. Hot water alone was not effective and tended to lower the percentage of germination. Soaking the seed in water at room temp. without proper drying reduced germination. The following method was found the most efficient and safest for treating aster seed: (1) presoak in water for 30 minutes at 100° F. and drain, (2) immerse in a 1:1,000 $HgCl_2$ sol. for 30 min. at 100° and drain, (3) wash 5 min. in cold running water, then spread out to dry 24 hr. at room temp., avoiding direct sunlight. On a commercial scale, the seed was subjected to 90° instead of 100° F. At lower temp., the efficiency of the treatment may be so reduced that complete killing of *Septoria* does not result. Treatment at room temp. up to 80° may not always be efficient and a supplemental application in the seed bed with weak bordeaux mixture may be necessary. Liquid or dust treatments with organic mercury compounds were less efficient. Semesan dust when added to aster seed kept in storage showed neither injurious nor beneficial effects. Aster seed readily gives off and takes on moisture from the surrounding atmosphere. If the seed is stored in an atmosphere of high relative humidity deterioration, first manifest by delayed germination and increase of mycelium on the surface, sets in. Fresh seed stored in a damp atmosphere soon took on the characteristics of old seed. Aster seed best maintains its vigor and germination if dried in a heated room during the winter, then stored in fruit jars. Such seed may live 4 yr. or more, while seed stored in cloth bags may die within a yr. The same method of seed treatment is also effective against *Septoria* on other crops, such as celery.—*W. O. Gloyer.*

6400. **GRAM, ERNST. Fruktträdgardens hälsovard. [Orchard hygiene.]** *Sveriges Pomologiska Förenings Arsskr.* 31(2): 67-81. 4 fig. 1930.—Winter spraying with tar oil emulsions and oils has been generally practiced, but is now decreasing, partly because the orchards have been more or less cleaned up and partly because summer spraying is on the increase, which makes the winter treatment less necessary. Winter spraying still remains unequaled as the first treatment for neglected orchards. Apple scab is controlled better by bordeaux mixture ½-1-100 (kg./liter basis) than by lime-sulphur 2:100. 4 bordeaux treatments also reduced brown rot greatly, and controlled die-back and Nectria canker. Russeting is a problem with the Reinette group, for which it has been found best to apply lime-sulphur for the pink and calyx sprays, and bordeaux ½-1-100 at the 2 following treatments. Against *Sclerotinia cinerea* on cherries spraying with bordeaux 10-15 days, and again 2-5 days, before blossoming proved efficient.—*E. Gram.*

6401. **HARVEY, R. B. Sprays for the protection of trees against sunscald and rodent injury.** *Proc. Amer. Soc. Hort. Sci.* 27: 548-549. 3 pl. 1930 (1931).—A preparation made by heating linseed oil to 470°F. and adding 10% of powdered sulphur was found to be a better repellent than those previously used.—*R. B. Harvey.*

6402. **JOHNSON, J. Steam sterilization of soil for tobacco and other crops.** *U. S. Dept. Agric., Farmers' Bull.* 1629. 14p. 7 fig. 1930.—Information on the effects of and methods for sterilizing soil, details of the inverted pan method of steaming the soil, and the management of steam sterilized plant beds, cost of steaming, and soil steaming for crops other than tobacco are given.—*H. M. Steece (courtesy Exp. Sta. Rec.).*

6403. **McCLINTOCK, J. A. The relation of canker treatment to fire-blight control.** *Phytopath.* 21(9): 901-906. 3 fig. 1931.—With blossom-visiting insects excluded from caged trees, the absence of fire-blight (*Bacillus*

amylovorus) infection during and immediately following the blooming period is proof of the effectiveness of the 53% zinc chloride sol. in destroying the blight bacteria in hold-over cankers on crab apple trees. The fact that 2 of these caged trees were later artificially infected through water-borne bacteria, while the unexposed tree remained healthy, indicates that these trees were equally susceptible to blight in 1930 as when naturally infected in 1929. No serious injury resulted from treatments with 53% zinc chloride sol. The primary spread of the organism by bees can be greatly reduced by a thorough application of zinc chloride sol. to the hold-over cankers.—*W. A. Whitney.*

6404. **MUNDKUR, B. B.** Bacteriophage and its possible relations to the control of plant parasites. *Jour. Indian Bot. Soc.* 9(4): 211-217. 1930.—A summary of recent work.—*W. Dudgeon.*

6405. **PASINETTI, L.** Prove di devitalizzazione dei semi di Cuscuta nel terreno con l'acido monocloracetico. [Tests of the devitalization of Cuscuta seed in soil with monochloracetic acid.] *Riv. Patol. Veg.* 20(1/2): 1-8. 1930.—Seed of wheat, maize, trefoil, peas, and radish, treated with various concentrations of monochloracetic acid, showed the trefoil and peas to be least injured and the wheat most. In plot experiments concentrations of 3-10% acid used at the rate of 1.2-1.4 liters per sq. m. were sufficient to prevent the growth of *Cuscuta*, and also alfalfa when sowed previous to the treatment or soon afterward. Trials with wheat indicated that if planting was delayed for 15 days injury would be avoided. —*F. M. Blodgett.*

6406. **SCHANDER, R., und G. STAAR.** Untersuchungen über die Bekämpfung der durch Phytophthora infestans hervorgerufenen Kraut- und Knollenfäule der Kartoffeln mit besonderer Berücksichtigung der kupferhaltigen Stäubemittel. *Arbeiten Kartoffelbaues No.* 33. 138p. 14 fig. 1930.—Part 1 gives a description of the disease and the conditions under which it develops on the vegetative parts and tuber of the potato. A distinction is made between primary infection, which apparently originates from the stored tuber, and secondary infection, which spreads from plant to plant by means of zoospores. The growth of the fungus depends upon humidity, air temp. and resistance of the individual plant. Resistance is conditioned by the growth stage (less resistance after flowering) and upon inherent characteristics. Early planting of sprouted tubers of early varieties in warm, well drained soil is recommended. Dusting with copper-containing preparations has proved unsatisfactory because of insufficient resistance to rain. Part 2 deals with attempts to improve dusts. With bordeaux mixture the irreversibility of the colloidal particles when precipitated is important from the standpoint of resistance to rain. Experiments with 8 different mixtures showed that the thicker the layer applied of a 2% sol. the less the adhesiveness, while the reverse is true of a 1% sol. A dust composed of 1 part anhydrous $CuSO_4$, 2 parts CaO and 2 parts talc, exhibited extraordinary adhesiveness. Various dusting preparations were tested under laboratory and field conditions for copper content, resistance to rain, wind and agitation, relative adhesiveness, pulverizing properties, and reaction. Cupulvit (manufactured by the Chemische Fabrik Meyer, Mainz) was outstanding and was followed closely by the author's preparation L 122. All other materials failed in laboratory tests. Under field conditions Cusisa (Merck, Darmstadt), preparation 110 (Pflanzenschutz G. m. b. H. Schweinfurt) and to some extent Schering 240 (Schering-Kahlbaum) proved relatively satisfactory. The final chapter deals with practical control of potato blight, including the design, selection and cost of equipment. —*G. Staar (transl. by F. F. Halma).*

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE

6408. **CROCKER, WILLIAM.** A delicate method of detecting illuminating gas in a greenhouse. *Florists Exch. & Hort. Trade World* 70(12): 15, 54, 2 fig. 1929; also in *Boyce Thompson Inst. Prof. Papers* 11. 81-85. 1929.—Concentrations of artificial illuminating gas far below those detectable by odor or chemical methods will do injury to some greenhouse plants. The tomato plant shows marked epinastic growth of the leaf petiole in concentrations of gas as low as 1 part of water gas in 200,000 of air, ethylene being the effective constituent. The tomato plant can be used for detecting illuminating gas in the lowest concentration that will injure plants. —*W. Crocker.*

6409. **DeLONG, W. A., and A. D. PICKETT.** On a possible effect of fungicides upon the composition of apples. *Science* 73(1902): 649-650. 1931.—Sulphur-treated fruit possessed a slightly lower reducing power than bordeaux-sprayed or unsprayed fruits. The numbers of determinations were too few and the differences too small for final conclusions.

6410. **HILTNER, L., K. FLACHS, und A. PUSTET.** Pflanzenschutz nach Monaten geordnet. 2nd edit. 391p., 185 fig. E. Ulmer: Stuttgart, 1926. Pr. 10m.—An enlarged edition of HILTNER'S "Plant Protection," in which the practical application of protective and sanitary measures is stressed. The descriptions of diseases are abbreviated but ample consideration is given to control measures. It is brought up to date to embody recent investigations. A comprehensive appendix contains an account of chemical means of disease control. There are chapters on soil reaction, influence of fertilization, phenology, and inoculation of leguminous crops, and sections dealing with diseases caused by fungi, by animals, and by non-parasitic agencies. A very comprehensive index makes the contents easily accessible.—*Morstatt.*

6411. **HOPKINS, J. C. F.** Some common diseases of potatoes in Southern Rhodesia. *Rhodesia Agric. Jour.* 28(8): 736-742. 2 pl. 1931.—*Alternaria solani, Rhizoctonia solani, Fusarium culmorum, F. solani,* brown fleck, frost injury, white spotting, and virus diseases are discussed.

6412. **HUBERT, ERNEST E.** An outline of forest pathology. 543p. 168 fig. John Wiley & Sons, Inc.: New York, 1931.—This book especially covers the principles and practices of forest pathology in the U. S. A., but is general enough to be applicable to forest conditions in Canada. It is intended to serve those interested in forestry, tree surgery, logging, lumbering, wood preservation, pulp and paper manufacture, the manufacture and sale of various kinds of forest products, and in the erection, maintenance, and protection of wooden structures. Chapter headings and sub-headings are as follows: Historical; The trend in forest pathology; Classification of tree diseases; The influencing factors; The relative importance of tree diseases; Economic losses; Symptoms; Non-organic or physiogenic agencies; Organic agencies, The classification of fungi, Schizomycetes, Phycomycetes, Ascomycetes, Fungi imperfecti, Basidiomycetes, Phanerogamic parasites; Control methods; The properties of wood affected by decay; The relative resistance of wood to decay; Saprophytic agencies, Dry rot in buildings, The decay of ties, posts, poles, piling and mine timbers, The decay and stain of logs and wood pulp; Semi-parasitic agencies; Control methods.—*C. S. Gager.*

6413. **MARCHAL, P., et E. FOEX.** Rapport phytopathologique pour l'année 1928. *Ann. Épiphyties* 14(6): 415-470. 1928.—An official report on the prevalence of insects and fungous diseases of cultivated plants in France, with observations on the effects of meteorological conditions. The summer in question was dry and cool, causing extensive drought injury. The occurrence of *Armillaria mellea* on *Juglans, Coryneum* on peach and apricot, *Oidium* and *Plasmopara* on the vine are reported. Chlorosis and court-noué continue to reduce

the growth of vines, especially on certain types of soils. —*H. S. Reed.*

6414. **[NESTERCHUK, G. I.]** НЕСТЕРЧУК, Г. И. Леса Карело-Мурманского края и их вредители. [Forests of Karelia-Murman and their pests.] [German summary.] Болезни Растений. [*Bolezni Rastenii*] 19 (3/4): 159-182. 1930.—Among the chief causes contributing to the development of pests in the region are forest fires and cutting in the forest without proper disposal of slash. Among the fungi injurious to forestry are: *Trametes pini, Fomes annosus, F. fomentarius, F. ignarius, Peridermium pini corticola.* Other fungi and insect pests are listed in the appendix. The extensive occurrence of mycorrhiza merits study, since forest growth is thereby favored where the vegetative season is short, especially within the Arctic Circle where chemical processes are slow in the cold soils. In addition to direct damage to forest stands by pests, injury occurs indirectly from lichens of the genus *Usnea,* which at times cover the tree crowns and, especially in drought seasons, favor the spread of forest fires. The quantity of decadent timber in the forest varies with latitude, but, contrary to expectations, rot and defects decreased toward the south. The high frequency of defective trees in the far north is due to the age of the stands. The forests on the Kola Peninsula are commonly 300-350, and more, yr. old, hence, overmature and low in commercial value. Here the defective material in stands on quality V sites may be as high as 78% for pine and 100% for spruce. A strip, burnt from recurrent fires, varying in breadth up to 3 km., extends along the Murman railway. Recently the careless system of lumbering has afforded favorable breeding grounds for detrimental insects, which now concentrate their attacks on the small areas of forest that escaped devastation by fire. On such burns occur epidemic developments of *Ips acuminatus, I. sexdentatus, Blastophagus piniperda, Pityogenes bidens* and other such pests. The last named insect attacks and thrives on spruce on the Kola Peninsula. It is interesting and important here that *Ips subelongatus* and *Dryocoetes baicalicus* occur on pine, although larch is their normal host.—*Author's summary (transl. by G. S. Perry).*

Appleton & Co.: New York, 1930.—This is one of the volumes of Appleton's "New World of Science Series." The chapter headings are: Living matter from rocks, water, and air; Place in the sun; Models of sun-screens and our utilization of their products; The grass blade; Pine needles: tree records of climate; The oak leaf: movements of sap and autumnal colors; Green stems; A visit to green leaf-mills; Green mills and their grist; Protoplasm: how it started and how it goes on: growth; Ghosts and other dwellers in darkness; Leaf-products and human populations; Index.—*C. S. Gager.*

PROTOPLASM

6419. **COLLA, S. Untersuchungen über Plasma und Plasmaströmung bei Characeen. II. Die Wirkung verschiedener Salze auf die Plasmaströmung.** *Protoplasma* 6: 438-448. 1929.—KCl, NaCl, and $MgCl_2$ increase the speed of streaming of full-grown normal *Chara* in the following order: K > Na > Mg. NaCl, Na_2CO_3, and $MgCl_2$, on the other hand, slow up the speed in young cells. Li-, Ca-, and $BaCl_2$ stop motion quickly in the following order: Li > Ca > Ba. Ba and Li are very toxic to young cells. Na_2SO_4, Na_2CO_3, Na_3Po_4, and NaCl all increase the rate of streaming in grown cells in the following order: NO_3 > (HPO_4, H_2PO_4) > SO_4 (HSO_4) > Cl > CO_3 (HCO_3).—*L. Moyer.*

6420. **JOST, L. Einige physikalische Eigenschaften des Protoplasmas von Valonia und Chara.** *Protoplasma* 7: 1-22. 1929.—In the presence of certain plasmolysing agents, especially Ca salts, the protoplasm of *Valonia* falls together in a net. The plasma membrane is also destroyed. The cytoplasm adheres to the walls and forms folds. *Chara* does not form such clear nets and if it does, they are confined to the outer part of the cytoplasm, while the central portion remains as a closed sack. Wherever Ca enters to the inner portion a new membrane is formed. A cell of *Chara* cut across forms no membrane, but a protoplasmic plug which permits it to live for a long time. *Valonia* can, however, completely recover. Cations with a valence of 2 or higher produce normal plasmolysis in *Chara,* while with univalent cations and non-electrolytes the cell usually is killed.—*L. Moyer.*

6421. **KIESEL, ALEXANDER. Die Plasmodien der Myxomyceten als Objekt der chemischen Protoplasmauntersuchung.** *Protoplasma* 6: 332-369. 1929.—This article is a review dealing with the direction protoplasm research is taking, its problems, the metaphysical viewpoint of the living substance, and the identity and chemical constitution of protoplasm.—*W. Seifriz.*

6422. **LEONTJEW, H. Über das spezifische Gewicht der Plasmodien von Myxomyceten.** *Protoplasma* 8: 152-154. 1929.—The specific gravity of plasmodia is 1.04.—*W. Seifriz.*

6423. **STRUGGER, SIEGFRIED. Untersuchungen über Plasma und Plasmaströmung an Characeen. III. Beobachtungen am ausgeflossenen Protoplasma durchschnittener Chara-Internodialzellen.** *Protoplasma* 7: 23-45. 1929.—Observations made with dark-field illumination on *Chara* internodes showed that the plasma streaming out of a *Chara* internode cell cut across forms a large ball of protoplasm which is surrounded by a clearly visible membrane. The peripheral plasma is first altered by the water. This is seen by alterations of the optical properties. Thereupon the ball has a 3-layered structure: haptogen membrane, an almost optically empty middle layer, and an optically unaltered inner layer. Later the protoplasm undergoes a complete alteration due to the taking up of water. This altered protoplasm is no longer

able to surround itself with a membrane. It distributes itself by flowing out in the water and is partially miscible with water. Hence a flocculation is noticeable. The nuclei flowing out with the first protoplasmic portion coagulate. This coagulation is not called forth by the medium but by the traumatic stimulus caused by injury to the cell. After taking up water this gel condition of the nucleus goes over to that of a sol and the nuclei appear optically empty. The nuclei flowing out later keep their optically empty appearance. If the protoplasmic ball is broken at any place after about 20-30 min., then the nuclei flocculate. Only a part of the nucleus goes over into a gel condition; a semi-spherical bubble surrounded by a membrane remains as a sol. While the contents of this sol droplet slowly flocculate, there begins to form a 2nd optically empty droplet formed from the 1st and surrounding it. This grows gradually. Finally the sol droplet disappears, then the outer nuclear droplet and only the gel part of the nucleus remains visible. Fixation reveals that the gel part consists of chromatic while the sol part consists of achromatic substance.—*L. Moyer.*

6424. **WEBER, FRIEDL.** Vergessene Beobachtungen. *Protoplasma* 6(1): 157-158. 1929.—A brief discussion is given of Brücke's paper (1862) on the effect of electromagnetic forces on protoplasmic streaming in hairs of *Urtica urens* and a comparison is made of the formation of protoplasmic threads observed by Brücke with recent similar observations by Küster, Scarth, and others.—*W. Seifriz.*

6425. **WEBER, FRIEDL.** Fadenziehen des Endoplasmas bei Spirogyra. *Protoplasma* 6(1): 159-161. 1929.—The formation of protoplasmic threads has an important bearing on the viscosity, adhesiveness, and other physical properties of protoplasm. Heretofore nearly all observations have been on ectoplasmic threads. The endoplasm in *Spirogyra* likewise forms threads. These can be produced by deplasmolyzing *Spirogyra* protoplasts; the shrunken chloroplast does not return to its former position and as a result endoplasmic threads are formed as the protoplasm returns to its deplasmolyzed state.—*W. Seifriz.*

6426. **WEBER, FRIEDL.** Bildung von Niederschlagsmembranen im Musa-Saft mit Neutralrot. *Protoplasma* 8: 434-436. 1 fig. 1929.—Bag-like structures were found in sap of banana upon treatment with neutral red. These are typical Traube cells. The rest of the sap is colorless in appearance. Tannins, combined with the dye are suggested as the cause of these formations.—*L. Moyer.*

OSMOSIS, PERMEABILITY, PHYSICO-CHEMICAL PHENOMENA

6427. **BROOKS, MATILDA MOLDENHAUER.** Studies on the permeability of living cells. X. The influence of experimental conditions upon the penetration of methylene blue and trimethyl thionine. *Protoplasma* 7: 46-61. 3 fig. 1929.—*Valonia ventricosa* and *Nitella* were placed in .000095 M. solutions of methylene blue (Grübler's; Merck's; and dye prepared by Clark) in sea water and in doubly distilled water, respectively, buffered at pH 5.8 and at 8.83. After various time intervals up to 3 hrs., the sap from the vacuoles was analyzed spectrophotometrically. The results confirm previous experiments on *V. macrophysa* which showed that the dye penetrating into the sap of these plants is not an oxidation product such as trimethyl thionine, but methylene blue itself. The accuracy of the spectrophotometric method is limited since this instrument does not detect small amounts of impurities. Interpretations of data obtained by this method must be made with this reservation. The rate of penetration of methylene blue varies with the pH of the external solution, but after a given time, the concentration of dye in the sap is equal, at all pH values used, to the concentration of dye in the external solution. This indicates that an equilibrium had been reached. Various samples of methylene blue from different sources were tested for purity and Clark's was found to be the purest. Trimethyl thionine penetrated *Nitella* much more rapidly than methylene blue. Irwin's findings differ from the writer's because of certain details of technique including her use of excessively high pH values, high concentration of dye, and relatively impure dyes.—*From author's summary.*

6428. **BROOKS, S. C., and SAMUEL GELFAN.** Bioelectric potentials in Nitella. *Protoplasma* 5: 86-96. 3 fig. 1928-1929.—Potential differences between 2 microelectrodes, one in the protoplasm of *Nitella* and one just outside the cell, have been measured. The p. d. increases with increase in size of the cells studied in tap water or in .001 M. NaCl from 15 m. v. for a cell volume of about 0.5 mm.^{3} to about 40 m. v. for cells of 3 mm.^{3} in volume. Larger cells showed irregular p. d., mostly less than 40 m. v. The p. d. yielded by cells immersed in artificial *Nitella* sap was 7 m. v.; dilution of the sap to $\frac{3}{4}$, $\frac{1}{2}$, or $\frac{1}{4}$ strength led to successively greater p. d., approaching as a limit the figure for cells of similar size in tap water or .001 M. NaCl.—*Authors' summary.*

6429. **BROOKS, S. C.** The accumulation of ions in living cells.—A non-equilibrium condition. *Protoplasma* 8: 389-412. 5 fig. 1929.—Living cells of *Valonia macrophysa* were exposed for different lengths of time to sea water in which the proportion of K had been increased or decreased by the addition of isotonic KCl or NaCl solutions. The concentration of K in the sap ordinarily increased more than that of Na or Cl regardless of whether it was present in more or less than normal concentration in the surrounding solution. The Cl concentration in the sap ordinarily changed in much the same way as the K concentration, but to a significantly smaller extent. The Na concentration appears to have first increased and then decreased, depending upon the length of exposure and the extent to which the sea water was altered. This may be explained by supposing that: (a) the cell is normally in a non-equilibrium condition with respect to the surrounding solution; (b) the cell is surrounded by a plasma membrane consisting of a mosaic of anion-permeable and cation-permeable areas which are of the nature of charged porous films, and as such exaggerate differences between the diffusion velocities of the ions to which they are permeable; (c) the diam. of the pores varies according to experimental conditions; (d) the penetrabilities of different ions are characteristic functions of their own effective diam. and of the diam. of the pores in the membranes. This theory explains more or less completely also the intake of ions by plants, the changes in morphology of green algae grown in darkness, the characteristic ion content of erythrocytes and of neoplastic cells, and the relation between glycolysis and growth of neoplasms.—*Author's summary.*

6430. **DERRY, B. H. E.** Plasmolyseform- und Plasmolysezeit-Studien. *Protoplasma* 8: 1-49. 3 fig. 1929.—Saccharose solutions used as plasmolysing agents on *Spirogyra* revealed that the stronger the solution the longer was the time needed for plasmolysis. The idea is advanced that short plasmolysing times depend on a low viscosity of the protoplasm, while longer times are due to a high viscosity. By treatment with low temp. (0° C.) before treatment with the saccharose, the plasmolysing time is indefinitely increased. Narcotics in slight doses for varied times produce increased speed of plasmolysis. Increase of the pH of the culture fluid had an opposite effect.—*L. Moyer.*

6431. **DIETRICH, FRITZ.** Beobachtungen über Stoffwanderung in lebendigen Zellen. *Protoplasma* 8: 161-198. 1929.—The rate of diffusion of chrysoidin in *Mucor* is 5 μ per min., in gelatin, 25 μ per min. The higher the protoplasmic viscosity the lower is the diffusion rate. The rate of diffusion of chrysoidin in plasmodia is 50 μ per min. faster in the endoplasm than in the ectoplasm. Diffusion rates of other dye stuffs in other materials are given.—*W. Seifriz.*

6432. **GAIL, FLOYD W., and WM. H. CONE.** Osmotic pressure and pH measurements on cell sap of Pinus ponderosa. *Bot. Gaz.* 88(4): 437-441. 1929.—Osmotic

pressure measurements made by means of freezing point depressions, and pH values determined electrometrically were made on 1st, 3rd, and 5th yr. needles of *P. ponderosa*. There is a high pH and low osmotic pressure during the period of growth, and a lower pH and higher osmotic pressure during the dormant period. The pH and osmotic pressure of the cell sap increase with the age of the needles for any given time. The fluctuation of osmotic pressures and pH values becomes less as the age of the needles increases. The needles fell when the pH was approximately 4.1.—*Authors' summary.*

6433. **GALVEZ, NICOLAS. The use of the antimony electrode in the control of cane juice defecation and for measuring the hydrogen ion concentration of soils.** *Philippine Agric.* 19(4): 219-227. 1930.

6434. **GICKLHORN, J. Kristalline Farbstoffspeicherung im Protoplasma und Zellsaft pflanzlicher Zellen nach vitaler Färbung.** *Protoplasma* 7: 341-352. 2 fig. 1929.—Neutral red in 0.05% concentration employed as a vital stain for the leaves of *Ceratophyllum submersum* and *C. demersum* produced crystals in the cells after long immersion. These crystals vary in position and shape according to the type of leaf cell in which they are found. They may even resemble droplets. These crystals may be found in the cytoplasm or in the vacuole. No granules are found which might serve as foundations for them. In no preparation in which crystals were found in the cytoplasm, was the cell sap colored. Stains other than alkaline neutral red did not produce as great an effect nor did they go beyond the epidermis.—*L. Moyer.*

6435. **GRÜSS, J. Semipermeabilität der Gerstenfrucht und Samenschale. III.** *Wochenschr. Brauerei* 47(22): 249-252. 2 fig.; (23): 257-261. 5 fig.; (24): 269-272. 1 fig. 1930.—Barley grains (100) soaked in N/10 NaOH take up 0.4 gm. NaOH in 6 hrs. and 0.054 gm. in 10 hrs. A notable difference can be seen if one lets microscopic sections lie for some time in normal KOH and NaOH solutions. Longitudinal and surface sections placed in KOH and NaOH solutions showed after a moderately long action a great difference in the tissue, which is destroyed easier by NaOH than KOH.—When grains were soaked in 1% Na_2CO_3 solutions, 100 grains took out 0.041 gm. Na_2CO_3 in 6 hrs. and the tissue showed no semipermeability for the salt. The entrance of Na_2CO_3 into the grain can be followed by phenolphthalein after killing the tissue. Grains placed in $NaHCO_3$ take up very little of this salt and their viability is not injured. The diffusion gradient and viability for grains placed in NaOH, KOH, Na_2CO_3, K_2CO_3, $CA(OH)_2$+ Na_2CO_3 are tabulated. In the penetration of these substances through the membranes of the pericarp no semipermeability is shown. Without exception, the diffusion gradient increases with the concentration of the diffusing substance.—*J. Grüss (transl. by Oran Raber).*

6436. **JOST, LUDWIG. Elektrische Potential-Differenzen an der Einzelzelle.** *Sitzungsber. Heidelberg. Akad. Wiss., Math.-naturwiss. Klasse* 1927(13): 3-27. 4 fig. 1927.—Individual internodal cells of *Chara coronata* were laid as a bridge connecting 2 paraffin vessels containing various solutions. Similar electrodes were placed in 2 other vessels containing tap water, each connected by a siphon of tap water in agar to one of the solutions. E.M.F. measurements were made by the compensation method, using a capillary electrometer, the sensitivity being 1 or 2 millivolts. Using the same salt in concentrations of 0.01 and 0.1 *N*, the dilute end was always positive, the potentials being of the order of 20-40 millivolts. Using different salts at the same concentration, both anions and cations could be arranged in series with respect to their influence on the size of the potential. With one end in dilute alcohol and the other in tap water, the alcohol end was negative. Mechanical injury to one end of the cell, or to an adjoining cell, made the injured end negative. Experiments with *Valonia* gave small and discordant potentials of 1-3 mv. This is ascribed to the fact that the walls of *Valonia* had imbibed highly conducting sea water, while those of *Chara* contained poorly conducting tap water. The lack of constancy and reproducibility of all the potentials is explained by the theory that the seat of the P. D. is the protoplasmic membrane, and that its permeability is easily changed.—*D. I. Hitchcock.*

6437. **KACZMAREK, A. Untersuchungen über Plasmolyse und Deplasmolyse in Abhängigkeit von der Wasserstoffionenkonzentration.** *Protoplasma* 6: 209-301. 1929.—The course of plasmolysis, deplasmolysis, and the entrance, in time, of injury and death to the cells of *Rhoeo discolor* shows in alkali salt solutions a clear relation to the pH and to the concentration of the plasmolysing medium. A minimum number of plasmolysed cells is reached at the end of the 1st quarter hr. at pH 4.2. With increasing and falling acidity the number of plasmolysed cells lessens. In the interval pH 4.3-5.5 lies a minimum. From here the curve climbs to a maximum on the alkaline side. Deplasmolysis is not seen at lower pH values, but increases as the pH increases until at pH 4.75-5.25 a maximum is reached. Above this, deplasmolysis is slower. Injury and death are greatest at the highest and lowest pH values, and the minimum is at pH 4.7-7.5. Mixtures of $CaCl_2$ and KCl did not slow up plasmolysis, but the resistance of the cells against the medium was increased sharply. *Rhoeo* is permeable to sucrose if deplasmolysis is taken as an index for the entrance of substances. The longer the cells are washed with water beforehand, the greater the plasmolysis.—*L. S. Moyer.*

6438. **KOVAR, LADISLAV. On the influence of surface active substances upon the imbibition of plant tissues. I. Imbibition of potato tuber in monovalent alcohols and in chloralhydrate, studied by the auxographic method.** *Protoplasma* 8: 585-627. 1930.—In connection with the relative experiments, the surface tension of the solutions used was measured before and at the conclusion of each experiment. The suction tension of the tissue was interpolated with the help of the data supplied by the auxograms obtained. The time suction curves thus obtained for each of the substances in question were then compared with one another and a quantitative ratio of the toxicity of the alcohols to the number of C atoms was numerically expressed.—*Author's summary.*

6439. **KÜSTER, E. Beiträge zur zellenphysiologischen Methodik. I u. II.** *Protoplasma* 5: 191-200. 8 fig. 1929.—The effects of puncturing plasmolyzed cells are described.—*W. Seifriz.*

6440. **KÜSTER, E. Beobachtungen an verwundeten Zellen.** *Protoplasma* 7: 150-170. 1929.—The cytoplasmic and vacuolar membranes of injured cells retain their semipermeability for a long time after the injury. It is possible in badly wounded cells to bring opened vacuoles to contraction so that 2 portions separate themselves from one another, one of which is closed on all sides and the other open and in communication with the outside. This last soon disappears. In lightly wounded cells it is possible to bring not only the membrane but the whole body of the cell to osmotic contraction. One can place foreign substances in the opened vacuole before contraction. The spontaneously occurring vacuole contraction is a wound reaction in the bulb leaves of the onion. Sap extracted by pressing leaves of *Rhoeo* is a strong plasmolyzing agent on the cells of its epidermis. It is also toxic even when made hypotonic by dilution. This effect is expressed by the contraction of the protoplasts.—*L. Moyer.*

6441. **MAHDIHASSAN, S. Die Wasserstoffionenkonzentration im Zellinnern von Fusarium lini B. und Hefe. Mechanismus der Enzymwirkung, 7.** *Biochem. Zeitschr.* 226(1/3): 203-208. 1930.—In agreement with their almost identical metabolism, the endo-cellular pH of yeast XII and of *Fusarium lini* B. was determined by microinjection to be for yeast 5.9-6.0 and for *F. lini* B. 6.0-6.1. This agrees well with the findings of Tait and Fletcher as well as of Nord and Franke, according to whom the optimum zymatic activity occurs near pH 6.0.—*A. G. Olsen.*

6442. **MORAVEK, VLADIMIR. Osmotic studies on**

Nereocystis. *Protoplasma* 7: 145-149. 2 fig. 1929.—The bladder of *Nereocystis* was prepared as an osmotic cell by cutting away the stem and leaves and fastening a glass tube to the cut end of the bladder. Various experiments on the osmotic effect of solutions inside and outside of the bladder are recorded, particularly with reference to the partition of Cl in the interior and exterior fluid. Using natural sea water, dilute sea water, and distilled water, as the liquids separated by the *Nereocystis* bladder cells, the exosmosis of Cl was found to proceed in either direction across the membrane. Part of the water was taken into the head, and used for the swelling of the cells; part of the water was transported through the head in the direction from the inside layers through the outside epidermis.—*From author's summary.*

6443. **OHN, ASTA. Viscosity of pectin sols. II. Effect of citric acid and various sugars.** *Indust. & Eng. Chem.* 22(6): 635-639. 3 fig. 1930.—The specific effect of the variables (citric acid, sucrose, fructose, dextrose, and lactose) upon the viscosity of unheated pectin sols was studied to determine their ability to aid gelation. The measurements of viscosity were made by an Ostwald viscometer. Citric acid decreased the viscosity of both the unheated pectin and pectin-sugar sols. Under the same experimental conditions, sucrose caused a greater increase in the viscosity of the pectin sols than any of the other sugars used. Pectin-citric acid-sucrose sols set to a firmer jelly than the sols containing any of the other sugars. Crystalline formation was found in the pectin-citric acid-sucrose sols at a higher pH value than in the jellies containing dextrose or lactose. No visible crystals were found in the pectin-citric acid-fructose jellies. In consideration of the data obtained, it seems feasible to postulate that the mechanism for gelation of pectin-acid-sugar sols may depend a great deal upon the specific effect of the acid upon the pectin fibrils.—*A. Ohn.*

6444. **OPPENHEIMER, HERMANN. Osmotische und Saugkraftmessungen an unseren Kulturpflanzen. III. Gemüse und Handelsgewächse.** *Fortschr. Landw.* 2(7): 215-219. 1 fig. 1927.—The plants which mature early and especially those which are forced, show higher osmotic values (shown by resistance to plasmolysis) than the more slowly maturing kinds which ripen later. Plants that are resistant to heat and cold also have a higher osmotic value than those that are not. A regularity existed between absorption power and length of developmental period; and the product of the absorption power and length of developmental period is a constant for each kind of plant. The relation between absorption power and yield, just as between yield and length of developmental period, shows no regularity. The investigated sp. from the same field of origin had approximately equal osmotic values.—*Author's summary (transl. by E. T. Bartholomew).*

6445. **PEIRCE, GEORGE J. The movement of starch suspensions through vascular bundles.** *Amer. Jour. Bot.* 16(10): 852. 1929.—Abstract.

6446. **SELIBER, G., und R. KATZNELSON. Der Einfluss der Zusammensetzung des Nährbodens auf das Gewicht und den osmotischen Wert der Hefezelle.** *Protoplasma* 7: 204-231. 1929.—The determination of the number of cells in 1 gm. of yeast in relation to the wt. of the yeast cell cultivated in colonies with varying sugar concentration has shown that with the increase of the sugar concentration the number of cells in 1 gm. of yeast first lessens and consequently the wt. of each cell increases, but with further increase the number increases and the wt. lessens. At a concentration of 35% sugar the wt. of the cell approaches a minimum. The number of the cells in relation to the wt. of a cell depends on the nature of the peptone. On the basis of the alteration of the wt. of the yeast cell after a stay in salt solutions of varying strength, is made a method of defining the osmotic value of the yeast cell. It is claimed that as the sugar concentration increases, the osmotic value of the yeast cell increases but this is not proportional for all concentrations and not all high concentrations show this increase in comparison to all lower. Yeast on glucose solutions shows a lower value than that on sucrose. NaCl and NaF solutions of the proper strength sharply increase the values.—*L. Moyer.*

6447. **[SHOLOKHOVA, V. N.]** ШОЛОХОВА, В. Н. Накопление пластических веществ в пшенице люте-сценс No. 62, ячмене, просе No. 853, горчице под влиянием повышения при помощи Na_2SO_4 осмотического давления почвенного раствора на 1, 3, 5 атмосфер по данным 1925 г. [**The storing of plastic materials by plants under increased osmotic pressure of the soil solution.**] Саратовская Областная Сельско-Хозяйственная Опытная Станция. Краткий отчет о работах отдела полеводства. [*Saratov Agr. Exp. Sta. Short Repts. Saratov, USSR.*] 1925-26: 152-156. 1927.—Increasing the osmotic pressure of the soil solution from 1 to 3 atmospheres had a slight effect on plant development; an increase to 5 atmospheres produced a considerable effect apparent even in the early stages of development. Thus tillering of wheat was slightly retarded, and in barley increased. Increased osmotic pressure (a) decreased the yield of wheat and millet more than that of barley and mustard, (b) increased the content of N and by materials in the grain and straw of wheat, but decreased their absolute yield, and (c) increased the content of dry materials of the grain and straw of millet. Under these conditions, however, the content of N and dry materials in the grain and straw of barley was slightly decreased both in % and in absolute quantity; but in mustard the content of N and dry materials in the grain was increased.—*G. A. Lebedeff.*

6448. **STEWARD, F. C. Phosphatides in the limiting protoplasmic surface. 1. A review with special reference to the plant protoplast.** *Protoplasma* 7: 602-621. 1929.—The article is a review and concludes with the statements that notwithstanding the varied properties of the lecithin molecule, the experimental justification for many of the theoretical speculations regarding the rôle of this, or related substances, in plant cells is either lacking or of controversial significance. The paramount importance of phosphatides in nuclear behavior and hereditary phenomena seems to be overemphasized. Much indirect evidence indicates that fat-like substances have some function in the plant protoplasmic surface. To ascribe predominant importance to them as a group, more especially to any specific substance like lecithin or related phosphatide, seems to be at present unjustified.—*From author's summary.*

6449. **STOCKER, OTTO. Über die Messung von Bodensaugkräften und ihrem Verhältnis zu den Wurzelsaugkräften.** *Zeitschr. Bot.* 23: 27-56. 2 fig. 1930.—The suction force of a soil may be measured within ± 1 atmosphere by the use of strips of filter paper saturated with cane sugar solutions. The value of this force is of great importance in the water economy of the plant. If one determines the suction pressure of the absorbing cells of the root, at the same time one may calculate the pressure gradient with which the plant draws water from the soil. The suction force of different strata in the alkali steppes of Hungary varies from 5 to over 400 atmospheres. On the other hand the suction pressure values of the root cells of plants growing on these soils, even in dry periods, are only about 40 atmospheres, and following rain periods drop to approximately 7. In general, the pressure gradient between root-cell and soil does not exceed 2-7 atmospheres. The root hairs of these plants die when the suction force of the soil approaches 30 atmospheres but quickly form again with rain. Thus, these steppe plants make up a very versatile group, their vitality fluctuating with the quickly changing soil conditions.—*O. Stocker (transl. by J. D. Wilson).*

6450. **URSPRUNG, ALFRED. The osmotic quantities of the plant cell.** *Proc. Internat. Congress Plant Sci., Ithaca, N. Y.*, 1926. 2: 1081-1094. 4 fig. 1929.—The quantities: suction force of the cell, suction force of the contents of the cell, and wall pressure or turgor pressure, are defined and illustrated. The confusion re-

sulting from failure to separate these forces in practice is pointed out. It is shown that in beech and ivy the suction force of the cells increases from the ground upward, and in a single leaf from the vicinity of a vein to more distant regions. In the absorbing root of *Vicia faba* the suction force increases from the epidermis through the cortex, but the endodermis, pericycle, and vascular parenchyma show lower values. By a special method it was determined that the outer sides of these tissues have a higher suction force than the cortical cells, while the inner sides have very low or even negative values. By a simplified method the mean suction force of tissues in the field was measured, and high values are correlated with low humidity and low soil moisture. Measurements of turgor pressure showed high values correlated with the opening of stomata, but low turgor pressure and high suction force were found in regions of most rapid growth in roots.—*H. H. Clum.*

6451. **WEBER, FRIEDL. Plasmolyze-Zeit-Methode.** *Protoplasma* 5: 622-624. 1928-1929.—The form of the plasmolyzed protoplast, i.e., whether convex, concave, or angular, indicates the viscous and adhesive state of the protoplast. The time required to plasmolyze, which may be instantaneous or infinite, is also an indication of the physical properties of protoplasm.—*W. Seifriz.*

6452. **WEBER, FRIEDL. Plasmolysezeit und Lichtwirkung.** *Protoplasma* 7: 256-258. 1929.—The viscosity of the protoplasm of mesophyll cells is much higher in light than in darkness.—*W. Seifriz.*

6453. **WEBER, FRIEDL. Zentrifugierung und Protoplasma-Viskosität.** *Protoplasma* 7: 444-445. 1929.—Previous centrifuging has no effect on plasmolysis form and time. Centrifuging has no effect on viscosity.—*W. Seifriz.*

6454. **WEBER, F. Plasmolyse-Ort.** *Protoplasma* 7: 583-601. 14 fig. 1929.—The positive "place of plasmolysis" is the point where the protoplast clings to the cell; the negative one is the point where the plasmolyzed protoplast is free from the wall. Usually there are numerous such points, the number of which is often characteristic.—*W. Seifriz.*

6455. **WEBER, FRIEDL. Plasmolyse in verdünntem Gewebesaft.** *Protoplasma* 8: 437-439. 1929.—The ripe berries of *Polygonatum officinale* if crushed on a slide in distilled water, enter at once into apparent plasmolysis. *Elodea* leaves are not plasmolysed if added to the water used. This is supposedly due to the complete crushing of some cells and the production of a mixture irritating if not hypertonic to the whole cell.—*L. Moyer.*

HYDROGEN ION CONCENTRATION

6456. **ARMSTRONG, J. I. Hydrogen-ion phenomena in plants. I. Hydrion concentration and buffers in the fungi.** *Protoplasma* 8: 222-260. 7 fig. 1929.—In *Hypholoma fasciculare,* phosphates account for only half the buffering in the pH range 6.0-7.0 while in *Coprinus micaceus* the buffer complex is composed of phosphate, oxalate, and an unknown but small quantity of citrate, the phosphate accounting for all the buffering in the range pH 7.0-7.5. In *Collybia velutipes* the buffer complex is composed of phosphates, malates, and citrates but phosphates account for only half the buffering in the range pH 6.5-7.0.—*From author's summary.*

6457. **ARMSTRONG, J. I. Hydrogen-ion phenomena in plants. II. An investigation of the Buffer complex of sap from stems of Pelargonium sp.** *Protoplasma* 8: 313-343. 2 fig. 1929.—The expressed sap from young and mature stems and leaves has a low initial pH, in the region of pH 4.0. Organic acids constitute the major part of the buffer complex at the initial pH of the sap. The acids found and estimated include oxalic acid 0.0573 M., malic acid 0.0337 M., citric acid 0.0066 M., and tartaric acid 0.003 M.; and the contributions made by all these buffer systems to the buffering exhibited by expressed sap are considered in detail.—*Author's summary.*

6458. **ARMSTRONG, J. I. Hydrogen-ion phenomena in plant tissues. III. The acidity of certain cell walls considered in relation to the higher fatty acids.** *Protoplasma* 8: 508-521. 1930.—Higher fatty acids belonging to both the acetic or saturated series and the oleic or unsaturated series, together with certain derivatives of oleic acid, notably ricinoleic or suberinic acid, are tested with a series of 9 indicators recently used in an investigation of the pH of plant cells and tissues.—*Author's summary.*

6459. **INGOLD, C. TERENCE. The hydrion concentration of plant tissues. X. Buffers of the potato tuber.** *Protoplasma* 6(1): 51-69. 4 fig. 1929.—The use of the "buffer index," dB/dpH, to express buffer capacity is discussed. The buffer index of the potato tuber sap increases from an average value of 0.0079 at pH 6—7 to 0.0105 at pH 5—6 and 0.026 at pH 4—5. The sap of the tuber is much more strongly buffered than that of the leaflets. The buffer index curves of the leaflets and of sunflower hypocotyl sap are very similar. Inorganic phosphates in the sap account, on the average, for 30% of the buffer index at pH 6—7. At pH 5—6 they account for about 8% and at pH 4—5 for less than 1%. In a particular case, citrate in the boiled and filtered sap accounted for 22.5% of the buffer index at pH 4—5, 39% at pH 5—6, and 19% at pH 4—5.—*W. Seifriz.*

6460. **LOEHWING, WALTER F. Sap hydrion concentration as a factor in plant metabolism.** *Proc. Iowa Acad. Sci.* 35: 135-139. 1928(1930).—Sterile muck soils of high acidity were used. Application of lime and potash often proved harmful, due largely to low hydrion concentration of the sap which caused precipitation of Fe in the lower parts of the plant. Examples (cited) show that increased absorption of some mineral nutrients may involve reduced intake or improper movement of others.—*H. S. Conard.*

6461. **ROBERTSON, I. M., and A. M. SMITH. A capillary electrode suitable for the determination of the hydrogen-ion concentration at a point on plant tissue.** *Chem. & Indust.* 49(9): 120t-121t. 1 fig. 1930.—Potato tubers were examined with aid of the apparatus described for variation of pH value from point to point on the tissue and results are tabulated. The pH value of pulp was always higher than that of tissue, due probably to loss of CO_2 present in the sap.

WATER RELATIONS, SAP MOVEMENT

6462. **HEINICKE, ARTHUR J. A method for studying the relative rates of transpiration of apple leaves and fruits.** *Proc. Amer. Soc. Hort. Sci.* 26: 312-314. 2 pl. 1929(1930).—The water lost by the leaves is taken up by $CaCl_2$ contained in small weighing bottles held to the leaf by a special clamp. The amount of water given off is determined by the increase in the wt. of the bottle and its contents. The light conditions are not interfered with. The values obtained by this method were comparable with those of other methods in common use. The method does not give absolute values of transpiration, but is convenient for studies involving comparisons in the rates of water loss where the entire plant cannot be used.—*A. J. Heinicke.*

6463. **KÔKETSU, R., und S. TSURUTA. Anwendung der "Pulvermethode" für vergleichende Bestimmungen der Transpirationsgrösse. [The "powder method" in comparative determinations of transpiration magnitudes.]** *Arb. Bot. Lab. Kaiserlichen Kyushu-Univ.* 23p. 253-266. 1929.

6464. **KOYAMA, TAKUJI, and YOSISUKE TAKIGUTI. Growth and water requirement of young soybean plants in auto-irrigated soils, as related to the water-supplying power of the soil.** [Japanese, with English summary.] *Bulteno Sci. Fakult. Terkult. Kjusu Imp. Univ.* [*Fukuoka, Japan*] 4(2): 53-65. 1 fig. 1930.—Soybeans were grown in soil mixtures of clay and sand in different proportions in porcelain containers, each being auto-irrigated under a different hydrostatic pull (Livingston's method). The growth and the water requirement of the plants were compared; also the water-supplying power of the soil was determined by

Livingston's "soil point." The growth rate, the fresh and the dry wt., and the leaf area were in the same order as the water-supplying power of the soil. A conspicuous relation was observed between the wt. of 1 c.c. of powdered tissue of the plant (determined by Koketsu's "Pulvermethode") and the water-supplying power of the soil, but this relation varied with age. At a month old, the greater the water-supplying power the higher was the apparent specific gravity of the powdered tissue. With older plants this was reversed. The higher the water-supplying power, the greater was the total transpiration loss. Likewise when the plants were young, the more water they transpired to produce 1 gm. of dry matter, but when they grew older, the relation became quite reversed. These facts suggest that the relation between the physiological condition of the plant and the water-supplying power of the soil varies with age.—*From authors' summary.*

6465. **MASKELL, E. J., and T. G. MASON. Studies on the transport of nitrogenous substances in the cotton plant. II. Observations on concentration gradients.** *Ann. Bot.* [*London*] 43(172): 615-652. 2 fig. 1929.—Upward movement of N in the wood, its elaboration in the leaves, and downward transport via the bark towards the roots, as reported in Part 1, is here confirmed. The downward transport of N takes place against a concentration gradient of total N, and of the total organic crystalloid (non-protein) N in the bark, while the parallel transport of carbohydrates is along a definite gradient of sugar concentration. Two possibilities are considered: (1) some only of the crystalloid N fractions are concerned in longitudinal transport, the positive gradient in these fractions being masked by negative gradients in the other fractions; (2) there is a positive gradient of some or all of the crystalloid N fractions in the actual conducting cells, but this is masked by negative gradients of the same fractions in the other tissues of the bark. As to (1), chemical analysis establishes well marked negative gradients in asparagine (acid amide) N and in amino-acid N, which together more than account for the observed negative gradient in organic crystalloid N. There results a positive gradient in the residual N fraction, but this gradient is relatively small and, on the data available, is not statistically significant. As to (2), the vertical gradients of asparagine N, amino-acid N and residual N are much the same in the inner half of the bark (which contains most of the sieve-tube groups) as in the outer half. The radial distribution of N fractions across the bark (subdivided into inner, middle, and outer zones) indicates that the amino-acid and residual N fractions occur mainly in the sieve-tubes, while asparagine is present in highest concentration in the rays. This localisation suggests that residual N or amino acids may be concerned mainly with longitudinal transport, and asparagine mainly with storage. The organic crystalloid N of the leaf parenchyma is chiefly residual N, and this fraction shows a marked concentration gradient out of the parenchyma through main veins and petiole to the bark of the main axis. There is a small gradient of amino acids in the same direction, but the gradient of asparagine is in the opposite direction. It is possible that some part of the residual N fraction may form the head for transport throughout the plant, but until some closer analysis of the dynamic and storage components of the observed gradients is possible, no definite conclusions as to the mobile fraction or fractions can be attempted.—*T. G. Mason.*

6466. **MATSUDA, KIYOKATSU. Ueber die Wassergehaltsveränderung der sich entwickelnden Reiskörner und die Beziehung zwischen ihre Entwicklung und Reifestadien.** [Japanese.] *Proc. Crop Sci. Soc. Japan* 3: 58-65. 1929.—The length of developing rice grains was determined during the milk stage while the breadth and thickness of the grains was first measured at the beginning of the stage of yellow ripeness. Increases in fresh wt. of rice grains continued for some time after the beginning of yellow ripeness and increases in dry wt. continued still longer. The water content reached its maximum at the milk stage and decreased gradually during yellow ripeness to maturity. The water content of the grain at the time of blooming was 86% of the fresh wt. and only 19% 49-51 days later.—(*Courtesy Japanese Jour. Bot. Transl. by A. D. Moinat*).

6467. **MONTEMARTINI, L. Sul ordine di caduta delle foglie nei pioppi e nei gelsi.** [Leaf fall of poplars and mulberries.] *Atti. Soc. Ital. Sci. Nat.* 69(1): 23-29. 1 pl. 1930.—In the Po valley the last leaves to fall from the poplar are those at the ends of the branches, the youngest; whereas the last mulberry leaves are those at the base of the branches, the oldest. This is correlated with the difference in the type of transpiration of these trees. In the poplar, transpiration is chiefly stomatal, and the young leaves have the more mobile stomata, so that they control water loss better. In the mulberry, the transpiration is chiefly cuticular, and the older leaves are the better protected.—*L. Montemartini (transl. by H. S. Wolfe).*

6468. **NAKANO, HARUFUSA. On the remarkable powers of water absorption by the leaves of Polypodium lineare Th., with special reference to the ecology of this plant.** *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 2: 1901. 1926(1928).—Abstract.

6469. **NEWTON, R., and W. H. COOK. The bound water of wheat-flour suspensions.** *Canadian Jour. Res.* 3(6): 560-578. 1930.—The bound-water method was modified for use with flour suspensions and provided a simple means for the direct measurement of the approximate hydration of the colloidal constituents in dilute lactic acid. The average hydration of the dry matter in 15% suspensions was 40-50%, the value being slightly higher in washed suspensions. Starch maintained a hydration close to 30% under all conditions investigated. The prepared proteins, in dilute lactic acid, were hydrated about 85%. The calculated hydration of the proteins as they occurred in the flour was about 100% in unwashed and 200% in washed suspensions. No significant differences were found in the hydration of strong and weak flours, and it is thought that such differences as may exist are too small to be major factors in baking quality. The experimental results are harmonized with the facts concerning viscosity and behavior of bread dough by assuming micellar aggregation of the gluten.—*Authors' summary.*

6470. **PARK, O. W. The influence of humidity upon sugar concentration in the nectar of various plants.** *Jour. Econ. Ent.* 22(3): 534-544. 3 fig. 1929.—Sugar concentration in nectar varied inversely with relative humidity. Correlation between these 2 factors was much closer in some types of flowers than in others. The Abbé refractometer was highly satisfactory for the work. —*Author's summary.*

6471. **REED, HOWARD S. The swelling of citrus fruits.** *Amer. Jour. Bot.* 17(10): 971-982. 1930.—Oranges and lemons were submerged in test solutions and the volume changes were registered by an auxograph. Both fruits absorbed water, acids, bases, and salts with resulting increases in volume. Solutions of compounds which coagulate pectins caused incipient swelling, but it was followed by shrinkage. The translocation of liquids appears to depend upon their passage through the layers of hydrophilic colloids on the walls of the mesocarp cells and only to a small degree upon the participation of living cells. The juice sacs in the locules of the fruits have sufficient suction pressure to pull water from the hydrophilous colloids in the mesocarp. The prompt expansion of fruits in water indicates that there was an unsatisfied capacity for imbibition in most of the fruits. —*H. S. Reed.*

6472. **SCHROPP, W. Beiträge zur Frage der Regelung der Standorts- und Wasserverhältnisse bei Vegetationsversuchen in Gefässen.** *Angewandte Bot.* 11(5): 461-552. 24 fig. 1929.—The importance of the pot culture method justifies an examination of this technique. The relative position of the pots takes a place of special importance. This question and that of water relations

are examined in this paper. The following points are considered: How will soil temp. and the use of water in each pot be influenced by the relative position of the pot? How will tillering, length of each plant, yield, and soil reaction in each pot be affected? To answer these questions 2 experiments were performed with summer barley and summer rye, each on 2 trucks. One series involved 9 fertilizer treatments, the other no differential fertilizing. All of the factors could not be readily differentiated, so that indirect methods of interpretation must be used. Especially useful was the application of probable error to the yields. An unfavorable judgement of the usefulness of the method of maintaining pots in position is not justified. With the customary arrangement of pots on one truck, with border pots on each end, the short-lived agricultural plants at least need not have their positions changed daily without introducing excessive experimental error. Rectangular boxes are recommended in order to utilize the space to the maximum, and to reduce the cost. The relative water-loss approximates very closely the values obtained by Hellriegel.—*W. Schropp (transl. by E. L. Proebsting)*.

6473. **SELIBER, G. Die Mutterknolle als wasserversorgendes Organ der Kartoffelpflanze.** *Angewandte Bot.* 12(3): 216-224. 1930.—By means of determination of the dry wt. of the wilting plant with the mother tuber attached, the capacity of the latter to supply the daughter plant with water was determined. It was proven that the plant is able to draw water from its seedpiece, or the seedpiece may supply water to the daughter plant. Possibly this capacity varies with different varieties. The solution of the question as to whether the low transpiration rate of the plant with the mother tuber attached is due to (1) the decreased absorptive power of such a plant or (2) to a particular characteristic of the mother tuber must remain for future investigation. —*G. Seliber (transl. by A. D. Moinat)*.

6474. **STÅLFELT, M. G. Die Abhängigkeit der Spaltöffnungsreaktionen von der Wasserbilanz.** *Planta Arch. Wiss. Bot. Abt. E. Zeitschr. Wiss. Biol.* 8(1/2): 287-340. 16 fig. 1929.—Three reaction systems are recognized in the opening and closing of the stomata: the passive, the photo-active, and the hydro-active. The operation of these 3 systems is related to the water content of the plant. Thus, when the water content is supra-optimal the guard cells of the stomata are caused to open and close by the changing pressure of the turgescent cells of the adjacent epidermis and mesophyll; and, since the guard cells act only in a passive manner, this is called the "passive" system. The photo-active system results from the effect of light in influencing either the osmotically active substances within the guard cells, or by a stimulative effect of light upon the pressure equilibrium between the guard cells and the surrounding tissue. The opening and closing is particularly sensitive to the photo-active system at the time of optimum water content; if the water content is increased, then the passive system comes into play, and at a certain water content a delicate balance between these 2 systems results. When the water content becomes sub-optimal, then the stomatal movement is dominated largely by the hydro-active system, in which process the stomatal cells take an active and not merely a passive part. The hydro-active reaction does not come into operation at once after the water loss but becomes effective a few min. afterward. Here again, as the water content falls below the optimum a stage is reached in which the photo-active and hydro-active systems are nicely balanced as to their importance in the regulation of the stomatal opening. Observation on *Picea excelsa* in the field, and measurements on *Vicia faba* in the laboratory, furnished the data for these conclusions. The interrelations of the 3 factors at different water contents, at different hrs. of the day and under different external conditions are given.—*F. E. Denny*.

6475. **SU, M. THET, and ERIC ASHBY. The interaction of factors in the growth of Lemna. 2. Technique for the estimation of dry weight.** *Ann. Bot. [London]* 43(170): 329-332. 2 fig. 1929.—In order to avoid significant decomposition, also excessive expenditure of time, on the one hand, and risk of loss on the other by overheating, samples of *Lemna* dried for ½ hr. at 50° C. in a vacuum (5mm. of Hg) yielded consistent results. The drying apparatus is here described.—*G. J. Peirce*.

MINERAL NUTRIENTS, SALT RELATIONS

6476. **BERTRAND, GABRIEL, et VORONCA-SPIRT. Recherches sur la présence et la répartition du titane dans les plantes phanérogames.** *Ann. Sci. Agron.* 46: 551-60. 1929.—To determine whether Ti is a component part of the plant structure or merely present in the extraneous deposit of dust and dirt, 53 phanerogams and parts of plants were analyzed. After preliminary treatment to remove adhering dust and dirt, sufficient fresh material was dried and ignited to furnish 10-50 gm. of ash. After removal of the SiO_2 by HF, the Ti was determined by the method of Weller modified to obviate interference by Fe and phosphates. Ti was found in all the plants examined. As in the case of Fe, Mn, Zn, etc., the green parts, especially the leaves, contained the largest amount. In the seed almost the whole amount was found in the integument. The parenchyma contained only very small amounts. It is, therefore, concluded that Ti like Fe and Mn is a physiological element.—*K. S. Markley*.

6477. **BROOKS, S. C. Composition of the cell sap of Halicystis ovalis (Lyng.) Areschoug.** *Proc. Soc. Exp. Biol. & Med.* 27(5): 409-412. 1930.—The anomalous chemical composition (particularly as to ratio K: Na) of the cell sap of *Halicystis ovalis* (reported under the name *Valonia ventricosa*) found by Osterhout and Dorcas is considered, and their analyses of this alga and of *V. macrophysa* are criticized on the grounds that the floating plants used were possibly rendered abnormal by being torn loose from their normal habitat. Analyses are reported of a Pacific coast *Halicystis* morphologically identical with *H. ovalis*, from its normal position, and of *V. ventricosa* from Tortugas, and are compared with Brooks' data on *V. macrophysa* from Tortugas. In these 3 sp., the K: Na ratio was 1.50: 1, 10.58: 1, and 5.53: 1, respectively, as compared with 0.0271: 1 in sea water (Brooks) and 0.0278: 1 in the sap of *Halicystis* reported by Osterhout and Dorcas.

6478. **CHAPMAN, G. W. An easily constructed form of micro colorimeter.** *Analyst* 55(652): 443-444. 1930.—The apparatus described was designed for colorimetric determination of Fe and Mn in ash from sap of plant fragments.

6479. **FREAR, DONALD E. The adaptation of the Benedict-Denis method to the determination of sulfur in plants.** *Jour. Biol. Chem.* 86(1): 285-289. 1930.—The Benedict-Denis solution may be used alone as an oxidizing agent for determining S in plants, giving results which are in close agreement with the values obtained by the official Na_2O_2 fusion method. The use of any preliminary treatment of the sample is thus avoided, thereby making the determination shorter and simpler. While these results are only for corn, buckwheat, cabbage, spinach, and onions, these crops represent 5 different families and a wide range of S content; and the methods here used may be applied to any crop with the expectation of reasonably accurate results.—*Author's summary*.

6480. **GREAVES, J. E., and C. T. HIRST. The mineral content of grains.** *Utah Agric. Exp. Sta. Bull.* 210. 38 p. 1929.—The ash contents of wheat, oats, and barley, respectively, were materially raised by increased quantities of irrigation water on a productive calcareous Utah soil, the maximum % of ash being produced at 40-50 in. of irrigation water. Ash content in wheat varied slightly with variety. Ash contents of wheat, oats, and barley varied greatly with the section of Utah in which they were grown. The basic elements Ca, Mg, and K were studied individually. Their %, respectively, in the different cereal grains varied between wider extremes than did total ash, but in substantially the same order. Individual studies with P, S, and Fe, the acid forming

elements, showed variations of a similar nature.—*M. J. Blish.*

6481. [GRISHAEVA, K. F.] ГРИШАЕВА, К.Ф. Влияние солей в уравновешенных растворах на накопление пластических веществ в культурных растениях. [The effect of salts in balanced solutions on the storing of plastic materials by cultivated plants.] Саратовская Областная Сельско-Хозяйственная Опытная Станция. Краткий отчет о работах отдела полеводства. [*Saratov Agr. Exp. Sta. Short Repts., Saratov, USSR.*] 1925-26: 139-144. 1927.—Wheat, millet, sorgo, and flax showed different resistances to the same concentration of balanced solution of soil chlorides. The most resistant was wheat, which withstood 0.5 *N*, and gave only a very slightly diminished yield at 0.1 *N*. The transpiration coefficient of all plants was lowered with increasing concentration of the salts to 0.1 *N*. The content of *N* and dry materials in the grains and straw increased with increase of salts in the soil, except in millet, in which the % of *N* and dry materials in grain and straw decreased.—*G. A. Lebedeff.*

6482. **KOEHLER, Z. Sur les composés phosphorés des plantes. V. La solubilité des composés phosphorés des embryons de seigle.** *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B (1[Bot.])* 1829 (2/7): 237-254. 1929.—Previous work has established that aqueous extracts of various embryos (maize, barley, etc.) show a ratio between organic and inorganic phosphates depending on the pH of the solvent employed, using dilute solutions of HCl, acetic acid, and rarely NaOH. With HCl (0.01% or greater) consistent results were obtained on the relation of the organic to inorganic phosphates. At a lower concentration of acid the phosphatases are stimulated with a consequent rise in the amount of inorganic phosphate at the expense of the organic. An analysis of air-dried, defatted rye embryos gave a total phosphate content of 3.548% P_2O_5, of which 11% approximately is inorganic.—*O. F. Black.*

6483. **PRÁT, S., und B. MINASSIAN. Über die Stoffaufnahme und Wasserabgabe bei Moosen.** *Protoplasma* 5: 161-167. 6 fig. 1929.—Strips of filterpaper with 1 end in a nutrient solution resorb the solution in unaltered concentration. Plants of *Polytrichum* behave in precisely the same way.—*W. Seifriz.*

6484. **RIPPEL, AUGUST. Über den Zusammenhang zwischen dem Aufnahmeverlauf der Bodennährstoffe bei den höheren Pflanzen und der Beweglichkeit dieser Stoffe in der Pflanze. (Untersuchungen über physiologisches Gleichgewicht bei Pflanzen, III.)** *Biochem. Zeitschr.* 187 (4/6): 272-282. 4 fig. 1927.—Determinations of the mineral substances in *Helianthus annuus* (sand cultures) were made at 15 growth periods. Taking the quantity in mature plants as 100, the relative amount in young plants (period 7) was: dry matter 8, N 50, K 37, P 16, Mg 12, Ca 12, S 11. This is taken to indicate that the more mobile ions are absorbed earlier than the less mobile. The absolute amounts in plant tops per pot (5 plants) at this period were: N 0.77 gm., K_2O 1.67, P_2O_5 0.128, MgO 0.186, CaO 0.742, and SO_3 0.187 gm.—*S. H. Eckerson.*

6485. **RUNNEHJELM, DAGMAR. Mikro-Eisen-Bestimmungen an chlorophyll-defekten Blättern.** *Biochem. Zeitschr.* 224 (4/6): 481-486. 1930.—Micro analyses of the total Fe content according to the Friedenthal-Lachs-Schönheimer-Oshima method were carried out with leaves deficient in chlorophyll. Although no difference in total Fe content could be found between normal leaves of barley (albino type) and those deficient in chlorophyll, white leaves of *Tradescantia,* which lacked chlorophyll, showed more than twice as much Fe as normal leaves.—*Author's summary (transl. by C. J. Lyon).*

6486. **SAMUEL, GEOFFREY, and C. S. PIPER. Manganese as an essential element for plant growth.** *Ann. Appl. Biol.* 16 (4): 493-524. 3 pl., 1 fig. 1929.—The conclusions of certain previous investigators that Mn is an essential element for plant growth have been confirmed by means of water-cultures. Mn becomes necessary to plants at an early seedling stage, and remains necessary until a late stage in growth. The symptoms of Mn deficiency are essentially an arrest of development followed by death of the undeveloped tissues at the growing points, and the use of the word chlorosis as the primary symptom is misleading. In many cases a special type of chlorosis of the upper parts of the plant does occur before death of the tissues. Rye developed to maturity in water-cultures on an amount of Mn which did not allow the complete development of oats. A concentration of Mn of 1 part in 50,000,000 parts of nutrient solution allowed complete development of rye, and would probably be sufficient for oats also if a method of continuous solution change were arranged. Evidence is given that the minimum quantity of Mn which will allow healthy growth of Algerian oats is about 14 parts per million of the dry matter at the flowering stage. On certain soils oats are unable to absorb this minimum quantity and they then suffer from the Grey Speck disease, a true Mn deficiency disease which can be cured by application of a soluble Mn salt. On soils with abundant available Mn considerably more is absorbed by oats than is required for normal development. The amount absorbed varies greatly, and probably depends to some extent on soil reaction and soil aeration. Analyses given show that a number of plants, when growing on a red clay loam soil on which no deficiency disease occurs, have a much higher Mn content than similar plants taken from soils on which oats suffer from Mn deficiency. Such factors as the presence of organic matter, or excess of Ca ions, which have at various times been claimed as causes of the Grey Speck disease of oats, have been shown to play no part in the appearance of this trouble in water-cultures where a soluble Mn salt is present. These factors cannot themselves render Mn unavailable when it is present in a soluble form. This does not exclude the possibility that they may later be found to have some effect, in conjunction with other factors as yet undetermined, in rendering Mn unavailable in certain soils. None of 10 different rarer elements tried, nor the combination Zn, Cu, Bo, and Al, was able to replace Mn in the growth of oats.—*Authors' summary.*

6487. **STOKLASA, JULIUS. Die Resorption des Jods durch das Wurzelsystem der Pflanze.** *Protoplasma* 8: 199-214. 1929.—Hydrophytes and halophytes accumulate a marked quantity of I.—*W. Seifriz.*

6488. **TUBBS, F. R. Physiological studies in plant nutrition. II. The effect of manurial deficiency upon the mechanical strength of barley straw.** *Ann. Bot.* [*London*] 44 (173): 147-160. 5 fig. 1930.—The force in gm. required to crush 1 cm. of stem radially is taken as a measure of strength. The strength of succeeding internodes of fully-manured plants falls off rapidly. N and P deficiency results in a large increase in strength of the lower internodes, while K starvation decreases the strength of the lower and increases that of the middle internodes. The effects of manurial deficiency are most marked in the lower internodes, the upper ones approximating to the normal. Variation in thickness of mechanical tissues follows that of strength, but is not sufficient to account for the large differences observed. Total and partial linear correlations between strength and the morphological status of the internode, and between strength and thickness of the sclerenchyma, lignified parenchyma, and unlignified parenchyma have been calculated. It is concluded that the observed fall in strength of succeeding internodes is due both to decrease in efficiency of the mechanical tissues and also to decrease in their actual amount. Equations connecting strength and morphological status of the internode give a good fit in the fully manured, N-deficient and P-deficient series. The relation between strength and internode number is logarithmic (the strength of each internode being a constant fraction of that next below), the value of the fraction being dependent on the type of manuring applied. The ratio of the external radius to the internal radius of the mechanical tissues is constant for in-

ternodes of the same status, independent of manuring. It appears that the mechanical function of the elements composing them is determined at a very early stage. The observed effects of mineral deficiency may be explicable on the assumption that K is essential to the production of an efficient mechanical tissue.—*Author's summary.*

6489. **WALLACE, T. Experiments on the manuring of fruit trees. III. The effects of deficiencies of potassium, calcium, and magnesium, respectively, on the contents of these elements, and of phosphorus in the shoot and trunk regions of apple trees.** *Jour. Pomology & Hort. Sci.* 8(1): 23-43. 1930.—Eighty maiden apple trees of Stirling Castle variety worked on Malling Type I rootstock were used, divided into 4 equal groups for the 4 treatments—complete nutrient, Ca omitted, Mg omitted, and K omitted. Planting was done Jan., 1926, in 10-in. waxed pots containing quartz sand. The first applications of nutrient solution were given Feb. 25. Each group was again subdivided into a summer pruned group and a winter pruned group. The experiment was continued for 3 seasons and detailed growth observations and chemical analyses of leaves, stem, petioles, and shoots (as bark and wood) were made each season. K omission resulted in increased shoot growth, leaf scorch, and defoliation of shoots. Ca omission produced slightly increased shoot growth, relatively large leaves, and breakdown of leaf tissue in patches. Mg omission effected a great reduction in shoot growth after the first season, and after 2 seasons the trees were unable to make appreciable shoot growth. The omission of Mg produced the most severe leaf breakdown of the 3 omission tests. Reduction in K_2O and MgO content was effected in all material by omission of these bases, but omission of Ca did not make such large reduction of CaO. The respective omissions possibly affected the P_2O_5 content in dry matter in the various parts of the trees, this content being generally high in the leaves and shoots and low in the main stems.—*M. C. Merrill.*

6490. **WALLACE, T. Experiments on the effects of leaching with cold water on the foliage of fruit trees. I. The course of leaching of dry matter, ash and potash from leaves of apple, pear, plum, black currant and gooseberry.** *Jour. Pomology & Hort. Sci.* 8(1): 44-60. 1930.—This work was done in 1927 on 4 varieties each of the fruits named. Two samples of leaves, each weighing approximately 20 gm., were taken from each variety, one being used as a control and the other given 4 successive leachings (24 hrs. each) in a 1-liter cylinder of distilled water at laboratory temp. Only the laminae were leached. The leached leaves of all varieties lost considerable proportions of potash, ash, and dry matter, the leached proportion of potash being greater than that of ash, and that of ash being greater than that of dry matter. The ratios of the leached % of potash to ash and of ash to dry matter varied for the different fruits and varieties. Leaves of all varieties of apples and gooseberries were readily leached; pear leaves only fairly so; plum varieties showed much variation; black currant leaves were least readily leached. Summation curves indicate that the leaching was continuous; and the curves for potash, ash, and dry matter suggest that the same groups of materials were leached throughout the leaching periods.—*M. C. Merrill.*

6491. **WINTER, O. B., and O. D. BIRD. The determination of aluminum in plants. II. Aluminum in plant materials.** *Jour. Chem. Soc.* 51(10): 2964-2968. 1929.—The analytical procedure involves the slow ashing of the plant material, digesting the ash with HCl, removal of the iron and silica, and the determination of the Al by a colorimetric method previously described. The accuracy of the method was proved by analyses of samples of plant material to which known amounts of Al were added and by checking against other methods. Analyses of 76 kinds of dry plant materials showed a range in Al content from 2.0 p.p.m. in wheat flour to 850.0 p.p.m. in lettuce roots.—*E. N. Fergus.*

6492. **ANONYMOUS. Recherches sur la présence et la répartition du titane dans les plantes cryptogames.** *Ann. Sci. Agron. Franç. et Étrang.* 47(1): 1-3. 1930.—Titanium is ordinarily found in cryptogams as in phanerogams, except that in certain fungi the amount is consistently smaller (perhaps 10 times less) than is usually the case. This does not exclude a physiological rôle for Ti in plants, as in these sp. other elements, especially Mn, are also extraordinarily reduced.—*Author's résumé (transl. by J. J. Taubenhaus).*

PHOTOSYNTHESIS, CHLOROPHYLL

6493. **ALEXANDROV, W. G. Zustand und Tätigkeit der Chloroplasten bei verschiedenen klimatischen Bedingungen.** *Protoplasma* 6: 429-437. 1929.—At high temp. (33° C.) and strong sunlight, *Helianthus* and *Zea* store sugar instead of starch. The plastids alter in composition under such conditions; their permeability increases; they lose the sharp outlines of their contours and swell. Plastids of *Helianthus* swell more than those of *Zea* and are often destroyed. Plastids in different tissues of the same leaf are differently affected. To the number of indications which characterize the natural resistance of a plant to drought, there must be added the resistance of the plastids. A plant resistant to drought must have resistant plastids or higher temp. may so injure it that it cannot regain its normal condition.—*L. Moyer.*

6494. **BRIGGS, G. E. Experimental researches on vegetable assimilation and respiration. XX. The energetic efficiency of photosynthesis in green plants: some new data and a discussion of the problems.** *Proc. Roy. Soc. [London]* B105(734): 1-35. 2 fig. 1929.—The structural complexity of several photosynthesizing tissues is discussed. Equations are given for the absorption and transmission of light by *Monostroma* thallus. Measurements of photosynthesis were made on *Phaseolus vulgaris*, yellow elm, green elm, and *Sambucus nigra*. Yellow-red, green, or blue light was obtained from a 1500 watt lamp by means of gelatin filters. Incident energy was measured with a thermopile. The efficiency of photosynthesis was found to decrease from the red to the blue end of the spectrum. The results are discussed in relation to those of Ursprung, Reinke, Brown and Escombe, Wurmser, and Warburg and Negelein. The possible significance of the yellow pigments is discussed, and the efficiency of photosynthesis is considered from the point of view of photochemical theory.—*R. Emerson.*

6495. **CHOUCHAK, D. L'assimilation chlorophyllienne de l'acide carbonique par les feuilles vertes dans un champ électrique.** *Rev. Gén. Bot.* 41(488): 465-468. 1929.—The amount of CO_2 existing in the air before and after passing through a tube containing leaves of *Casuarina equisetifolia* was measured. The leaves, divided into 2 lots united by a Pt wire, are placed in a U-shaped tube which can be set in an electrical field of 1500 volts/cm. One lot takes a positive load, the other a negative one. The experiments show that the electrical field has no action in the darkness, but that, in the light, the leaves with positive load absorb a greater amount of CO_2 than those with a negative load. The action is reversible by inverting the direction of the field. The explanation must be sought in the number and properties of ions in the air, and the electrical state of the substances of the leaves.—*M. Homès.*

6497. **GORDON, ROBERT B. Suggested equations for the photosynthetic reaction.** *Ohio Jour. Sci.* 29(3): 131-132. 1929.—Many investigators in this field agree that the photosynthetic process is composed of 2 reactions, one a chemical reaction with a temp. coefficient of about 2, and the other a photo-chemical reaction with a low temp. coeff. The 2 following equations are suggested as

a better representation of the probable behavior of chlorophyll in the process of photosynthesis:

(1) $6C_{55}H_{70}O_6N_4Mg + 6H_2O \rightarrow 6C_{55}H_{72}O_5N_4Mg + 6O_2$
(Chlorophyll "b" + water → Chlorophyll "a" + oxygen);

(2) $6C_{55}H_{72}O_5N_4Mg + 6CO_2 \rightarrow 6C_{55}H_{70}O_6N_4Mg + C_6H_{12}O_6$
(Chlorophyll "a" + carbon dioxide → Chlorophyll "b" + glucose).
—*Author's summary.*

6498. **GORSKI, FRANCIZEK. Recherches sur les méthodes de mesure de photosynthèse chez les plantes aquatiques submergées.** *Acta Soc. Bot. Poloniae* 6(1): 1-29. 4 fig. 1929.—The bubbles of gas set free in the course of photosynthesis by *Elodea canadensis* and *Potamogeton lucens*, and analyzed by means of a micropipette of special construction, consist of a mixture of O (21-50%), N (50-80%), and CO_2 (2%). The % of O increases with the intensity of light, and the curve of increase may be represented approximately by an equilateral hyperbola. The quantity of O contained in the bubbles is only approximately proportional to the rate at which bubbles are produced, being relatively greater for greater intensities of photosynthesis. Since gas analysis would take no account of the O absorbed by the water, whereas the curve of the total volume of gas set free parallels closely that of the total O produced, it is urged that methods based on the number or volume of bubbles give more exact results than those based on chemical analyses of bubbles.—*F. Gorski* (*transl. by H. S. Wolfe*).

6499. **GUTTENBERG, HERMANN von. F. A. Preisings Untersuchungen über den Kohlenhydratstoffwechsel immergrüner Blätter im Laufe eines Jahres.** *Zeitschr. Wiss. Biol. Abt. E. Planta* 6(5): 801-808. 4 fig. 1928.—It was attempted to follow the course of carbohydrate metabolism in native evergreen leaves (*Ilex aquifolium, Hedera helix,* and *Pinus cembra*) throughout the yr. in order to see whether leaves surviving the winter retained the same composition as in the previous summer. The exact quantitative methods caused much difficulty, but in spite of this the results indicated that old leaves, on the summer following, continued to metabolize carbohydrates, but in a way essentially different from that exhibited by the young leaves.—*O. F. Black.*

6500. **[HENKEL, P. A., and L. S. LITVINOV.] ГЕНКЕЛЬ, П. А., и Л. С. ЛИТВИНОВ. О сезонных изменениях фотосинтетической способности некоторых растений. [Seasonal variations in photosynthesis in certain plants.]** [German summary.] Известия Биологического Научно-Исследовательского Института и Биологической Станции при Пермском Государственном Университете. (*Bull. Inst. Rech. Biol. Univ. Perm.*) 7(3): 133-146. 1930.—Seasonal variations in the ability to photosynthesize were studied throughout the yr. in *Asarum europaeum,* an evergreen; in *Helianthus tuberosus,* an annual; and in *Fragaria vesca* (Victoria), intermediate in character. Photosynthesis was determined by Sachs' method under natural conditions and in the greenhouse. In the 3 sp. the intensity of assimilation in leaves decreased throughout the fall, finally reaching a minimum in which the loss of dry substance by respiration exceeded the gain by photosynthesis. The overwintering leaves (*Asarum* and *Fragaria*) were in a condition of anabiosis; no assimilation took place, and the loss by respiration, determined by comparison of the dry wt. per unit of surface in late fall with that in the spring, was not perceptible. On the approach of spring the leaves came out of anabiosis. In early spring the loss by respiration exceeded the gain by photosynthesis, but this condition was of short duration. The intensity of assimilation increased rapidly, reaching a maximum during the summer. The overwintered leaves of *Fragaria* and *Asarum* died in late spring and early summer, without having undergone any decrease in the intensity of assimilation. This annual periodicity in the photosynthesizing capacity of the plant is ascribed to (1) the effect of the annual succession of macro- and micrometeorologic factors on the assimilation process, and, more important, (2) the effect of these same factors on the photosynthetic apparatus, which brings about a persisting effect, or a complicated reaction of the organism, upon the change of external conditions.—*From authors' summary* (*transl.*).

6501. **LANZONI, F. Ricerche sulle screziature di Acer negundo L. b. variegatum Hort. I. [Variegation in A. n. variegatum.]** *Ateneo Parmense* 2(5): 481-487. 4 fig. 1930.—The specimen in question is a flourishing, very leafy tree derived by layering from a completely white offspring of a variegated tree. It has borne abundant but infertile fruit. It receives abundant sunlight, and the blanching is evenly distributed, as abundantly on the sunny as on the comparatively shaded sides. No full-grown leaf is entirely green; the green coloration rarely amounts to $\frac{3}{4}$ of the leaf surface, and sometimes is reduced to a mere discontinuous line following the leaf ribs perhaps half way, or even to a mere dot; but the tips of the twigs and the rudimentary leaves are green. The depth of coloring varies not so much from leaf to leaf as from one zone of the leaf to another. Histological examination showed that, while in leaves of ordinary specimens of *A. negundo* all 3 layers of palisade cells contain chloroplasts, in this variegated specimen the upper layer, even in the most deeply colored portion, contained none; in the paler portions 2 palisade layers were without chloroplasts; in the completely blanched zone there were no chloroplasts in any of the palisade cells; and these were reduced in volume. The flourishing condition of the tree compels acceptance of the blanching as a physiological, not a pathological condition. The peculiar distribution of chloroplasts may be an adaptation enabling the plant to make the most efficacious use of the light that reaches it.

6502. **MARCHLEWSKI, L., et A. SYZMANSKI. Studja w grupie chlorofilowej. [Studies in the chlorophyll group.]** *Bull. Internat. Acad. Polonaise Sci. et Lettr. Cl. Sci. Mat. et Nat. Ser. A. Sci. Mat.* 1929(2): 119-129. 1929.—A method is given for preparing Cu-neochlorophyll from neochlorophyllan, and for the transformation of Cu-neochlorophyll into Cu-neo-β-prophyllotaonine and Cu-neo-α-prophyllotaonine. By similar methods allocholorophyllan was converted into Cu-allochlorophyll, and the latter into Cu-allo-β-prophyllotaonine and copper-allo-α-prophyllotaonine. Studies were made of the absorption of ultra-violet and visible lights by phytol, Cu-neochlorophyll, Cu-allochlorophyll, the Cu-neo-prophyllotaonines, and the Cu-allo-prophyllotaonines. Phytol was found not to cause selective absorption of light, and is not transformed into another substance by distilling as was supposed by its discoverer. —*W. H. Eyster.*

6503. **MONTFORT, CAMILL. Fucus und die physiologische Licht-Einstellung der Wasserpflanzen. Studien zur vergleichenden Ökologie der Assimilation. 1.** *Jahrb. Wiss. Bot.* 71(1): 52-105. 10 fig. 1929.—The commonly accepted shade character of submerged plants does not hold as a general characteristic of marine algae. The photosynthetic activity of *Fucus vesiculosus* was studied near the surface, at 1.5 m., and at 3 m. deep. Curves of "assimilation-surplus" recorded in successive afternoon hrs. became rapidly steeper with decrease in incident light, but even with the same amount of light falling on the surface, the ratio of surface: 1.5 m.: 3 m. varied on different days according to the physiological condition of the photosynthetic cells. These depth curves offer evidence against the determination of the lower limit of the *F. vesiculosus* (and possibly also of the *F. serratus*) zone by a purely photosynthetic factor. Ratios were formulated between the daily performance of *Fucus* and that of other aquatics and of land plants. *Fucus* showed an adaptation to much higher light intensity than either a fresh water *Cladophora* from moderate shade, or the extreme shade form, *Trichomanes.* The light curves of photosynthetic surplus of *Fucus* were markedly different, not only from those of *Tri-*

chomanes, but also of land plants adapted to moderate shade. The maximum relative increase in photosynthesis with increase in light intensity (the efficiency of the plant) shows *Fucus* from sunny habitats to be related to the sun land plant, *Nasturtium,* rather than to any of the various grades of shade land plants. *Fucus* utilized 50% of each unit of light increase; *Nasturtium* 68%. The most efficient shade plant, *Oxalis,* utilized only 24%. *Fucus* from sunny habitats should be classified as an ecological equivalent of a sun plant. If a shade *Cladophora,* with its light curve similar to that of *Trichomanes,* be considered as the "norm" of light adaptation for shade aquatics, the opposite condition of a sun-adapted *Fucus* shows that just as heterogeneous ecological types of light adjustment have been developed in water as on land.—*L. M. Snow.*

6504. **NOACK, KURT. Der Zustand des Chlorophylls in der lebenden Pflanze.** *Biochem. Zeitschr.* 182(1/3): 135-152. 1927.—True solutions of chlorophyll in organic solvents show strong red fluorescence while colloidal aqueous solutions are non-fluorescent. Tending to harmonize the view that in the living leaf chlorophyll exists mostly in the adsorbed state and the fact that red fluorescence occurs in the normal chloroplast, is the fact that pure chlorophyll in solution is adsorbed by $Al(OH)_3$ and other solid substances, including lipoid-free globin, and the preparations show red fluorescence in ultra-violet light. By fractional centrifuging the product of grinding plants of *Selaginella* or fresh leaves of spinach, *Aspidistra,* and grass with $CaCO_3$ and water, a dark green mass composed chiefly of crushed chloroplasts can be isolated. This mass forms colloidal solutions in water which show red fluorescence. Heating to 70-100° for 1-5 sec. destroys the fluorescence but longer heating restores it. The fresh solution yields with salts of heavy metals and $(NH_4)_2SO_4$ a dark green mass which quickly loses its fluorescence when heated. Assuming the chlorophyll is weakly combined with a labile protein, heating might modify this protein so as to cause the chlorophyll to pass into the colloidal stage and lose its fluorescence. Further heating would cause the liquefied lipoid to partially dissolve the chlorophyll, thus restoring its fluorescence. Treatment of the solution with proteolytic enzymes also destroys the fluorescence. In the living leaf the chlorophyll is best considered as consisting of an adsorbed monomolecular layer on the protein of the chloroplast.—*W. W. Garner.*

6505. [RÎAZANTSEV, A. V.] РЯЗАНЦЕВ, А. В. К вопросу о сезонных изменениях ассимиляционного аппарата у некоторых вечно-зеленых растений. [Seasonal changes in the assimilation apparatus of evergreens.] [German summary.] Известия Биологического Научно-Исследовательского Института и Биологической Станции при Пермском Государственном Университете (*Bull. Inst. Rech. Biol. et Sta. Biol. Univ. Perm*) 7(3): 105-132. 3 pl. 1930.—Specimens of *Pinus silvestris, Picea excelsa, Abies sibirica, Juniperus communis, Andromeda polifolia, Cassandra calyculata, Ledum palustre, Oxycoccus palustris,* and *Vaccinium vitis idaea* were collected 1925-1927 in Perm. The material when removed from the plant was immediately placed in the fixing fluid, a solution of 95% ethyl alcohol and 1% formalin. To this was added a solution of 1 part of a 10% formalin and one part of 3% K-dichromate. The material remained in the fixing fluid for 4-7 days, and the washing lasted 12-24 hrs. Results showed that the cold season produced small marked disintegrations in the chloroplasts. Nor are the disintegrations very marked even during the spring, when the chloroplasts are assuming assimilatory functions. The beginning of cold weather brings forth a rearrangement of the chloroplasts in all the observed sp. With the beginning of spring, a reversed rearrangement of the chloroplasts occurs, which lasts through the summer. The time for the various rearrangements is not definite but depends on the temp. Variations in seasonal temp. also produce variations in size of plastids.—*L. J. Pessin.*

6506. **WALTER, HEINRICH. Plasmaquellung und Assimilation.** *Protoplasma* 6(1): 113-156. 11 fig. 1929.—The extraction of water by means of osmotically active substances (cane sugar) produced a marked reduction in assimilation in *Elodea canadensis.* Assimilation was reduced in proportion to the amount of water withdrawn from the protoplasm and fell to zero at a suction pressure of the protoplasm of 12.75 atm.=0.5 gm.-mol. cane-sugar. Respiration was not greatly influenced.—*W. Seifriz.*

6507. **WOOD, J. G. The relation between water content and amount of photosynthesis.** *Australian Jour. Exp. Biol. & Med. Sci.* 6(2): 127-131. 1 fig. 1929.—No direct correlation exists between water content and amount of assimilation in leaves, as stated by Dastur (1925). Fluctuations in water content of about 10% around the normal fresh wt. of the leaf cause no changes in the amount of assimilation; though with further water-loss by evaporation or by injection of the leaf with water the rate of assimilation decreases.—*J. G. Wood.*

BIOCHEMISTRY, METABOLISM (GENERAL)

6508. **ADAM, W. B., F. HARDY, and M. NIERENSTEIN. The catechin of the cacao bean.** *Jour. Amer. Chem. Soc.* 53(2): 727-728. 1931.—The catechin of the cacao bean is identical with one of the 3 catechins present in the heartwood of the cutch-producing acacias, namely, l-acacatechin.—*Authors' summary.*

6509. **ARNEMAN, WILLIAM GERHARD, and JOHN CAMPBELL EARL. The celluloses of some Australian plants.** *Jour. & Proc. Roy. Soc. N. S. Wales* 63: 44-46. 1929(1930).—The hypothesis that celluloses of all plants are chemically identical has been called in question by the isolation from *Posidonia* fiber of a cellulose whose triacetate, dissolved in chloroform, has [a] $D = -39.8°$ (the value for cellulose triacetate from cotton is $-22.3°$). Therefore, an examination of celluloses from various plants was undertaken to yield more data on their possible identity. Celluloses were isolated by Cross and Bevan's chlorination method. Acetylation was by Barnett's (1921) method. Values of [a] *D* of acetate [presumably in chloroform; not stated definitely] are: cellulose from *Posidonia* fiber, $-39.9°$; from *Posidonia* leaves, $-39.9°$; from *Cymodocea* sp., $-22.0°$; from *Potamogeton* sp., optically inactive (only 1 sample investigated); from undetermined water plants, possibly *Zostera* sp., $-22.2°$; from wood of *Doryphora sassafras,* $-22.6°$; from wood of *Araucaria cunninghamii,* $-22.6°$; from *Atriplex vesicarium,* a saline plant, $-20.1°$. The assumed identity of celluloses from various plants must then be regarded as doubtful.

6510. **BISH, ERNEST JOHN BROOK. The determination of small quantities of starch in vegetable tissue.** *Biochem. Jour.* 23(1): 31-34. 1 fig. 1929.—In work on the reserve foods of the bracken fern, a more accurate method of estimating starch in small quantities was required than those which involve comparison of determinations of the sugar mixture, obtained after hydrolysis, by reduction of Cu salts, and by the polarimeter, as the quantities were too small for use of the polarimeter. A method was therefore devised by which the Cu-reducing power of the hydrolysed starch was related to the reducing power of known quantities of a carefully purified starch preparation. Such a method does not give absolute values as the reducing power of starches of different origins is not the same. It does, however, give values comparable with each other for any 1 material and this is sufficient for many purposes, such as the comparison of the amounts of starch present at different stages of development.

6511. **BUTKEWITSCH, WL. S., und M.W. FEDEROFF. Über die Umwandlung der Essigsäure durch Mucor stolonifer in Bernstein- und Fumarsäure und das Verfahren zur Trennung und quantitativen Bestimmung dieser Säuren.** *Biochem. Zeitschr.* 207(4/6): 302-318. 1 fig. 1929.—Fumaric acid is not produced in any quantity when *M. stolonifer* acts on succinic, malic, lactic, or tartaric acids in presence of $CaCO_3$, but it is produced

in considerable amount when glycerol is used under similar conditions. In the presence of $CaCO_3$ acetic acid is converted to the extent of 15-30% into fumaric and succinic acids. Here the succinic acid constitutes 80-90% of the total ether-soluble acids produced, whereas when sugar is used it constitutes only 10% of the mixture. When sugar is added to the acetic acid, the balance of acids formed is shifted in favor of fumaric acid. The chemical interpretation of these facts is discussed and the separation of fumaric and succinic acids by means of permanganate is described.—*O. Owen.*

6512. CHRZASZCZ, T., und D. TIUKOW. Oxalsäure in Schimmelpilzkulturen. *Biochem. Zeitschr.* 218(1/3): 73-85. 1930.—Oxalic acid of the substrate was increased when amino-acids were added to the culture medium of *Penicillium* X. Oxalic acid was increased at the cost of the sugars present and depended on the structure of the amino-acids. The smaller the number of C groups the amino-acid had, the smaller amounts were necessary to increase the oxalic acid of the medium. Oxalic acid was a source of energy and also a product of protein degeneration. Amino-acids added to the culture medium also increased the citric acid concentration of the nutrient medium. A small amount of citric acid was formed on protein breakdown.—*N. M. Payne.*

6513. DOYLE, JOSEPH, and PHYLLIS CLINCH. Further notes on the metabolism of conifer leaves. *Proc. Roy. Irish Acad. Sect. B.* 38(7): 116-127. 1928.—The main groups of Coniferales are each distinguished by a characteristic pH. No obvious relationship could be established between the winter variation in water soluble pentosan and the pH. Peroxidase is the only oxidizing enzyme demonstrable in the leaves. This may be marked by the presence of an inhibitor removable by alcohol. The inhibitor, apparently, fades on standing, at any rate in water suspensions of fresh leaves. Autoxidizable substances can readily be demonstrated in the leaves, although normally their oxidization is prevented by the presence of tannins.—*E. L. Evinger.*

6514. FINK, HERMANN. Über die Koproporphyrie der Hefe. *Biochem. Zeitschr.* 211(1/3): 65-130. 1 fig. 1929.—Two yeast stocks of *S. anamensis* were grown for over a year with an excess of Cu porphyrin (Cu salt of porphyrin "e"). During this process the greater part of the yeast at the end of every fermentation was removed for further study, while the rest was used to continue the stock. By employment of a single pure culture apparatus the yeast was carried through 30 generations entirely free from contamination. In spite of the plentiful supply of Cu porphyrin the cultures did not die out. The number of red fluorescent Cu cells was determined at each 2 transfers in a spectro-microscope. The same agrees more or less well with the number of dead methylene blue positive cells. The high glycogen content was correlated with a low protein content. The respiration and fermentation were estimated at regular intervals. The quotient maintained by the Cu yeasts was lower than for ordinary *S. anamensis*. The respiration was generally less affected than the fermentation. Along with the great porphyrin intake the appearance and disappearance of the intensely red chromogen is to be noticed. Light seems to play a rôle in this; the greater part is colorless at first, and color compounds form when the yeast comes in contact with air. Even in the oldest cultures the color spectrum of the cytoplasm could be recognized. The isoelectric point of Cu porphyrin, as estimated by various methods, lies around pH=4. These physico-chemical results were the starting point for the solution of important questions on the Cu culture of yeast. While previous workers contended that the porphyrin was exclusively within the cell, it was noted that 70-80% of the total is loosely bound to the yeast. Upon the death of the cells, the complex is broken down in a neutral or weakly alkaline reaction, and the red-fluorescent Cu cells vanish. Solution occurring most easily at about pH 7, it is evident that the transfer into new media causes the disappearance of the color. The dissolved porphyrin combines itself with that of the dead cells, and from these is adsorbed on the surface of the living cells. The remaining 20-30% of the color compound is within the living yeast cells and cannot be extracted without killing them. Conversely, the adsorption of Cu porphyrin by the yeast was determined under physiological conditions. When a porphyrin containing yeast suspension was adjusted to pH 4, the cells which were dead or weakened by autolysis quantitatively removed the porphyrin from very dilute solutions and formed beautiful red fluorescent bodies. The live yeast takes up the porphyrin in small amount, yet shows the red fluorescence. While Cu porphyrin is able to enter into the dead cells, it is only adsorbed on the surface of the living cells. Thus it is established how, under the Cu culture, the loose combination of the porphyrin with the yeast comes about, together with the further appearance of the red fluorescent Cu cells at the end of the fermentation when the cells are mostly dead. Upon transfer the dissolved porphyrin is again adsorbed on the yeast. In the light of the physico-chemical principles, the mysterious appearance and disappearance of red fluorescent Cu cells appears as an equilibrium between absorption and adsorption. The question yet remains, where and how the increased porphyrin occurs, further the manner by which the Cu porphyrin is generated in the first "generation."—*H. Fink (transl. by O. E. Street and T. R. Swanback).*

6515. FIRKET, J., et COMHAIRE. Recherches expérimentales sur la teneur en glutathion des pois au début de la germination. *Bull. Acad. Roy. Med. Belgique* 9(3): 93-122. 5 fig. 1929.—Glutathione, or at least substances with SH, appears in peas from the time of swelling. This glutathione comes entirely from the reserve of peas; it precedes and actually conditions the development of the embryo. The large content of the reserve and of the embryo is maintained, so that the growth is regular during the first few days. There is no parallelism between the intensity of growth and the relative content of glutathione, which is not localized in the places of most intense cellular multiplication. It disappears from the plant as chlorophyll development proceeds. In seedlings that develop in darkness, which they sometimes do quicker than in the light, the content of glutathione remains high. Whether the disappearance of glutathione conditions the etiolation of plants in darkness or during the period which precedes the chlorophyll assimilation is not stated, but glutathione plays an energetic rôle when this function is initiated. If glutathione disappears when the plant becomes green, it is because the chlorophyll, in oxidizing it, removes it. Its rôle in the first stage of germination does not appear to be less important.—*From authors' conclusions (transl. by W. A. Whitney).*

6516. GAFFRON, HANS. Methoden zur Untersuchung der Kohlensäureassimilation. In: Handbuch der biol. Arbeitsmeth. Abt. XI. Chemische, physikalische und physikalisch-chemische Methoden zur Untersuchung des Bodens und der Pflanze. Teil 4, Heft 1, Lief. 300. p. 100-160. 28 fig. Urban & Schwarzenberg: Berlin, 1929. —A description is given of the manometric methods developed by Warburg and Negelein for studying photosynthesis, respiration, fermentation, nitrate assimilation, and other processes involving the formation or exchange of gaseous products. The principles are discussed on which the methods are based, as well as the derivation of the mathematical formulae, and the apparatus is described in detail. This includes the manometers, thermostats, light sources, light filters, and means of measuring light intensity. The applications of these in Warburg and Negelein's investigations with *Chlorella* are given together with extracts from their results.—*H. A. Spoehr.*

6518. HIBBERT, HAROLD, and JOHN BERNARD PHILLIPS. The nature of the resins in jack pine (Pinus banksiana). *Canadian Jour. Res.* 4(1): 1-34.

1931.—Green and seasoned jack pine had an average crude resin content of 4.58% and an ether-soluble of 3.52%. The value of "total acids" present in the resin was the same in each case, but the proportion of "fatty" acids was greater in green wood, while the unsaponifiable matter was considerably less. The seasoned wood contained a lower % of fats than the green wood and a correspondingly higher % of resin acids. The amount of unsaponifiable, polymerized terpenic substances was also higher. There was a marked decrease in the amounts of phytosterol and "resene" in the seasoned wood. The isolated resin acids obtained by distillation, or esterification, contained a high % of abietic acid formed by transformation of the original acids. A higher % of crystalline acids was found in the resin acids from green wood than from seasoned, due presumably to change into amorphous products during storage. The fatty constituents were chiefly members of the unsaturated series, present both as free acids, glycerides, or other esters. The amount of the total unsaturated fatty acids was higher in the glycerides and free acids from green wood than from seasoned wood. The quantities of essential oil obtained from the resins of each kind of wood were very small, amounting to 1.5-4.3% of the total crude resins. The % of phytosterol and resene were extremely small, and were appreciably less in the seasoned than in the green wood.—*From authors' summary.*

6519. [IGAKI, SHIGEFUKU.] [Quantitative changes of the constituents of each part of the tobacco [plant] during growth.] [In Japanese, with English summary.] *Bulteno Sci. Fakult. Terkult., Kjuŝu Imp. Univ., Fukuoka, Japan* 3(4): 317-326. 1929.—This investigation is a comparative study of changes of composition of leaves, stalks, roots, and flowers in the different stages of growth of tobacco. Samples for examination were cropped 4 times, once a mo., from transplantation to ripening. The samples for analysis were prepared by rapidly drying with a current of air, after heating for 20 min. at 100° C. in a water bath in order to destroy the enzyme. The constituents determined in each sample were total N, nicotine, protein N, nitrate N, ammonia N, organic base N, crude ash, crude fibre, crude fat, and soluble N-free extractive matter. In all parts of the leaves, stalks, and roots, the water content decreased continuously in proportion to the growth. The leaves and stalks contained more water than the roots. The highest nicotine content was obtained in the leaves. In the other parts, there was found a small quantity of nicotine and the difference in each stage of growth was also small. In leaves, the % of nicotine in fresh material increased continuously until the end of growth, but in dry material it reached a maximum about 90 days after transplantation and then decreased slightly, owing to the rapid increase of the % of solid matter. In comparisons made with fresh material, the % of total N was almost constant in the leaves, but decreased continuously in the other parts. In comparisons made with dry material, the % decreased in all parts. There was generally little variation in the % of protein N in the fresh material. The leaves contained more protein than the other parts. The % of organic base N generally increased in the fresh material. There was little variation in the % of crude ash. The % of crude fat generally increased in proportion to growth, especially in the leaves. The % of crude fibre increased in proportion to growth. The roots contained the most, and the leaves the least. The % of soluble N-free extract generally increased in the fresh material.—*Author's summary.*

6520. **ISEKI, TAKO. Die Spaltung der β-oxybuttersäure durch Oidium Lactis. Über die Konfiguration der optisch aktiven β-oxybuttersäure.** [Japanese.] *Osaka Igaku Kwai Zasshi* 26: 2745-2760. 1927.—Certain microorganisms decompose fatty acids (or cyclic compounds with a fatty acid side chain) so that they oxidise a newly formed, terminal hydrocarbon group into a carboxyl group, while CO_2 is given off. Chikano and Kitano proved that *Oidium lactis* probably does this. Therefore it is possible that this mould forms lactic acid out of β-oxybutyric acid by decarboxylization and oxidation. This was proved right by the writer, who also showed that the used dl-oxy-butyric acid was attacked asymmetrically. In the nutrient medium appeared l-β-oxybutyric acid in addition to the lactic acid which was the d-form. Therefore, d-β-oxybutyric acid and d-lactic acid probably have the same configuration.—*Author (courtesy Japanese Jour. Med. Sci. IV. Transl. by M. C. Brandwijk).*

6521. **JACOBS, WALTER A., and EDWIN L. GUSTUS. The digitalis glucosides. III. Gitoxigenin and isogitoxigenin.** *Jour Biol. Chem.* 82(2): 403-409. 1929.—In a previous article the probable close relationship of gitoxigenin to digitoxigenin was pointed out. A further study of these glucosides and some of their derivatives enables one to state definitely that gitoxigenin, like digitoxigenin, is a tetracyclic lactone in which a C atom, presumably γ to the lactone γ C atom, carries a tertiary OH group. —*O. F. Black.*

6522. **KIM, CHANG SEI. Some chemical and biological studies of the mung bean, Phaseolus aureus Roxburgh.** *China Med. Jour.* 42(5): 337-349. 1928.—Germination of the mung bean results in a loss of approximately ¼ its original mass, owing to the utilization of carbohydrates and fats by the growing seedling. The germinated product possesses higher content of vitamins B and C, a higher content of roughage, and more pronounced characteristics of greens.—*From author's conclusions.*

Vergleichende Bestimmungen des Kohlenhydrat- und Eiweissgehaltes. (R. KÔKETSU, H. KOSAKA, TOSHIO SATO, und TERU FUJITA.)** [In Japanese, with German summaries.] *Bulteno Sci. Fakultato Terkult. Kjuŝu Imp. Univ. Fukuoka, Japan* 2(3): 200-208; (4): 273-286. 1927; 3(1): 36-48; (2): 154-181. 1928; (3): 232-243. 1929.—I. Comparative determinations are given of the water content of the leaves of 30 plants growing under widely diverse conditions. The data are expressed as % of total and of dry wt. and as amount of tissue powder per unit of volume; the object being to determine which of these methods is the most useful for expressing ecological and comparative physiological effects. It is concluded that the powder method is best and that data expressed on the basis of total wt. is the least useful. II. The relative wt. of dry substance and the relative value of ash content of the seed of various cereals, as determined by the usual methods and by the powder method, do not give good agreement. Each of the ordinary methods of determination has certain sources of error which seem to be lacking in the powder method. The dry wt. per cc. of powder of various seed or tissues is a specific property of dry substance, and is designated as the "specific powder wt." Obviously this is not the same as true specific gravity of the powder, but is of greater significance. III. The dry wt. per cc. of tissue powder (the specific powder wt.) of hulled seed of various lines of rice was determined by the powder method in order to give numerical comparison of the differences between these lines. The specific powder wt. of ripening grain increased as ripening proceeded; seed from plants grown on well fertilized soil had a smaller specific powder wt. than seed from plants on soil which was unfertilized or fertilized

with an incomplete fertilizer. Material of one and the same line grown in different regions, shows different values for the powder wt.; the same is true of seed of various lines grown in the same area; in the latter case seed native to the region on which it was grown had generally the higher value. It is concluded that seed with a high specific powder wt. is well ripened; and that seed shown with high powder wt. is well adapted for the locality in which it is grown. The question of whether the quality of the seed is better when the powder wt. is higher remains as yet unanswered. IV. The ash content of the plant body, and more particularly of the leaves, was determined under different external conditions, and the data expressed as % of dry wt. and of fresh wt. and also in content per unit of volume of tissue powder in order to establish which data were most suitable for the purpose. For comparison, data obtained by these 3 methods were reduced to a definite standard material. Since the material used showed discrepancies, for the most part in the relation of the relative wt. to both the dry matter and the fresh wt., it follows that a certain error is concerned both in the use of dry wt. and of fresh wt. methods. It is concluded that the powder method is a method well adapted to comparative determination of ash content in physiological and ecological studies, and that this method could be used with advantage in studies of whatever purpose dealing with the significance of the ash content in plant life. Finally it is proposed that there be adopted a universal standard value for the content of a given substance in order to make possible a physiologically and ecologically useful general comparison of results of different studies. In this investigation an average value of 7.102 gm. of ash per 100 cc. of tissue fiber was found in the leaves of the 105 plant sp. investigated, these sp. being widely different from each other ecologically. The value 7.00 gm. per 100 cc. of tissue fiber is suggested as an example of a standard value, in the sense indicated above, for the ash content of leaves. V. The sugar, starch and protein of the plant body were determined from the diverse conditions. Data were expressed in % of fresh and dry wt. and also as amount per unit of volume of tissue powder, and also occasionally as amount per unit of surface of material. For purpose of comparison the data from each comparative study were reduced to a definite standard. The results obtained, considering the diversity of method employed, were as different as expected. However, in the case of the results obtained by the fresh wt. and dry wt. methods corrected by the use of the formula indicated in the preceding article, the results corresponded well with those obtained by the powder volume method, in all the materials investigated—an indication that the use of the powder method in these cases, and in all probability in all similar cases, is highly advantageous.—*Authors' summaries (transl.)*.

6524. KÔKETSU, RIICHIRO. Eine Auto-maschine zur Messung der Pulvervolumen. [Japanese, with German summary.] *Bulteno Sci. Fakult. Terkult. Kjušu Imp. Univ.* [*Fukuoka, Japan*] 4(2): 134-140. 2 fig. 1930.—An electrically driven shaking machine is described in which the powder is shaken compactly into graduated cylinders 1 cm. in diam. Error in measurement of plant powders is within 1%.

6525. KROEBER, LUDWIG. Ein Beitrag zur Kenntnis der Verteilung der Saponine in der Pflanze während verschiedener Reifestadien. *Heil- u. Gewürz-Pflanzen* 12 (4): 131-137. 1930.—Although not especially outstanding, it appears that the hemolytic titer of plants is influenced by the quality of the soils in which they grow; plants from Brandenburg sand, medium rich Munich garden soil, and rich garden soil from Hameln on the Weser exhibited low, medium, and high values respectively. Complete agreement in saponin values was obtained for 3 consecutive yrs. with plants from the Munich soil. Saponin in leaves increased with development of the plant and reached its high point in late autumn. The saponin content of unopened flowers was significantly higher than from opened ones. Saponin in seed is less than in flowers. Roots were practically saponin-free at every stage of development (Jan., May, July, Aug., Sept.). The low absolute and relative saponin content of stems decreased with development of the plants, finally almost completely disappearing. Hemolytic titers of stems (200-250), seed, flowers (3846-4762), and leaves (6000-7144) followed in ascending scale. Slow drying in air of *Saponaria* led to a considerable decrease in saponin content compared with artificial drying at 55° C. It is inadvisable from the similar conducts of *Saponaria* and *Solidago* under drying to draw the conclusion that all carriers of saponin act in a similar manner. The saponin content of *Solidago virga aurea* was about 50% less than that of *S. gigantea*.—*Author's summary (transl. by L. T. Leonard)*.

6526. KUBES, VL. Studie o koagulaci rostilinných bílkovin kapkovou metodou Bečkovou a o jejím použití ve fytoserologii. [**Coagulation of plant albumins by means of Bečka's drop method and its use in phytoserology.**] [German summary.] *Biol. Spisy Vysoké Školy Zvěrolékařské Brno* (*Publ. Biol. École Vét. Brno*) 7: (119-134). 1928.—The precipitation of albumins from water extracts of plants estimated according to form and extent of the precipitate depends, as in the case of animal albumin solutions, upon the quality and concentration of the albumin solution and the precipitating agent. It is not possible by this method to differentiate normal and immune sera (rabbit, *Triticum sativum, Lens esculenta*). The relatively low titer of the immune sera used does not permit the use of the drop method as a substitute for the precipitin reaction. By the Bečka drop method, a union of the antigen with the specific antiserum takes place under certain conditions at such concentrations of these reaction components at which the precipitation still fails to appear.—*Author's summary (transl. by C. I. Nelson)*.

6527. KURSCHNER, K., und A. HANAK. Zur Bestimmung der sog. Rohfaser. Ein neues Verfahren der Bestimmung der Rohcellulose in Kakao. *Zeitschr. Untersuch. Lebensmittel* 59(5): 484-494. 1930.—This reports on a rapid and practical method of determination of crude fiber of both fat-free and not fat-free cacao. The hydrolysis consists of boiling with a mixture of 10 parts by volume of 80% acetic acid and 1 part by volume of commercial HNO_3. This corresponds to a concentration of HNO_3 of approximately 7% by wt. Constant wt. of crude fiber is reached after boiling 15-20 min. The end product possesses the characteristic color of good crude fiber. Further experiments indicate the possible general usefulness of this reagent in crude fiber determinations of other substances (flours, feeding materials, potato pulp, etc.). It is also evident that this method, in a certain degree, is applicable to microdeterminations.—*From authors' summary (transl. by E. Carsner)*.

6528. LEEMANN, A. Chemical biogenesis and the development of secretion cells. *Nature* [*London*] 124 (3138): 946-947. 1929.—Studies of the development of secretory cells in *Asarum europaeum, Laurus nobilis,* and *Cinnamomum camphora,* show that terpenes originate in the cytoplasm, not by gelatinization of the cell wall as was held by Tschirch. The probable mechanism of the formation of terpenes in secretion cells is explained on the following hypothesis: "The protoplasm as a whole is transformed into terpenes (together with phosphatides and perhaps some minor constituents). Thus a destruction of protoplasm has to precede the synthesis of terpenes, and this disintegration certainly leads through the stage of amino-acids. The deamination of amino-acids by the deaminases is a well-known process, which generally leads to the production of an alcohol. If the deamination be incomplete it will result in an aldehyde. *l*-Leucine, one of the most abundant amino-acids, would in these circumstances yield isovaleraldehyde."

6529. LUY, P. Gasometrische Mikrobestimmungen von Wasserstoffsuperoxyd, Stickstoffverbindungen und Gärungskohlendioxyd. *Biochem. Zeitschr.* 201(1/3): 165-184. 5 fig. 1928.—The use of Paechtner's "Ponderovolu-

meter (P.V.M.)" to determine the volume of a gas freed from a compound is described. Tables are included giving the amounts of O_2 split off from H_2O_2 by K-permanganate; of N_2 set free from urea by bromine-NaOH; and of CO_2 produced in fermentation of glucose by yeast. The % error differs with each apparatus but in general was ± 1%.—*S. H. Eckerson.*

6530. **McNAIR, JAMES B. The differential analysis of starches.** *Field Mus. Nat. Hist. Bot. Ser.* 9(1): 3-44. 1930.—The extensive tables of the various histological, physical, and chemical characteristics of 350 starches as determined by Reichert are rearranged according to physical and chemical properties. The use of these tables and characteristics of previously undetermined starches makes it possible to identify readily the starches of different plant families, different members of the same family, and different varieties of one sp. These tests require a minimum of material and individually each test requires not more than about 1 hr. Details are given of the preparation of the starch specimen, the preparation of the reagents, and the method of analysis. —*J. B. McNair.*

6531. **McNAIR, JAMES B. A study of some characteristics of vegetable oils.** *Field Mus. Nat. Hist. Bot. Ser.* 9(2): 47-68. 1930.—There may be a relationship between the melting point of a fat or oil of a plant and the temp. of its environment. Such a relationship is known to exist in the case of oils of marine and land animals. Oils are found in 83 plant families out of 277 listed by Engler and Prantl. Some 318 oils from these families show 62 to be drying, 83 semi-drying, 71 non-drying, and 102 are fats. Oils found in seed coverings may have a higher m.p. than oils of seed kernels. Waxes are found more abundantly on tropical plants than on those of temperate climates. There is a close agreement between the oils of the different sp. of a genus. The physical and chemical properties of oils may be more or less definitely correlated with specificity. Tables of I nos., saponification nos. and specific gravity of over 300 oils are given. Tropical and subtropical plants are more likely to have fats and non-drying oils than semi-drying or drying oils; i.e., tropical and subtropical oils have higher m. p. than the oils of temperate climates. As to the possible relation between high m. p. oils and tropical origin a list of 40 families is given. Of this list 3 are mainly temperate in habitat.—*J. B. McNair.*

6532. **MUCH, H., mit T. NYRÉN und SCHUBERT. Fünf Beiträge zur Lipoidbiologie.** *Zentralbl. Bakt. I. Abt. (Orig.)* 116(1): 1-18. 11 fig. 1930.—This paper consists of notes and observations having some bearing on lipid relations, under the following headings: (1) The tea fungus; (2) Tuberculosis bacilli in living plants; (3) Lipid acids and bacteria; (4) Plant [*Digitalis*] studies; and (5) Explosions.

6533. **NIETHAMMER, ANNELIESE. Histochemische Untersuchungen über Gerbstoffe im Blatte von Carpinus betulus zu verschiedenen Zeitpunkten.** *Biochem. Zeitschr.* 216(4/6): 462-466. 1929.—On the 9th of May the upper epidermis was free from tannins. Palisade-cells and parenchyma in general had a great deal of tannin but some sections of palisade-cells were tannin free. After rain tannin was more generally distributed than on sunny days. On the 24th of June the upper epidermis of the leaf gave a negative test for tannin, the under epidermis a weak test. The parenchyma was strongly positive for tannin. In Sept. the palisade-cells were strongly positive for tannin, the upper epidermis was negative, and the under was weakly positive. Results in Oct. were similar to those in Sept.—*N. M. Payne.*

6534. **PHILLIPS, MAX. The chemistry of lignin. V. The distillation of alkali lignin with zinc dust in an atmosphere of hydrogen.** *Jour. Amer. Chem. Soc.* 53(2): 768-774. 1 fig. 1931.—The distillate [from corn cobs] consisted of an aqueous portion and an oil. The aqueous distillate contained methanol, acetone, and acetic acid to the extent of 1.48, 0.36, and 0.24%, respectively (calculated on basis of the wt. of lignin used). Catechol was present in the aqueous distillate. The yield of oil obtained amounted to 16% of the wt. of the lignin used; 55% of the oil was alkali-soluble, and in this fraction guaiacol was definitely identified. A phenol containing the methoxyl group and yielding a 3, 5-dinitrobenzoyl derivative melting at 110° was also obtained but was not further identified. The isolation of catechol and guaiacol as degradation products of lignin is believed to lend support to the hypothesis that lignin contains an aromatic nucleus. The evolution of CO_2 in the Zn dust distillation of lignin in an atmosphere of H indicates that, in all probability, the lignin molecule contains at least 1 C atom directly united to 2 O atoms. This may indicate the presence of either a carboxyl group, free or esterified, or a lactone group in the lignin molecule.—*Author's summary.*

6535. **RAISTRICK, H., et al. Studies in the biochemistry of micro-organisms.** *Phil. Trans. Roy. Soc. London B* 220: 1-367. 1931.—**I. W. RINTOUL. Introductory.** p. 1-10. Generalizations are given concerning the biochemistry of 238 spp. of fungi investigated. By means of carbon balances it is possible to classify different spp. in certain families of fungi, particularly so in the case of Aspergilli. The data obtained, in general, indicate a Cannizzaro reaction involving the production of a molecule each of mannitol and gluconic acid from 2 molecules of glucose as the initial step in the breakdown of this sugar by fungi. With certain spp. definite metabolic products are produced which are characteristic only for small sub-groups and the identification of these products is a valuable aid in classifying the organism. The marked ability of fungi to bring about synthetic reactions is pointed out.—**II. J. H. BIRKINSHAW. Quantitative methods and technique of investigation of the products of metabolism of micro-organisms.** p. 11-26. Methods used for the estimation of C by wet combustion and for the separation and analysis of the types of products formed are outlined. C of the product is divided into 3 general groups: (1) as gaseous compounds; (2) as insoluble solid compounds; (3) as compounds in solution. (1) is subdivided into C as volatile compounds soluble in H_2SO_4, C as CO_2, and C as permanent gases. (2) consists of mycelium. (3) is subdivided into C as residual glucose, as CO_2 in solution, as volatile and non-volatile acids, as volatile and non-volatile neutral compounds, and as C unaccounted for. From such data a carbon balance sheet may be prepared for each organism.—**III. J. H. BIRKINSHAW, J. H. V. CHARLES, and J. A. R. STOYLE. Quantitative examination by the carbon balance sheet method of the types of products formed from glucose by species of Aspergillus.** p. 27-54. 96 sp. of *Aspergillus* were each cultured at 23-25° C. on 250 cc. of Czapek-Dox medium containing 12.5 gm. glucose. Each culture was aerated by passing 500 cc. of sterile air over the mycelium for one hr. each day and the results obtained therefore apply to these organisms only when they are allowed to develop under a restricted air supply. The data are tabulated carbon balance sheets. The chief value of the results is that they enable a choice to be made of organisms to be further investigated and offer a means of biochemical classification which in the main agrees well with the system based on morphological data.—**IV. J. H. BIRKINSHAW, J. H. V. CHARLES, and A. C. HETHERINGTON. Quantitative examination by the carbon balance sheet method of the types of products formed from glucose by species of Penicillium (including Citromyces).** With an appendix by **C. THOM.** p. 55-92. 75 spp. of *Penicillium* and 81 of *Citromyces* were investigated and the data tabulated. The close agreement between the morphological and biochemical classifications found with Aspergilli is not so apparent with Penicillia, although in the majority of cases it is good. With several species a large part of the C remains unaccounted for, i.e., did not fall within any of the sub-groups given in II. A history of the spp. used and comments by Thom are given in the appendix.—**V. J. H. BIRKINSHAW, J. H. V. CHARLES, and J. A. R. STOYLE. Quantitative examination by the carbon balance sheet method of the types**

of products formed from glucose by species of Fusarium. p. 93-98. Twenty-three spp. of *Fusarium* were investigated. Despite a relatively poor growth, considerable quantities of glucose were metabolized. The main product of metabolism was ethanol and the suggestion is made that selected spp. of *Fusarium* might be of some value in its production from waste vegetable matter. Fusaria do not lend themselves to biochemical classification as readily as do the Aspergilli.—VI. **J. H. BIRKINSHAW, J. H. V. CHARLES, C. H. LILLY, and A. C. HETHERINGTON. Kojic acid (5-hydroxy-2-hydroxymethyl gamma pyrone).** p. 127-138. Kojic acid was isolated from the metabolic products of a number of Aspergilli of the *flavus-oryzae* group. One species of *Penicillium* was also found which produced this substance. A strain of *A. effusus* produced kojic acid from glycerol, xylose, arabinose, glucose, levulose, galactose, mannitol, sucrose, lactose and starch. An apparatus is described in which kojic acid was produced in quantity (500 gm.) with recovery yields, calculated on sugar, of 18.8% and 16.8% from sucrose and glucose respectively.—VIII. **J. H. BIRKINSHAW. The estimation of kojic acid.** p. 139-152. A method for the quantitative estimation of kojic acid involving oxidation with alkaline iodine solution is described. To the solution containing 7-14 mg. of kojic acid, 40 cc. of 0.1*N* iodine is added, followed by 50 cc. of 0.1*N* NaOH. The mixture is shaken and set aside for 90 minutes in a stoppered flask. 10 cc. of 2*N* H_2SO_4 is then added and the excess iodine is titrated with 0.1*N* $Na_2S_2O_3$. The difference between this figure and a blank determination with 40 cc. of 0.1*N* iodine solution gives the quantity of iodine absorbed and from this the quantity of kojic acid is calculated (1 cc. 0.1*N* iodine solution = 0.00142 gm. kojic acid). The reaction has been experimentally found to proceed as follows: $C_6H_6O_4 + 5I_2 + 11\ NaOH = CHI_3 + 7\ NaI + HCOONa + (COO)_2Na_2 + CH_2OHCOONa + 6\ H_2O$.—IX.—**J. H. BIRKINSHAW, J. H. V. CHARLES, and A. C. HETHERINGTON. On the production of mannitol from glucose by species of Aspergilli.** p. 153-171. The formation of mannitol from glucose by 3 unnamed spp. of white *Aspergillus*, a strain of *A. elegans* and 5 strains of *A. nidulans* was investigated. Restricted aeration of the cultures was essential for its formation in appreciable quantities. Large scale experiments were carried out in the apparatus described in VII with the recovery of 600 gm. of mannitol from 60 l. of 5% glucose solution. Replacement of the exhausted solutions with fresh glucose solutions gave good yields of mannitol in a shorter period than the first fermentation. Succinic and malic acids in small quantities as well as appreciable quantities of glycerol were also found.—X. **W. YOUNG. The estimation of mannitol in fermentation solutions.** p. 173-207. Two methods are described for the estimation of mannitol in the presence of glucose based on the optical rotation of mannitol in borax solution. In one method glucose is removed by fermentation to ethanol. The second method takes advantage of a new observation that glucose at a concentration of 0.9% in a 6% solution of $Na_2B_4O_7.10H_2O$ is optically inactive and at concentrations below 0.9% is actually levo-rotatory. Extensive tables are included.—XI. **A. C. HETHERINGTON. On citromycetin, a new yellow coloring matter produced from glucose by species of Citromyces.** p. 209-244. A new biochemical product designated as citromycetin ($C_{14}H_{10}O_7$) was isolated from culture solutions of various species of *Citromyces*. Glycerol proved to be a superior source of carbon. Citromycetin is almost insoluble in cold water, slightly soluble in hot water, fairly soluble in cold absolute ethanol, hot glacial acetic acid and somewhat soluble in acetone. It is readily soluble in aqueous Na_2CO_3 and $NaHCO_3$ with evolution of CO_2. It does not melt sharply, darkening at 263° C., becomes progressively darker and finally melts with decomposition at 283°-285° C. It is optically inactive, contains no N, reduces cold ammoniacal $AgNO_3$ and Benedict's solution on boiling, and contains no OCH_3 groups. It crystallizes from 50% aqueous ethanol as lemon yellow needles containing 2 molecules of H_2O of crystallization. A number of derivatives are described, the most characteristic of which is the polymorphic diacetyl compound which crystallizes from absolute ethanol as typical crystals melting with decomposition at 223-224° C., while it separates from its solution in aqueous potassium acetate on acidification with dilute HCl as needles melting with decomposition at 235-236° C. Decomposition products of citromycetin resulting from various methods of treatment were investigated in attempts to establish its constitution and a tentative structure is given.—XII. **J. H. BIRKINSHAW. A new methoxy-dihydroxy-toluquinone produced from glucose by species of Penicillium of the P. spinulosum series.** p. 245-254. A dimethoxy-dihydroxy-toluquinone, $C_9H_{10}O_4$, melting at 202-203.5° C., was isolated from well aerated glucose solutions on which *P. spinulosum* was cultured. After purification the crystals are dark colored, almost black, with a metallic luster. The diacetyl derivative melts at 139.5° C. The complete identity of the new product has as yet not been definitely established.—XIII. **M. L. RINTOUL. On a new type of mucilaginous material, luteic acid, produced from glucose by Penicillium luteum Zukal.** p. 255-267. *P. luteum* when cultured on glucose solution gives rise to a mucilaginous acid product which is designated luteic acid. It is an amorphous hygroscopic substance and in aqueous solution is strongly acid to litmus. (α)Hg green of Na salt = −47°. It does not contain a CHO group and is not hydrolyzed by diastase or invertase. 100 grams of luteic acid on acid hydrolysis yields 83 grams glucose and 23.4 grams malonic acid as the sole end products. Alkaline hydrolysis yields malonic acid and a complex polysaccharide, luteose. Luteic acid is probably a complex compound, each molecule of which is built up of a number of similar units. Each unit is a condensation product of 2 molecules of glucose with one molecule of malonic acid with the loss of 2 molecules of water. The compound is constituted so as to leave one carboxyl group of the malonic acid free while the CHO groups of the glucose are linked in a manner so as to destroy their aldehydic properties.—XIV. **A. C. HETHERINGTON. On the production and chemical constitution of a new yellow coloring matter, citrinin, produced from glucose by Penicillium citrinum Thom.** p. 269-295. A new metabolic product, citrinin ($C_{13}H_{14}O_5$), is produced by *P. citrinum* when cultured on modified Czapek-Dox glucose solution. Its production is apparently specific for this species. It is a yellow crystalline compound melting with decomposition at 166-170° C., soluble in chloroform, acetone and hot ethanol and slightly soluble in boiling water. It dissolves in aqueous Na_2CO_3 with evolution of CO_2. Levorotatory in alcoholic solution. Its phenyl hydrazide melts at 207° C. with decomposition. An extensive account is given of the investigation of various decomposition products of citrinin.—XV. **F. P. COYNE and R. ROBINSON. The molecular structure of citrinin.** p. 297-300. The results of the previous paper, together with some new observations, are discussed, from the standpoint of the probable constitution of citrinin. A structure is proposed which is in harmony with the known reactions of this compound.—XVI. **P. W. CLUTTERBUCK, and M. L. RINTOUL. On the production from glucose by Penicillium spiniculisporum Lehman of a new polybasic fatty acid, $C_{17}H_{28}O_6$ (the lactone of γ hydroxy-β-δ-dicarboxypentadecoic acid).** p. 301-330. *P. spiniculisporum*, when cultured on Czapek-Dox glucose solution, produced succinic acid and the lactone of γ-hydroxy-β-δ-dicarboxypentadecoic acid, the identity of which is definitely established. The new product melts at 145°-146° C. (α)Hg green (in absolute ethanol) = −2.44°. (α)Hg green of Na salt in H_2O = +14.98°. The acid is soluble in ethanol, acetone, ether and boiling H_2O but practically insoluble in cold H_2O.—XVII. **J. H. BIRKINSHAW. The products of glucose metabolism formed by various species of fungi (Helminthosporium, Clasterosporium, etc.)** p. 331-353. Czapek-Dox glucose solution was used. *Helminthosporium geniculatum* produced chiefly mannitol and ethanol, to-

gether with small quantities of glycerol and acetaldehyde. *Clasterosporium* spp. in addition to the foregoing substances, formed succinic and probably malic acids. *Aspergillus wentii* produced gluconic acid as the chief metabolic product, together with smaller quantities of glycerol and mannitol. *Fumago vagans* formed a new, strongly rotary $(\alpha)^{18}$ Hg yellow $= +217°$ polysaccharide, $(C_6H_{10}O_5)_n$, composed entirely of glucose units and readily soluble in hot H_2O. The main metabolic product of this organism was gluconic acid and in addition smaller quantities of glycerol and succinic acid were formed. *Penicillium chrysogenum* formed gluconic acid and mannitol as the chief metabolic products.—XVIII. **J. H. BIRKINSHAW, and J. H. V. CHARLES. Biochemical characteristics of species of Penicillium responsible for the rot of citrus fruits.** p. 355-362. *P. digitatum* Saccardo produces considerable quantities of ethyl acetate when cultured on glucose solutions. Ethanol is also formed. A strongly rotatory $(\alpha)^{20}$ Hg green $= +299°$ complex carbohydrate, which hydrolyzes to glucose and is insoluble in cold H_2O, is obtained by hot H_2O extraction of the mycelium. *P. italicum* produces a substance which gives characteristic color reactions with $FeCl_3$ and with bleaching powder and which are "characteristic of and diagnostic for *P. italicum* Wehmer."—*O. E. May.*

6536. **SANDE, J. G. van der. Préparation et étude de quelques produits de l'assimilation de Pleurococcus vulgaris.** *Rec. Trav. Chim. Pays-Bas* 49(4): 471-478. 1930.—The presence of "phycic acid" and erythrite-i in *P. vulgaris* is reported, together with an improved method of preparation of these 2 substances. The "phycic acid" was found to correspond to the formula $C_{27}H_{51}N(OH)_4$. The exact molecular wt. was not established. Its general physical and chemical properties indicate that "phycic acid" is neither an acid, a free base, an aldehyde, a ketone, an acid ketone, a primary or secondary amine, an acid amine, an anhydride, a lactone, a nitro, nitroso or isonitroso derivative, nor an ether compound of an alcohol or a phenol. Moreover, it is not a phytosterin, nor a derivative of urea or of anthracine. Neither pentose, other sugars, nor glycerine are decomposition products. Oxidation of the molecule did not reveal any additional evidence of structure. It is possible that the molecule contains an atom of N in ring formation (perhaps as a derivative of coniine), around which are grouped the C atoms combined with H and with four OH groups, forming a saturated compound.—*Author's summary (transl. by F. B. Wann).*

6537. **SCHNEIDER, ERICH. Beiträge zur Physiologie der Farbstoffe der Purpurbakterien. I. Die Reinkultur des Rhodobacillus palustris Molisch und die Gewinnung seiner Pigmente.** *Beitr. Biol. Pflanzen* 18(1): 81-115. 6 fig. 1930.—*R. palustris* was isolated from foul ditch water and grown in pure culture on glycerin-pepton-agar. It is a spore-forming organism 2-3μ long and 0.6-1.3μ wide, whose optimum temp. for growth is 32-36° C. Blue light is less effective for growth and pigment production than red or chlorophyl filtered light. The most favorable O tension for pigment production is 2% (air=20.8%). In complete absence of O the bacteria develop very little pigment. For mass pigment production, bacteria were grown in glycerin-pepton broth at 30-36° C. The air over the cultures was diluted with H. In 2-3 weeks 2.5-3.5 gm. of bacteria (fresh wt.) can be grown on 500 cc. of medium. The bacteria were filtered by suction through a layer of talcum and dried in vacuo at 40-50° C. The pigment is best extracted in a mortar with a boiling mixture of methyl and ethyl alcohols. Saturated $(NH_4)_2SO_4$ changes the absorption spectra of the pigment markedly. An apparatus is described for extraction of pigment in the absence of O. —*R. D. Coghill.*

6544. **WREDE, FRITZ, und OTTO HETTCHE. Über Thiocellobiose und Thiocellobioside.** *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 172(4/5): 169-178. 1927.—In order to produce a S-containing sugar of greater stability than the previously obtained glucose derivative, cellobiose was used, and from this a beautifully crystalline sulphuric derivative of pronounced stability was prepared. This was obtained in the form of cellobiose acetate, following the method of Freudenberg, from absorbent cotton; and acetobromcellobiose by the method of E. Fisher and Zemplen, with certain modifications. Other similar substances can be obtained, e.g., dicellobiosyldisulfid, hepta-acetylthiocellobiose, thiocellobiose, silversalts of thiocellobiose, methylthiocellobiosid-heptaacetate, methylthiocellobiose, athylthiocellobiosid-heptaacetate, and ethylthiocellobiosid. Emulsin acts on these bodies so that the cellobiose component is split without formation of glucose; thus, from the dicellobiosyldisulfid, diglucosylsulfid, and from the methylthiocellobiosid, methylthioglucosid were obtained. Both compounds can be characterized in the form of acetates.—*G. J. Peirce.*

BIOCHEMISTRY, METABOLISM (NITROGEN RELATIONS)

6545. **ANDREADIS, THALES. Über den Nitratgehalt des Tabaks und über eine Fehlerquelle der bisherigen**

Bestimmungsmethode. *Biochem. Zeitschr.* 204 (4/6) : 484-492. 1929.—According to the method criticized nitrate was extracted from pulverized tobacco by hot 40% alcohol, then reduced by $FeCl_2$ in HCl and the resulting NO gas measured. But the hot alcohol also extracts some pectic substance which is partially hydrolyzed by the reducing agent, freeing CO_2. Thus the volumeter contains both NO and CO_2, causing an error. If KOH be introduced into the volumeter tube, the gas volume after absorption will be a true measure of the NO gas.—*S. H. Eckerson.*

6546. **FAITELOWITZ, A. Zur Kenntnis des Nikotinabbaus im Tabak.** *Biochem. Zeitschr.* 224 (4/6) : 459-470. 1930.—A rapid orientation method is described for the estimation of nicotine in a tobacco liquor, which consists in dissolving the nicotine in an excess of mercuric KI reagent, giving a transparent liquor. In the absence of $CHCl_3$ an acid decoction of tobacco gradually loses its acidity and becomes alkaline after 48-72 hrs. This reaction does not occur in the presence of $CHCl_3$ (2%) and is favored by a large surface as well as the presence of the tobacco pulp. As the acidity becomes less there is also a loss in the nicotine content and an increase in the total N bases. Decomposition of the nicotine ceases as soon as the liquor becomes alkaline. If an alkaline decoction along with the tobacco from which it came is evaporated at ordinary room temp. until the tobacco is air-dry, there is a large loss of N bases, the latter being quite volatile. If more water is added to this air-dry nicotine-poor tobacco, the decomposition of nicotine begins again. The repetition of this procedure 2-3 times gives a tobacco that is free from nicotine. However, its content of N bases is so very low that it seems flat when judged by its smoking qualities. As the nicotine is decomposed the catalase activity of the tobacco increases, indicating bacterial action. Most kinds of tobacco bear bacteria which ferment sugar and starch to acids and those which decompose the protein of milk and thereby form ammonia. If 1% sugar (dextrose, lactose, sucrose, or starch) is added to a decoction of tobacco, there is an acid fermentation which develops CO_2. This does not take place in the presence of $CHCl_3$, and is checked by too large a surface although the liquor becomes alkaline. It may also be checked if the concentration of the liquor is too high (probably on account of the toxicity of the nicotine). The reaction which decomposes the nicotine proceeds along with the acid fermentation but ceases as soon as the acidity becomes too great. There is also an increase in the basic content, corresponding to the decomposition of nicotine. If the extract and the tobacco are evaporated to dryness, this tobacco shows an increase in total N bases which corresponds to the decrease in nicotine. These bases are not volatile in combined form. The resultant tobacco has an acid reaction and is rich and mild for smoking. A total decomposition of nicotine without loss of N is obtained (1) if only the tobacco extract is subjected to fermentation, and (2) if one part of the extract is given a large and the other part a small surface. It is then possible to neutralize with the acid liquor the basic reaction formed in the extract with the large surface, and to continue until the liquor has become entirely free from nicotine. This gives an almost nicotine-free tobacco with the same N content and an increased catalase content. The bases appear to have a great influence on the value of tobacco for smoking.—*Author's summary (transl. by C. J. Lyon).*

6547. **FINNEMORE, HORACE, and CHARLES BERTRAM COX. Cyanogenetic glucosides in Australian plants.** *Jour. & Proc. Roy. Soc. New South Wales* 62: 369-378. 1928 (1929).—The phyllodes of *Acacia glaucescens* and *A. cheelii* gave by extraction with ether the same cyanogenetic glucoside, identified as sambunigrin (*d.* mandelo-nitrile glucoside). Five samples of the former, collected at different seasons, yielded 0.12-0.42% of HCN, calculated on the air dried material. In view of the suspected toxicity of *Euphorbia drummondii* to stock, a systematic collection showed that of 113 specimens, from 35 districts, 11 contained an unknown cyanogenetic glucoside. The HCN obtained was 0.041-0.103%. *Goodia lotifolia* yielded 0.25% of HCN, equivalent to 0.57, calculated on the air dried leaves. Herbarium specimens contained none. *Poranthera microphylla* gave 0.051% HCN and *Eucalyptus corynocalyx* 0.179%, while *P. corymbosa* is only slightly cyanogenetic.—*H. Finnemore.*

6548. **[FUKAKI, SADAYOSHI.] [Über den Nährwert des Calciumnitrats und des Ammoniumsulfats als Stickstoffquelle zur Wasserkultur der Reispflanzen (Oryza sativa).]** [In Japanese with German summary.] *Bulteno Sci. Fakult. Terkult. Kjusu Imp. Univ. Fukuoka, Japan* 3 (3) : 244-262. 5 fig. 1929.—For the most part swamp rice, but occasionally mountain rice, was used in these tests, using modified Knop's solution and Hansteen-Cranner's solution in 1/20th dilution as culture media. The solutions were obtained from 3 different mixtures, the 1st having the N in the form of $(NH_4)_2SO_4$, the 2nd as $Ca(NO_3)_2$, and the 3rd with a mixture of these 2. or in the form of NH_4NO_3, comparable quantities being used throughout. The tests and experiments were carried out with particular reference to the reaction and concentration of the cultural media; the pH was determined frequently and buffer mixtures of H_3PO_4 and its salts were added to regulate the pH. In dilute solutions, well regulated as to pH, rice plants developed well through all of their vegetative stages, not only on $Ca(NO_3)_2$ or $(NH_4)_2SO_4$, but also on mixtures of these. In all stages of development $(NH_4)_2SO_4$ appeared better than KNO_3 for vegetative development; but for seed development, differences between these sources of N were difficult to observe; however, there seems to be a tendency for $Ca(NO_3)_2$ to be more favorable for maturing of seed.—*Author's summary (transl.).*

6549. **HOPKINS, FREDERICK GOWLAND (with a section by LESLIE J. HARRIS). On glutathione: a reinvestigation.** *Jour. Biol. Chem.* 84 (1) : 269-320. 1929.—A rapid and easy method is described for separating from yeast a pure crystalline substance with the characters of a tripeptide. It yields on hydrolysis glycine, glutamic acid, and cysteine and its % analysis corresponds exactly with the composition of a tripeptide containing these 3 amino acids. The yield from yeast is 1 gm. per kilo and upwards. The substance is present in red blood corpuscles. Acidimetric titration methods have been applied (by Harris) to the determination (1) of the NH_2 and COOH groups, and (2) of the minimal molecular wt. The values so found agree with those calculated for a tripeptide of the above constitution within the experimental error of 2% when the routine methods generally applicable to amino acids, polypeptides, etc., were used; or less (e.g., within 0.3%) when special refinements were adopted. The substance is unstable. On boiling with pure distilled water for instance it yields the diketopiperazine of cysteine and glycine, together with free glutamic acid; but also slowly undergoes a more deep-seated decomposition. The tripeptide constitutes a large proportion of the preparations of glutathione made by earlier methods. The description of that substance as a dipeptide was, therefore, erroneous.—*Author's summary.*

6550. **JANKE, ALEXANDER, und HANS HOLZER. Probleme des Stickstoffkreislaufs. II. Weitere Untersuchungen über das proteolytische Vermögen der Mikroben.** *Biochem. Zeitschr.* 226 (4/6) : 243-249. 1930.—The breakdown of casein by normal, multiplying cells was compared with that caused by equal numbers of chloroform-treated cells of *Bact. prodigiosum, Streptococcus lactis, Saccharomyces cerevisiae,* "Spiritushefe" Rasse XII, *Willia anomala, Kloeckera apiculata, Mycoderma vini, Aspergillus niger,* and a *Fusarium* sp. In agreement with previous findings, the casein breakdown by the so-called liquefiers was more vigorous with the normal cells than with the chloroform-treated cells; the non-liquefiers, however, exhibited a reverse behavior. Appar-

ently the proteolytic enzymes of the liquefiers occur as exoenzymes and those of the non-liquefiers as endoenzymes, so that the former are active at all times while the latter become active only after injury to the cell walls. The proteolytic activity reported in the literature for many organisms may well have been due to dead or degenerating cells. The coli test of Wollman for the detection of microbial proteolysis should be employed with caution.—*Authors' summary (transl. by B. Cohen).*

J. Lyon).*

6553. **KEENAN, GEORGE L., and J. D. WILDMAN.** Note on a previously unrecorded occurrence of crystalline globulin in banana seeds. *Jour. Biol. Chem.* 88(1): 425-426. 2 fig. 1930.

6554. **KENDALL, EDWARD C., BERNARD F. McKENZIE, and HAROLD L. MASON.** A study of glutathione. 1. Its preparation in crystalline form and its identification. *Jour. Biol. Chem.* 84(2): 657-674. 1929.—The formulae suggested in this paper are based on 3 facts: (1) succinic acid is obtained after H_2O_2 treatment only after hydrolysis; (2) glycine but no glutamic acid can be separated after treatment with HNO_2; (3) neither glutamic acid nor glycine can be separated after oxidation with H_2O_2. The fact last mentioned is negative in character; therefore, until more evidence positive in nature is obtained, the structure of the tripeptide must remain in doubt.—*From authors' summary.*

6555. **KLEIN, G.** Nitratsassimilation bei Schimmelpilzen. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 174 (5/6): 278-283. 1928.—A reply is made to objections of Kostytschev to an earlier work of Klein, Eigner, and Müller dealing with the same subject.

6556. **KLEIN, GUSTAV, KARL TAUBÖCK, und HANS LINSER.** Harnstoff und Ureide bei den höheren Pflanzen. I. Das Vorkommen von Harnstoff im Pflanzenreich und sein Wandel im Laufe der Vegetationsperiode. *Jahrb. Wiss. Bot.* 73(2/3): 193-225. 3 fig. 1930.—Minor improvements have been made in Tauböck's previously reported micro-method for the detection of urea and ureides in plants, whereby an acetic acid extract of plant tissue is treated with xanthydrol on a cover glass, with the formation of dixanthylcarbamide, whose small doubly refracting crystals can be microscopically identified. Within certain limits quantitative estimations may be approximated. The authors have identified urea or ureides in large numbers, in many varieties of seed-bearing plants. The quantities varied among the different families and sp., in the different organs of the plant, and with the growth stage. Urea was not found in ripe seed. Seedlings contained urea more frequently than older plants. Some seedlings show urea in all parts, some only in their roots. Herbaceous plants generally contain urea in their roots, but this is not true of the woody plants. Young leaves, petioles and leaf buds usually give positive tests. Distribution of urea between blossom and pedicel varies greatly among different plants. Urea is most likely to occur in the more actively growing parts of plants. This irregularity of the distribution of urea renders difficult the drawing of conclusions as to its origin and physiologic function.—*M. J. Blish.*

6557. **KLEIN, GUSTAV, und KARL TAUBÖCK.** Physiologie des Harnstoffs in der höheren Pflanze. II. *Österreich. Bot. Zeitschr.* 76(3): 195-221. 1927.—Urea has been found in a wide range of plants, particularly in the *Urticacae, Leguminosae,* and *Aceraceae;* also in cucurbits, grasses, and orchids. In dicotyledons urea, when present, is found in the petioles; in orchids in the roots. Latex from different plants, likewise all lichens, mosses, and ferns examined, contain no urea. The amount present in any group of plants is very variable. Of the blossoms examined, only those of *Laburnum anagyroides* gave positive results. There appears to be an inverse relation between urea and urease. In culture solutions ammonia from the decomposition of urea is liable to cause injury. Part of the urea is also liable to "exoenzymatic" decomposition. The possibility that arginine is the precursor of urea in plants is discussed.—*O. Owen.*

6558. **PIRSCHLE, KARL.** Nitrate und Ammonsalze als Stickstoffquellen für höhere Pflanzen bei konstanter Wasserstoffionenkonzentration. *Zeitschr. Wiss. Biol. Abt. E, Planta* 9: 84-104. 3 fig.; also in *Ber. Deutsch. Bot. Ges.* 47(Generalversammlungsheft): (88)-(92). 2 pl. 1929.—The physiological reactions of N salts (nitrate and ammonium) were investigated to determine their differences in nutritive physiological action. Water and sand cultures (constant renewal) with constant pH and different plants in strong acid and in alkali regions give poorer growth with ammonia-N than with nitrate-N. In a narrow range of pH (pH 5-7) the yields were equal. The physiological reactions of the nitrate (alkaline) and the ammonium salts (acid), although important, cannot be the only grounds for the nutritive physiological differences between these forms of N, or otherwise comparative cultures at equal and constant pH would give equal yields, which is not the case.—*K. Pirschle (transl. by J. B. Hester).*

6559. **SAUNDERS, FELIX.** Studies in proteins. II. Concerning the uniformity of the protein fraction extracted from orange seed meal by salt solutions. *Jour. Amer. Chem. Soc.* 53(2): 696-700. 1931.—The alkali halide salts in normal concentration all extract the same amount of N from orange seed meal; there is no evidence for the existence of a lyotropic series. The protein isolated from orange seed meal by extraction with different salts is probably the same in every case.—*Author's conclusions.*

6560. **SVEDBERG, THE, and TOMINOSUKE KATSURAI.** The molecular weights of phycocyan and of phycoerythrin from Porphyra tenera and of phycocyan from Aphanizomenon flos aquae. *Jour. Amer. Chem. Sci.* 51(12): 3573-3583. 1 fig. 1929.—The specific volume, light absorption and molecular wts. of phycoerythrin and phycocyan from *P. tenera* and of phycocyan from *A. flos-aquae* have been determined at different pH values. The specific volumes of these proteins are identical and independent of pH and, within the limits of error, also identical with the specific volumes of all other proteins studied except the hemocyanins. This fact is in line with the result of the molecular wt. determinations, according to which all the proteins in question are loosely built up of units of approximately the same mass. viz. 34,500. It is also probable that they have the same general constitution. The light absorption of the phycoerythrins from *Porphyra* and *Ceranium* are identical and the same is the case for the corresponding phycocyans. The light absorption of phycocyan from *Aphanizomenon* is different from that of the proteins of Rhodophyceae. Near the isoelectric points the molecular wts. of these 3 proteins are identical and approximately 208,000 ± 5000. With increasing pH decomposition of the moleclules takes place. The phycoerythrin is the most stable one. At pH 6.8 it is still undecomposed but at pH 11.0 it consists of a mixture of 75% 208,000 and 25% $\frac{1}{8} \times 208{,}000$. Phycocyan from *Porphyra* shows indications of decomposition at pH 6.8, but the bulk of it consists of $\frac{1}{2} \times 208{,}000$; at pH 11.0 it is decomposed into small units of varying size. Phycocyan from *Aphanizomenon* is decomposed into a mixture of 65% of 208,000 and 35% of 100,000 at pH 6.8 and is completely decomposed into the protein unit $\frac{1}{8} \times 208{,}000$ at pH 12.0.—*Authors' summary.*

BIOCHEMISTRY, METABOLISM (ENZYMES, FERMENTATION)

6561. **AMBROS, OTTO, und ANNA HARTENECK.** Über natürliche Aktivierung von Proteasen pflanzlicher Milchsäfte. *Hoppe-Seyler's Zeitschr. Physiol.* 181 (1/2/3) : 24-41. 2 fig. 1929.—Comparison of fresh papaya juice with commercial papain shows that the fresh juice varies in activity according to the degree of ripeness of the fruit. Similarly in the expressed juice of the pineapple, especially in the unripe fruit, the presence of an activator can be demonstrated which increases the effectiveness of the proteolytic enzyme to the same degree as that shown by commercial papain activated by HCN. On the other hand, the ripe fruits contain no activator, but the juice can be activated by HCN or by the juice of unripe fruits. The fully ripe papaya fruits yield no milky juice. Extracts from seed are fully activated. Therefore it appears that in the earlier stages of development of papaya fruits, the protease can hydrolyze higher and lower proteins, but with increasing ripeness confines its activity to the higher ones. The same relation between ripeness and condition of activation is shown in the pineapple; but due to the structure of the pineapple, it was impossible to distinguish between the activator and inactivated proteases. The name phytokinase is proposed for such natural activators of fruit proteases. Besides the simple system of proteases in the milky juices of plants there is another group of plant proteases, such as those in pumpkin and cucumber, the action of which is checked by HCN.—*G. J. Peirce.*

6562. **AMELUNG, H.** Säurebildung aus Raffinose mittels Aspergillus niger. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 187 (4/5) : 171-172. 1930.—*A. niger* split raffinose into melibiose and fructose. Melibiose was then not used as a C source, but fructose was further utilized and citric acid was formed from part of it.—*N. M. Payne.*

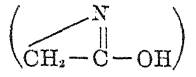
6563. **BARTON, ARTHUR WILLIS.** Studies in autolysis. I. Autolysis in seeds. *Trans. Kans. Acad. Sci.* 32: 34-36. 1929.—Under the ordinary conditions of experimentation the so-called autodigestive changes commonly known as autolysis, as far as seed are concerned, would seem to be brought about by microorganisms, since when complete sterilization of living seed was effected, no autolytic changes occurred.—*F. C. Gates.*

6564. **ENGLIS, D. T., and F. A. DYKINS.** The effect of ethylene upon the hydrolysis of salicin by emulsin. *Jour. Amer. Chem. Soc.* 53 (2) : 723-726. 1931.—The fact that ethylene hastens coloration of many fruits and vegetables gave rise to the belief that its effect might be associated with the activation of the enzyme responsible for the hydrolysis of many glucosides. A study was made of its influence upon the rate of hydrolysis of salicin by emulsin, followed by polarimetric observations and determinations of reducing sugar. No acceleration of the reaction was observed in favor of the treated samples over the controls. The results are in accord with the idea that ethylene does not directly affect the activity of enzymes, but acts indirectly through its effect upon the living matter.—*Authors' summary.*

6565. **EULER, H. v., KARL MYRBÄCK, und SIGNE MYRBÄCK.** Zur Bestimmung der Katalase in Pflanzenmaterial. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 186 (4/6) : 212-222. 3 fig. 1930.—Catalase was determined for dry barley meal, for embryonic leaves, and for sprouts. There was no evidence of a naturally occurring anti-catalase. Maximum activity of malt extract occurred at pH 7-8. A phosphate buffer was used. Catalase of the sprouts was higher than that of the barley kernel from the 7th to 12th days of the experiment. On the 6th day the kernel had a slightly higher catalase content than the sprouts. Catalase content of sprouts grown in dark was lower than that of those grown in light, from the 4th to 8th day, but by the 10th day tended to be the same. Total catalase of barley increased with length of time after germination.—*N. M. Payne.*

6566. **GRASSMANN, WOLFGANG, und HANNS DYCKERHOFF.** Über die Wirkungsweise der Hefepolypeptidase. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 175 (1/2) : 18-37. 1928.—The dipeptidase-free polypeptidase splits d, l-leucyl-glycyl-glycin into leucine and glycyl-glycine, and glycyl-glycyl-l-leucine into glysin and glycyl-leucine, i.e., the enzyme attacks the end with the free amino group. Leucyl-diglycyl-glycine is split into leucine and diglycylglycine; triglycyl glycine into glycine and the tripeptide. The tripeptide resulting from the hydrolysis of the leucyl-diglycylglycine is not attacked because of inhibition by leucine; but leucine has little effect on the hydrolysis of the tetra- or dipeptide. Substitution of the amino group destroys the affinity of the enzyme for the substrate.—*G. S. Eadie.*

6567. **HUPPERT, OSKAR.** Konstitution und Konfiguration der Eiweissstoffe. 41p. 7 fig. F. Deuticke: Leipzig & Vienna, 1928. Pr. 4 M.—The formation of proteins and carbohydrates, in nature, is brought about by a photochemical means from the system CO_2 and NH_3 in the presence of water. Carbamic acid (NH_2-COOH) is formed from the CO_2 and NH_3 which assumes the more reactive form iminocarbonic acid [$NH=C(OH)(OH)$] and this compound by the condensation of 2 molecules and loss of H_2O_2 forms cyanimidocarbonic acid [$NH=C(OH)CN$]. By methylene polymerization of the cyanimidocarbonic acid cyanoaminomalonimidic acid ($NH_2-\underset{\underset{CN}{|}}{C}=C=NH$) is formed. From this compound the anhydride of glycolimidic acid



is formed, and this is the fundamental unit of all proteins, since all the amino acids can be considered derivatives of it, e.g., alanine would be  , etc. Condensation of these units is brought about by photochemical energy and a micromol of a normal protein is formed. Further condensation of several micromols produces the protein itself. No new experimental data are presented but there is an appended bibliography of 60 references.—*H. O. Calvery.*

6568. **KERTESZ, Z. I.** The acidity optimum of yeast hexosediphosphatase. *Jour. Amer. Chem. Soc.* 52 (10) : 4117-4119. 1930.—The pH optimum of the yeast hexosediphosphatase was 6.5.

6569. **KONOPKA, K., und H. ZIEGENSPECK.** Die Kerne des Droseratentakels und die Fermentbildung. *Protoplasma* 7: 62-71. 1929.—On feeding with meat, egg albumen, and pollen, the cells of the tentacles of *Drosera* reveal rounded structures in the cytoplasm which are claimed to be partially assimilated food. These later dissolve. Meanwhile the nucleus decreases in size and disappears. Indications point to the substance around the nucleus as a digesting organ. Alterations in the nucleus and nucleolus are thought to be due to the formation of enzymes.—*L. Moyer.*

6570. **[KUNO, YUFU.] [Critical study on the enzymic decomposition of nicotine.]** [In Japanese, with English summary.] *Bulteno Sci. Fakult. Terkult. Kjusu Imp. Univ. Fukuoka, Japan* 3 (3) : 287-291. 1 fig. 1929.—Fodor and Reifenberg published a paper purporting to show that nicotine is decomposed by an enzyme in tobacco juice or extract. To confirm their findings their experiments were repeated, and for the determination of nicotine several methods were used. The analytical results obtained agreed in all the 4 methods except Fodor and Reifenberg's, which as a rule gives a lower value of nicotine. The findings of Fodor and Reifenberg were not confirmed and the conclusion was reached that there is no enzyme splitting nicotine in tobacco juice and extract. The discrepancy should be ascribed to the incompleteness of their method of determining nicotine, and also to the fact that their experiments lacked proper controls.—*Author's summary.*

6571. **LANTZ, C. W.** Temperature and catalase activity in germinating corn. *Proc. Iowa Acad. Sci.* 35: 147-149. 1928 (1930).—Three strains of corn [*Zea mays*] were used at 30-40° C. Catalase diminishes rapidly at 42° and growth is retarded, but Palladin states that respiration does not diminish. If this is true, catalase is not responsible for physiological oxidation, but more probably for destruction of injurious peroxides formed in metabolism.—*H. S. Conard.*

6572. **NARAYANAMURTI, D., and ROLAND V. NORRIS.** Studies in enzyme action. II. The nature of amylase. *Jour. Indian Inst. Sci.* 11A(11): 134-139. 5 fig. 1928.—The activity of electro-dialysed cholam (*Sorghum vulgare*) diastase was considerably increased as compared with that subjected to ordinary dialysis. The electro-dialysed diastase gave none of the usual protein reactions but was positive to the Molisch test. The diastase is separated into saccharifier and liquefier fractions by electro-osmosis.—*H. D. Brown.*

6573. **PITMAN, GILBERT A., and W. V. CRUESS.** Hydrolysis of pectin by various microorganisms. *Indust. & Eng. Chem.* 21(12): 1292-1295. 1929.—The pectinase activity of representatives of the more important groups of microörganisms occurring on fruits was determined for aerobic growth at room temp. in or on apple juice containing added apple pectin. Of the microörganisms tested, *Penicillium glaucum* and a *Pythium* sp. exerted the greatest hydrolytic action. In fact, the *Pythium* sp. destroyed practically all of the pectin in 12 weeks' incubation at approximately 20° C. The bacterial cultures, *B. aceti* and *B. amylovorus*, had little effect under the experimental conditions. Yeasts (*Saccharomyces cerevisiae*, several strains of Mycoderma, and *S. ellipsoideus* from grapes) had no noticeable effect on the pectin. The effect of several organisms on the pectin was not only quantitative but qualitative. The appearance and texture of the pectin precipitate varied greatly, indicating that the degradation of the pectin had occurred in more or less definite stages. One organism had apparently not greatly reduced the quantity of pectin as shown by the Wichmann method, but it had changed its character so markedly that the "pectin" refused to form a jelly under conditions where even lower concentrations of pectin from other cultures gave a firm jelly. The enzyme involved in the latter case was apparently pectase rather than pectinase. The viscosities of the liquids from most of the cultures followed in only a general way the apparent pectin content as determined by the Wichmann method. In the presence of Ca salts pectic acid as well as pectin affects the viscosity. The natural enzymes of apple tissue did not greatly reduce the pectin content during the period required for complete alcoholic fermentation of the sugars by *S. cerevisiae* at 35° C. This finding confirms earlier observations and indicates a method of reducing the cost of extraction of pectin commercially from apple waste. Hydrolysis of pectin by *P. glaucum* was more rapid in media of pH 6 and 5 than in one of pH 3. This is in keeping with the finding of Wilson and others that pectin is more stable in solutions of moderately low pH value than in those of high pH value. Dextrose, when present in a pectin stock solution, is not altogether objectionable, as it has a protective effect against the hydrolysis of pectin by *P. glaucum*. This effect would probably apply to other organisms.—*G. A. Pitman.*

6574. **TATE, P.** On the enzymes of certain dermatophytes, or ringworm fungi. *Parasitology* 21(1/2): 31-54. 1929.—Enzyme preparations were made by the acetone powder method from 6 typical sp. (*Trichophyton tonsurans, Sabouraudites radiolatus* (2 forms), *S. audouini, S. lanosus,* and *Grubyella schoenleinii*) of dermatophytes. A trypsin-like proteolytic, and a lipolytic enzyme, amygdalase, urease, maltase, and diastase were found in all sp.; invertase, inulase, lactase, zymase, and a keratolytic enzyme were absent in every case. The sp. with most proteolytic activity have least carbohydrases and conversely.—*R. W. Thatcher.*

6575. **TAUBER, HENRY.** Studies on crystalline urease. Inactivation by ultra-violet radiation, sunlight with the aid of a photodynamic agent, and inactivation by trypsin. *Jour. Biol. Chem.* 87(3): 625-628. 1930.—Direct sunlight did not affect urease to which no eosin has been added at the various temp. and time intervals studied. In the presence of eosin, sunlight inactivated the urease. Ultra-violet had an inhibitory effect upon the activity of urease, inversely proportional to the distance. The presence of eosin increases this effect. Crystalline urease was inactivated by trypsin in the presence of a protective colloid, which would indicate its protein nature.—*Author's summary.*

6576. **TRAUTWEIN, K., und J. WASSERMANN.** Die Gärleistungen der Hefen der ersten Untergruppe der Gattung Saccharomyces (Meyen) Rees. *Biochem. Zeitschr.* 215(4/6): 293-318. 3 fig. 1929.—CO_2 production from sucrose, dextrose, and maltose was measured in terms of the number of min. necessary to hydrolyze ½ of a given amount by a weighed quantity of dry yeast. Temp. in the different experiments was 17-22° C. In all sp. of yeast except a Johannisberg culture and *Saccharomyces saké*, sucrose was hydrolyzed more readily than dextrose. Sp. differences for maltose hydrolysis were the most variable, ranging from a ratio of 82 for *S. batatae* to 502 for *S. yedo* when compared with 100 as the unit for sucrose hydrolysis. In only 1 case (*S. willianus*) were the hydrolysis rates for dextrose and sucrose identical, although they approached identity with *S. saké, S. vordermanni,* and *S. validus*. Both quantitative and qualitative differences seem to exist between different yeasts. Dextrose was as a rule more readily hydrolyzed than maltose, although there were a few cases in which the reverse was true.—*N. M. Payne.*

6577. **VINES, S. H.** The proteases of plants; a record and a reply. 32p. Macmillan Co.: London, 1930. Pr. 1 s. —A brief summary of 13 papers published by the author in Annals of Botany 1897-1910 is followed by a discussion of the controversial views of himself and Willstätter and his collaborators as to whether protein hydrolysis by plant enzymes through the 2 steps of proteins → proteoses and peptones → amino-acids, respectively, is effected by a single enzyme or by 2 distinct enzymes, the 1st a proteinase and the 2nd an ereptase. The author defends his original views in favor of the latter hypothesis but says that he has had no opportunity to secure experimental evidence during the last 20 yrs.—*R. W. Thatcher.*

6578. **VIRTANEN, ARTTURI I., H. KARSTRÖM, und O. TURPEINEN.** Über die Vergärung von Dioxyaceton. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 187(1/3): 7-44. 1930.—The fermentation of dihydroxyacetone by *Bacillus coli* was studied. These bacteria were grown in culture media, which were then centrifuged, and the bacteria washed in sterilized water to which chalk had been added, in order to keep the products of bacterial groups separate from those of their fermentation. *B. coli* strain I produced from glucose about 40% lactic acid, 20% succinic acid, 10% acetic acid, and 10% alcohol and formic acid which split to CO_2 and H_2. Bacilli that has been grown in nutrient media in which dihydroxyacetone was present fermented dihydroxyacetone much faster than bacilli grown on glucose. Fermentation rate of glucose, however, was independent of the nutrient medium in which bacteria were grown. 1 gm. of bacteria could ferment 500 mgm. of glucose in 864-950 min. 1 gm. of bacteria grown in lactose or glucose fermented 500 mgm. dihydroxyacetone in about 2400 min.; 1 gm. of *B. coli* from cultures grown in media containing 0.22% dihydroxyacetone fermented 500 mgm. dihydroxyacetone in 425 min. The optimal phosphate concentration for fermentation was 0.5-1.0% P_2O_5. Dihydroxyacetone was not condensed to hexose, but was produced directly from glucose. From dihydroxyacetone, *B. coli* strain I produced about 50.1% glycerol, 30% acetic acid, and 15% formic acid. Some minor products of fermentation were also formed. The fermentation of dihydroxyacetone is considered as primarily a regrouping of 2 triose molecules. According to Cannizzaro, this transformation

would involve 1 mol. of glycerine and 1 mol. of glyceric acid. The latter would break down to acetic and formic acid.—*N. M. Payne.*

6579. VIRTANEN, ARTTURI I., und ERKKI PELTOLA. Über die Vergärung von Glycerinsäure. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 187(1/3): 45-52. 1930.—*B. coli* breaks down *dl*-glyceric acid into acetic and formic acids, the latter breaking farther to H_2 and CO_2. l-glyceric acid is first fermented, but since the reaction stops when the levo-acid is consumed, the d-acid can be isolated in pure form from the fermentation solution. The d-glyceric acid can be fermented, however, if the reaction is allowed to go to completion. The rate of fermentation is slower with glyceric acid than with dihydroxyacetone.—*N. M. Payne.*

BIOCHEMISTRY, METABOLISM (RESPIRATION, OXIDATION)

6580. ALBACH, W. Mikrospirometrische Untersuchungen über den Einfluss der Vitalfärbung und der Plasmolyse auf die Atmung von Pflanzenzellen. *Protoplasma* 7: 395-422. 10 fig. 1929.—A long stay in damp air has no effect on the respiration intensity of *Elodea canadensis* taken from the water. Equal wts. of different parts of the plant have different respiration values; stem tips respire more than older parts. Animal material reveals that with increasing age respiration slows up. Injury and increased temp. increase respiration. Methylene blue increases the respiration of *Elodea* about 100%. Neutral red only increases it 30%. Fuchsin S acts like methylene blue. Eosin and chrysoidin decrease it about 33%. All these changes can be brought back to normal by washing out the stain with water. The respiratory quotient during these experiments remained near 1. KNO_3 and $Ca(NO_3)_2$ hinder the gas exchange, while weak sugar solutions increase it and stronger ones decrease it.—*L. Moyer.*

6581. GENEVOIS, L. Sur la fermentation et sur la respiration chez les végétaux chlorophylliens. *Rev. Gén. Bot.* [*Paris*] 41(484): 252-271. 1929.—In this work, Pasteur's reaction as defined by O. Meyerhof was studied. That means synthesis of carbohydrates by using the energy produced by respiration. This synthesis is the inverse of fermentation. Meyerhof has shown this reaction to proceed in frog's muscle, in bacilli of lactic fermentation, and in yeast. Genevois does the same for *Lathyrus odorato* where the fermentation persists, in the air, in the cotyledons by reason of their thickness. The oxidation quotient is nearly the same as that found by Meyerhof for yeast. Respiration is thus the sum of 2 phenomena: oxidation of carbohydrates (exothermal) and synthesis of carbohydrates, or Pasteur's reaction (endothermal). The 2nd is nearly hidden by the 1st in green algae, and there KCN arrests both reactions. In animals, KCN stops only Pasteur's reaction. Genevois shows that, in *Lathyrus odorata,* a suitable quantity of KCN acts also upon Pasteur's reaction and not upon respiration. Fermentation proceeds in lower algae and in phanerogams. Respiration and fermentation are the same in plants and animals.—*M. Homès.*

6582. GUSTAFSON, FELIX G. Intramolecular respiration of tomato fruits. *Amer. Jour. Bot.* 17(10): 1011-1027. 1930.—Tomatoes can respire anaerobically for a long time without showing a great decrease in the CO_2 production besides the initial decrease which occurs during the first 24 hrs. Every time air was admitted after a period of anaerobiosis there was a large increase in the CO_2 production above the original amount. This is interpreted as being due to the respiration of some substance produced as a result of the intramolecular respiration, as the increase was less when the period of anaerobiosis was short than when it was long. The production of CO_2 in absence of O is not due to injury, as the fruits were in perfect condition after the experiments.—*F. G. Gustafson.*

6583. HARRIS, G. H. Studies on tree root activities. I. An apparatus for studying root respiration and factors which influence it. *Sci. Agric.* 9(9): 553-560. 15 pl. 1 fig. 1929.—The bases of young fruit trees were placed in air-tight containers with the roots in nutrient solution through which air was bubbled. The amount of CO_2 produced was then determined.—*H. H. Clum.*

6584. JOYET-LAVERGNE, PH. Glutathion et chondriom. *Protoplasma* 6(1): 84-112. 7 fig. 1929.—This is a review of the literature on glutathione and its rôle in oxidation and respiration, emphasizing particularly the relation of this substance to the mitochondria.—*W. Seifriz.*

ORGANISM AS A WHOLE

6585. GAGER, C. STUART. Aeration of tree roots—theory. *Nation. Shade Tree Confer.* 5: 26-27. 1929.—Note.

6586. KIGASAWA, T. Untersuchungen über Hefepopulationen. *Arch. Hyg.* 99(5/6): 196-208. 1928.—Both of the 2 yeasts used in this work exhibited active fermentation properties and small bud formations. Beer wort and occasionally other media were used, and always the same Pt loop. One loop to 2 cc. sterile salt solution was denoted as $\frac{1}{2}$, a loop from this to 2 cc. of the $\frac{1}{2}$ solution as $\frac{1}{3}$, etc. A loop of the resultant growth was stroked on wort agar plates, and colonies counted, in the following experiments: (1) Strong dilutions of wort culture added to 5 cc. beer-wort at room temp., observed after 2, 4, 8, etc., to 192 hr. intervals showed no colonies at 8 hrs., with marked increase at 24, and maximum at 120 hrs., the Malaga yeast showing slight, the Compressed no increase after this. (2) From the 192 hrs. old cultures, centrifuged repeatedly, washed in salt solution, and inoculated in 4.5 cc. fresh media, 3 strengths were made: (a) 4 cc., (b) 0.4 cc. with 3.6 cc. fresh medium, (c) 0.04 with 3.96 cc. fresh medium. Results were surprisingly uniform with (1), especially in (a) where with $\frac{1}{2}$ and $\frac{1}{4}$ dilutions no growth appeared and with $\frac{1}{8}$ dilutions about 100 colonies without further increase. In (b) and (c) there was a large increase over (a), showing a strong inhibition of growth in (a) from death or loss of virility of cells. (3) From (2c), after growth of 128 hrs., centrifuging, washing the precipitate with salt solution and mixing with 3 cc. beer-wort, 4 strengths were made: 2 cc. full strength; 0.5 cc. with 1.5 of wort; 0.05 with 1.95; and 0.005 with 1.995. Further dilutions after 24 hrs. were made from the above, from these again further dilutions, and so on, 5 times. The results displayed many peculiarities; the $\frac{1}{2}$ to $\frac{1}{3}$ dilutions produced colonies of 200-300, the $\frac{1}{4}$ none, or, rarely 2-40. On the whole, the result showed that a certain concentration was not exceeded, the doubling of growths in (3) being due to a constantly fresh source of supply of the necessities of life. Further tests were made by counting cells microscopically with a hemocytometer after growth on, (1a) 20 cc. hop infusion and (2a) 4 cc. of 10% glucose in 16 cc. of hop infusion, from each of which 2 infusions of (b) 1/10 and (c) 1/100 strength were made. The cells were counted at intervals up to 264 hrs. In the hop infusion very little growth was noted in (2), slight in (b), none in (c). In medium (2) the growth was considerable in all 3 and held the relationship of 1, 1/10, and 1/100, the same as the dilution. The absence of growth in the first 24 hrs. is analogous to the latent period of growth of bacteria. The period from 72 hrs. on, during which the growth was stationary, shows that either cell division ceases at a certain point, or that cell division continues, but is not apparent owing to the death or dissolution of the cell, a constant balance being thus produced between new cells and dying ones. To determine this, cultural and counting methods were used side by side. The figures in the cultural methods were very low and showed that many cells which were transplanted on agar did not develop, making the method uncertain. Other experiments gave similar results. On the whole the M concentration for yeast followed the same laws as for bacteria.—*J. A. Bauer.*

6587. TUORILA, PAULI. Untersuchungen über die chemische Zusammensetzung der Kartoffeln in Finnland.

Suomen Suoviljelyshydistys Tietellisiä Julkaisuja No. 11. 1-73. 1929.—A table shows the relation between the specific wt. of potatoes and that of starch and dry material. During the growth period starch and dry substance increase with regularity; N and ash show irregularities. The average starch content of Finnish potatoes is 14%, that of German potatoes 19%. Dry substance varies similarly. These differences are ascribed to the colder climate of Finland and the consequent incomplete ripening of the potatoes. The starch content is more influenced by temp. than by moisture. The N content of Finnish is equal to that of German potatoes, while potash and phosphates are somewhat lower. Comparative results are given for tubers grown on high and low moorland and on sandy soil. Different varieties of potatoes showed a wide variation in habits of growth and in constituents.—*O. F. Black.*

GROWTH, DEVELOPMENT, REPRODUCTION

6589. **BAAS-BECKING, L. G. M., and LELAND S. BAKER. Studies on growth. 1. The point binomial and its derivatives. 2. Experimental data—application of the theory.** *Stanford Univ. Publ., Univ. Ser., Biol. Sci.* 4(2): 61-135. 30 fig. 1926.—Part I is a statistical analysis of the expectation of sizes in a population composed of cells which are undergoing fission. It is emphasized that fission by itself gives rise to skewness in the frequency of sizes. Frequencies taken at any one time thus tend to be bimodal ("clivoid"). Various forms result, depending on whether or not growth-rate depends on age or size of cell, whether or not cell division results in equally sized progeny, whether or not fission occurs regionally, periodically, or multiply. Part II is an analysis of measurements made at intervals of a few hrs. upon each cell in certain filaments of *Spirogyra* and *Chaetomorpha*. The rate of growth in length decreased with the size of the cells. Daughter cells were definitely unequal in size as compared with their sisters, at least in *Chaetomorpha*. Fission tended to occur only in the largest cells; yet skewness toward small sizes was not found among the cells measured, being perhaps masked by the inequalities in rate of growth at various cell ages.—*E. F. Adolph.*

6590. **BORESCH, KARL. Gibt es Beziehungen zwischen dem Vorkommen von Blausäure in Knospen und ihrer Treibwilligkeit?** *Beitr. Biol. Pflanzen* 17(2): 259-271. 1 fig. 1929.—Since exposure of dormant plants to HCN has the effect of inducing growth in the buds, and since many plants contain cyanogenetic glucosides from which HCN can be liberated, experiments were undertaken to determine whether this naturally occurring cyanide was related to the dormancy of buds and to the breaking of their rest periods. Tests were applied to 79 sp. in 25 families to determine whether HCN could be released from bud tissue (and if so in approximately what quantities); simultaneously, a comparison was made with the length of time required for bud development to take place from cut twigs placed in the greenhouse. No broad relationship was found since plants not containing HCN were easily forced in the greenhouse, and others whose buds yielded HCN on autolysis could be forced only late in the season. Yet, when the comparisons were made between closely related forms differing with respect to their content of cyanide compounds, the correlation was sufficiently close so that in such cases "yes" was regarded as a better answer than "no" to the title of the paper.—*F. E. Denny.*

6591. **COCKERHAM, GEORGE. Some observations on cambial activity and seasonal starch content in sycamore (Acer pseudoplatanus).** *Proc. Leeds Philos. Soc. (Sci. Sect.)* 2(2): 64-80. 2 pl. 1930.—The experimental plants were 13 comparable young trees. One was felled each mo. and samples taken at 1-ft. intervals along the stem, main branches, and roots. Duplicate samples were used for observing the starch content. Xylem differentiation showed a swelling of cells, in the cambial zone, then differentiation of vessels without cambial cell division, followed by periods of rapid cell division, slower division with relatively increasing differentiation, and finally cessation of cambial division after the differentiation of summer wood. This activity began in the new elongation growth in the buds and spread downwards through the branches, stems, and the basal region of the roots. The distal portions of the roots showed "typical root cambium" which slowly divides throughout the yr. Phloem differentiation began by a swelling of the nucleus, then uncallused sieve plates developed, and later callus was deposited. This activity was most rapid in the spring before the xylem differentiation, and again at leaf fall when the summer wood is complete. Determination of the starch content was by the I method and not strictly quantitative. Seasonal starch content showed 2 maxima (in late winter and at leaf-fall) and 2 minima (in early winter and just after bud-break). The disappearance of starch seemed to be from the apex downwards; the reappearance began at the base of the stem and roots.—*M. B. Garnett.*

6592. **DENNY, F. E. Der Einfluss des Thioharnstoffs auf die Gipfelaugenentwicklung und auf die Vieltriebigkeit der Kartoffelaugen.** *Jour. Landwirtsch.* 77(3): 219-221. 2 fig. 1929.—Following previous results with 3 var. of potatoes (in which soaking cut tubers with thiourea solutions induced the development of several buds at each eye of the potato, and prevented the dominance of the apical eye over basal eyes), the experiments were repeated with 7 other var.: Spaulding's Rose, Early Rose, Jersey Red Skin, Burbank, Early Ohio, Great Scot, and Green Mountain. All varieties tested responded in the manner above described. Von Velsen's failure to corroborate these results completely was probably due to the use of intact rather than cut tubers.—*F. E. Denny.*

6593. **FREY, ALB. La formation des cellules géantes du "Sterigmatocystis nigra."** *Rev. Gén. Bot.* 39(461): 277-305. 7 fig. 1927.—The nucleus is not enlarged. The vacuome consists of 1 or several very large vacuoles; the metachromatin occurs in the form of little corpuscles placed at the periphery of the vacuoles. The immersed cells store fat. The liquid medium (Molliard's) upon which the *Sterigmatocystis* grows becomes increasingly acid due to the formation of oxalic acid. When the pH reaches 2.0, the mycelium is still normal and the cell sap has a pH of about 6.0. Below the level of pH = 2.0 the hyphae change into giant cells, and the pH of their sap decreases to 5.0—3.5. Following the combustion of some sugar in the medium, the pH increases, the giant cells produce normal hyphae and fructification ensues if K is present in the solution. Relying upon the previous investigations of Molliard, the conclusion is that the giant cells are caused by a shortage of K and also by a pH lower than 2.0. In this latter instance it may be that the large number of H^+ ions present prevent the entrance of the K^+ ions into the hyphae, and thus create a shortage of K.—*A. Frey (transl. by P. D. Strausbaugh).*

6594. **FUJA, M. C. On the formation and development of roots and shoots on the isolated cotyledons of Cucurbita, Cucumis and Lupinus.** *Bull. Internat. Acad. Polonaise Sci. et Let. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. (I[Bot.])* 1929(2/7): 209-218. 4 pl. 1929.—*Cucurbita pepo, Cucumis sativus,* and *Lupinus* possess dormant buds in the axils of the cotyledons; these, if left on the isolated cotyledons develop into shoots, or may even produce an entire plant. The axillary cotyledonary buds of *C. pepo* appear as collateral-serial buds. The isolated cotyledons of *Cucurbita, Cucumis,* and *Lupinus,* if kept in a moist place, develop calluses on the nerves at the cut end; these calluses produce roots, and in some rare cases shoots. The isolated cotyledons of 1 sort of *L. albus* form no calluses, but develop roots directly from the cambium of the fibrovascular bundle at the cut end; cotyledons derived from another sort produce calluses and roots. The longitudinal and the farther transverse halves of the cotyledons of *C. pepo* form calluses on the middle cut surface and produce roots. Cotyledons isolated from the embryo or from

very young seedlings produce longer and more vigorous roots than cotyledons isolated from older seedlings or than portions of the cotyledons.—*Author's summary.*

6595. **HELDMAIER, CLARA.** Über die Beeinflussbarkeit der Sexualität von Schizophyllum commune (Fr.) und Collybia velutipes (Curt.). *Zeitschr. Bot.* 22 (4): 161-220. 3 fig. 1929.—Toxic substances, extremes of temp., and x-rays were applied to *C. velutipes* and *S. commune*. All but the x-rays produced sexual modifications. *S. commune* was more strongly influenced than *C. velutipes* in all cases.—*C. Heldmaier (transl. by T. C. Scheffer).*

6596. **JONÁS, VÁCLAV.** Nové zpusoby mnození kulturních drozdárenských kvasinek a vznik nových kvasnicných forem. [New methods of reproduction of pure yeast plants and development of new yeast forms.] *Chemický Obzor* 4(11): 345-347. 1929.—From seemingly dead yeast which had been killed by physical or chemical means there were successfully grown a few typical forms of organisms representing evolutionary lines of development from that of unorganized plasmatic substance to normal yeast cells. These new forms of yeast can reproduce by means never previously observed in yeast, viz. by small "sporoid" bodies, and a few types of "plasmatic" reproduction. From the enzymic standpoint this discovery contributes to the discussion of the validity of Buchner's theory.—*Fr. Hruska.*

6597. **KAWAMURA, SEIICHI.** On the periodical flowering of the bamboo. *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 2: 1915. 1926 (1928).—Abstract.

6598. **KOMÁREK, V.** Zur experimentellen Beeinflussung der Korrelationstätigkeit von epigäischen Keimblättern. *Flora oder Allgem. Bot. Ztg. [Jena]* 24(3): 301-314. 1930.—Two effects of removing the cotyledons from seedlings are recognized: increase of axillary growth or retardation of it. In the study of a number of seedlings with epigean cotyledons there are some anomalous results, but for the most part growth is retarded. In certain cases of increased axillary growth the effect is lost if the mutilation is applied to older seedlings, and it appears that where the effect is to increase growth it is to be interpreted as secondary to other physiological effects of the experimental treatment. Any variations in the influence of many epigean cotyledons is explicable as due not to specific inherence but rather to variations in growth habits.—*E. A. Baird.*

6599. **MAEKAWA, TOKUJIRO.** Preliminary report on the influence of cotyledons on the root regeneration of young plants. *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 2: 1916-1920. 1926 (1928).—Cuttings consisting of young plants devoid of tap roots show very energetic root-regeneration in a few days, largely due to the plastic substances contained in the cotyledons, and partly to the assimilation products prepared by the leaves grown on the cutting. The favourable influence of cotyledons on root-regeneration in *Phaseolus nana* and in *Pisum sativum* is especially noticeable.—*Author's conclusions.*

6600. **MONTEMARTINI, L.** Di alcune azioni ormoniche nelle piante. [Plant hormones.] *Boll. Soc. Ital. Biol. Sper.* 4(7): 872-874. 1929.—When leaves of *Crassula* are exposed to desiccation, transpiration is curtailed whenever adventitious buds develop along the petiole. When a red-hot wire is thrust into an unripe pear and the seed are penetrated and killed, the ripening of the pulp is greatly accelerated. Seed exert a chemogenetic as well as a morphogenetic effect.—*L. Montemartini (transl. by H. S. Wolfe).*

6601. **NIETHAMMER, ANNELIESE.** Bio- und Histochemie pflanzlicher Früchte und Samen. II. Reife- und Alterserscheinungen. *Biochem. Zeitschr.* 227(4/6): 462-471. 1930.—In unripe fruit and seed there are often deposits of Ca-oxalate which practically disappear with ripening. The druses of Ca-oxalate are used again in metabolism and are therefore not a useless excretion. In many fruits of certain families, over-ripening brings on inclusions which are sack-like structures that fill the cells. Most fruits show an increased content of acetaldehyde as they ripen. Dry seed and fruits exhibit such an increase only when they have the maximum capacity to germinate. Chemical changes are to be observed in the embryos of some seed as they grow older.—*Author's summary (transl. by C. J. Lyon).*

6602. **OKADA, YÔNOSUKE.** Study of Euryale ferox Salisb. IV. On the rate of growth of the lamina. *Sci. Rept. Tôhoku Imp. Univ. Biol.* 4(2): 361-368. 2 pl., 2 fig. 1929.—The largest lamina appear from late Aug. to mid-Sept., the air and water temp. being the determining factor. Diam. of random samples were measured twice daily for 2 days. The increment was as high as 25 cm. in 24 hrs., being slightly greater by day than by night. The ratio of mass to area is greater the smaller the diam. The ratio of dry wt. to fresh wt. is almost constant, and independent of size and age.—*Mrs. W. R. Garnett.*

6603. **PFEIFFER, HANS.** Experimentelle und theoretische Untersuchungen über die Entdifferenzierung und Teilung pflanzlicher Dauerzellen. I. Der isoelektrische Punkt (IEP) und die aktuelle Azidität von meristematisierten Zellen. *Protoplasma* 6: 377-428. 6 fig. 1929.—The article deals with the relations between cell differentiation, dedifferentiation and aging, and such purely physical properties as isoelectric point, acidity, imbibition, and hysteresis.—*W. Seifriz.*

6604. **POPESCO, CONSTANTIN.** Régénération des faisceaux conducteurs libéroligneux dans la moelle, à la suite de la décortication annulaire. *Rev. Bretonne Bot. Pure et Appl.* 1926: 1-47. 14 pl., 15 fig. 1926.—The removal of a ring of bark from the stem of herbaceous plants or from small twigs of woody plants causes, after a few weeks, a noticeable swelling of the stem just above the girdle and a slight swelling at and just below the girdle. Following this increase in diam. of the stem there appear longitudinal cracks in the girdled part. Girdling has caused living cells within the stem (parenchyma in the medullary rays, pith or wood) to grow and from them develop new tissues which are responsible for the swelling of the stem and the cracking of the old wood in the region of the girdle. By this experiment it has been show that living cells in old tissues, whenever there is a necessity, are rejuvenated and become again embryonic in character and upon development supply all types of tissues necessary to heal the gap caused by girdling.—*A. E. Longley.*

6605. **SAEGER, ALBERT.** A method of obtaining pure cultures of Spirodela polyrhiza. *Bull. Torrey Bot. Club* 57(2): 117-121. 1930.—Resting buds treated with 10% "Zonite" (solution of NaOCl) yielded cultures free from other organisms. Successful cultures were maintained in Knop's solution containing inorganic salts only, thus showing that Bottomley's contention that minute amounts of organic matter are essential for growth of green plants (Lemnaceae), and also, Mockeridge's point that the necessary "auximones" may be supplied by contaminating organisms, are not tenable. In one experiment the addition of autolyzed yeast greatly stimulated growth as contrasted with the purely synthetic culture medium.

6606. **SÖDING, HANS.** Untersuchungen an Aspergillus niger über das Mitscherlich-Baulesche Wirkungsgesetz der Wachstumsfaktoren. *Zeitschr. Wiss. Biol. Abt. E. Planta* 6(3): 482-509. 6 fig. 1928.—Cultures of *A. niger* were prepared on media having graded quantities of K and phosphate. With optimum doses of K and phosphate, maximum amounts of fungous substance, A, were harvested; with known insufficient amounts of K a fraction of the maximum $(1/m)A$, was obtained; with known insufficient amounts of phosphate a fraction, $(1/n)A$. These were so valued with simultaneous insufficiency of K and phosphate as to get for the product, E, the relation: $(1/m)A$ and $(1/n)A > E > (1/m \cdot n)A$. Neither Liebig's law nor the Mitscherlich-Baule law of action fits this. The first forms an upper, the latter a lower limit for the actual product. These results were obtained with fungous cultures about 100 hrs. old. It is suggested that the results with microorganisms of such

short experimental periods but not those of long duration, may probably apply also to higher plants.—*H. Söding (transl. by L. R. Tehon).*

6607. **STEPHAN, JOHANNES. Entwicklungsphysiologische Untersuchungen an einigen Farnen. I.** *Jahrb. Wiss. Bot.* 70(5): 707-742. 14 fig. 1929.—For the germination of *Osmunda regalis* a 0.16% Tottingham solution was a more favorable culture medium than the solutions of Knop, A. Meyer, or v. d. Crone. Contrary to earlier results germination occurs also on distilled water. The optimal concentration of the various solutions is not the same for light and darkness. The addition of orthophosphoric acid to the normal nutrient solution aids germination and growth. Organic acids in general injure the spores, and lactic acid only gave a stimulating effect. Normal germination and growth can be obtained in darkness but only on solutions of grape sugar and of glycerine. Laage's results with germination on K_2PO_4 and on $MgSO_4$ were not confirmed. By this the conception of "germination" expressed by Laage (1906) is refuted. In the young germination stages, phosphates, then chlorides, are the best for producing large-celled prothallia; then follow sulphates, which, with the exception of $MgSO_4$, favor the production of large-celled prothallia; at the end come the nitrates which usually produce small-celled prothallia. In agreement with the results of Prantl, the failure of the meristem occurred on N-free solutions, but the lack of N usually did not check the formation of the meristem. As to the effect of the different rays of the spectrum on germination and growth, the investigations (conducted in daylight owing to lack of suitable facilities) in agreement with earlier work, permit the assumption of a specific quality effect. To each kind of ray is ascribed a specific morphogenic effect, and in opposition to the results of Klebs (1916-1917) each has a special photoblastic effect on elongation, as well as on the number and type of cell divisions. In agreement with Klebs, the "blue" rays do not show any specific checking influence on germination. According to Klebs no prothallia are formed in the "red"; the forms are exceptionally small and show only oblique divisions, as well as a complete lack of meristem. A typical increase in elongation, as was shown by the author in *Balantium* (1928), does not occur in *O. regalis*. The prothallial structures obtained by Klebs are interpreted as the result of a combination effect of several rays which passed through the filter. Preliminary investigations on spores of *Ceratopteris thalictroides* show the possibility of germination without previous illumination. Narrow prothallia with terminal meristem are formed in "red" light; in "blue," shorter and broader prothallia with lateral meristem. The prothallia grow as germination filaments in all rays of the spectrum, as reported by Klebs (1916-1917), because of fluctuations in intensity.—*J. Stephan (transl. by A. G. Stokey).*

6608. **STYER, J. FRANKLIN. Nutrition of the cultivated mushroom.** *Amer. Jour. Bot.* 17(10): 983-994. 1930.—Solutions of higher concentration than 0.2 molar inhibited the growth of mycelium of *Agaricus campestris*. The water content of manure in test tubes could vary from 125% to 200% without affecting the growth. Above 200% growth rapidly decreased, this effect being attributed to poor aeration. High moisture content favored rhizomorph formation. Sowing spores in masses promoted their germination. As C sources, sugars (except galactose), starch, peach gum, pectin, wheat bran, peat moss, rotten wood, and several proteins were good, while cellulose, the organic acids, and mannite were poor; as N sources, proteins, except nucleo-proteins, NH_4NO_3, glycine, leucine, creatine, and creatinine were good, while urea, $(NH_4)_2SO_4$, $NaNO_3$, glutamic acid, and arginine were poor, these materials having been tested in a silica gel base containing nutrient salts.—*J. W. Sinden.*

6609. **TADOKORO, T., and M. ABE. Studies on the ripening of rice-grains. 2.** *Jour. Fac. Agric. Hokkaido Imp. Univ.* 27(3): 349-387. 1930.—The actual wt. of unhulled and hulled rices increased until a certain period of maturity, then decreased. The specific gravity of unhulled rice increased at first and afterward decreased while that of hulled rice at first decreased and then increased. The specific gravity seemed likely to be most affected by the water content. The sharp drop of unripened and half-ripened grains may perhaps be due to the dead ripeness. The water content of hulled rice increased at first and then decreased, showing a close relation with the specific gravity. The decrease of dry substances in 1000 grains is probably due to the reversibility of physiological functions during ripening. The ash and phosphoric acid contents decreased for a while and crude fat also showed a tendency to decrease. Total N showed no definite change during ripening, but the ratio of pure protein to crude protein constantly increased. Of the 4 kinds of protein, the water-soluble form gradually decreased with ripening, the NaCl-soluble and alcohol-soluble forms increased, and the alkali-soluble was inconstant, with tendency to decrease. The reverse changes characterize germination. The free-amino N in the non-protein substances sharply decreases with the free amino-N in protein substances, indicating that the protein substances are formed from non-proteins. The decreasing velocity of free amino-N formation in both cases suggests that this transformation proceeds more rapidly than the polymerization of higher proteins from lower. Protein solubility and reducing sugar of hulled rice decreased with ripening, while dextrin and starch increased. The ash and P contents of oryzenin of hulled rice decreased at a definite time in the ripening period, while N, S, and free amino-N increased. The quantity of HCl required to cause maximum turbidity and surface tension of the protein solution also decreased at this period, thus placing the isoelectric point of oryzenin on the alkaline side. The specific rotatory power increased. The increase or decrease, with ripening, of the various amino acid fractions was determined. From these results, it seems that oryzenin is probably at the peak of condensation at a time in late ripening, and then disintegrates again. The ash and phosphoric acid contents of rice starch decreased gradually with ripening, while the saponification value increased, showing the change of quantity or construction of starch molecule. The amount of glucose formed from starch by hydrolysis with HCl acid reached a maximum at a definite time of ripening. The ash content of soluble starch decreased gradually like that of the original starch, while the phosphoric acid slightly increased in the last period. The specific rotatory power of acetylated starch reached a maximum at a definite time and the content of acetyl radical a minimum, showing the least quantity of the hydroxyl group replaced by the acetyl radical, by condensation. These results suggest that the starch is also more condensed then.—*From authors' summary.*

6610. **TOMKINS, R. G. Studies of the growth of moulds.—I.** *Proc. Roy. Soc. [London] B* 105(738): 375-401. 12 fig. 1929.—The rate of germination of mould spores is measured at known temp. on "soils" in equilibrium with known humidities. The rate of germination decreases with decrease of humidity. The range of humidity allowing germination is greatest at the optimum temp. and decreases the further the temp. is removed from the optimum. It is increased by presence of nutrients. Germination is independent of the surface if it provides nothing assimilable to the spores. The relation between the growth of a "colony" and temp., humidity, and nutrients resembles qualitatively that found for the germination of spores.—*R. G. Tomkins.*

6611. **WILLIAMS, ROGER J., and ELIZABETH M. BRADWAY. The further fractionation of yeast nutrilites and their relationship to vitamin B and Wildiers' "bios."** *Jour. Amer. Chem. Soc.* 53(2): 783-789. 1931.—Experiments show that Wildiers' original yeast "bios" is not readily absorbed by fuller's earth and appears to be the same as the nutrilite which stimulates the growth of Mayer yeast. No conclusive evidence of its multiple

nature is available. The yeast nutrilites studied by W. L. Miller and his associates are distinct from the "bios" of Wildiers. The Toronto workers should be credited with the discovery of a new series of yeast nutrilites. Yeast No. 578 of the American Type Culture Collection and old process baker's yeast appear to have more complex requirements than Wildiers' yeast. Evidence is presented for the existence of a 4th distinct nutrilite concerned in the growth stimulation of yeast No. 578. It seems reasonable to suspect that several of the nutrilites for this yeast may be components of "vitamin B," since the antineuritic vitamin has previously been shown to affect its growth very strikingly.—*Authors' summary.*

6612. **WILLIAMS, ROGER J., and RICHARD R. ROEHM. The effect of antineuritic vitamin preparations on the growth of yeasts.** *Jour. Biol. Chem.* 87(3): 582-590. 1930.—Certain yeasts do not require for growth stimulation any substance which is adsorbed readily by fullers' earth. Only those yeasts which require such material can be materially affected by antineuritic vitamin preparations. A satisfactory method is described for determining quantitatively the potency of preparations with respect to their content of the readily adsorbed yeast nutrilite. The "bios" of Wildiers is not precipitated by phosphotungstic acid (or other common precipitants) nor presumably absorbed by fullers' earth. It probably has no relationship to the antineuritic vitamin. However, the method of Jansen and Donath for preparing the antineuritic vitamin is very effective for concentrating the adsorbed yeast nutrilite, as far as the major portion of the procedures is concerned. A sample of crystalline antineuritic vitamin proved very effective (in conjunction with the unadsorbed factor) for stimulation of growth of certain yeasts. 1 part of the crystals in 100,000,000 parts of the culture medium can easily be detected. This crystalline substance has twice the potency of the most active preparation hitherto reported (Z_2). However, one of the preparations made by Williams and Waterman from fractions discarded in the Jansen-Donath acetone-alcohol procedure has an activity for yeast at least twice as great as that of the crystalline vitamin. The antineuritic vitamin of Jansen and Donath thus appears to be only one of the substances involved in yeast growth stimulation.—*Authors' summary.*

6613. **YAMPOLSKY, CECIL. Induced alteration of sex in the male plant of Mercurialis annua.** *Bull. Torrey Bot. Club* 57(1): 51-58. 1 pl., 2 fig. 1930.—Eighteen ♂ plants selected for vigor and uniformity of growth were severely pruned. Eleven of the 18 responded by producing besides the ♂ flowers varying numbers of ♀ and ☿ flowers. Eighteen check plants failed to produce other than ♂ flowers. Subjecting ♂ plants to severe pruning, therefore, results in a sex reversal. The reversal is transitory and after a time the plants return to their original ♂ condition.—*C. Yampolsky.*

TROPISMS, GROWTH AND TURGOR MOVEMENTS

6614. **ANDREWS, F. M. A natural proof that the root tip alone is sensitive to the gravitational stimulus. 2.** *Proc. Indiana Acad. Sci.* 38: 87-89. 1928(1929).—This paper deals with those cases in which the root tip is encased in the tissue of the grain immediately surrounding it so as to prevent movement, thus functioning as in the glass cap experiment.—*F. M. Andrews.*

6615. **CASTLE, E. S. The light-sensitive system as the basis of the photic responses of Phycomyces.** *Proc. Nation. Acad. Sci. U. S. A.* 16(1): 1-6. 2 fig. 1930.—Sporangiophores of *Phycomyces* show 2 types of photic response: acceleration of the rate of elongation and phototropic bending. The total reaction time of each type of response consists of an exposure period, a "latent period," and an action time. The duration of the reaction time of each mode of response varies similarly as a function of the duration of exposure to light, for sufficiently brief exposures. The 2 responses are therefore based on the same photosensitive system. The velocity of the latent period process is directly proportional to the amount of preceding photochemical change. —*E. S. Castle.*

6616. **DOSTÁL, R. Versuche über die Massenproportionalität bei der Regeneration von Bryophyllum crenatum.** *Flora [Jena]* 24(3): 240-300. 4 fig. 1930.—Fresh and dry wt. was determined of sprouts and roots produced by isolated leaves and one-node stem pieces of *B. crenatum.* The relative amount produced by mature leaves and stem pieces taken from the apical part of the shoot was greater than that produced by the basal ones. Likewise the apical parts of halved leaves produced relatively more than the basal half. Division of the leaves also increased the relative production of regenerated material. The results obtained contradict Loeb's conception of the existence of a simple "mass relation" in *Bryophyllum.* There are minute but significant correlations between marginal leaf buds and axillary stem buds which are influenced, although secondarily, by water and nutrients. —*R. Dostál (transl. by F. F. Halma).*

6617. **KEEBLE, FREDERICK, M. G. NELSON, and R. SNOW. The integration of plant behaviour. 1. Separate geotropic stimulations of tip and stump in roots.** *Proc. Roy. Soc. [London] B* 105(739): 493-498. 1929. —Seedlings of *Zea mays* were kept with their coleoptiles and main roots horizontal for 1-2 hrs. The tips of these organs were then cut off and placed upon the decapitated roots of other similar seedlings that were kept pointing vertically downwards all the time. The latter roots curved towards the side of the tip that had been lowest when horizontal. Also seedlings with decapitated roots were arranged with the roots horizontal for 1-2 hrs. They were then arranged with the roots pointing vertically downwards again, and the tips of vertical coleoptiles of other seedlings were placed upon some of the roots. The proportion of the roots that curved towards the side that had been lower was significantly increased by the unstimulated tips.—*R. Snow.*

6618. **MEYLAN, SUZANNE. Effet phototropique et distribution dans le temps de la quantité de lumière.** *Bull. Soc. Vaudoise Sci. Nat.* 57(223): 89-90. 1929.— A difference was manifested in the phototropic responses of small oat plants receiving the same quantity of light accordingly as the intensity was increased or decreased during the period of exposure.—*S. Meylan (transl. by P. D. Strausbaugh).*

6619. **RIMBACH, A. Endodermiswellung und Caspary-scher Punkt.** *Ber. Deutsch. Bot. Ges.* 46(7): 424-433. 1928.—The folding of the endodermis and the Casparian point are caused by the physical peculiarities of the Casparian strip. The folding is due to the peculiar mechanical structure of the Casparian strip, of which a part, being less capable of shortening than the rest, is drawn together in folds. This folding can be imitated by fastening a strip of rubber between 2 somewhat stretched strips and allowing the 3 to contract, when the middle one will necessarily fold. There are, however, 2 forms of endodermal folding: the natural, often very pronounced, which takes place in roots in consequence of their shortening, and is therefore not found in the younger parts; and weak folding, which can be produced in cross sections by plasmolysis, through the reduction of turgor. There follows in this instance a contraction of cell walls in roots or stems, which can be produced in both young and older endodermis. In uninjured plants the folding takes place only where conditions permit contraction longitudinally. This occurs only in roots. The endodermis takes only a passive part in this contraction; therefore its folding is limited to those parts of the root which shorten, and the degree of folding depends entirely upon the degree of shortening. The Casparian point is due to the optical peculiarities of the Casparian strip. It is more widely distributed than the natural endodermis folding, for it is visible in all cross sections which contain the Casparian strip, whether this contracts or not during the development of the uninjured plant. It is therefore not limited to contractile roots, but is seen in other roots as well as in rhizomes

and above-ground stems in which natural folding of the endodermis does not occur. Therefore natural folding of the endodermis is not the cause of the Casparian point. If one assumes the folding of the cell wall as the cause of the Casparian point, one could produce it also by artificial folding of the endodermis cell walls, but this is not the case. Therefore, endodermal folding and the Casparian point have distinct origins consisting in the physical constitution of the Casparian strip, and the folding of the endodermis is not necessary to the development of the Casparian point, which is a peculiar optical appearance.—*Author's summary (transl. by G. J. Peirce).*

6620. **SAVELLI, R. Difetto di reazione geotropica in germinazioni di canapa da seme vecchio. [Failing geotropical reaction in seedlings from old hemp seed.]** *Atti. Soc. Nat. e Mat. Modena* 7: 90-92. 1 fig. 1928.—In fresh (1 yr.) hemp seed, even if placed with the radical apex upward, the radicle, as soon as it appears, presents a very strong positive geotropism. In old seed placed with the radical apex upward, the radicle often grows upward and only later bends down towards the ground.—*M. Tirelli.*

6621. **STÅLFELT, M. G. Pulsierende Blattgewebe.** *Planta; Arch. Wiss. Bot. Abt. E. Zeitschr. Wiss. Biol.* 7(5): 720-734. 7 fig. 1929.—Under normal conditions stomatal cells of leaves of *Vicia faba* show continuous rhythmic changes in volume. The pulsations of all stomatal cells on the upper side of a leaf show an almost synchronized occurrence. In turgid leaves, pressures exerted on the stomatal cells by epidermal and palisade cells also show rhythmic fluctuations. Hence the epidermal and palisade cells pulsate also. The frequency of their occurrence corresponds with those of the stomatal cells. However, the epidermal pulsations are timed inversely with those of the palisade tissue.—*N. A. Pettinger.*

6622. **ULLISCH, ANNA. Die Gewebespannungen beim Entfalten monokotyler Blätter.** *Bot. Arch.* 30(1/2): 195-234. 6 fig. 1930.—By cutting leaves in various ways and observing the resulting bending, it was found that internal tensions were greatest in the regions of most rapid growth. The formation of special developmental tissues is unnecessary; when such exist they give direction to the tensions of the entire organ, and can fix the movements due to turgescence by the permanent form of the cells or of their walls. The developmental tissue is in many cases, perhaps in all, not active, but passive. Also the tissue which develops active tensions can fix the plastic shape of its cells and thus alone or in conjunction with developmental tissue determine the permanent form. The fall of leaves in Araceae and palms is brought about by tissue tensions, caused in certain places by the transformation of the cells or by the formation of special abscission tissue. Very often we find antagonistic tensions in developing leaves and stems which bend them first to one side and then to the other. Thus the development of the organs has a great similarity to circumnutation movements. That the tension causes sprouting is shown by its latent presence, before it is outwardly perceptible; and, as it were, development follows.—*H. H. Clum.*

6623. **WALLACE, RAYMOND H. Studies on the sensitivity of Mimosa pudica I. The effect of certain animal anesthetics upon sleep movements.** *Amer. Jour. Bot.* 18(2): 102-111. 1 pl. 1931.—Quantitative experiments have shown that the sleep movements of *Mimosa pudica, Oxalis stricta,* and *Marsilia macropus* can be inhibited by certain concentrations of ether and acetylene. The concentration of ether necessary to prevent the evening closing is different from that necessary to prevent the morning opening. The lethal concentration (about 2.5%) of chloroform seems to have little or no effect on the sleep movements of these 3 sp. The plants continue to show their usual evening closing and morning opening in atmospheres composed of approximately 100% nitrous oxid or ethylene. Very high concentrations of acetylene, ethylene, and nitrous oxid are harmless to the foliage.—*Author's summary.*

GERMINATION, DORMANCY, RENEWAL OF ACTIVITY

6625. **BARTON, ARTHUR W. The effect of long-continued soaking on seed germination.** *Trans. Kansas Acad. Sci.* 32: 37. 1929.—The capacity for germination is not destroyed by long continued soaking (3 or more mo.) in sterilized water saturated with CO_2.—*F. C. Gates.*

6626. **BERKNER, und W. SCHLIMM. Der Einfluss der Herkunft von Weizenkörnern auf ihre Keimenergie.** *Wiss. Arch. Landw. Abt. A, Pflanzenbau* 2(3): 545-562. 6 fig. 1929.—Germinated seed (200-400 in each lot) of different origin were grown in cane sugar solutions of various concentrations. The concentration limit, which fluctuates around a mean, is characteristic for the sp. The concentration limit for xerophytes is higher than that for hydrophytes. Only mean values of many experiments with seed of different origins give reliable results. Seed obtained under extreme conditions give misleading results.—*Author's summary (transl. by F. F. Halma).*

6627. **BREMER, H. Die Abhängigkeit der Zuckerrübenkeimung von der Temperatur.** *Angewandte Bot. [Berlin]* 11(2): 112-115. 1929.—The minimum temp. of the germination of sugar beet seed has recently been given as 9.4° C. although existing data indicate that even at 3° C. germination may take place although very slowly. Perhaps, however, from the practical standpoint a limit exists at about 9° C., above which good results are assured. Above 35° C. the germination rates indicated a harmful temp. effect.—*L. F. Hawley.*

6628. **BUCHINGER, A. Der Einfluss hoher Angangstemperaturen auf die Keimung, dargestellt an Trifolium pratense.** *Jahrb. Wiss. Bot.* 71(1): 149-153. 1929.—Seeds were put into a liter of water at 23°, 30°, 40°, 50°, 60°, 70°, and 80° C. and allowed to stand in a 23° C. room until they attained room temp. Temp. up to 40° C. hastened germination but gave the same final germination as the check. Temp. higher than this lowered germination % and rate but reduced the number of hard seed. The injury increased with the temp. At 40° C. it took 200 min. for the seed to reach room temp.—*W. Crocker.*

6629. **DEKKER, J. F. Stimuleerende werking van zilvernitraat op kiemplanten van bloemkool. [Stimulation of $AgNO_3$ on cauliflower seedlings.]** *Tijdschr. Plantenziekten* 36(5): 96-97. 1930.—A solution of 0.1% of $AgNO_3$ used for disinfection of seed decreased the % of germination, but 0.05% gave good results. At the same time the plants treated showed better growth than the untreated, which difference was still to be seen after several weeks.—*H. L. G. de Bruyn.*

6630. **DOERFEL, FRANZ. Über den Einfluss des Frostes und intermittierender Temperaturen auf die Keimung verschiedener Samen.** *Bot. Arch.* 30(1/2): 1-50. 1930.—The seed that Kinzel claims are greatly favored in their germination by freezing (*Ranunculus sceleratus, Primula officinalis, Lysimachia punctata, Gentiana straminea, G. cruciata, G. kesselringi, G. lutea, Cuscuta europaea, Hyoscyamus niger, Datura stramonium, Verbascum thapsus, V. thapsiforme,* and *Digitalis purpurea*) germinate as well or better at daily intermittent temp. of 0° or 5° C. as at the lower temp. In some cases freezing lowers the germination as compared with best intermittent temp. above freezing. Kinzel did not distinguish between freezing and intermittent temp. effects and received favorable results from the latter rather than the former. The effect of daily intermittent temp. was studied on *Hyoscyamus, Datura, Lysimachia,* and *Gentiana cruciata* using 60 different combinations of high and low temp. with a wide variation in length of time

each was applied daily. There are 2 types of response: *Hyoscyamus* type and *Lysimachia* type. In the 1st type the daily intermittent temp. is most effective when the low temp. acts for a short period and the high temp. for a long period daily, also when the difference between the temp. is great. Zero or 5° C. in combination with 30° C. is very effective, but 10° C. in combination with 20° C. sometimes gave less germination than favorable constant temp. 25° in combination with 30° C. always inhibits germination as compared with favorable constant temp. In the 2nd type intermittent temp. always favor germination, and a longer lower temp. and a shorter higher daily temp. is most effective. Maximum germination was obtained when 10-20° C. were combined with higher temp. *Datura stramonium* is like the latter, except that the daily low temp. may be too long for maximum results. Increased partial O pressure did not favor germination in these seed and a full atmosphere of the O inhibited. This is contrary to Gassner's results with *Chloris ciliata*. The author believes that intermittent temp. as such are not stimuli to germination but that different metabolic processes in the seed have different cardinal temp. so that only combinations of distinct temp. and duration of action produce optimum conditions for germination. He also holds that difference in internal O pressure with various temp. does not explain the effect of intermittent temp. in the seed he studied, as it does for *Chloris ciliata* studied by Gassner.—*W. Crocker.*

6631. FUKAKI, SADAYOSHI. Über die Frage der Beeinflussung des eigenen Fruchtsaftes auf die Samenkeimung. [Japanese, with German summary.] *Bulteno Sci. Fakult. Terkult. Kjušu Imp. Univ. Fukuoka, Japan* 4(2): 119-133. 1930.—Suppression of germination within the fruit was ascribed by Oppenheimer to lack of water and O, and to the action of inhibitors. The extent to which osmotically active substances in the sap, aside from the presence of inhibitors, influence germination, is uncertain. Experiments aimed to clarify this question are reported. Seed of *Solanum lycopersicum*, *Cucumis sativus*, *C. melo* var. *common*, and *Luffa cylindrica*, in various stages of maturity, were sown on filter paper in petri dishes, and flooded with sterile (filtered) fruit juice, or with cane sugar solution isotonic with fruit juice. Unripe seed of *S. lycopersicum*, *C. sativus*, and *C. melo*, rinsed with the juice of ripe fruit, showed to some extent an inhibition of germination, other than that due to osmotically active substances. The action of the substance responsible for this inhibition differs according to the respective maturity of seed and fruit. The inhibitory action of fruit juice on 1-yr. old seed of *C. sativus*, on the slightly after-ripened seed of *C. melo*, and on the seed of *L. cylindrica* not after-ripened was scarcely noticeable. The substance is apparently not present in the fruit juice of *C. sativus*. The osmotic pressure of the fruit juice increases on boiling, while the inhibitory action decreases.

6632. GASSNER, G., und H. RABIEN. Weitere Untersuchungen zur Frage des Frühtreibens durch gasförmige Blausäure. *Gartenbauwiss.* 1(4): 385-402. 9 fig. 1928.—The following plants responded to a 2-4 hr. exposure to HCN gas (0.25 to 3 vol. %) at 1-12° C.: *Carpinus betula, Dicentra spectabilis, Astilbe japonica, Rosa* sp., *Tilia parvifolia, Tamarix tetrandra, Fraxinus excelsior*, and *Viburnum lantana*. Negative results were obtained with: *Tulipa gesneriana, Hyacinthus orientalis, Viola odorata, Phlox canadensis, Aster alpinus*, and *Doronicum caucasicum*. Responsive plants were forced by a 20 hr. exposure at 0.24 vol. %.—*H. D. Hooker.*

6633. KONSULOFF, STEFAN. Samenstimulation durch Druck und Vakuum, nebst Bemerkungen über die Stimulationserklärungsversuche. *Biol. Generalis* 5(4): 605-626. 1 fig. 1929.—Cell stimulation is interpreted to mean any change of metabolic rate (+ or −) produced by outside influences. This change lasts a varying time after the stimulating factor has been eliminated and also shows in later cell generations without affecting the genotype. Stimulation experiments with rice seed were carried on with an increased pressure to 2 atmospheres and with the vacuum of a water pump. A positive effect in which the difference is higher than the 3x average error was also obtained. The experiment with CO_2 under pressure gave positive results under certain circumstances. These results contradict the opinion of many authors on the suspension of the narcotic effect of CO_2 by pressure. The results with dry and swollen seed contradict the opinion on cell stimulation as a direct effect of enzymatic processes. Decreased or increased enzymatic processes are not the cause of cell stimulation, but the result. Cell stimulation affects the cell mechanism, the condition of the protoplasm itself. These changes keep on through several cell generations without affecting the genotype. The existence of cell stimulation in the sense described above is confirmed by investigations on the lasting modifications of unicellular organisms.—*Author's summary (transl. by J. Giersbach).*

6635. SCHEIBE, ARNOLD. Über das sorteneigentümliche Verhalten der Kulturpflanzen im Keimlingsstadium, dargestellt am Sommerweizen. *Fortschr. Landw.* 2(21): 677-681. 4 fig. 1927.—Seed of different varieties of summer wheat were planted under sterile conditions in wide-mouth Erlenmeyers on 5-20% gelatin. Observations were made on the time for first appearance of radicle tip in at least 30% of the seed and of the average shoot length at the end of the experiment, using different temp. Strains found in previous transpiration studies to be xerophilous germinated more quickly than those found to be hygrophilous, and with increasing gelatin concentration the latter types showed more difference than the former. Xerophytic types germinated quickly and grew fairly well even on 20% gelatin, while hygrophytic ones germinated slowly or not at all and made slow growth, although at lesser concentrations the slower starting hygrophytes often overtook the xerophytes later. These differences in germination and growth are believed to be due to inherent rhythms of development, and are criteria of "germination energy." Account must be taken of racial differences of the kind here studied when using seedlings of oats for tropism studies.—*H. S. Wolfe.*

6636. STEPHAN, JOHANNES. Stimulationsversuche mit Cannabis sativa. *Faserforschung* 7(4): 292-298. 1928.—Hemp seed treated with 0.25% Uspulun gave higher and faster germination (indicating greater stimulation) in light than in darkness, whereas untreated seed gave a higher germination % in darkness. The optimum length of treatment was 1 hr.; optimum concentration was 0.01%, which gave maximum germination in light as well as in darkness. Uspulun in optimum concentration increased both % and speed of germination. High concentrations and long treatments, singly or combined, were inhibitory to germination. Maximum germination for short-time treatments with orthophosphoric acid occurs at a concentration of 0.1%; however, all concentrations increased germination over that of untreated seed. In longer treatments (½-1 hr.), maximum germination after 24 hrs. was at 1% concentration but after 60 hrs. germination was essentially the same at 1%, 0.25% and 0.10% concentration. In 2-hr. treatments, maximum germination occurred at .01% concentration. Germination, following treatment, was equally good in light and darkness. In general, results with $MgSO_4$ follow closely those obtained with orthophosphoric acid. As the time of treatment was increased, the concentration producing maximum germination was shifted to a lower level. Treatment with 1% solution resulted in definite injury to the seed especially as length of treatment was increased. In all cases, for same concentration and length of treatment, the germination % was higher in darkness than in light (directly opposite to results with Uspulun and orthophosphoric acid), indicating that $MgSO_4$ can to only a slight degree overcome

the inhibitory effects of light on germination of hemp seed. Length of root of seedlings is correlated with high % germination. No correlation exists between root and shoot length. It is believed that the frequency of cell division is accelerated. Swelling processes, occasioned by treatment with agents, alone can not account for the stimulation noted, for seed soaked in distilled water gave, in respect to germination, number of cotyledons freed from seed coats, root length, and subsequent growth of seedling, lower magnitudes than when one of the 3 agents was used in favorable concentration. A definite and direct influence upon the seed must be ascribed to the agent, the exact nature of which awaits solution.—*G. L. Fick.*

RADIANT ENERGY RELATIONS, PHOTOPERIODISM

6638. **FEICHTINGER, NORA. Über die Einwirkung von α- und β-Strahlen auf das Protoplasma.** *Naturwiss.* 18(12): 252-257. 11 fig. 1930.—The "germ" roots 1-2 mm. long of *Crepis virens* were irradiated with α and β rays of equal total energy from polonium and radium E respectively. The α rays produced injury to a depth of 30μ, the inner root appearing normal. The β rays damage the entire root due to the greater penetration.—*N. Feichtinger (transl. by H. Kahler).*

6639. **[GURWITSCH, A. G.] ГУРВИЧ, А. Г. Некоторые проблемы митогенетического излучения. [Some problems of mitogenetic rays.]** (German summary.) Журнал Русского Ботанического Общества при Академии Наук СССР. (*Jour. Soc. Bot. Russie Acad. Sci. URSS.*) 13(1/2): 179-189. 1928.—In answer to criticisms contained in the literature, an exhaustive discussion on the fundamentals of the method for detecting mitogenetic rays is followed by an analysis of their successful induction. The chief criticism presented comes from von Guttenberg, who on the basis of his findings and those of N. Wagner denies the existence of the high-grade symmetry of the roots which the author maintained was present in respect to mitosis. The investigations in induction are thus questioned. The author reaffirms that in his extensive research material of over 100 cases with "Nulleffect" the induction always shows a high grade symmetry of both sides of the onion root depending on the amount of mitosis, the deviations seldom reaching 10%. The preponderance on the induced side which follows without exception in certain types of experiments can only depend on a real induction effect. The conclusions are again restated that point to the identification of these mitogenetic factors with ultraviolet rays. The author concludes with a discussion of some theoretical questions.—*Author's summary (transl. by H. S. Mayerson).*

6640. **GURWITSCH, ALEXANDER. Über den derzeitigen Stand des Problems der mitogenetischen Strahlung.** *Protoplasma* 6: 449-493. 4 fig. 1929.—In this article, which is a review of the work of Gurwitsch and others, the (universal) presence of such rays in bacteria, yeast, amphibian eggs, blood, muscle, seedlings, root tips, etc., is emphasized, and their physical nature is discussed.—*W. Seifriz.*

6641. **HUTCHINSON, A. H., and DOROTHY NEWTON. The specific effects of monochromatic light on the growth of yeast.** *Canadian Jour. Res.* 2(4): 249-263. 1930.—An isolated strain of a cultivated yeast was exposed to monochromatic light of various wave-lengths (obtained from the line spectrum of a Cooper-Hewitt lamp) continuously for 24 hrs. Controls were run in ordinary light and in darkness. In general, the orange, yellow, and green bands stimulated multiplication of the yeast cells, and the blue and violet bands inhibited it. The bands in the near ultra-violet region gave rather inconclusive results, sometimes causing stimulation and sometimes retardation. The explanation given is that at either end of the near u.-v. portion of the spectrum inhibitive and stimulative lines are in close proximity, that the yeast cells were exposed to these simultaneously, and that sometimes one line predominated and sometimes another. The far u.-v. bands including line λ2253Å and all shorter ones used markedly retarded multiplication.—*F. Brown.*

6642. **LUYET, BASILE. La radiosensibilité à l'ultra-violet chez les Mucorinées, en fonction de leur âge.** *Arch. Sci. Phys. et Nat.* [*Genève*] 11: 107-108. 1929.—*Mucor hiemalis* was exposed to u.-v. light of 235-400mμ at 25 cm., using cultures 1, 6, 14, 22, and 38 hrs. old. The lethal exposure period of mycelium 6, 12, and 24 hrs. old was 10-20 sec. After the formation of sporangia, 20 min. exposure to u.-v. were required to kill the fungus.—*N. M. Payne.*

6643. **MAGROU, J., et M. MAGROU. Action à distance du Bacterium tumefaciens sur le développement de l'oeuf d'Oursin.** *Compt. Rend. Acad. Sci. Paris* 186(12): 802-804. 4 fig. 1928.—Eggs of *Paracentrotus lividus* develop into abnormal larvae filled with mesoderm cells when exposed to "radiation" of colonies of *B. tumefaciens* through quartz. No abnormal effect was found when exposure was through glass. Similar results had been obtained earlier in studies using onion roots.—*E. Deichmann.*

6644. **MEZZADROLI, GIUSEPPE. Acción de los rayos ultra-violetas sobre la formación de los azúcares, y de los aldehidos a partir de soluciones de bicarbonatos y de anhidrido carbónico en presencia de catalizadores reductores y coloidales. [Action of ultra-violet rays on the formation of sugars and aldehydes by breaking down solutions of bicarbonates and CO_2 in the presence of colloidal, reducing catalysts.]** *Rev. Industr. y Agric. Tucumán* 19(5/6): 154-159. 1928.—In solutions of bicarbonates the reducing power increases gradually on exposure to u.-v. until a maximum is reached (after 30 min. when exposed in an open vessel; after 1 hr. in a quartz receptacle with Ca-bicarbonate; and after 2 hrs. in a quartz receptacle with $KHCO_3$) then decreases rapidly; solutions of CO_2 obtained by bubbling it continually into distilled water show a constant increase in reducing power; the presence of colloidal reducing catalysts sensibly increases the reducing power of the solutions. Experiments performed under the same conditions in the presence and absence of catalysts, have given, in most cases, with the most active catalyst, an increase of triple or quadruple the maximum reducing power obtainable in solutions exposed to u.-v., without a catalyzer; the maximum yield, calculated in reducing substance in relation to CO_2 placed in reaction, is obtained with Ca-bicarbonate in the presence of very finely powdered metallic Mg.—*Author's summary (transl. by A. C. Hildreth).*

[Fluorescent plant materials in their relation to some photolytic phenomena.]** *Boll. R. Staz. Patol. Veg.* 8(4): 374-406. 1 col. pl., 1 fig. 1928.—Blue or violet fluorescent substances have been found in various groups of the higher and lower plants. In the phanerogams, no relation has been noted between resistance to intense and excessive illumination (eliophylic plants) and the presence of such fluorescent substances, which in some cases seem to be able to determine photolytic actions when the temp. is higher (45° C.) than ordinary. The fluorescent substances studied belong to the glucosides and fluoroglucotannoids

in the higher plants and to the anthracenes and hydroquinones in fungi.—*L. Petri (transl. by B. F. Lutman).*

6647. **WIGODER, SYLVIA B., and RUTH PATTEN. Some effects of Röntgen rays on seedlings.** *Proc. Roy. Irish Acad.* 39B(9/10): 146-155. 2 pl. 1929.—When dry seed of *Vicia faba*, barley, white mustard, timothy grass, and peas were irradiated with x-rays, the results were negative in every case. Seed were then soaked for short periods and afterwards irradiated, with negative results. Injurious effects, consisting mainly of failure to develop root or shoot, were obtained with bean seed kept in germinating conditions for 5-7 days and then irradiated for short periods. Maximum effect occurred with actively dividing cells in the last 4 mm. of the root tip. Mitosis greatly decreased 3 hrs. after irradiation and was almost entirely absent after 3 days. Cell division was often resumed after 5-8 days, when many abnormal multinucleate cells were observed.—*J. M. Arthur.*

TEMPERATURE RELATIONS

6648. **[ALEKSEEV, A. M.] АЛЕКСЕЕВ, А. М. К. вопросу о влиянии супрамаксимальных температур на растение. [The effect of high temperature on a fungus.]** [German summary.] Журнал Русского Ботанического Общества (*Jour. Soc. Bot. Russie* [*Leningrad*]) 14(3): 479-488. 1929(1930).—Studies are reported on the effect of high temp. (60-65° C.) on the germination of chlamydospores of *Ustilago panici miliacei* Wint. With short exposure, germination as high as 60% was obtained. The rapidity of germination (of single spores) was cut down, but the time during which germination goes on was lengthened. The relationship between the time of exposure to high temp. and the % of germination is expressed by Newton's formula as modified by Porodko, which is an empirical formula descriptive of the sigmoid curves obtained by plotting time of exposure at various temp. against the % of spores killed. $\log (J_\infty - J) = \log (J_\infty - J_0) - 0.4343k\ (Z - Z_0)$. Where Z is the time of heating, Z_0 the time required for the spores, after immersion, to reach the temp. of the water bath J=the % of dead spores after heating for the time Z, J_∞=the % of dead spores at infinitely long heating period, J_0= the % of spores which have died in the period Z_0, k is a constant, and e the base of the natural system of logarithms. A 2nd attempt was made to determine the effect of temp. on the energy of germination of the spores, using Porodko's modification $(Z_1/Z_2 = (t_2/t_1)^m$, where t=temp., z the time of heating, and m is a constant) of the formula of Harcourt and Esson. The formula, so modified, represents the temp. effect well; the mean value of m was 19.55. Spores heated even for a short time did not germinate in a normal manner.

6649. **BĚLEHRÁDEK, JAN. L'emploi de la formule D'Arrhénius en biologie, est-il justifié?** *Protoplasma* 5: 311-318. 2 fig. 1929.—The thermodynamic law of the velocity of chemical reactions in terms of temp. increase (the temp. coeff. Q_{10} of van't Hoff) having been established for homogeneous systems is not applicable to heterogeneous biological systems.—*W. Seifriz.*

6650. **BOOTH, E. G. Daily growth of the oat kernel and effect on germination of immaturity and controlled low temperatures.** *Minnesota Agric. Exp. Sta. Tech. Bull.* 62. 42p. 9 fig. 1929.—The progressive development of the kernels of Gopher oats was studied from pollination to maturity, and samples of Gopher, Victory, and Banner oats in the early milk to ripe stages were subjected to controlled low temp. at daily intervals. The average flowering period in panicles lasted about 8 days. Flowering progressed from the apex downward, so that the kernels in the lowest whorl were still in the late dough stage when apical kernels were ripe. The growth in length was more rapid during the first 6 days and then became more gradual until the maximum was attained on the 15th day. The width and thickness increased rapidly during the first 10 days and reached their maxima before growth in length ceased. The developmental period of the kernels studied continued for 15 days after pollination and ended when the glumes of the apical spikelet assumed a straw color. General ripening occurred in 2 days and was completed in 4 days, during which time the lemma and palea took on a uniform straw color and the moisture dropped from 41.5 to about 21%. The green wt. increased rapidly for 13 days, but after the 15th day a pronounced decline occurred. The dry wt. rose more gradually than green wt. until ripening began on the 15th day. The increase in dry matter during the ripening period was 3% of the maximum, and the loss when harvesting was delayed 2 days was 8.3%. The N increased rapidly during the first 10 days and the ash during the first 12 days. Thereafter the quantity of N in 20 kernels fluctuated considerably, and differences in the amount of ash were very slight. Exposure to controlled temp. (31-27° F. for 1-3 hrs.) apparently did not affect germination, whether the samples were cooled for 2 hrs. before the exposure or were placed in the chamber without precooling. The average germination in the laboratory increased materially and the field germination still more with the accumulation of dry matter in the kernels. The average germination in the laboratory exceeded that in the field. In general the laboratory germination of immature samples was relatively high and did not indicate reliably what field results might be. With mature samples the laboratory germination always averaged slightly higher than the field tests but was a reliable index of field germination. Immature kernels made low field germination, and the seedlings lacked vigor. Potted oats plants were particularly sensitive to low temp. soon after pollination but endured the cold better when nearing maturity. Exposure during the developmental period to a temp. of 31° for 1 hr. destroyed most of the green color in plants of Gopher oats.—*H. M. Steece (courtesy Exp. Sta. Rec.).*

6651. **GASSNER, G. Die experimentelle Bestimmung der Frosthärte von Getreidepflanzen.** *Züchter* 1(9): 257-264. 4 fig. 1929.—The underlying physical and chemical causes of winter hardiness are very complex, and breeding cold resistant plants is not a simple task. A simple cold resistance test during germination did not give a true index of what a plant may do in the field.—*F. V. Owen.*

6652. **GEDDES, W. F. Chemical and physico-chemical changes induced in wheat and wheat products by elevated temperatures. II.** *Canadian Jour. Res.* 2(1): 65-90. 1930.—Studies were conducted on heat-treated samples of unbleached straight-grade flour milled from Western Canadian hard red spring wheat with the purpose of determining the influence of time and temp. of heating flour with normal moisture content on certain biochemical properties related to "strength." Gluten quality was impaired in all heat-treated samples, as evidenced by decreased viscosity of leached, acidulated flour suspensions, a decreased rate and extent of imbibition of the washed out gluten, and decreased gas retention of the dough. Diastatic activity, as determined by the modified Rumsey method and by the rate of gas production in doughs without added sugar, revealed only slight decreases with those flours which showed improvement in baking quality due to heat treatment. Marked decreases were observed with the more severe heat treatments. Susceptibility of the starch to diastatic action was unaltered until marked damage to baking quality resulted, when significant decreases were noted. Heat inactivation of diastase evidently occurred before changes in amyloclastic susceptibility. Proteolytic activity markedly decreased with heat treatment, significant decreases being noted before diastatic activity was appreciably altered. The pH of flour extracts revealed no particular trend due to heat treatment, but the buffer value was somewhat increased. The biochemical changes investigated were, for the most part, in a direction associated with decreased baking quality, and provided no adequate explanation for the improvement in baking quality observed in certain samples when baked by the basic procedure.—*From author's abstract.*

6653. **HIORTH, GUNNAR. Ein Versuch über den Einfluss der Erwärmung des Pollens auf die Nachkommenschaft.** *Zeitschr. Indukt. Abstamm.- u. Vererb.* 56(1): 39-50. 1930.—The resistance of the pollen of *Antirrhinum majus* to heat was tested by subsequent germination experiments in gelatin-sugar solution and by pollination. The results of the 2 tests were in agreement. A few viable seed were obtained from pollen which had been maintained 8 days at 42°, 62 hrs. at 61°, 46 hrs. at 66.5°, 60 min. at 95°, and 17 min. at 102°. The exposure of pollen to adverse conditions (measured by the number of progeny per pollinated flower) led to an increase in number of variants in the progeny, especially when pollen had been maintained at 42° for 8 days or at 66.5° for 46 hrs. The variants were genetically unstable, but there was no increase in the frequency of gene mutations.—*Author's summary (transl. by H. S. Reed).*

6654. **THOMPSON, H. C. Influence of temperature on flowering in celery.** *Proc. Internat. Congress Plant Sci. Ithaca, N. Y. 1926* 2: 1070. 1929.—Of the various environmental factors influencing seeding of celery, temp. seems to have the most marked effect. Exposing the young plants to relatively low temp. in the cold frame (above freezing) for periods of 15-35 days resulted in the production of flowers and seed the 1st yr. Similar lots of plants kept in the greenhouse at an average temp. of 60° F. until time for planting in the field did not produce flowers. Results of other experiments carried on in the greenhouse, where the plants were grown to maturity, indicate that relatively high temp., averaging 70° F., prevented seeding regardless of the previous treatment. High temp. favored vegetative growth and prevented reproduction. If, however, flower stalks had started before the plants were subjected to high temp., flowering and seeding were hastened by the transfer from low or medium to high temp.

6655. **WARTENBERG, HANS. Zur Biologie der Kartoffel-III. Über die Wirkung der Kalidüngung auf die Frostempfindlichkeit der Kartoffelpflanze.** *Arb. Biol. Reichsanst. Land- u. Forstw.* 17(4): 377-384. 2 pl., 2 fig. 1929.—An attempt was made to check the assumption of Bolhuis that potash fertilization increases the hardiness of the potato. Hardiness may be considered as of 2 types, primary or innate, and secondary or induced. Increased hardiness induced by repeated exposure to cold changes the susceptibility relation which is primarily determined by potash fertilization, so that a demonstration of Bolhuis' results is possible.—*H. Wartenberg (transl. by W. B. Mack).*

6656. **WOOD, J. G. Physiological derangements in vines subsequent to injury by cold.** *Australian Jour. Exp. Biol. & Med. Sci.* 6(2): 103-106. 2 fig. 1929.—Sultana and currant vines in S. Australia after a "black frost" first showed a degeneration of the cambium owing to extensive oxidative metabolism resulting in the formation of poly-hydroxy benzenes. Subsequently air was admitted to the tracheids, which became functionless. Later still, when flower buds developed from the injured shoots, they all fell. Again, this was due to intense metabolism of tannins and phenols, causing death of the cells and isolation of the vascular tissues from the buds.—*J. G. Wood.*

TOXIC ACTION

6657. **COTTON, MARJORIE. Toxic effects of iodine and nickel on buckwheat grown in solution cultures.** *Bull. Torrey Bot. Club* 57(2): 127-140. 1930.—Buckwheat plants were grown in a solution containing KH_2PO_4, $Ca(NO_3)_2$, $MgSO_4$, and $FeSO_4$, and in a 2nd solution containing the following additional salts in low concentrations: $MnSO_4$ $ZnSO_4$, H_3BO_3, $Al_2(SO_4)_3$, NaCl, $Co(NO_3)_2$, $CuSO_4$, $LiNO_3$, KF. In the 1st experiment the plants also received a low concentration of $Ni(NO_3)_2$. KI was extremely injurious. Concentrations equalling 40.1 p.p.m. and 126.9 of I killed nearly all of the plants within 3 weeks. Marked depression of growth occurred at 1.27-12.7 p.p.m. Although weaker concentrations did not reduce growth, they had a toxic effect on the leaves. In all tested concentrations I induced on the leaves pale brown spots surrounded by a darker margin; it had no stimulative action. Ni appeared to be less harmful; concentrations of 5.87-58.68 p.p.m. were very toxic. In the stronger solutions the stems and leaves lost their turgidity and the young plants died within 2 weeks. At 5.87 p.p.m. most of the plants also died. The surviving plants were stunted; new leaves that developed were yellow and covered with minute brown spots, and brown lesions appeared on the stems. 1.88 p.p.m. caused spotting and chlorosis of leaves and depression of growth. In some cases 0.59 p.p.m. caused chlorosis without affecting growth. Weaker concentrations were neither toxic nor stimulative. Plants supplied with a full nutrient solution containing minute quantities of $MnSO_4$, $ZnSO_4$, H_3BO_3, $Al(SO_4)_3$, NaCl, $Co(NO_3)_2$, $CuSO_4$, $LiNO_3$, and KF made decidedly better growth than plants grown in a solution containing only the 3 main nutrient salts and Fe. A markedly higher yield was obtained from plants grown in a full nutrient solution than from those grown in good garden soil, under the same environment. Equal growth occurred in the soil and in a solution containing only the 3 main salts and Fe. Additional light caused plants in soil cultures to produce more flowers, but did not increase the yield of dry material.—*Author's summary.*

6663. **TRUE, RODNEY H. The toxicity of molecules and ions.** *Proc. Amer. Philosoph. Soc.* 69(4): 231-245. 1930.—The toxic equivalent of a substance is the least concentration of the substance that kills the roots of seedlings of *Lupinus albus* in 24 hrs. The toxic equivalents of a considerable number of salts and acids both organic and inorganic were determined; and when this physiological series dealing with ions was compared with atomic weights, speed of migration of ions, and solution tension no very close correspondence was found between physiological and physical values. It is suggested that toxicity being a property of concentration represents the results of an adaptation throughout evo-

lutionary history of plants to the soluble constituents of their environment, the toxic substances being in general those that have been rare in the form here offered and, therefore, not concerned with plants during their history. Different sp. of plant protoplasm are chemically different and have different toxic equivalents for given ions.—*R. H. True.*

ELECTRICAL PHENOMENA

6664. **HERČÍK, FERD. Die photoelektrischen Grundlagen der photokapillaren Reaktion.** *Protoplasma* 5: 400-411. 1929.—The attempt is made to interpret the photocapillary reaction of plant sap as a photoelectric phenomenon. Cataphoretic experiments support this. The surface tension of the colloidal micelle is raised or lowered by a greater or less charge caused by light.—*W. Seifriz.*

6665. **REMINGTON, ROE E. The high frequency Wheatstone bridge as a tool in cytological studies; with some observations on the resistance and capacity of the cells of the beet root.** *Protoplasma* 5: 338-399. 13 fig. 1929.—The literature of the subject of cell permeability has been reviewed, and the accepted idea as to the structure and properties of the plasma membrane discussed in detail. According to this conception, the membrane of the cell is a non-homogeneous film composed of lipoids and hydrophile colloids, lipoid-soluble and water-soluble substances being transferred across the membrane by different paths. Based on methods used in electrical engineering, a mathematical treatment of resistance and reactance is developed for electrolytes and for tissues or closely packed cells. The resistance values read off the bridge can truly represent those of the circuit within the electrolyte or tissue only when the configuration of resistances and condensers in the measuring arm is the same as that within the electrode vessel, and that neither the series nor parallel condenser method of balancing gives true values for the resistance. A number of measurements on slices of tissue of the beet root are reported, the average of which gives, for a single plasma membrane, a resistance of 32 ohms and capacity of 0.88 microfarad per cm.^{2} of membrane surface. On the assumptions that the membrane is a uniform dielectric of dielectric constant 10, and that the plates of the electrolytic condenser act like metal plates, the thickness of the plasma membrane is calculated at 100 Å, and the specific resistance of the membrane material at 3.2×10 ohms.—*Author's summary.*

6667. **ELFORD, WILLIAM JOSEPH. Structure in very permeable collodion gel films and its significance in filtration problems.** *Proc. Roy. Soc.* [*London*] *B* 106(743): 216-228. 1 pl. 1930.—Microscopic and ultramicroscopic studies were made on collodion membranes prepared from alcohol-ether solutions and from acetic acid solutions absorbed in filter paper. In structure the former were "ultragel films" of a permeability of 100 mμ or less, while the latter were "microgel films" of a permeability of 1-5 μ or less, with a much more variable pore size, which depends on the concentration of the nitro-cotton. The bearing of these observations on the general behavior of ultra filter membranes is discussed.—*J. M. Ort.*

6668. **FRIEDENWALD, JONAS S. The permeability of the lens capsule to water, dextrose and other sugars.** *Arch. Ophthalmol.* 4(3): 350-360. 1 fig. 1930.—The permeabilities of lens capsules from the eyes of adult cows, pigs, and rabbits are of the same order of magnitude. The permeability decreases with age and with increasing molecular wt. of the diffusing substances.—*From author's summary.*

6669. **HARPUDER, KARL. Über Diffusionsvorgänge an der menschlichen Haut.** *Zeitschr. Ges. Exp. Med.* 76 (5/6): 724-730. 1931.—Distilled water and various dilute solutions were applied by compresses to the inner forearm for 2 hr. periods. Analysis indicated an exchange of ions between skin and solution.

(Considerazioni sulla struttura chimico-fisica della cellula.) [Regulation of viscosity impeded by fertilization and increased viscosity following development in the egg of A. aequituberculata.]** *Pubbl. Staz. Zool. Napoli* 10(2): 197-230. 1 pl., 3 fig. 1930.—The viscosity of the unfertilized *Arbacia* egg increases with the rise in temp., the increase in viscosity is reversible for a time; but if the egg is fertilized then the increased viscosity may become irreversible. This phenomenon is clearly demonstrated by an increase in time of the first segmentation, by the different shape of the cells in the first "plasmodieresis" (cytoplasmic division), etc. Later the increase in viscosity is irreversible; the fertilized eggs show a very slow but normal development. In a 3rd period "oolysis" (cytolysis) was observed.—*M. Tirelli.*

ANIMAL PHYSIOLOGY

ELECTRICITY, X-RAY, RADIUM

(See also in this issue Entries 6191, 6203, 6379, 6638, 6640, 6664, 6665, 6942, 7063, 7069, 7175, 7246, 7259, 7459, 8245)

6674. **HELD, A. Die Blutzuckerregulation unter Röntgenstrahlen.** *Strahlentherapie* 38(1): 27-39. 1930.—A distinction is drawn between the general action of x-rays on blood sugar regulation, and their direct action on sugar transformation within the sphere of irradiation. Experiments involving re-injection of irradiated own blood show that the general action of rays on blood sugar regulation manifests itself as hyperglycemia, and is due to reaction products of the rays. Decreased pH transmineralization, and the denaturation products of albumin are some of the factors responsible for these general effects. The direct action of rays was studied in comparison of blood sugar of arterial capillaries and veins of irradiated and non-irradiated lower extremities. Muscle cells also may interfere with blood sugar regulation. In the absorption territory of the rays, hypoglycemia occurs; this is regarded as a direct reaction to the rays.—*Author's summary (transl. by P. M. Susk).*

6675. **HOED, D. den, and G. STOEL. Intensity measurements of radium rays.** [With English, French and German summaries.] *Acta Radiol.* 10(5): 442-461. 7 fig. 1929.—The advantages and disadvantages of the photographic method for measuring the intensity of radium rays, as compared with the ionometric method, are outlined. With the photographic method, it is possible to measure up to a very small distance from the source of rays with the ionometric method, measurements less than 2 cm. from the source are subject to errors due to the size of the ionometer and to the shortness of time of running down; the measurings can be made from point to point; the experiment is simple to set up; and the blackenings obtained have a documentary value. The disadvantages of the photographic method are: There are difficulties with applicators of a complicated shape; at a distance from the source of rays the duration of the measurings becomes very long; and the different operations (developing, determining and calculating of the blackenings) require considerable time. Care has to be taken in photographic measurings that the blackening is of sufficient strength, and that it is not larger than 1, otherwise there is no linear relation between blackening, time of exposure and intensity. The methods may be combined. Use of the photographic method for the first few cm. and the ionometric method for larger distances is recommended. The measurements done with this method indicate that the intensity in the deeper regions (in relation to that of the surface) may be increased by enlarging the field of irradiation, or by applying a distance filter between the Ra and the skin.—*From authors' summary.*

6676. **HOEHNE, HERMANN. Der Einfluss von Röntgenstrahlen verschiedener Wellenlänge auf den Cholesterinstoffwechsel.** *Arch. Gynäkol.* 146(1): 41-61. 1931.—Serum cholesterol was determined in irradiated patients immediately before and after irradiation and 1-3 times at 24-hr. intervals thereafter. Series I: 13 carcinoma-free, irradiated patients on hospital diet, 8 unirradiated controls; II, 6 carcinoma-free and 4 carcinomatous patients on a standard diet and relatively short wave length (hard) irradiation; III, 5 carcinomatous on standard diet and relatively long wave (soft) irradiation. A decrease in cholesterol usually occurred in carcinomatous, an increase in carcinoma-free patients, averaging ± 10.4% with hard rays, ± 22.2% with soft. Composition of the diet appeared to be of significance.

6677. **KNUDSON, ARTHUR, and PHILIP J. SCHAIBLE. The effect of exposure to an ultrahigh frequency field on growth and on reproduction in the white rat.** *Arch. Path.* 11(5): 723-727. 1931.—Exposure of 28 young rats for ½-1 hr. daily and raising their body temp. to 40.5° C. did not seem to retard growth. The reproductive organs were not appreciably affected nor was there loss in power to breed. Repeated exposures in which the body temp. was raised to 40.5° C. produced no abnormal lesions.

6678. **KNUDSON, ARTHUR, and PHILIP J. SCHAIBLE. Physiologic and biochemical changes resulting from exposure to an ultrahigh frequency field.** *Arch. Path.* 11(5): 728-743. 1 fig. 1931.—The body temp. of dogs could be raised to any desired point by exposure to an ultrahigh frequency field, returning to normal quite rapidly unless the animal had been heated above 42°C. Animals heated above 42.5°C. for any great length of time did not survive, although one animal heated momentarily to 44.5° survived. Exposure to an ultrahigh frequency resulted in loss of weight, dependent somewhat on the length and intensity of treatment. There was also a decrease in blood volume (up to 25%). The concentration of the blood was also evidenced by the increase in cell volume and hemoglobin. Weight and blood volume usually returned to normal within 24 hrs. Raising the temp. to 41.7° C. produced no great change in pH of the plasma, although there was a tendency toward alkalosis. With higher temp. the tendency was toward acidosis, apparently caused by great increase in the production of lactic acid, probably due to greatly increased tissue metabolism resulting in a tissue anoxemia. Changes in the chloride, total protein and total base were accounted for by the dehydration. Bicarbonate was greatly reduced, owing to excessive pulmonary ventilation with rise in body temp. Changes in inorganic P were somewhat variable, although with a maximum temp. to 41.7° there was a marked reduction. Blood non-protein N was generally increased; in some instances the increase was over 200%. Urea N, creatinine and amino-acid N were also increased. These increases were accounted for by the increased metabolism resulting from rise in temp. and the oliguria. Blood sugar increased in most experiments, in some cases 150%, the greatest increase occurring in experiments in which the pH had been lowered most. There was an increase in both red blood cells and total white cells; also, in many instances, a marked increase in immature forms of red cells, suggesting a stimulation of the hematopoietic tissues.

6679. **KÖHNLE, HANS. Die allgemeinen Grundlagen der Röntgenstereoskopie erläutert an Hand des Hasselwanderschen Stereoskiagraphen.** [The general bases of X-ray stereoscopy.] *Sitzungsber. Phys.-Med. Soc. Erlangen* 61: 221-278. 3 pl., 43 fig. 1929(1930).

6680. **LACASSAGNE, A. M. B., et G. GRICOUROFF. De l'action des radiations sur les leucocytes du sang, étudiée au moyen de la méthode des cultures.** *Arch. Exp. Zellforsch. bes. Gewebezücht. (Explantation)* 6: 303-315. 1928.—Cultures of rabbit leucocytes were irradiated with x-rays or with radon, and their survival was studied. X-rays and γ-rays did not prevent migration. β-rays killed them quickly. Filtered rays had no effect on polynuclears. The lymphocytes are more sensitive than the other leucocytes. The insensitive monocytes become macrophages. Leucopenia, observed after experimental or therapeutic irradiation, is due to lesions of the centers of leucocyte formation and the arrest of the production of new leucocytes, not to the destruction of the leucocytes in the circulating blood.—*A. M. B. Lacassagne (transl. by E. R. Gregory).*

6681. **LASER, HANS. Strahlenbiologische Untersuchungen an Gewebekulturen.** *Strahlentherapie* 38(3): 391-437. 1930.—Cultures of 18 yr. old Carrel chicken fibroblast strain, a 40 day old fibroblast strain in the 15th passage, chicken osteoblast cultures 3-5 mos. old, pure cultures of iris epithelium from chicken embryo at the

20th-30th passage, embryonic rat fibroblasts at the 9th passage, mouse carcinoma cultures (Ehrlich strain) which had been about 2 yrs. in the culture, and cultures of a rat sarcoma at about the 60th passage, were exposed to x-ray or radium (mesothorium), ½ the given culture being shielded as control. Sensitivity (shown by a retardation of growth) and latency bore a definite relation to speed of proliferation, for both malignant and normal cells. Cultures with experimentally determined growth velocity (in latent life) show, after a small irradiation, no change in their accustomed growth rate. After any irradiation which does not produce death, a gradual recovery occurs. Sometimes, but not regularly, one may observe a temporary (compensatory) growth increase of the irradiated cultures over the controls. By preliminary irradiation and immediate repeated transplantations,—on account of the regeneration being thus accelerated,—an increase in sensitivity can be produced. Repeated irradiation of an already irradiated culture, after a certain time, produces no further effect (immunity). The biological sensitivity of the cells, measured by the retardation of growth,—with regard to the direct effect,—corresponds with the product of the time and intensity of irradiation. Carcinoma cultures treated by irradiation followed by transplantation show an especially high sensitivity. The relationship thus established does not indicate a qualitative difference, but merely a quantitative one.—*E. H. Quimby.*

6682. MOPPETT, WARNFORD. Observations on the action of colloidal lead on an in vitro culture with reference to supplementary irradiation. *Med. Jour. Australia* 2(21): 690-692. 1930.—The γ rays from radium D reinforce the destructive action of colloidal lead on cultures of heart muscle from an 8-day chick embryo; mixed x-rays are without effect. This difference may be due to a time effect or to some specific selective action of the radiation. Possibly the atoms of the colloidal Pb become ionised and so pass more readily through the cell-membrane.—*W. Moppett.*

6683. POHLE, ERNST A., and C. H. BUNTING. Skin reactions following exposure to roentgen rays. I. A comparison of the effect of two different wave lengths on the skin of rats. *Radiology* 13(6): 496-503. 7 fig. 1929.—Exposure of the skin of rats in small fields on the back to x-rays of an effective wave length $\lambda = 0.61$ Å (60 K. V., no filter, measured through 2.0 Al) and of $\lambda = 2.0$ Å (7 K. V., no filter, measured through 0.1 Al), in doses of 4 times the average human erythema dose (2,400 r and 1,000 r, respectively) leads to the following reactions: The area treated by the radiation produced at 7 K. V. [apparently 60 is meant] shows a slight macroscopic ulcer between the 10th and 14th day following the exposure, which heals with a smooth scar after 2 mo.; the area treated by the radiation produced at 7 K. V. likewise shows a slight macroscopic reaction but the skin is in an atrophic condition 2 mo. following the exposure. There is no doubt as to the effect of these rays on the capillaries and on the hair follicles.—*From authors' conclusions.*

6684. REISNER, A. Biologische Versuche über die Wirkung der verschiedenen Strahlenmengen bestimmter Radiumpräparate auf die Haut. *Strahlentherapie* 38(1): 19-26. 2 col. pl. 5 fig. 1930.—The dose designated in literature as a skin bearable dose caused an intense inflammation (radiodermatitis of 3rd degree). The overdosage amounted to about 40%. A second series of irradiations with correspondingly lowered doses gave the skin reaction answering the conception of HED. For the tubelet-preparation used, the skin bearable dose was about 310-330 with exposure at 1 cm. distance and about 60 mgeh on immediate contact over skin. The difference in skin responses after exposure to hard x-rays and radium rays is discussed. In comparison of x-rays and radium the doses must be evaluated on the basis of resulting skin change.—*P. M. Suski.*

6685. SCHUBERT, MARTIN. Biologische Röntgenstrahlenwirkung, ihre Erforschung mittels der Gewebeexplantationsmethode. *Strahlentherapie* 26(3): 425-471. 16 fig. 1927.—Explants of the heart of chick embryos 9 days old, on having been radiated in the eggs with 10 HED without filter, grew for 3-4 days if explanted immediately after the radiation. If explanted 4 hrs. after irradiation, growth does not occur. By washing in Ringers solution the inhibition of growth can be prevented in explantations made 2 hrs. after irradiation. The embryos left in the eggs were dead 3 days after irradiation. Cultures irradiated in vitro showed no inhibition in growth. The experiments confirm the works of Krontowsky. Embryonal extracts of the irradiated embryos, taken 4 hrs. after irradiation, produced a slight inhibition of growth when added to the tissue cultures; if taken 24 hrs. afterwards, they completely inhibited the growth in the cultures. The same results are caused by extracts of frozen chick embryos, an indication that the effect is not specific for x-rays. In both cases the pH of the embryonal extract is shifted to the acid side. Grenz rays (a dose of 1½ HED) caused the same effects. The inhibition of growth is supposed to be due to a primary damage of cells in the egg. This damage causes, secondarily, poisonous decomposition products which pass into the embryonal extracts. The death of the cultures to which embryonal extract irradiated in ovo has been added is believed to be due to a change of the permeability of cells after the x-ray treatment in vitro. This change in permeability is supposed to be ineffective in the case of cultures irradiated in vitro because the embryonal extract in this case originates from normal animals.—*F. Freund.*

6686. SPERTI, GEORGE, and ROBERT J. NORRIS. Theoretical and experimental investigation of the excitation of corpuscular, atomic, and molecular radiations in tumor tissue. *Bull. Basic Sci. Res.* [*Univ. Cincinnati*] 2(1): 11-31. 6 fig. 1928.—In the x-ray treatment of cancer, the part of the absorbed energy responsible for a cure is shown to be probably that energy which is changed to fluorescent radiations and photo-electrons. For every depth and thickness of tumor there exists an optimum band of wave-lengths within which treatments should be given. The absorption of energy by the tumor during x-ray treatment can be increased by injection of elements of such atomic numbers that characteristic radiations, and photo-electrons, or β particles, are emitted in the tumor itself. Only a limited number of possible combinations of elements with radiations of specific wave-length will in general produce the desired results. The lethal dose of x-rays for a transplantable mouse sarcoma in vitro at 150 peak K.V., 20 M.A., 19″ skin target distance is 40 min. without CsI_2 and 30 min. with CsI_2 (2 mgm. per gm. body wt.). This action is due to one or more of the following factors: characteristic radiation of relatively long wave-length, fluorescent radiation in the ultra-violet region when excited by x-rays, emission and subsequent absorption of photo-electrons. The dose of x-rays required to kill a given tumor is independent of the age of the tumor and is the same for all mice.—*J. L. Cameron.*

6687. WIESER, WOLFGANG von. Röntgentherapie des Schwachsinnes bei Kindern. *Radiologische Praktika-Band* 10. 266p. 85 fig., Otto Nemnich Verlag: Kempton i. A, Germany. 1928.—This book presents a summary of 5 yrs. effort in studying, classifying, and treating roentgenologically various types of mentally deficient children. The material consisted of 719 afflicted children and 361 adults, and of these, 571 children and 217 adults were subjected to treatment and observation for varying periods of time. In addition, 1500 normal children were studied in establishing the boundaries of normalcy. Roentgentherapy was at first directed only to the pituitary glands, but later the frontal, occipital and parietal regions, as well as the thyroid, thymus, kidneys, tonsils, spinal cord and genitalia were also exposed to radiation. In certain instances this was supplemented by the feeding of appropriate endocrine glands, which often seemed to hasten the appearance and prolong the beneficial effects of irradiation. Beneficial effects of roentgentherapy were observed in the following types

of cases (classified according to Ziehen): Psychoses with intelligence defect, such as Mongolian and microcephalic idiocy, dementia epileptica, and focal degenerative processes, such as those following meningitis, encephalitis, syphilis, hemiplegia, dementia praecox, etc.; psychoses without intelligence defect, such as those due to epilepsy, periodic mania, kleptomania, pyromania, and psychopathic constitution; and disturbances of physical development with normal intelligence, e.g., dwarfism and chondrodystrophy. Perhaps the best results of all were seen in Mongolian idiocy, a condition hitherto regarded as almost entirely intractable to treatment. Improvement of children with mental deficiency associated with hypofunction of the genital, thyroid, and other endocrine glands was only slightly less satisfactory. The book contains a discussion of the theoretical grounds for roentgentherapy, description of the exact technique followed, and numerous illustrations to show the effects of therapy.—*T. C. Hempelmann.*

6688. WOSKRESSENSKY, N. M. Ueber die Wirkung der Roentgenbestrahlung auf das embryonale Wachstum. *Zeitschr. Wissenschaft. Biol. Abt. D. Roux' Arch. Entwicklungsmech. Organ.* 113(3): 447-461. 5 fig. 1928.—Studies of the biological effects with various doses of x-rays and the effects which may depend on the age of the growing organism are reported, using axolotl embryos and larvae of *Drosophila melanogaster*. From a chart of the results one may predict the time of death of the radiated embryo after each given dose at a certain age. It is concluded that sensitivity of the growing organism to radiation decreases with age according to a hyperbolic function; that the decrease of sensitivity is synchronous with the decrease of velocity of the growth; and that variations in the curve of decrease of sensitivity between *Drosophila* and axolotl are caused by differences in the type of growth and in the processes of cell division in the 2 objects.—*N. M. Woskressensky (transl. by O. Glasser).*

6689. ALEXEEFF, A. I., und K. I. RUSSINOWA. Über die Einwirkung der physikalischen Faktoren auf die Katalase des Blutes. II. Die Einwirkung einiger physiko-therapeutischer Prozeduren auf die Katalase des Blutes. *Biochem. Zeitschr.* 231(4/6): 460-471. 1931.—Studies on 71 men showed that there may be a ± 3% variation in catalase under normal conditions in the course of 40 min. and as much as +4.6% in 8 men in the course of 2 hrs. after taking food. In 17 men the percent of variation was from +1.9% to −17.9% after 45 min. to 1 hr. of exercise (volley ball). Following a 10-15 min. full length bath (40 men) at 38-41° (high temp.) a 6.9-23.6% decrease appeared; no significant change in the bath at 33-35° or after a CO_2 bath. Baths at a temp. of 22° at 2.5 atmospheres pressure for 25-30 sec. showed no immediate significant change but after 30 min. a 7.7-18.8% decrease in 14 men. Electric baths (8 men) at 32-50° produced a decrease of 4.8-20.0%; air baths (11 men) at 21.2-23.1° produced no change. Thus under the same conditions the blood catalase remains fairly constant, food and light exercise have little effect on it, but temp. has a pronounced effect—the higher the temp., the lower the catalase action of the blood.

6690. ANSELMINO, KARL JULIUS, und FRIEDRICH HOFFMANN. Vergleichende Untersuchungen über osmotische Resistenz und Permeabilität der roten Blutkörperchen von Mutter und Kind. *Arch. Gynäkol.* 142(3): 649-661. 1930.—It is proven by the method of partial hemolysis, that in the blood of the new-born a part of the corpuscles (40-50%) are osmotically less resistant, and another and greater part (50-60%) more resistant than those of the mother. The range of osmotic resistance in the child is increased to 3 or 3.25 atmospheres, whereas that of the mother, outside of pregnancy, does not exceed the physiological limit of 2 atmospheres. From the observation that a relatively large number of the corpuscles of the child have a lowered resistance, it is concluded that this condition favors an increased destruction of blood in the newborn. Corpuscles of mother and child differ also in that the lipid phase (which, together with the protein phase forms the mosaic structure of the cell membrane, the function of which in permeability is briefly discussed) of the new born is more permeable, as shown by experiments with pentose and hexose sugars. Similar experiments with substances which penetrate by means of the hydrophile phase, show that there is no difference in permeability in the protein phase in the 2 cases.—*Authors' summary (transl. by R. E. Remington).*

6691. BACH, E., und L. LUSZTIG. Lipaseuntersuchungen am Leichenmaterial. *Virchow's Arch. Path. Anat. u. Physiol.* 280(1): 325-339. 1931.—The lipase of the serum was determined in 107, and of the spinal fluid in 76 unselected cadavers. Serum determinations were made in some cases 2-3 days before, and a few hrs. after death; the variations were within the limits of error. No variations were found in determinations 6-12-24 hrs. after death. Usually increase in serum lipase was paralleled in the spinal fluid. The lipase content of the serum varied with the condition of the patient, high in obese, and low in thin patients, below normal in cachectic. In acute tuberculosis it was apt to be increased, in the chronic type tending to caseation it was low or absent. It usually decreased following uremic conditions. Following acute, febrile conditions it was usually high, frequently many times normal values.

6692. BANUS, M. GARCIA, L. N. KATZ, and J. W. MULL. Observations on the rôle of tissues in maintaining the acid-base equilibrium of the blood. III. Further studies on the hind-leg preparation. *Amer. Jour. Physiol.* 91(1): 150-156. 1929.—The finding is confirmed that the perfusion of blood acidified with HCl through a hind-leg preparation of a dog tends to restore the acid-base equilibrium of the blood toward normal. It is shown that the increase in CO_2 combining power (and pH) of the blood may be explained by a migration of chloride from the blood to some tissues in the hind-leg preparation. Perfusing acidified blood through bone tissue causes no outpouring of red blood cells from its marrow, nor any significant liberation of Ca under the conditions of the experiments.—*Authors' summary.*

6693. BAYLISS, L. E., and A. R. FEE. Studies in water diuresis. IV. The changes in the concentration of electrolytes and colloids in the plasma of decerebrate dogs produced by the ingestion of water. *Jour. Physiol.* 70(1): 60-66. 1 fig. 1930.—Having shown in an earlier paper of this series that a true flood diuresis could be produced in decerebrate dogs not only as a result of the absorption of water from the alimentary canal, but also as a result of the injection of 0.6% NaCl intravenously, the

authors undertook a re-examination of the concentration of the blood plasma in these circumstances. The 11 dogs, including 2 controls, were anesthetized with chloroform and ether, both carotids tied and cannulated, 1 for measurement of the blood-pressure, and the other for obtaining the blood samples; both ureters were then cannulated extra-peritoneally (in ♂ animals) or a catheter passed (in ♀ animals); and, usually, a central incision was made in the abdominal wall, and a loose ligature passed round a loop of small intestine (usually duodenum), so that it could be brought to the surface for the insertion of the large needle used to introduce water. (In some cases water, with a little $NaHCO_3$, was given by stomach tube.) Decerebration was then performed. In the 2 controls no water was introduced, blood samples being taken at intervals. Variations up to 3% in electrolyte concentration and possibly 10% in the colloid concentration occurred, owing partly to experimental inaccuracy and partly to mobilization of fluid due to loss of blood. In every experiment in which water was introduced the colloids became more dilute as a result of the ingestion of water, and the magnitude of this dilution was approximately that which would be expected if the extra water had been uniformly distributed throughout the body. The concentration of the electrolytes, on the other hand, remained constant, within the limits of experimental error in 4 experiments, while in the remaining 3 experiments the change was definitely less than that of the colloids. In 2 experiments 0.6% NaCl was injected intravenously at a rate of 300 cc. per hr. In both of these dilution of the plasma colloids took place, the magnitude of which was approximately that expected.

6694. BENHAMOU, ED., et A. NOUCHY. La leucocytose adrénalinique. *Jour. Physiol. et Path. Gén.* 29(1): 7-37. 16 fig. 1931.—Unlike adrenalin erythrocytosis, which is related to splenic contraction, the leucocytosis due to adrenalin gives no guide to splenic behavior in man. It is not consistently and significantly affected by splenectomy or diseases involving the spleen, and seems to be a defensive reaction involving the entire blood rather than the mere emptying of a local reservoir.—*W. R. Fearon.*

Med.* 49(4): 603-614. 1929.—Attempts have been made in dogs to lower the serum chlorides by means of various procedures. Of these the withholding of food, anoxemia, tissue destruction, anaphylactic shock, leucocytosis, and fever yielded negative results. Ingestion of large amounts of water lowered the chloride level independently of body temp. The chloride drop under these circumstances could not be accounted for by excretion and appeared to run parallel with an increase in the serum water content. Experimental pneumococcus infection in 2 animals reduced the serum chloride concentration.—*Authors' summary and conclusions.*

Tropen-Hyg.* 34(11): 608-612. 1930.—The average Na, Cl, phosphate, sulphate, rest-N and sugar of the blood in the tropics were within normal limits, but the heavy perspiration reduced the K and Ca ions in the blood (number of observations not stated).

6699. BURNS, E. L., F. H. SCHARLES, and L. F. AITKEN. The effect of mixtures of tissue extracts and blood sera of various animals on the coagulation of blood. *Amer. Jour. Physiol.* 97(2): 233-242. 1931.—Experiments in incubation of various blood sera and kidney extracts produce the following effects on coagulation of dog heparinized plasma: (a) marked inhibition of clotting preceded in some cases by acceleration; (b) marked acceleration of clotting. Evidence points to the development of 2 substances in mixtures of serum and extract, one causing inhibition and the other acceleration of coagulation; both form through combinations of precursor substances in blood sera and tissue extracts. Accelerating and inhibiting precursor substances are both present in all sera and extracts tested, but they vary in amount or activity in different species. The effect of the mixtures on coagulation is the resultant action of these 2 substances. There is evidence of a specific adaptation between both accelerating and inhibiting substances. The inhibiting precursor substances tend to disappear in the blood serum of P-poisoned dogs.—*Authors' summary.*

Argentina Biol.* 6(9/10): 560-570. 1930.—In 13 cases it diminished, in 2 it increased and in 1 no variation was observed.—*J. T. Lewis.*

6701. CIACCIO, IVAN. Comportamento dei fosfati e del glucosio del sangue di cani normali e di cani deficienti di tessuto adrenalogeno per azione del bagno freddo. [P and glucose content of blood in normal dogs and in dogs with adrenal deficiency following cold baths.] *Boll. Soc. Ital. Biol. Sperim.* 5(6): 997-1001. 1930.—Following cold baths a marked increase of blood glucose occurred at first with a fall of body temp.; later a rise of temp. was accompanied by a decrease of the glucose content. The increased glucose was accompanied by an increase in inorganic P, the latter being of various amount compared with the first. The total P content of the blood was also increased.—*M. Comel.*

6702. CONDORELLI, LUIGI. Ricerche sulla pressione osmotica del sangue in alcuni pesci del Golfo di Napoli. *Boll. Soc. Ital. Biol. Sper.* 3(2): 197-203. 1928.—Quantitative analysis of the urine of the goosefish, *Lophius piscatorius,* shows it is always hypotonic with respect to the blood. Similarly the urine, lymph, sarcoplasm, bile, intestinal content and blood have always an osmotic pressure much lower than that of the water in the Bay of Naples. Therefore the membranes separating the fish from the surrounding water have a selective function permitting to pass into the fish a solution significantly hypotonic with respect to sea water. The osmotic pressure of the blood of teleosts living in different seas is independent of that of the water in such seas—it is practically constant.—*L. Condorelli (transl. by J. G. Edwards).*

6703. CONKLIN, RUTH E. The formation and circulation of lymph in the frog. I. The rate of lymph production. II. Blood volume and pressure. III. The permeability of the capillaries to protein. *Amer. Jour. Physiol.* 95(1): 79-90. 2 fig.; 91-97; 98-110. 1930.—I. In 33 urethanized and 30 curarized frogs and 4 in which the lymph hearts were cauterized lymph was collected and fluid shown to be lost from the blood at a rapid but variable rate, according to the circulatory condition of the frog. During edema caused by stoppage of the lymph hearts induced by curarization in 6 frogs gains in weight of 16-28% were made in 6 hrs.; in 6 frogs in which urethane was added to the curare the increase was 10-32%, the urethane not having the expected effect of increasing the lymph flow. Fluid injected into the circulation did not remain long in the blood vessels. In 6 frogs 1 gastrocnemius was removed from each and weighed, the frog intravenously injected with 10 cc. Ringer's solution, and later the other gastrocnemius removed and weighed. In each case the 2nd gastrocnemius had gained slightly in weight. The muscles being thus shown not to be the chief depot for water, comparative weighing experiments were made on all organs of 22 injected and 62 uninjected frogs; the skin was found to be the only tissue absorbing any amount of fluid. Hence it was inferred that the skin vessels were more

permeable to fluid than other vessels.—II. A new method is here described for determining blood volume in the frog. This method is a micromodification of the dye injection method, and does not require the immediate sacrifice of the animal. The values obtained by this method are higher than those reported by earlier observers. The average blood volume is 8.74% of the body weight. A method is described for the direct observation of blood pressure in the anterior tibial artery of the frog. Initial values for blood pressure varied in 9 cases from 14.8 to 42.0 cm. of water. When blood pressure is watched for several hrs. it is maintained in quiescent frogs at practically the initial level. Exercise causes an immediate rise in blood pressure, with a rapid readjustment to the former level, due to transudation of fluid. Blood volume and pressure are mutually dependent and intimately related to the formation of lymph. Increase in blood pressure brought on by activity concentrates the blood, forcing more fluid out of the capillaries, and so increasing the flow of lymph. Quick return of lymph to the blood is provided for by the lymph hearts.—III. Capillaries of the frog's skin are normally permeable to protein, but this substance, once it has left the capillaries, does not return through their walls, but takes the lymphatic route, passing through the lymph sacs, and eventually being returned to the blood by the lymph hearts. Experimental proof is offered as follows: (1) Lymph normally contains fibrinogen, albumins and globulins, the proteins of the plasma. (2) The plasma proteins may be almost entirely washed out of the blood by injecting large amounts of Ringer's solution into the circulation of curarized frogs. The lymph hearts are stopped by the curare, and the lymph is drained off through cannulas inserted under the skin. The percentage of protein in the lymph rises quickly, then falls slowly as the blood is depleted. At the end of the experiment both blood plasma and lymph are vary low in protein. Foreign proteins injected into the circulation pass through the skin capillaries and may be recovered in the lymph. Hemoglobin and hemocyanin pass through with relative ease, while egg albumin and gelatin will pass through only after the capillaries have been rendered abnormally permeable by injection of Ringer's solution. The latter is also true of colloidal carbohydrates. The integrity of the lymphatic system is essential to the frog, because of its important circulatory function in returning protein to the blood.

6704. CURTIS, GEORGE M., and A. BRUNSCHWIG. The permeability of the synovial membranes. *Proc. Soc. Exp. Biol. & Med.* 27 (5) : 358-360. 1930.—In experiments on 5 ♂ patients with effusion of the knee joint (4 traumatic, 1 chronic multiple arthritis, *Streptococcus viridans* being present in the effusion fluid), effusion fluid was withdrawn with a bored needle, and phenolsulphonephthalein was injected; withdrawal of urine through a catheter gave indication of phenolsulphonephthalein in the urine after 9-13½ min. (ave. 11½ min.) a longer lag than is usual with intravenous or intramuscular injections of phenolsulphonephthalein. By a similar technique, the times elapsing before appearance of P. S. P. in urine after its passage through the tunica vaginalis (10-12 hrs.); peritoneum (2nd hr.); pleura (2nd hr.); synovial bursa; and synovial tendon sheath (15 min.) were compared.

6705. DELAVILLE, MAURICE, et PAUL TCHERNIAKOFSKY. Variations de l'équilibre acido-basique du sang en relation avec un rythme paradoxal de fatigue. *Compt. Rend. Soc. Biol.* 100 (14) : 1179-1180. 1929.—Cases (9) in which morning fatigue decreased progressively throughout the day showed a simultaneous decrease in the alkaline reserve. The authors conclude that alkalosis is responsible for fatigue.

6706. DENNIG, H., J. H. TALBOTT, H. T. EDWARDS and D. B. DILL. Effect of acidosis and alkalosis upon capacity for work. *Jour. Clin. Investigation* 9 (4) : 601-613. 1931.—In view of the complications associated with exercising a sick man the authors established acidosis in a normal man by NH_4Cl administration and studied his performance while normal, while in acidosis, and while in the alkalosis subsequent to withdrawing NH_4Cl. The buffer value of blood proteins is reduced 1/9 or more with a decrease of 1/2 in carbonic acid capacity. Owing to this effect as well as to decrease in carbonic acid capacity, the ability to neutralize lactic acid and hence to accumulate an O debt is greatly curtailed when one begins exercise in a state of acidosis. Inferentially, the ability to accumulate an O debt is increased by establishing a state of alkalosis before beginning exercise.

6707. DETRE, LADISLAUS, und IMRE ZARDAY. Über die Pathogenese der Arbeitserythrocytose. (Neue Beiträge zur Frage der symptomatischen Polycythaemien.) *Zeitschr. Klin. Med.* 114 (3) : 379-387. 1930.—Reports and recent investigations (on 8 dogs, 2 humans) have established that acidosis causes an erythrocytosis in the circulating blood. Since with muscular activity acidosis occurs as well as erythrocytosis, it is suggested that work erythrocytosis is an acid-erythrocytosis. Work erythrocytosis accompanies acidosis in man as well as in animals. On the basis of the well known part which the spleen plays in work erythrocytosis, it can be assumed, that acidosis is one factor in the causation of splenic contraction.—*Author's summary (transl. by M. Lederer).*

6708. DIRKEN, M. N. J., and H. W. MOOK. The carriage of carbon dioxide by blood. *Jour. Physiol.* 70 (4) : 373-384. 5 fig. 1930.—An apparatus is described with which it is possible to measure either the pH or CO_2 tension of a fluid after CO_2 has been added at various moments up to about 4 sec. The reaction of acids with phosphate solutions is found to be very rapid, whereas anhydrous CO_2 reacts very slowly. This suggests that the hydration of CO_2 is responsible for the retardation. In the same sense the dehydration of H_2CO_3, although much more rapid than its reverse reaction, must be regarded as slow, as can be deduced by comparing the velocity with which acids combine with bicarbonate and phosphate. If hemoglobin is present anhydrous CO_2 disappears from the fluid just as rapidly as any acid. From this it is concluded either that there must exist some direct combination of anhydrous CO_2 with hemoglobin as suggested by Henriques, or else that a catalytic acceleration of the reaction $CO_2 + H_2O \rightarrow H_2CO_3$ by hemoglobin occurs.—*Authors' summary.*

6709. DJURICIC, ILIJA. Glucose et résistance globulaire. *Compt. Rend. Soc. Biol.* 100 (14) : 1222-1223. 1929.—Glucose exercised a protective action on blood corpuscles in hypotonic solutions, or in isotonic solutions to which had been added hemolyzing agents which attack the protein colloids. No such action was manifested against those agents which attacked the lipid colloids (saponin). The author concludes that hemolysis by hypertonic solutions is in part due to a change in the protein colloids of the surface of the cell.

6710. DJURICIC, ILIJA. Glucose et normo-hémolysine. *Compt. Rend. Soc. Biol.* 100 (14) : 1224-1225. 1929.—Glucose exercises no protective action against normal hemolysin (rabbit corpuscles and beef serum). The author concludes that normal hemolysin does not act against the colloidal proteins of the surface of the corpuscle.

6711. DÖRLE, M. Über die Einwirkung von Muskelbewegung und Andrenalin-injektion und Reizung mit mittleren galvanischen und faradischen Strömen auf den Blutzuckerspiegel. *Zeitschr. Ges. Exp. Med.* 69 (1/2) : 242-254. 1929.—Vagotonic patients (asthmatics) showed fall of blood sugar level following muscular exertion or adrenaline injection; sympathicotonic patient (thyroid poisoning, Graves' disease) showed rise. Several cases with abnormal blood sugar level (diabetes mellitus, arsenic poisoning) showed rise. Excitation of vegetative nervous system in rabbits by electric current caused rise in blood sugar; in one case marked fall. Sugar was determined as total reducing substances in blood. Alterations in blood pressure, corresponding to but not parallel with changes in sugar content, were observed in all cases. Author's explanation is that sugar

content and pressure of blood depend on cell and nerve tone, this on the adrenal system, the latter on the vegetative nervous system.—*R. J. Doyle.*

6712. **ETTISCH, G., und H. SACHSSE. Zur Frage der chemischen Selbständigkeit der Serumproteine.** *Biochem. Zeitschr.* 230(1/3): 129-135. 1931.—By the authors' method of affinity determination of protein for Cu it was found that euglobulin when 1/3 saturated with $(NH_4)_2SO_4$ agreed with the globulin fraction in electrodialysis. The paraglobulin which was precipitated on half saturation with $(NH_4)_2SO_4$ was to be regarded as a chemical entity. It occupied a well characterized position between globulin and albumin.—*From authors' summary (transl.).*

6713. **FISHBERG, ELLA H. The rate of disappearance of foreign sugar from the blood stream.** *Jour. Biol. Chem.* 86(2): 665-670. 1930.—The monomolecular reaction velocity equation is found to apply to the rate of disappearance of foreign sugars injected into the blood stream of rabbits. It is thus possible to determine the concentration of the non-fermentable reducing substance at any time in the blood when its concentration at any definite time is known, since the logarithm of the concentration of the foreign sugar at any time is proportional to the time after injection.—*Author's summary.*

6714. **FOLIN, OTTO, and ANDREA SVEDBERG. Diffusible non-protein constituents of blood and their distribution between plasma and corpuscles.** *Jour. Biol. Chem.* 88(3): 715-728. 1930.—The average ratio of the amount of sugar in the corpuscles of normal human blood to that in the plasma was about 60: 100. For diabetic blood this ratio was about 69: 100. This ratio for urea and for creatinine was about 80: 100, which ratio signifies equal concentration in the water of the plasma and of the cells. The ratio for uric acid is about 22: 100. Contrary to previous beliefs, the diffusible amino acid N was much more abundant in the plasma than in the intact corpuscles. All of the analyses show that unlaked blood is more useful than laked blood in clinical applications of blood analysis.—*H. C. Koser.*

6715. **FONTÈS, GEORGES, et LUCIEN THIVOLLE. Identité du taux glucidique dans le plasma vivant et dans le plasma fluoré a 2 p./1,000.** *Compt. Rend. Soc. Biol.* 100(14): 1196-1197. 1929.—The glucose content is the same for fluorated as for living plasma. Exchange between corpuscles and plasma cannot take place instantaneously, and it is on the plasma only that the determination of free blood glucose should be made.

6716. **FONTÈS, GEORGES, et LUCIEN THIVOLLE.** La perméabilité des hématies aux glucides plasmatiques. *Compt. Rend. Soc. Biol.* 100(14): 1198-1199. 1929.—Experiments with prolonged induced hyperglycemia in 9 dogs indicated that the corpuscles are slowly permeable to glucides. Epinephrine appeared to aid in the establishment of an equilibrium between the plasma and corpuscle glucides. The authors conclude that the difference in the permeability of red corpuscles to glucides, which exists between man and other vertebrates, is merely one of degree.

6717. **FONTÈS, GEORGES, et LUCIEN THIVOLLE. L'action hyperglucidémiante de l'adrénaline.** *Compt. Rend. Soc. Biol.* 100(14): 1200-1202. 1929.—The blood contains, besides glucose, a saccharoid which the authors name "glucide X." The latter fraction is increased in relatively greater quantities than the glucose following the injection of adrenalin, which, then, is said to exercise a hyperglucidemic power. Morphine and ligation of the portal vein cause an increase in the glucose, but none in "glucide X"; therefore their action is considered as hyperglycemic. This "glucide X" is immediately utilized by yeast and is precipitated by $Hg(NO_3)_2$.

6718. **FONTES, G., et L. THIVOLLE. Sur la validité des chiffres de la glucidémie immédiatement réductrice. VI. La différence de pouvoir réducteur obtenue, par molybdomanganimétrie, entre les filtrats des défécations tungstique et mercurielle du sang est due à un glucide. (Seconde preuve.)** *Bull. Soc. Chim. Biol.* 12: 264-270. 1930.—Adrenaline increased the difference in the reducing power between tungstic acid and mercurial deproteinized blood filtrates, and this difference exceeded considerably any possible experimental errors. The reducing agent which produces the difference in reducing power between the two filtrates is of saccharoid nature of unknown constitution and will be called "glucide X." It is present in all blood, entirely utilized by yeast and is augmented by adrenaline. The increase in "glucide X" by adrenaline is greater in plasma than in whole blood.—*E. G. Schmidt.*

6719. **FORBES, W. H. [et al.]. The equilibrium between oxygen and haemoglobin. I. W. H. FORBES, and F. J. W. ROUGHTON. The oxygen dissociation curve of dilute blood solutions. II. W. H. FORBES. The oxygen dissociation curves of dilute solutions of horse haemoglobin.** *Jour. Physiol.* 71(3): 229-260, 261-267. 1931.—I. Two independent gas analysis methods were developed for studying the O dissociation curves of dilute blood or hemoglobin solutions: (1) a modification of the Van Slyke-Neill technique; (2) a method depending on the manipulation and analysis of gas phases, carried out by the Haldane method, so modified as to measure O pressures to within 0.002-0.001 atmosphere. Both methods give an accuracy of about 1% oxyhemoglobin when applied to blood solutions of hemoglobin content equal to 1/30-1/50 that of whole blood. The 2 methods also check satisfactorily with one another. When applied to diluted sheep's blood solutions, pH 7.8-9.3, temp. about 20° C., both methods give definitely S-shaped dissociation curves. These are interpreted on Adair's intermediate compound hypothesis, in connection with which various theoretical aspects are discussed.—II. Solutions of 0.5% purified horse hemoglobin in a 1% borate buffer solution of pH 9.1 gave S-shaped curves in all cases except 1, in which putrefaction was beginning. There was evidence in all cases of a slight inconstant amt. of denaturation. Variations in dilution between 0.32 and 0.94% had no effect on the points on the curves.—*Authors' summaries.*

6720. **FREMONT-SMITH, FRANK [et al.] The equilibrium between cerebrospinal fluid and blood plasma. I. FREMONT-SMITH, FRANK, MARY ELIZABETH DAILEY, H. HOUSTON MERRITT, MARGARET P. CARROLL, and GILES W. THOMAS. The composition of the human cerebrospinal fluid and blood plasma. II. FREMONT-SMITH, FRANK, MARY ELIZABETH DAILEY, H. HOUSTON MERRITT, and MARGARET P. CARROLL. The composition of the human cerebrospinal fluid and blood plasma in meningitis.** *Arch. Neurol. and Psych.* 25(6): 1271-1289, 1290-1296. 1931.—I. Data are presented on 240 simultaneous samples of venous blood plasma or serum and cerebrospinal fluid. The cerebrospinal fluid of human beings is in osmotic equilibrium with the blood plasma and has a constancy of composition as great as that of the blood plasma.—II. Study of the sugar, nonprotein N, chloride and protein in 89 parallel samples of blood plasma or serum and cerebrospinal fluid from 50 patients, aged 2½-65 yrs., showed that the principal changes in the chemistry of the spinal fluid characteristic of all forms of acute meningitis, including tuberculous and acute syphilitic meningitis, were: (a) increase in cells and protein; (b) decrease in sugar and chlorides. In addition, in the few cases in which the authors studied P and Ca, they, like Cohen, found an increase in these substances. They also observed a decrease in Na in a few cases. In the blood plasma the sugar was frequently increased, even though the patient may have been fasting; this increase (in marked contrast to the decrease in the sugar in the spinal fluid) is striking evidence that the diminution of sugar in the spinal fluid is due to a local breaking down of sugar. The chlorides in the blood plasma were nearly always decreased, and this decrease accounts in large part for the decrease in the chlorides in the spinal fluid in the majority of cases, as pointed out previously. These values for Na, Ca and P in the serum were usually below normal. The protein in the serum varied greatly in these

cases, but in the majority it was within the normal range.

6721. **GARSIDE, EARL.** Effect of complete biliary fistula on blood cholesterol. *Proc. Soc. Exp. Biol. & Med.* 28(3): 336-338. 1930.—Blood cholesterol was determined daily on the blood in dogs with a complete biliary fistula, both with and without the presence of a gallbladder, using Sackett's modification of Bloor's method. After several normal readings were obtained, operation was done, and daily determinations of blood cholesterol were continued. There was no appreciable difference in blood cholesterol in dogs with complete biliary fistula, with cholecystectomy, and those with complete biliary fistula only.

6722. **GEILL, T.** Recherches relatives à l'action de sels biliaires sur la réaction sédimentation du sang. *Compt. Rend. Soc. Biol.* 106(9): 761-764. 1931.—Mixture of equal volumes of citrated blood (from a case of arterial hypertension) and sodium taurocholate was allowed to stand for 1 hr. The speed of sedimentation was determined with the apparatus of Westergren. The conclusion of former workers that bile salt has an inhibiting effect was true only for the first 15-16 min. The inhibiting effect disappeared entirely when the mixture was allowed to stand at room temp. for 24 hrs. Sodium glycocholate has practically the same effect. Allowing the mixture to stand for 24 hrs. in an ice-box increased the inhibiting effect. Exposure to 37°C for 24 hrs. reduced the action of the salts. Addition of fresh erythrocytes to mixtures which were allowed to stand 24 hrs. and then centrifuged showed that the plasma retained an inhibiting effect. In most of these, an increase in speed of sedimentation occurred after 6-8 hrs. Fresh plasma and erythrocytes, exposed to bile salts 24 hrs., showed a sedimentation which was strongly accelerated within a few hrs. The effect of these salts is probably on the erythrocytes or on the colloidal state of the plasma proteins. Effects in vitro cannot be directly applied to those in vivo. The slow sedimentation noted in jaundice may not be attributed with certainty to the retention of the bile salts.—*E. Weiner.*

6723. **GLASS, JERZY.** Veränderungen der Chlorverteilung im Blute unter dem Einfluss der Ultraviolettbestrahlung. *Biochem. Zeitschr.* 231(1/3): 45-53. 1931.—Blood samples (5-6 cc.) were taken from ears of 5 rabbits before and ½, 1, 2, 4, and 24 hrs. after ½-3 hrs. U. V. irradiation (50 cm. distance, 130 v. and 3.5 amp.). Between 2-4 hrs. after irradiation there was a shift of Cl to the red blood cells, which often lasted 24 hrs. Three men were irradiated, chest and back, for 3-8 min. at 220 v. and samples from the cubital vein taken before, and 24 hrs. after, irradiation. After 24 hrs. there was a similar shift of acidotic character. The vol. % of blood cells, Cl conc. in mgm. % in blood cells and plasma, color index of blood cells, and Cl content in mgm. per 100 cc. blood for blood cells, plasma and total blood were determined.

6724. **GNOINSKI, H.** Variations du niveau de la glycémie chez les chiens néphrectomisés sous l'influence du blocage du système réticulo-endothélial. *Compt. Rend. Soc. Biol.* 98(1): 72-73. 1928.—Blockage of the reticulo-endothelial system resulted in a still greater rise in the blood sugar of double nephrectomized dogs. The intensity of the hyperglycemia varied with the glycogen reserve of the liver.

6725. **GRENDEL, F.** Über die Lipoidschicht der Chromocyten beim Schaf. *Biochem. Zeitschr.* 214(1/3): 231-241. 1929.—The lipids were extracted from erythrocytes of the sheep and their composition determined. 36% of the total lipids was cholesterol, 50% cephalin, and 13% sphingomyelin. It is proposed on the basis of measurements on the spreading of lipids on a fluid surface, that they occur in a bimolecular film on the surface of the erythrocytes. Observations indicate that a decrease in Ca of the plasma conditions a decrease in the thickness of the lipid film on the blood cells.—*K. Jeffers.*

6727. **GRIGOROWA, O.** Das Blutbild der Kinder in der Pubertätsperiode. *Zeitschr. Ges. Anat. Abt. II, Zeitschr. Konstitutionsl.* 15(1): 24-34. 1929.—Girls (100) between 12 and 16, and 100 boys between 13 and 17, were separated into 3 groups: (1) those with no sign of sexual maturity, (2) initial signs, (3) fully developed. The Hb was higher the more the children were developed; low Hb was compensated for by increased erythrocyte production. Delay in puberty, particularly hypogenitalism, was accompanied by a hemogram similar to that of castrates, i.e., increase in mononuclear cells, lymphocytes, and particularly monocytes; the leucocytes of the myeloid system decreased at the same time, juvenile forms often appeared, and eosinophils increased to some extent. The hemogram was very dependent upon the constitutional peculiarities caused by the hormone system. Evaluation of the hemogram was more difficult than in adults since deviations may have not only a pathological but also a biophysiological character owing to disharmony in organic correlation.

6728. **HAYNES, FLORENCE W., and MADELEINE E. FIELD.** The cell content of dog lymph. *Amer. Jour. Physiol.* 97(1): 52-56. 1931.—The number of cells in the lymph from different parts of the body as shown by experiments agreed with the data of others and showed similar irregularities. The cervical lymph which had passed at least in part through lymph glands contained 2,800-68,600 white cells per cu. mm., whereas leg lymph which had passed through few if any nodes contained 0-2,500 cells. By a short period of massage of the cervical lymph glands the white cell count of the cervical lymph could be greatly increased, falling gradually on continued massage.—*From authors' summary.*

6729. **HEILMEYER, LUDWIG.** Klinische Farbmessungen. IV und V. Die Harnfarbe in ihrer physiologischen und klinischen Bedeutung. *Zeitschr. Ges. Exp. Med.* 60 (5/6): 626-647. 7 fig.; 648-664. 4 fig. 1928.—The author continues his reports on a study of urinary pigments as determined by spectroscopic methods. Clinical estimation has shown that the most important source of coloring material is blood pigment. Normally there occurs a formation of bilirubin in the healthy liver from the blood pigment, and it is excreted via the intestinal tract. A small portion of the end product is excreted by the kidneys as urobilin. The origin of urobilin according to Friedrich Müller is probably intestinal. It is as yet an open question whether other pigments arise at this point. In disturbances of liver function or in conditions where there is an increased blood destruction the transformation into bilirubin is incomplete and a larger portion of the pigment is eliminated in the urine through the kidney. Urobilin is only a part of these pigments and furthermore is not the one most frequently involved. An essential portion is undoubtedly uroerythrin. There must be other unknown pigments. Urochrome, derived from protein, plays the least important rôle. There was no indication from these studies either experimentally or clinically that the kidneys had anything to do with the production of urinary pigments. Diuretics produced no effect on the elimination of urinary pigments, even when the secretory power of the kidney was markedly increased. Even in acute kidney disturbances there is no disturbance of urinary pigment excretion except in very severe cases of renal insufficiency, in which instance the diminution is a disturbance of excretion rather than of production of pigment. The two pathogenic instances that lead to an increased elimination of the normal urinary pigments are injuries to the liver and conditions in which there is increased blood destruction.—*D. Perla.*

6730. **HEKMA, E.** Ist das Fibrinogen in dem natürlichen Plasma im freien oder im komplexen Zustande vorhanden? *Biochem. Zeitschr.* 209(1/3): 90-102. 1929.—Fibrinogen is found in the free state in plasma and may be removed by vigorous mechanical treatment. —*M. E. Turner.*

Chem.* 87(2): 181-196. 1930.—A contour line chart is given defining the properties of the CO_2 dissociation curve of oxygenated blood as functions of 2 variables, CO_2 combining capacity at a partial pressure of 40 mm. (T_{40}) and O combining capacity. By its use one can obtain values of the slope of the CO_2 dissociation curve. An alignment chart is described by means of which one can construct the CO_2 dissociation curve of a specimen of oxygenated blood when one knows (1) the total H_2CO_3 content at any pressure of CO_2 and (2) the O capacity of the specimen. —*D. B. Dill.*

6733. HÖBER, RUDOLF, und GIULIO PUPILLI. Neue Versuche über die Aufnahme von Farbstoffen durch die roten Blutkörperchen. *Pflüger's Arch. Ges. Physiol.* 226 (4): 585-599. 1931.—A general parallelism is found between the tendency of dyes to accumulate in red blood corpuscles and their solubility in Nirenstein's mixture of oil of almonds, oleic acid and diamylamine. The intake from dilute solutions of dyes insoluble in this mixture is only apparent, the observed concentration changes being due to a superficial adsorption. In the case of a number of dyes, the intake by corpuscles of different species is in the order: horse < ox < pig. These specific differences are attributed to differences in the cell lipids. —*M. H. Jacobs.*

6734. HOLTZ, PETER. Der Einfluss des bestrahlten Serums auf die Zuckerabgabe der isolierten Warmblüterleber. *Pflüger's Arch. Ges. Physiol.* 226(4/5): 578-584. 1931.—The lowering of blood sugar by irradiation was investigated by perfusing livers from rabbits, cats, and dogs with Tyrode solution, normal or irradiated cattle serum. pH was measured and was kept approximately constant. Irradiation was conducted in open glass vessels at 20° with a mercury vapor lamp. Livers were perfused first with Tyrode solution and then normal and irradiated serum were alternated. Sugars were determined by the Hagedorn-Jensen method. In a large proportion of the experiments the sugar produced was less with irradiated than with normal serum.—*H. C. Bazett.*

6735. IMPARATO, E. Action des extraits placentaires sur le pH sanguin. *Compt. Rend. Soc. Biol.* 100(14): 1190. 1929.—In general, placental extract caused a slight increase in alkaline reserve, although exceptions were noted. pH also increased slightly. Method of administration made no difference in results.

6736. JERVELL, OTTO. Über Glykolyse im Blut mit besonderem Hinblick auf die Milchsäurebildung. *Acta Med. Scandinavica* 74(3): 221-234. 1930.—Glycolysis experiments carried out with the blood of various pathologic conditions showed no differences. No glycolytic ferment could be found in case of cancer. Glycolysis is independent of the initial concentration of blood sugar. Insulin has no effect on the glycolytic capacity of blood. Lactic acid formation is less than the blood sugar deficit caused by glycolysis.—*J. M. Johlin.*

6737. JOHNSTON, CHRISTOPHER. A comparison of the urea nitrogen content of cutaneous and venous blood by micro gasometric analysis. *Jour. Clin. Investigation* 9(2): 209-213. 1930.—The concentration of urea N in the blood from ear puncture has been compared with that from the vein in 13 experiments on 6 normal and 6 nephritic subjects, without regard to food intake. No difference betwen venous and cutaneous blood exceeding the limit of experimental error was found to exist.—*Author's summary and conclusions.*

6738. JORGENSEN, I. M. I. Studien über die Fällung der Serumproteine. *Skand. Arch. Physiol.* 61: 34-157. 1931.—$(NH_4)_2SO_4$ precipitation curves for the proteins of horse, dog, rabbit and human sera were established. A pH range of 7.0 to 5.4 had no influence, but lower pH values increased the precipitation. The Starlinger and Hartl method of determining serum proteins was improved by adding a buffer to the precipitating solution. The serum proteins are influenced only by repeated and considerable venesection. In such cases serum albumin regenerates more rapidly than the globulin.—*R. C. Herrin.*

6739. JUSSIN, W., und S. BELAWENETZ. Das Retikuloendothelialsystem des Hodens bei den weissen Ratten. *Anat. Anzeiger* 70(13/17): 274-277. 2 fig. 1930.—Injections of trypan blue and pyrrol blue solutions were given to 33 rats with simultaneous irritation of the testicles by light compression, producing enlargement of the blood-vessels, infliction of trauma by bruising, irradiation with white and blue light, and injection of solutions of $KMnO_4$, collargol-xylol or $ZnCl_2$. The animals were later killed and the tissues fixed and examined. The conclusions are: In the testicles of the white rat only the interstitial testicular and epididymal cells perform a reticulo-endothelial function. No other cells of the testicles are blocked, and the dye-stuff does not penetrate the interior of the tubules. Blockage is increased by all factors which promote dilatation of the blood-vessels and rise in metabolism. Hunger, injections of xylol and collargol, as well as pus formation, produce a depression of the testicular reticulo-endothelial system.

6740. KASAHARA, MICHIO [et al.] Studien über Liquor cerebrospinalis. I. MICHIO KASAHARA und YOSHIO FUJISAWA. Über die normale Cerebrospinalflüssigkeit der Versuchstiere. II. MICHIO KASAHARA, ISAMIR INO und MINORU TOMINAGA. Experimentelle Untersuchungen über Liquorzucker. *Zeitschr. Ges. Exp. Med.* 73(1/2): 11-13; 14-18. 1930.—I. Yamaoka's technique of suboccipital puncture was employed. The cerebrospinal fluid of 4 monkeys, 7 dogs, 5 goats, 5 cats and [?] rabbits was found to be similar in reaction and composition to human fluid.—II. Intravenous injection of 12 rabbits with glucose, 10 with lactose, 10 with saccharose, 9 with epinephrine, 13 with synthalin, and 10 with various narcotics (ether, chloroform, urethane, morphine and chloralhydrate, showed that the spinal sugar ran closely parallel with the blood sugar, both for normal, subnormal and hyperglycemic values.

6741. KESTEN, H. D. A study of saponin hemolysis of individual erythrocytes. *Amer. Jour. Physiol.* 91(1): 1-7. 1929.—A method is described for the study of saponin hemolysis of single, isolated, red blood cells. Utilizing this method, several series of determinations of single cell hemolysis were carried out. In each series the greatest number of cells was found to hemolyze during the earlier time intervals after addition of saponin, with a progressive falling off in number of cells hemolyzed as the time increased. This curve is different from the derivative of the usual sigmoid hemolysis time curve, and since observations on individual cells should, if anything, accentuate the probability distribution of individual cell resistances, no evidence can be found for such a distribution. It seems less probable that the curve is a manifestation of individual cell resistance than of the fortuitous completion of the hemolytic reaction on identical erythrocytes.—*Author's summary.*

6742. KISCH, BRUNO. Blutzuckeruntersuchungen bei Selachiern. *Biochem. Zeitschr.* 211(4/6): 276-291. 1929. —The blood sugar of *Scyllium* and *Torpedo* was investigated by the method of Hagedorn and Jensen. The lowest values in healthy animals approached those in frogs (20 to 40 mgm. %). The state of fullness of the stomach or intestine does not affect these values. Following hepatectomy the blood sugar sinks after a few days; the lowest values were 5-10 mgm. %. The disappearance of sugar is greatly accelerated by warming the animal. Asphyxia leads to hyperglycemia after 1 hr. at 15° C., sooner at higher temperatures. Arterialization of the blood with O does not prevent a continued rise for several hrs. A recovery of the blood sugar to normal takes

place very slowly; the normal value may not be regained after 7 days. The source of this excess of sugar is the liver. Hyperglycemia as a result of asphyxia is not to be observed after hepatectomy. Adrenalin, in the case of *Scyllium*, causes marked asphyxia. These changes in blood sugar may be associated with the peculiar functioning of the autonomous nervous system of these animals.—*J. M. Johlin.*

6743. **KOSCHATE, JORG. Ueber die Beeinflussung der Bakterizidie des Blutes durch gerinnungshemmende Stoffe.** *Zentralbl. Bakt. I. Abt. Orig.* 118(1/2): 60-63. 1930.—Reduction of the coagulating tendency of blood, especially by the addition of Na citrate, had the desirable effect of diminishing its bactericidal action in blood cultures. In 3 cultures of *Staphylococcus aureus* on citrated blood the organism was invariably found, while in control cultures on bile and bouillon 2 out of 3 on each were sterile. Cultures on citrated blood of *Streptococcus hemolyticus*, colon bacillus, paratyphoid B, typhoid and *Staphylococcus albus* were more abundant than on bouillon, and more abundant than on bile except in the case of *S. hemolyticus*.

6744. **KOSKOWSKI, W., et P. KUBIKOWSKI. Les propriétés dynamiques du sang au cours de la digestion.** *Compt. Rend. Soc. Biol.* 100(14): 1240-1242. 1929.—Defibrinated blood of the fasting dog has no effect on the isolated virgin uterus of the guinea pig. 25 hrs. after the ingestion of 500 gm. of horse meat the blood has a very decided action. After defecation the blood has no action. Various compounds (leucine, histidine, asparagine, etc.) were tested for their effect on the virgin uterus; creatinine had a slight effect, methylguanidine, α-alanine, choline, and histamine all had a marked effect. The ingestion of pure glucose was followed by a slight effect, that of fats only when connective or muscle tissue was present.

6745. **KOSKOWSKI, W., et P. KUBIKOWSKI. Les propriétés dynamiques des hématies pendant la digestion.** *Compt. Rend. Soc. Biol.* 100(14): 1243-1245. 1929.—The pharmaco-dynamic qualities of the blood, as evidenced by its action on the virgin uterus of the guinea pig, are present in the plasma for a very short time, and are then rapidly transferred to the corpuscles, which retain this action for a prolonged period. The use of purgatives or of absorbing agents such as animal charcoal, following the feeding of milk or horse meat, prevent the absorption of the active material by the blood.

6746. **KRYŽANOWSKAJA, L. I. Wassergehalt des Blutes in verschiedenen Zirkulationsbezirken nach Versuchen an angiostomierten Hunden.** *Pflüger's Arch. Ges. Physiol.* 218(5/6): 667-669. 1928.—Water (200 cc.) was injected in divided doses into the intestine of dogs during the course of 10 min., or was administered by mouth with other food. The dogs were fed on liver and milk. The increase in nutritive content of the portal vein after feeding was not proportional to its increase in water. The amount of dry substance resorbed began at 1.4%, then rose to 6.6%. The average amount of dry matter was about 5%. There is without doubt a direct relation between the quantity of water absorbed and the quantity excreted by the kidneys. Increase of the quantity of water absorbed leads to increase in quantity of water excreted. The liver withdraws only small amounts of water from the blood in fasting condition.

6747. **KUSCHINSKY, GUSTAV. Über das Verhalten von Kalium und Calcium im Blut des Hundes beim Histaminshock.** *Zeitschr. Ges. Exp. Med.* 64(3/4): 563-568. 1929.—Calcium, K, Hb, erythrocytes and refractive index were determined on plasma, serum and whole blood drawn from the jugular vein of grown dogs during typical histamine shock. Blood pressure and respiration changes were recorded. Hemoglobin content and erythrocyte count were increased while refractive index varied slightly. The K was greatly increased in the plasma and serum while the Ca was only slightly increased. In whole blood, the rise in K was small and Ca remained fairly constant.—*M. E. Turner.*

6748. **LENNOX, WILLIAM G. (with the assistance of ERNA LEONHARDT). The oxygen and carbon dioxide content of blood from the internal jugular and other veins.** *Arch. Internal Med.* 46(4): 630-636. 1930.—In a large series of patients, O and CO_2 content of the blood from an artery and various veins were measured. The gaseous content of blood from the femoral vein was the same as that of blood from a cubital vein. In sharp contrast, blood from the internal jugular vein was more reduced and blood from the external jugular less reduced than that from a cubital vein. These statements are true for average values. Measurements for individual patients varied widely. In 51 patients the average corrected respiratory quotient for blood from a cubital vein was 0.84 and from the internal jugular vein, 0.9. More sugar disappeared from the blood in its passage through the brain than in its passage through the arm. The former of these observations suggests that in the metabolism of the human brain, carbohydrates are unusually important. —*Authors' summary.*

6749. **LITARCZEK, G., H. AUBERT, et I. COSMOLESCO. Des facteurs qui peuvent influencer l'affinité de l'hémoglobine pour l'oxygène exprimée par la constante 1/k. Le pH plasmatique.** *Compt. Rend. Soc. Biol.* 106(9): 740-742. 1931.—In anemic, hyperthyroid, patients with polycythemia and cardiac patients, the independence of variations in the value $1/k$ from the pH of the plasma was verified. Therefore variations in $1/k$ must depend on certain intraglobular modifications, expressed by the factor α from the equation of Peter-Barcroft, $1/k = \alpha C_H \times 10^8$. From experiments on a normal and an anemic subject, it is concluded that the organism has 2 means of changing the affinity of hemoglobin for O: by intraglobular modifications, letting the pH of the plasma remain constant; or by extraglobular variations of the plasma pH. The former generally occurs.—*E. Weiner.*

6750. **LOEPER, M., R. DEGOS, et A. LESURE. Action des rayons ultraviolets sur la thiémie.** *Compt. Rend. Soc. Biol.* 106(9): 718-719. 1931.—Six subjects were exposed for 10 min. Blood S was determined before exposure, and 10 min., 1 hr., and 2 hrs. after. The total S was lowered after 10 min. In 4 of 6 cases, it continued to decrease for 10 days after. Neutral S diminished more than oxidized S, so that the ratio of oxidized S to total S was augmented generally. The results are probably due to increase in oxidation of the S.

6751. **LOUCKS, MILO M., and F. H. SCOTT. Calcium in the coagulation of blood.** *Amer. Jour. Physiol.* 91(1): 27-46. 1929.—Clark's Ca method was checked against ashing methods and the amount of Ca was found to be the same within experimental error, in serum, citrated plasma and heparinized plasma, if the oxalate was allowed to stand in contact with the plasma or serum for sufficient length of time. It was found that the ether-extractable lipids held some Ca in combination with them, but not all Ca soaps act as thrombin. Thrombin is probably a Ca-"tissue juice" compound which alters the sol fibrinogen to the gel fibrin. Prothrombin, if such exists, is any potential source of tissue extract (broken tissues, platelets or white blood cells) and not a separate chemical entity of the circulating blood. Rettger's work regarding the recalcification of fluoride blood was confirmed. Fluoride plasma will clot upon recalcification if the Ca is not added in excess. Vine's results showing that 3 or 4 times the amount of oxalate necessary to precipitate the normal amount of blood Ca must be added to blood to prevent its clotting, were confirmed. Thrombin is inactivated by means of oxalate. This is due to the removal of Ca and is not merely a salt effect. It seems impossible to remove Ca from thrombin by dialysis. Fibrin ordinarily contains Ca, but this Ca may be removed by washing. The Ca of fibrin probably belongs to the thrombin. Lowering of surface tension of blood is probably the causative factor concerned in the rupturing of platelets in shed blood.—*Authors' conclusions.*

6752. **MARGARIA, R. The vapour pressure of normal human blood.** *Jour. Physiol.* 70(4): 417-433. 1 fig. 1930.

—Measurements have been made of the vapor pressure of defibrinated human blood with Hill's thermoelectrical nethod. The accuracy of this method as used is such hat the probable error of a single determination is about ± 0.2 to 0.3%. The average value, expressed in terms of gm. of NaCl in 100 gm. of water, is for men (19 observations) 0.9447, with a probable individual deviation of ± 0.00495, for women (16 observations) 0.9269, with a probable individual deviation of ± 0.0059. The reality of a difference betwen the values of the osmotic pressure or men and for women is statistically certain; the difference is 0.0178 ± 0.0019. Such a difference is mostly lue to the difference in bicarbonate and urea content. The values of the probable individual deviations are an ndex of the great uniformity of the osmotic pressure of human blood under normal conditions. A preliminary tudy was made of the maximum variations which may occur in the osmotic pressure of human blood. After drinking 1500 to 2000 cc. of water, values were found as ow as 0.88: after severe muscular exercise a value as high as 1.048 was observed.—*Author's summary.*

6753. MARSHALL, F. W. The sugar content of the blood in elderly people. *Quart. Jour. Med.* 24(94): 257-284. 1931.—From study of 50 cases of old age, including 6 of healthy old men, the remainder being more or less pathological, Marshall concludes that 5 types of glucose-tolerance curves occur in healthy old people: the normal adult; the storage defect; the "lag"; the "flat"; and he typical diabetic types. The frequency with which each of these types occurs has been indicated, and the storage-defect type has been shown to occur most requently. The "lag" type of curve occurs in 25% of healthy cases, and this is probably a much higher incidence than is found in the normal adult. The same 5 types of curve occur also in the group of unhealthy cases, but the incidence of each type is altered and the "diabetic" type preponderates, and is found in as many as 0% of cases. It is concluded that most diseases (and particularly chronic bronchitis), when they occur in old age, have a deleterious effect on the sugar tolerance. No relation can be traced between the height of the blood-pressure, and either the sugar content of the blood, or he renal threshold. The renal threshold in healthy old age is generally raised, and may be taken to be in the neighbourhood of 0.2%.

6754. MATHIS, HERMANN. Über eine Proteidätherschwefelsäure aus der Magenschleimhaut. *Biochem. Zeitschr.* 220(4/6): 493-495. 1930.—A connection is suggested between this substance and the results obtained by feeding stomach tissue in pernicious anemia.

6755. MAZZEO, MARIO. La colesterina del siero di sangue e degli organi nel coniglio dopo introduzione d'adrenalina. [Cholesterol of blood serum and of the organs of the rabbit after adrenalin administration.] *Arch. Sci. Biol. [Napoli]* 11(3/4): 381-390. 1928.—In a 1st series of experiments 10 rabbits received subcutaneously each 1 cc. adrenalin per kgm. body weight, and 6 rabbits were given the same dose orally; in all the rabbits the blood cholesterol rose, beginning the 1st ½ hr., and reaching a peak in the 6th-18th hr. after the administration of adrenalin. In 8 rabbits, 4 ♂ and 4 ♀, of which 2 of each sex were dosed with adrenalin and not so treated, comparison of the cholesterol content of the blood, suprarenals, kidneys, testicles, ovaries, liver and spleen in the experimental animals and the controls showed that the rise in blood cholesterol was in proportion to the fall in cholesterol content of the other organs (more than ½ in the suprarenals, less in the other organs). The author concludes that introduction of adrenalin into the organism produces, not an even increase, but an abnormal distribution of cholesterol in the tissues and liquids of the body.

6756. MESSINI, M., e A. POLI. Ricerche sulle variazioni glicemiche in rapporto alla diminuzione del fosforo nel sangue. [Variations in blood sugar corresponding to diminution in blood phosphorus.] *Clin. Med. Italiana* 1(9/10): 421-442. 1930.—The relations between blood sugar and blood P, following injection of uranyl acetate and thymus extracts, were studied in rabbits (15 experiments reported). Intravenous injection of uranyl acetate diminished the concentration of inorganic P in the blood and simultaneously provoked hyperglycemia, a primary phase without and a secondary phase with glycosuria with signs of renal lesion and following oliguria and anuria. Subcutaneous injection of extract of calves' thymus likewise produced hyperglycemia and diminution of the concentration of the thymus. So far as this study goes, then, decrease in blood P is accompanied by a rise in blood sugar. The 1st set of experiments indicate that, contrary to current opinion, uranyl salts should not be counted among the substances causative of hyperglycemia without glycosuria, since hyperglycemia without glycosuria is constantly observed under suitable technical conditions. The thymus experiments support the theory of the anti-insulinic function of the thymus.

6757. MILLS, C. A. Do blood platelets, plasma, and tissues yield thrombin, or tissue fibrinogen? *Amer. Jour. Physiol.* 95(1): 1-6. 1930.—From experiments and critical review of literature, the author concludes: (1) that plasma alone contains, beside blood fibrinogen and Ca, prothrombin and cephalin; (2) that blood platelets do not yield thrombin or prothrombin, but do yield on extraction free cephalin and tissue fibrinogen; (3) that tissue juices likewise yield no extractable thrombin or prothrombin, but do yield free cephalin and tissue fibrinogen; (4) that there are at hand methods of properly identifying these various clotting agents, methods which should receive proper consideration in any study of the clotting problem.

6758. MOORE, NORMAN S., and HAROLD J. STEWART (with the assistance of YETTA POROSOWSKY). The variations of the specific gravity of the plasma of the blood and the means available for altering it. *Jour. Clin. Investigation* 9(3): 423-442. 1930.—It has been demonstrated that the specific gravity of the plasma and (Moore and Van Slyke's observations) the plasma proteins of normal individuals show remarkable constancy for short periods (days) provided the samples of blood are taken at the same time each day. In 5 patients suffering from heart disease who were in water balance the maximum and minimum daily variations in the specific gravity were 0.0004 and 0 respectively. In 2 normal individuals the variations were 0.0015 and 0.0011 over a period of 14 mos. There was corresponding variation in the protein content of the plasma. The specific gravity of the plasma of a normal individual varied 0.0007 in the course of a day. The protein content and the specific gravity of the plasma of arterial blood were found (in 7 cases studied for this point) to be uniformly less than those of venous blood. The intravenous injection into 2 dogs of normal salt solution resulted in decrease in the specific gravity of the plasma of the blood. The administration of water 1000 cc. by mouth to 2 human beings decreased the specific gravity of the plasma, however, only slightly. During "concentration tests" 2 patients exhibited increases (0.0013) in the specific gravity of the plasma of the blood. Hemorrhage in a dog was followed by decrease in specific gravity of the plasma, and a corresponding decrease in the plasma protein concentration. Return to the initial level occurred 4 days after bleeding. The intravenous injection of hypertonic solutions of glucose in 3 dogs resulted in decrease in the specific gravity of the plasma. The injection of gum acacia in glucose solution in an edematous patient increased the specific gravity of the plasma slightly, but the volume of fluid injected and the dilution resulting from the presence of hypertonic glucose solution decreased the protein concentration. Moore and Stewart conclude that the specific gravity and the protein content of the plasma of patients suffering from cardiac disease are within the range found in normal individuals. In those cardiac patients exhibiting edema as well as in those in whom this sign is not present, there is a linear relationship between the specfic gravity and the total protein content of the plasma which is expressed by the formula of Moore and

Van Slyke. They remark that the anticoagulant used has an effect on the specific gravity of the plasma. If data are to be compared with those published by Moore and Van Slyke, heparin must in consequence be used.

6759. **MORGULIS, SERGIUS, and ANNE MACGREGOR PERLEY.** Studies on cerebrospinal fluid and serum calcium, with special reference to the parathyroid hormone. *Jour. Biol. Chem.* 88(1): 169-188. 1930.—In experimental jaundice in dogs there was no change in either the cerebrospinal fluid or serum Ca. Ingestion of Ca salts was followed by only a slight rise in serum Ca without materially affecting the cerebrospinal fluid Ca. When the serum Ca was markedly increased by feeding Ca salts with injections of parathyroid hormone or by means of continuous intravenous injections of $CaCl_2$ solution, Ca of the cerebrospinal fluid commonly showed little increase. There was no transfer of Ca to the erythrocytes following parathyroidectomy. Serum was dialyzed against cerebrospinal fluid after continuous injection of large doses of $CaCl_2$, with or without the addition of parathormone, also on thyroparathyroidectomized and on unoperated dogs. The values for diffusible Ca were practically those obtained with normal dogs.—*S. Morgulis.*

6760. **MÜLLER, FRANZ, und GEORG CRONHEIM.** Die unter dem Einfluss des Höhenklimas im Blut auftretende Sauerstoffzehrung. *Biochem. Zeitschr.* 234(1/4): 302-306. 1931.—With rarefaction of air corresponding to ½ atmosphere (an altitude of 5500 m.), 38 determinations were made on 15 rats, and 250 on the author's blood in Berlin and at 1562 m. and 2550 m. In rats without the addition of reduced glutathione and in man with it, products occurred in whole blood and plasma which consumed O and which were due to altitude, since they did not appear in determination made at Berlin.

6761. **MUNCH-PETERSEN, CARL JUL.** Der Zuckergehalt der Cerebrospinalflüssigkeit. I. Untersuchungen über den Einfluss der Glucose- und Adrenalin-Hyperglycämie sowie der Glucose-Adrenalin-Hyperglycämie auf den Liquorzucker. *Acta Med. Scandinavica* 74(1): 31-58. 1930.—Spinal fluid sugar is only slightly raised within 4 hrs. by an alimentary hyperglycemia. It is promptly raised, however, by a hyperglycemia produced by adrenalin. Adrenalin and glucose taken together produce a more striking rise than either alone. This may be used clinically as a test for permeability.—*T. J. Putnam.*

6762. **MUNCH-PETERSEN, CARL JUL.** Der Zuckergehalt der Cerebrospinalflüssigkeit. II. Untersuchungen über den Einfluss der Glucose-Adrenalin-Hyperglycämie auf den Liquorzucker bei organischen Nervenleiden. *Acta Med. Scandinavica* 74(3): 235-283. 1930.—Glucose (50 gm.) per os, followed by a subcutaneous injection of 0.5 mgm. of adrenalin, caused an increase in the blood sugar amounting to 0.16% or more. This in turn caused an increase in the cerebrospinal fluid sugar ranging from 0.018 to 0.026% in normal individuals. Any increase below or above these limits is considered pathological. A number of cases with mental or nervous disease were studied. The diagnoses were post-encephalitic conditions, other extra-pyramidal diseases, neurasthenias, unclassified diseases, epilepsy, psychoses, brain tumor, and multiple sclerosis. It was found that extra-pyramidal diseases, especially those that are due to encephalitis, usually show an increase which is below 0.015%. Some of these may show an increase which is above the normal. A theory is advanced to explain the functions underlying this phenomenon.—*W. Malamud.*

6763. **NAEGELI, CLARA.** Experimentelle Untersuchungen über die Wirkung der Luftverdünnung auf die Resistenz der roten Blutkörperchen gegenüber hypotonischen Kochsalzlösungen. *Biochem. Zeitschr.* 231(1/3): 95-102. 1931.—Rabbits (7) at an average of 300 mm. Hg pressure (equivalent to about 6500 m. above sea level) showed osmotic sensitivity in a small number of erythrocytes after 144-192 hrs. The minimum resistance sank (in 5 cases to 0.02% of NaCl solution, in 1 to 0.06%, in 1 to 0.08%). The maximum resistance, on the other hand, rose (at least 0.08% of the NaCl solution). The more resistant the erythrocytes, the more intense the blue color in May-Grünwald staining of microscopic preparations.

6764. **NEALE, A. VICTOR, and MARION S. ESSLEMONT.** Observations on the chloride, sugar and calcium contents of the cerebro-spinal fluid in children. *Arch. Dis. Childhood* 3(17): 242-256. 1928.—In 41 non-meningitic cases the Cl content of the cerebrospinal fluid was normal; but in 5 cases of acute pneumococcus infection the Cl was subnormal. The sugar content in 24 non-meningitic cases and the Ca content in 19 such cases were within normal limits. The Cl and sugar content in tuberculous meningitis (25 cases) were not, as sometimes asserted, constantly low, but varied according to the stage of the disease, falling at first and rising later. Pneumococcal meningitis (7 cases) showed a progressive fall to death. Fatal meningococcal cases (2) showed the same fall, but cases ending in recovery (2) rose to normal. Cl in the cerebrospinal fluid was found to vary to some degree with that in the blood in 5 non-meningitic cases and 11 of tuberculous meningitis. Ca was usually above normal in the cerebrospinal fluid with inflammation (especially suppurative) of the meninges. No Ca deficiency was detected in patients having convulsive seizures in meningitis.

6765. **NORRIS, JOAN H.** A chemical investigation in Victoria (Australia) of the blood of cattle and sheep. *Australian Jour. Exp. Biol. and Med. Sci.* 7(1/2): 3-4. 1930.—In 50 samples of blood from steers and cows inorganic P ranged from 2.57 mgm. per 100 cc. to 8.25; total P from 6.1 to 17.39; and Fe from 35.1 to 75.75.

6766. **OELKERS, H. A.** Untersuchungen über den kolloidosmotischen Druck des Serums. *Zeitschr. Klin. Med.* 115(5/6): 854-863. 1931.—The colloid-osmotic pressure (C. P.) in the blood serum of 18 healthy subjects measured per mgm. protein N was almost constant (av. 38.4 mm. H_2O). The slight variations corresponded closely to simultaneous variations in the albumin: globulin; this parallelism was not present in 27 patients. The addition of salyrgan to serum in vitro increased its C. P.; in some cases an increase was found after ingestion of salyrgan at the time of diuresis, paralleling a simultaneous increase of albumin in the serum.

6767. **OKUNEFF, N.** Studien über parenterale Resorption. V. Über die Resorption des Farbstoffs Trypanblau aus dem subkutanen Bindegewebe. *Biochem. Zeitschr.* 226(1/3): 147-156. 1930.—The author's experiments show that the accumulation of trypan blue in the blood does not reach as high a value in the case of subcutaneous as in intraperitoneal injection. The reason may lie in the anatomical differences. In spite of these quantitative differences the types of curve obtained in both cases are similar, which suggests similar physiological processes. This similarity we may first of all seek in the part played by the lymphatic system in subcutaneous absorption. The author's experiments show that heat, cold, adrenalin and mustard plaster applications have a definite influence on the absorption, likely due to their strong local effect on blood and lymph circulation. Finally experiments with subcutaneous absorption from a focus of inflammation show considerable variation between different stages of inflammation, viz., acceleration at the start, retardation in later stages; this is correlated with the disturbance of the normal blood circulation associated with different inflammatory stages. The number and kind of experimental animals are not stated.—*A. G. Olsen.*

6768. **OSBORNE, WILLIAM ALEXANDER.** The toxicity of blood which has been frozen. *Australian Jour. Exp. Biol. and Med. Sci.* 7(4): 223-225. 1930.—The defibrinated blood of dogs (number not stated), when frozen, thawed and intravenously injected in the donor, produced syncopal fall of blood pressure, sometimes death; no such changes were produced by control injections of defibrinated unfrozen blood. This toxicity was not due to the ragged "ghosts" of broken corpuscles,

as was shown by development of toxic symptoms from injections of centrifuged and optically pure serum.

6769. **PARTOS, ALEXANDER.** Gesetzmässiger Zusammenhang zwischen Blutzuckergehalt und Blutgerinnungszeit. V. Mitteilung. Zusammenhang zwischen Blutzucker, Blutgerinnungszeit und Blutglykolyse. *Pflüger's Arch. Ges. Physiol.* 226(3): 347-353. 1930.—Determinations of the sugar content of approximately 80 mgm. portions of rabbit blood tend to show that there is no set relation between rate of glycolysis and blood clotting time as Stuber and Lang state. An important exception is cited. The author believes his experiments illustrate rather that there is a direct relation between the sugar level in the blood and the blood clotting time.—*E. P. Laug.*

6770. **PARTOS, ALEXANDER, und ALFRED HERZOG.** Gesetzmässiger Zusammenhang zwischen Blutzuckergehalt und Blutgerinnungszeit. VI. Mitteilung. Das Verhalten des Blutzuckers und der Milchsäure während der Glykolyse. *Pflüger's Arch. Ges. Physiol.* 226(3): 464-471. 1930.—There is no regular relation, as has been stated by other workers, between rate of disappearance of blood sugar and appearance of lactic acid. In fact, in many cases there is actually an increase in blood sugar within the first ½ hr. after drawing the blood, with no marked increase and in some cases even a decrease in lactic acid. Rabbit blood was used. An explanation for these observations is given.—*E. P. Laug.*

6771. **PARTOS, ALEXANDER, und ALFRED HERZOG.** Gesetzmässiger Zusammenhang zwischen Blutzuckergehalt und Blutgerinnungszeit. VII. Mitteilung. Das paradoxe Verhalten des Blutzuckers während der Glykolyse. *Pflüger's Arch. Ges. Physiol.* 227(1/2): 181-187. 1 fig. 1931.—There is an autolytic and glycolytic enzyme in blood. The addition of NaOH inhibits the autolytic enzyme but appears to speed up the glycolytic. Rabbit blood was used. It was found, by Bang's method for sugar analysis, that the sugar content of NaOH-treated blood was much lower than the control blood. The author's explanation for this is that autolysis, unless inhibited, liberates sugar from combinations, such as glycoproteins. This causes a piling up of sugar, more rapidly than the glycolytic enzyme can destroy it.—*E. P. Laug.*

6772. **PELLEGRINI, GIUSEPPE.** Sulle modificazioni delle proteine del siero dopo epatectomia. [Modifications in serum protein after hepatectomy.] *Boll. Soc. Med.-Chir. Pavia* 44(5): 571-575. 1930.—An unspecified number of frogs were hepatectomized in September and another group in January. In the 1st group the total serum protein (especially the albumins) diminished from a preoperative normal of 2.62-3.2 gm. % to 1.534 gm. % at death (on the 7th day), while the average weight was increased by edema about 27% by that time, the animals becoming blanched and the skin tense. Pellegrini believes that the water retention is due to the blood modifications. The January hepatectomies, however, produced an immediate fall in total serum proteins and rise in weight, after which the body weight and percentage of serum proteins remained fairly constant. Pellegrini attributes the fall in blood proteins after hepatectomy to the operative bleeding; the blood is rapidly regenerated after ordinary hemorrhage but not after extirpation of the liver. The difference between the autumnal and vernal postoperative results he ascribes to the difference between winter and summer metabolism in frogs.

6774. **PONDER, ERIC, and GEORGE SASLOW. The measurement of red cell volume. [I.] II. Alterations in cell volume in solutions of various tonicities.** *Jour. Physiol.* 70(1): 18-37; (2): 169-181. 1930.—[I.] A colorimetric method is described, by means of which the average volume of the mammalian red cell can be found, with a maximum error in a single determination of ± 3%. A comparison between the colorimetric method and the hematocrit method, in which rate and time of spinning are varied, demonstrates the inadequacy of the latter method for the accurate determination of cell volume. The average volumes of the red cells of several mammals, as found by calculation from direct measurement of the various dimensions, agree satisfactorily with the volumes determined by the colorimetric method. The refractometric method of determining the average volume of the red cell is shown to lead to erroneous results.—II. The addition to rabbit's blood and plasma of a solution of NaCl or glucose, whose depression of freezing point is approximately the same as that of rabbit's plasma, does not alter the mean volume of the red cells. The concentration of such a solution is (or is equivalent to) 1.12 gm. NaCl per 100 gm. of water (very nearly 1.12% NaCl). The cell volume increases in hypotonic media produced by the addition of solutions of NaCl to rabbit's blood and plasma, and the increase is approximately as great as would be expected on the assumption that the cells are simple osmometers and contain about 33% "free" water by volume. In hypotonic media produced by the addition of KCl or glucose the swelling is greater than can be accounted for in this way. The cell volume does not decrease (except very temporarily) in hypertonic media produced by the addition of NaCl, KCl, or glucose. The volume, in fact, steadily increases as time goes on. This indicates that the added substances penetrate into the cell. Crenation does not appear to be necessarily associated with a decrease in red cell volume, but is to be regarded rather as a failure on the part of the cell to maintain its peculiar shape.—*Authors' summary and conclusions.*

6775. **RAMSEY, ROBERT, and CHARLES O. WARREN, Jr. The rate of respiration in erythrocytes.** *Quart. Jour. Exp. Physiol.* 20(3): 213-229. 1 fig. 1930.—Using a modification of the Fenn type respirometer, the rate of respiration of suspensions of turtle, chicken, rabbit, and human blood cells were determined and found to be comparable to that of other resting tissues (from 14 to 85 mm^3/gm./hr.). Upon hemolysis by saponin, sodium taurocholate, sodium oleate, or hypotonic saline, there is a great but temporary increase in O consumption and also a production of heat. This is shown to be due to an increase in metabolism accompanying a liberation of cell contents.—*R. Ramsey.*

6776. **RAY, G. B., and L. A. ISAAC. Chemical studies on the spleen. III. The action of splenic and other tissues upon the removal of hemoglobin-methemoglobin solutions.** *Amer. Jour. Physiol.* 91(2): 377-389. 1930.—Experiments showed that $FeCl_2$ reduces methemoglobin to Hb in the absence of O. This action is reversed in the presence of O. The alcoholic extracts of spleen and muscle behave in the same manner as $FeCl_2$. Liver extract produces an oxidation of Hb regardless of the O tension. —*Authors' summary.*

6777. **RAY, G. B., and L. A. ISAAC. Chemical studies on the spleen. IV. Evidence favoring the formation of a colorless form of hemoglobin after splenectomy.** *Jour. Biol. Chem.* 85(2): 549-558. 3 fig. 1930.—The non-functional hemoglobin derivative, which accumulates after splenectomy in the dog, was studied, observations showing concentrations of unknown pigment varying from 5 to 29%. These values represent the differences found between figures for total pigment determined by Stadie's cyanhemoglobin method, and the O capacity, determined by the method of Van Slyke and Neill. The name "leucohemoglobin" is suggested for this unknown, non-functional compound which is colorless and probably closely related to hemoglobin or methemoglobin.—*R. A. Greene.*

6778. **REID, CHARLES, and B. NARAYANA. Studies in blood diastase. Factors which cause variations in the amount of diastase in the blood.** *Quart. Jour. Exp. Physiol.* 20(4): 305-311. 1930.—The blood diastase decreases after meals, injections of glucose, glycogen, and insulin, while anesthetics and injections of starch cause a slight increase. Since pancreatectomy causes little or no change in the amount of circulating diastase, the pancreas is not its main source. Ligature of the pan-

creatic duct does not result in any striking change in the diastase content of the blood in the course of 1-2 weeks. Since definite variations can be induced in the blood diastase by injections of insulin, glycogen, etc., it appears likely that the circulating diastase is not entirely a waste product on its way to excretion. Evidence is adduced that variations in blood diastase are probably due to its being taken up or given out by the liver cells, etc., according to the requirements of the body with respect to the glycogen $\rightleftarrows$ glucose, probably in association with insulin.—*Authors' conclusions.*

6780. **RIMINGTON, CLAUDE. The carbohydrate complex of serum proteins and the clinical determination of "bound sugar" in the blood.** *Nature [London]* 126 (3188): 882-883. 1930.—Preliminary note.

6781. **SAMSON, K. Physikalisch-chemische Grundlagen der Mastixreaktion. III. Mitteilung. Das Verhalten der Liquoreiweisskörper bei der Normo-Mastixreaktion.** *Zeitschr. Ges. Exp. Med.* 60(5/6): 665-675. 9 fig. 1928.—In previous studies the author determined that the globulin was the important protein substance operative in the normal flocculation phenomenon that occurs in mastic reaction. To determine the rôle played by the albumin, he studied the mastic reaction in spinal fluid from which the globulin had been precipitated by half saturation with $(NH_4)_2SO_4$. He found that the mastic sol shows a sensitivity to salt depending on the pH. The protein sensitivity of the mastic sol does not parallel its salt sensitivity. The principal substance of the spinal fluid concerned in the precipitation is incorporated in the globulin fraction. Large amounts of this substance protected the mastic sol against precipitation. The precipitation phenomenon occurs at the definite concentration globulin requirement of the mastic sol. The precipitation phenomenon occurs at a definite concentration and is also independent of the relative concentration of the globulin to the mastic sol. Albumin may act as a protective colloid but in its action produces precipitation with the mastic sol.—*D. Perla.*

6782. **SATO, EIICHI. Studies on the decomposition of glucose in blood.** *Nagoya Jour. Med. Sci.* 5(2): 167-174. 1931.—Experiment showed that there was no material difference between human blood at 37° C. and at room temp. Decomposition is most rapid in the first 3 hrs., whether the medium be physiological salt solution or blood serum. Soon after, it decreases gradually but can still be observed up to 48 hrs. Decomposition in human blood corpuscles in physiological salt solution is almost equal to that in blood serum, but it is more marked in phosphate solution; it diminishes in proportion to hemolysis in distilled water.

6783. **SCHMOLL, G. Das Blut des Menschen, mit neueren Methoden untersucht. IV. Mitteilung. Absolute Hämoglobinbestimmungen, Erythrocytenzählungen und Erythrocytenmessungen bei 40 jungen Frauen zur Ermittlung des Hämoglobingehalts eines Erythrocyten und des Hämoglobins pro μ^2 Oberfläche des Erythrocyten.** *Pflüger's Arch. Ges. Physiol.* 227(1/2): 160-170. 1931.—The hemoglobin content of the erythrocytes of normal young women was approximately 32×10^{-14} gm. per μ^2 of erythrocyte surface. Though the absolute amounts of hemoglobin in single erythrocytes are stated to be different in the 2 sexes, the amounts per unit area are practically the same in both and are in good agreement with those reported by Bürker for other mammals.—*M. H. Jacobs.*

6784. **SCHOLTZ, HANS GEORG. Über Änderungen des physikalischen Zustandes von anorganischen Bestandteilen des Serums durch gegenseitige Beeinflussung.** *Biochem. Zeitschr.* 231(1/3): 135-143. 1931.—Experiments with the ultrafilter showed the formation of a colloidal Ca-phosphate complex in the serum when the Ca or phosphate level was raised artificially. Mg formed a similar phosphate complex. Both reactions could be found in the living animal. After Ca infusion in 3 cats colloidal phosphate rose; after potassium phosphate injection in 4 cats colloidal Ca rose; after $MgCl_2$ infusion in 4 cats colloidal phosphate increased; after infusion in 2 cats colloidal Ca decreased. By addition of $CaCl_2$ to serum more K, and by addition of $MgCl_2$ more Ca, passed the ultrafilter. This reaction also appeared in animals. The hypothesis of colloidal K in serum gains more support.

6789. **SOMOGYI, MICHAEL. Nitrogenous substances in zinc filtrates of human blood.** *Jour. Biol. Chem.* 87 (2): 339-344. 1930.—Blood filtrates, [practically free from reducing non-sugars], prepared by deproteinization with Zn contain substantially smaller quantities of N than tungstate filtrates. The non-protein N in Zn filtrates normally varies between 11 and 21 mgm. per 100 cc. of human blood, the average being 17 mgm. %: in cases of N retention the non-protein N is in excess of 21 mgm. %. Urea shows identical values in Zn and tungstate filtrates, while creatinine is slightly lower and uric acid entirely absent in Zn filtrates. Zinc filtrates, prepared for the determination of true blood sugar are also adequate for the determination of non-protein N, urea, and creatinine.—*Author's summary.*

6790. **[SPERANSKAĬA-STEPANOVA, E. N.]** СПЕРАНСКАЯ-СТЕПАНОВА, Е. Н. **К вопросу о влиянии щитовидного аппарата и симпатической нервной системы на содержание Са в сыворотке крови. [Influence of the thyroid apparatus and of the sympathetic nervous system on Ca content of blood serum.]** [French résumé.] Архив Биологических Наук. (*Arch. Sci. Biol.*) 30(5/6): 593-601. 1930.—Experiments were conducted on cats, with urethane narcosis for the greater part. Serum was taken from the femoral artery, and its Ca content determined by the de Waard method. Decerebration caused a temporary increase of Ca in the serum provided the circulation in the thyroid apparatus remained normal. Even if the thyroid were excluded from

the general circulation, a strong irritation of the brain increased the Ca content. Irritation of the cranial extremity of tr. sympathicus below the thyroid glands would cause increase of Ca in serum only when the thyroid apparatus was present. Removal of the latter or its temporary exclusion from the general circulation causes the increase of Ca within the first few hours. Irritation of the caudal extremities of the abdominal sympathetic nerve below the nn. splanchnici also increased the Ca content of the serum.

6791. **STAHL, V. O. A study of blood development and the effect of barometric pressure on the number of corpuscles.** *Jour. Ent. & Zool.* 21(4): 137. 1929.—The red cell count in the rat's blood was lowest just after birth and at 67 days the highest of any early period. The adult condition was reached at the end of 10 mos. As the red cells mature they decrease in size. At 120 hrs. after birth they are of the adult size. Similar results were observed by use of a barometric chamber as in high altitudes. The red cells increase when subjected to lowered pressure. When the same lowered pressure was used but with the addition of O at the rate of 500 cc. per min., the red cell count fell below that in the control animals. Oxygen tension seems to govern the increase or decrease of the red cell count when the animals are subjected to varying barometric pressures. Changes begin to appear within 24 hrs.—*W. A. Hilton.*

6792. **STEINER, PAUL E., and FRANCIS D. GUNN. The response of blood platelets to external stimuli: ultraviolet light, iodine and coal tar.** *Arch. Path.* 11(2): 241-254. 1931.—The average normal platelet counts (90) in 14 normal rabbits were somewhat higher than those reported by others. The effect of U. V. light on blood platelets as reported by others was corroborated. I applied to the backs of rabbits caused thrombocytosis, beginning in 2-5 days, reaching a maximum by the 6th day, and slowly receding to normal in 2-3 weeks. Coal tar applied to the back was followed by either thrombocytosis or thrombopenia. The numbers of the other blood elements were not appreciably changed. The similarity between the effects on the platelet level of U. V. light and of other substances producing dermatitis suggests that the effects may be due to tissue injury and to the absorption of breakdown products that stimulate the formation of platelets.—*Author's summary.*

6793. **SUKO, HIDEO. Die Einflüsse des Lungenextraktes und der Lungenspülflüssigkeit auf die Sedimentierungsgeschwindigkeit der Erythrozyten des Kaninchens.** (In Japanese.) *Chosen Igaku Kwai Zasshi* 78: 514-524. 1927.—The lung fluid and the lung extract, both produced by the author's method (*Ibid.* no. 35), on intravenous injection accelerate the sedimentation rate of erythrocytes. The same effect is noted in vitro. On the other hand, a highly concentrated extract retards sedimentation. The active substance of the extract was removed by CO_2, and adsorbed by kaolin. It is concluded that the activity of the extract is due to globulin. But the activity of the lung fluid is not thus explained since these treatments do not lessen its activity.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by L. S. Godfrey).*

6794. **SŬLA, JAN. Studium oxyheminu z krve člověka a domácích zvířat. (Oxyhemins prepared from the blood of man and domestic animals.)** *Spisy Lékarské Fakulty Masarykovy Univ. Brno. (Publ. Fac. Med. Brno.)* 6(55): 1-6. 1928.—In 23 cases the author isolated the α modification; only in 1 case, with protracted action of H_2SO_4 (3 days), was the β modification obtained. The experiments support Hamsik's view that the blood contains only one modification of the prosthetic group, which by the influence of chemical agents may be changed into other modifications.—*From English summary.*

6795. **SUNDERMAN, F. WILLIAM. Studies of serum electrolytes. VII. The total base and protein components of the serum during lobar pneumonia with a note on the gastric secretion.** *Jour. Clin. Investigation* 9(4): 615-633. 1931.—The total base and protein components of the serum have been studied before and after the crisis in patients suffering with lobar pneumonia. The Na concentration in the serum was decreased in all cases studied before and for a considerable period after the crisis. The decreased concentration of Na was approximately equal to the decreased concentration of total base. The K concentration in the serum was increased in over ½ the determinations made before the crisis. This increase tended to persist after the crisis. The Ca values were generally decreased during the febrile period. Mg values were scattered about the normal range throughout the period of infection. The albumin concentration in the serum was diminished not only during the period of active infection but also during convalescence. The globulin fraction was usually increased, so that the total protein tended to remain within the normal or lower normal limits. Base bound by protein was usually decreased during the febrile period. From studies of 14 gastric analyses on 4 patients suffering with lobar pneumonia it was noted that: (1) The gastric acidity tended to be lowered until after the crisis. (2) When lowered it was generally increased by histamine stimulation. (3) There was no apparent correlation of either total base or chloride of the serum with the gastric acidity.—*Author's conclusions.*

Physiol.* 227(1/2): 85-89. 2 fig. 1931.—There is a marked decrease in peripheral blood clotting time when the vena cava is ligated, while the blood on the liver side of the V. C. shows marked increase in clotting time. These changes are associated with marked diminution in number of thrombocytes in peripheral circulation. When the lymph flow from the thoracic duct is prevented from entering the circulation no effects are noted. The phenomenon may be caused by disturbance of functional activity of intestine.—*E. P. Laug.*

6798. **VAN SLYKE, DONALD D., and JAMES A. HAWKINS. Studies of gas and electrolyte equilibria in blood. 16. The evolution of carbon dioxide from blood and buffer solutions.** *Jour. Biol. Chem.* 87(2): 265-279. 1930.—The rates of evolution of CO_2 from blood and phosphate buffers have been determined. As much CO_2 is liberated from blood or erythrocyte solution in 5 sec. as from a phosphate or serum protein solution with the same CO_2 content and buffer value in 80 sec. These findings agree with those of Henriques. The addition of red cells to the phosphate buffer in sufficient quantity so that the hemoglobin concentration is 0.05 that in blood accelerates the liberation of CO_2 so that the rate is as rapid as from whole blood. We have at present no explanation of the mechanism by which the cell contents (probably but not certainly hemoglobin) accelerate CO_2 evolution from solution. The direct combination of anhydrous CO_2 with hemoglobin assumed by Henriques is not proved. That the CO_2 in the blood is accounted for by the amounts present as bicarbonate and physically dissolved CO_2 has, furthermore, been shown by quantitative data published from this laboratory. The rapidity of evolution of CO_2 from evacuated blood solutions appears to be best described as due to a catalytic acceleration by the cell contents of the reaction $HCO_3^- + H^+ \rightleftarrows H_2CO_3$. Concerning the mechanism of the catalysis no data are at present available for the formation of a reasonably probable hypothesis.—*Authors' summary.*

6799. **VARS, HARRY M. Blood fibrin studies. The concentration of fibrin yielded by canine plasma in relation to dietary factors.** *Amer. Jour. Physiol.* 93(2): 554-567. 1930.—When diets of known composition, in which all the components but the carbohydrate and

protein portions remained constant (these 2 being substituted isocalorically, one for the other), were fed to dogs, the concentration of fibrin yielded by the blood depended upon the nature of the previous regimen and the duration of its feeding. The feeding of different protein-containing diets caused variations in the fibrinogen concentration of the blood. Rations containing a high percentage of protein, when fed over long periods, did not cause the fibrin values to remain at a high level. This seems to indicate that the ingested protein acted as some sort of transient stimulus to increase fibrinogen production. When rations containing gradually increased amounts of protein were fed the concentration of fibrin yielded by the blood did not increase with each increment of protein. Apparently, the type of protein ingested did not play any marked part in determining the response elicited; similar results were obtained with the widely unlike casein and "meat residue." Rations extremely low in protein when fed over long periods also seemed to stimulate fibrinogen production. Under the experimental conditions adopted pig stomach appeared no more effective in causing changes in the fibrin values than did pig liver or kidney. In fact, the variations were no greater than those observed when casein and "meat residue" were fed. Observational periods of 10 days or longer were necessary to secure a clear cut demonstration of the effects of the special diet. Longer periods might profitably be employed, whereas short periods were likely to give an entirely erroneous picture. The daily variations in fibrin concentration, observed in some periods, were less than 10%, though usually they amounted to more than this (20-25%). The reasons for the fluctuations were still unexplained. Starvation periods of 3 to 6 days might cause minimum fibrin values. The results, however, would depend largely upon the type of diet and duration of its feeding immediately preceding the inanition. As to fibrin concentration of blood from vessel to vessel, no difference was noted between arterial (heart) and venous (jugular) blood and the variations that were noted between other vessels were mostly within the limits of experimental error.—*Author's summary and conclusions.*

6800. **VILLA, LUIGI. Über den Ursprung des Hämoglobins.** *Virchow's Arch. Path. Anat. u. Physiol.* 277(2): 380-385. 32 fig. 1930.—The site of hemoglobin synthesis is the cell nucleus and not the protoplasm.

6801. **WADSWORTH, AUGUSTUS, FRANK MALTANER, and ELIZABETH MALTANER. Further studies of the chemical reactions underlying the coagulation of the blood. The activity of lecithin.** *Amer. Jour. Physiol.* 91(2): 423-428. 1930.—By a process of mild hydrolysis and precipitation in alkaline solution with $CaCl_2$, a fraction was isolated from pure lecithin which possessed active coagulative properties. The pure lecithin itself had no coagulative action. This hydrolyzed fraction of pure lecithin corresponds very closely both in method of preparation and in coagulative activity with the active lipid substance previously obtained from the crude acetone insoluble lipids of beef-heart tissue. In the authors' previous studies they suggested that this active lipid substance might be the residue of cephalin resulting from the replacement of the base, amino ethanol, with H, which is a diglyceride phosphoric acid. The results of the present study suggest that a corresponding residue of lecithin and the active lipid obtained from tissue extract are similar substances.—*Authors' summary and conclusions.*

6802. **WADSWORTH, AUGUSTUS, FRANK MALTANER, and ELIZABETH MALTANER. Further studies of the chemical reactions underlying the coagulation of the blood. The activity of cephalin.** *Amer. Jour. Physiol.* 97(1): 74-81. 1931.—A new method for the preparation of a relatively pure cephalin, free from lecithin, was developed. Purified cephalin prepared by this method possessed a high degree of coagulative activity. An aqueous solution reacted with $CaCl_2$ in neutral solution to produce a distinct chemical compound of cephalin with Ca, which, when washed free of its reaction product, HCl, was inactive as a coagulant of blood plasma. The cephalin recovered from the Ca compound possessed a high degree of coagulative activity. When an aqueous solution of cephalin was mixed with a solution of serum albumin or pseudoglobulin in the presence of a slight amount of acid (HCl), a globulin-like precipitate was formed whereas in the absence of acid no visible reaction occurred. No precipitation occurred when this amount of acid was added to the cephalin or the protein alone. Similar results were obtained when $CaCl_2$ instead of acid was added to a mixture of cephalin and serum protein. Lecithin, on the other hand, which has no coagulative action, did not give rise to precipitation when mixed with these proteins either in the presence or absence of similar amounts of acid or $CaCl_2$.—The results indicate that cephalin, like the active lipid fractions isolated from the crude tissue extract and from pure lecithin, coagulates blood plasma and, further, that this action is associated with a chemical reaction of the lipid with ionized Ca salts resulting in the formation of mineral acid.—*Authors' summary and conclusions.*

6803. **WALKER, MAURICE A., and NORMAN M. KEITH. The effect of a solution of acacia in restoring diminished body fluid.** *Amer. Jour. Physiol.* 95(3): 561-572. 1930.—Intravenous injection of a volume of 6% solution of acacia equal to 8% of the body weight of a dog (4.8 gm. acacia for each kgm. body weight [into 4 dogs]) did not cause manifestations of toxicity and resulted in secretion of practically the same volume of urine as injection of a similar quantity of 0.8% solution of NaCl [into 2 dogs], but the concentration of hemoglobin in the blood remained decreased for at least 3 days. After dehydration of dogs by intravenous injection of concentrated solutions of sugar [14 experiments], the largest amount of acacia injected without evidence of toxicity was 1.9 gm. for each kgm. body weight. Amounts of 4.8 gm. for each kgm. of body weight caused death. [In 5 experiments] dogs were dehydrated also by intravenous injection of sugars dissolved in solution of acacia. Except when the quantity of 1 or the other substance was great, the results were not noticeably different from those obtained when solution of sugar alone was used for dehydration. After loss by hemorrhage of approximately 50% of the total amount of blood in the body the fluid lost could not be restored with isotonic solution of NaCl or of solution of dextrose, and the animals died. However, solution of acacia restored the blood volume and the animals remained well, although the concentration of hemoglobin was greatly reduced. The volume of urine secreted in 22 hrs. was greater than the volume of solution of acacia injected. The general results of these experiments indicate that solution of acacia has the property of holding the injected fluid in the circulation for a considerable period. It does not inhibit renal excretion of water. There is evidence that under certain conditions acacia not only holds water in the blood, but at the same time favors renal excretion of water of extra-vascular origin.—*Authors' summary.*

FOOD AND NUTRITION

6804. ABDERHALDEN, EMIL. Studien über den Einfluss bestimmter Nahrungsarten auf den Gesamtzustand des tierischen Organismus. *Biochem. Zeitschr.* 234 (1/4): 142-169. 2 fig. 1931.—The author gives a comprehensive review of his experimental work in this field for the past 15 yrs.

6805. ABELIN, I. Über den Nähr- und Wachstumswert des Zwiebacks. *Zeitschr. Kinderheilk.* 50(4): 465-481. 1930.—On a diet of zwieback prepared with milk and butter 7 young rats averaged only 2 gm. increase in wt. in 2 mo., and 3 died; in the next mo. 22 gm. were gained. With the addition of 5 cc. boiled milk 64 gm. were gained in 12 wks. (av. wt. 138 gm.). On a normal bread and milk diet wt. increased to 153 gm. in 1 wk. Confirmatory experiments were made on 9 other rats on similar zwieback and 2 cc. or 5 cc. of raw milk followed later by bread and milk. Another experiment with 9 rats with bread or zwieback similarly prepared gave comparable results. No signs of avitaminosis appeared, except loss of hair; addition of yeast had no effect except on the hair. Experiments with amino acids (4 controls; 4 exp. rats) show that 25 mgm. lysine per day promoted growth (15 gm. in 2 wks.) but that 10 mgm. lysine + 25 mgm. cystine and 25 mgm. tryptophane had little effect; when baked with zwieback the lysine lost its effect (7 rats av. 25 gm. gain in 6 wks.—1 died; the following 11 days, on zwieback and 20 mgm. lysine per animal per day, av. gain of 12 gm.). Swedish bread given 7 rats for 4 mo. gave an av. gain in wt. of 30 gm.; 3 died; all showed loss of hair as a sign of disturbed nutrition; there was some xerophthalmia, keratomalacia, and frequent deformity of the thorax. Feeding of olive oil and mixtures of vitamins A, B, and D did not check the loss of hair; fresh growth reappeared with small amounts of thyroid gland (12 rats). Prophylactic feeding with thyroid or 25-75 mgm. cystine prevented loss of hair.

6806. BECKER, R. B., and W. M. NEAL. Relation of feed to bone strength in cattle. *Proc. Amer. Soc. Animal Prod.* 1930: 81-88. 1931.—Breaking strengths of ribs and leg bones of cattle, using principally a 6-inch span on an electrically driven Riehle Bros. testing machine, are presented. Leg bones of a persistent producing cow on a low-Ca ration were extremely weak, breaking at 335 pounds. Leg bones from 3 others whose feed contained 2% bonemeal broke at 7.0-10.3 times this weight; from 5 Angus on unsupplemented ration at 8.1-9.4; from an extreme low-P cow, 4.5; from a range cow on low mineral pasture, 5.3; from 2 on P-deficient plus $CaCO_3$ ration, 6.9 and 8.0; and from a cow fully recovered from P-deficiency, broke at 10.8 times this weight. Ribs were too flexible to give breaking strengths representative of the state of mineral storage. Depletion of mineral reserves through an inadequate intake is a suggested cause of weak bones; this is overcome by mineral supplements.—*R. B. Becker.*

6807. BICKEL, A. Zur Verwertung der Magermilch. Eine Anregung zur Lösung einer volks- und ernährungswirtschaftlichen Frage. *Zeitschr. Untersuch. Lebensmittel* 57(5): 437-443. 1929.—It is urged that dried casein from skim milk be used more for human food and experiments are described to show that such casein is of high biological value, as is that of fresh milk. Plasmon was superior to dried peas and to black bread in favoring growth in young rats and slightly negative N balances in dogs fed on oatmeal ration were improved when a part of the oatmeal was replaced by Plasmon of the same N content.—*M. H. Keith.*

6808. BICKEL, ADOLF, und GERHARD LISS. Weinessig- und Zitronensaftgenuss in ihrer Beziehung zur morphologischen Beschaffenheit des Blutes. *Arch. Verdauungs-Krankh.* 48(3/4): 158-166. 1930.—Three dogs received through an esophageal tube per kgm. body wt. respectively 0.525 cc. vinegar, 0.398 cc. vinegar, and 0.454 cc. lemon juice, each in 200 cc. water. Dog 4 received only 200 cc. water. The dogs were weighed daily, and blood counts and Hb estimations were made weekly. All the dogs showed a higher Hb content and erythrocyte count at the end of the experiment than at the beginning, indicating that there was no permanent production of anemia by ingestion of acid. To learn whether any transient change in the blood-picture followed the use of acid, supra-vital staining with basic stains was employed. Most erythrocytes are not stained by these basic colors, only those cells containing the so-called substantia granulo-filamentosa, which ordinarily occur in the ratio of about 1: 1000, but are increased when the bone-marrow is stimulated, especially in regenerating anemias. A dog in whose blood no cells with substantia granulo-filamentosa were found, and the 3 experimental dogs, were given acid; water was given as previously to the 4th dog; blood samples were stained 1 and 2 hrs. after the ingestion of the acid or water. A slight transient rise in the erythrocytes containing substantia granulo-filamentosa was observed in the dog given water; the dogs given acid showed no change. The authors conclude that the chronic use of vinegar in ordinary quantities does not injure the blood.

6809. CARR, R. H., and C. M. JAMES. Synthesis of adequate protein in the glands of the pigeon crop. *Amer. Jour. Physiol.* 97(1): 227-231. 2 fig. 1931.—In the lower end of the pigeon crop and extending into the esophagus are many branched alveolar glands (absent from the crop of a chicken) formed by hypertrophy of the basal cells of the stratified squamous epithelium which lines the entire crop. The ducts of the glands open upon the inner surface of the crop and esophagus. The desquamation of the basal lining cells produces the milky serum secreted by parent pigeons when feeding their young. This fluid is high in fat, protein, mineral matter, and contains such enzymes as rennet, amylases and saccharases, etc., all of which aid in providing a suitable food for the young. A possible synthesis may go on in these glands to supplement the amino acids known to be missing in corn and necessary for maintenance and growth.

6810. DÖRFFEL, J. Klinische, experimentelle und chemische Studien über den Einfluss der Ernährung auf Entzündungsvorgänge in der gesunden und kranken Haut. *Arch. Dermatol. u. Syph.* 162(3): 621-681. 3 fig. 1931.—Investigations on 141 patients on the Herrmannsdorfer modification of the low salt diet showed an increase in the inflammatory response of the diseased or healthy skin during the diet, which was sometimes considerable. This reaction regressed quickly when a normal diet was resumed. In rabbits, too, a corresponding

diet (oats) increased the response to inflammation. The alkaline, green diet had the opposite effect. The oat diet in rabbits had an effect similar to the salt-poor diet in man, particularly on the tuberculous infiltrate after intracutaneous inoculation with living bovine type. In non-specific wounds, too (after a more pronounced, circumscribed reaction), there was a more rapid healing than on green diet. In investigations on the alkali reserve, the actual reaction of the 24 hr. urine before and during the diet showed the slight acid influence of the Herrmannsdorfer diet. Additional acidification in the salt-poor diet by NH_4Cl and Ca silicate increased the therapeutic effect, particularly in chronic ulcers. The acid-base equilibrium was shifted correspondingly. The oat diet showed, as is known, an acidification of the actual reaction in the rabbit urine, the green diet an alkalinization. The salt-poor diet apparently called forth a moderate dehydration of the entire body which was definitely demonstrable on all the skin, most distinctly in the area diseased. In rabbits the dehydration was found in the skin after either the oat or the green diet. The acid Herrmannsdorfer diet in man, as well as the oat diet in the rabbit, produced a considerable mineral shift in the skin. K was increased, Ca and Mg sank. In the salt-poor diet Na was likewise decreased. The alkaline green diet produced the reverse condition. Particularly pronounced in the salt-poor diet was this mineral shift in the diseased area.—*Author's summary (transl.)*.

6811. **FRAZIER, WILLIAM C.** A defect in milk due to light. *Jour. Dairy Sci.* 11 (5) : 375-379. 1928.—A "cardboard" taste and "linseed-oil" odor develop in whole milk which has been exposed to diffuse daylight for 8 or more hrs. at about freezing temp. The light apparently acts as a catalyst in the oxidation of the milk fat. The defect develops more rapidly in pasteurized than in raw milk. The presence of neither enzymes nor bacteria is necessary for the reaction. The defect develops no more rapidly in milk from cows fed heavy rations of cottonseed meal or linseed cake than in milk from cows receiving no oil feed.—*Author's summary.*

6813. **KOSCHKIN, M. L.** Untersuchungen über mit Bierhefezusatz hergestelltes Brot. *Zeitschr. Untersuch. Lebensmittel* 60 (5) : 489-495. 1930.—Brewers' yeast contains 58.09% of digestible (88%) protein. By means of repeated washing with water and removal of the hop-resins, the unpleasant taste can be largely eliminated. The physical properties of the yeast-bread were not clearly distinguishable from the properties of the control-bread. Porosity was less, but moisture content and acid were greater than in the control-bread.—*C. R. Moulton.*

6814. **KRAUSS, W. E.** Studies on the nutritive value of milk. III. The supplementary value of various constituents of synthetic basal rations. *Jour. Dairy Sci.* 12 (6): 438-444. 1929.—Yeast, casein, starch, agar, and McCollum's salt mixture 185 were found effective in preventing nutritional anemia in rats fed an exclusive whole milk diet. The degree of effectiveness depended in general on the amount of Cu and Fe furnished by each substance. Cod liver oil, gelatin, rice polishings, wheat germ oil, and irradiated milk were found to be ineffective in preventing nutritional anemia in rats. An exclusive whole milk diet fed ad libitum to rats furnishes adequate protein, energy, and vitamins for growth, but is deficient in Cu and Fe.—*Author's summary.*

6815. **McCLELLAN, WALTER S., and EUGENE F. DU BOIS.** Clinical calorimetry. 45. Prolonged meat diets with a study of kidney function and ketosis. *Jour. Biol. Chem.* 87 (3) : 651-668. 1930.—Two men lived on an exclusive meat diet for 1 year and a third man for 10 days. The relative amounts of lean and fat meat ingested were left to the instinctive choice of the individuals. The protein content varied from 100 to 140 gm., the fat from 200 to 300 gm., the carbohydrate, derived entirely from the meat, from 7 to 12 gm., and the fuel value from 2000 to 3100 calories. At the end of the year, the subjects were mentally alert, physically active, and showed no specific physical changes in any system of the body. During the 1st week, all 3 men lost weight, due to a shift in the water content of the body while adjusting itself to the low carbohydrate diet. Thereafter, their weights remained practically constant. In the prolonged test, the blood pressure of one man remained constant; the systolic pressure of the other decreased 20 mm. and the diastolic pressure remained uniform. The control of the bowels was not disturbed while the subjects were on prescribed meat diet. In one instance, when the proportion of protein calories in the diet exceeded 40%, a diarrhea developed. Vitamin deficiencies did not appear. The total acidity of the urine during the meat diet was increased to 2 or 3 times that of the acidity on mixed diets and acetonuria was present throughout the periods of exclusive meat. Urine examinations, determinations of the nitrogenous constituents of the blood, and kidney function tests revealed no evidence of kidney damage. While on the meat diet, the men metabolized foodstuffs with FA: G ratios between 1.9 and 3.0 and excreted from 0.4 to 7.2 gm. of acetone bodies per day. In these trained subjects, the clinical observations and laboratory studies gave no evidence that any ill effects had occurred from the prolonged use of the exclusive meat diet.—*Authors' summary.*

6817. **NELSON, E. K., and H. H. MOTTERN.** The organic acids of spinach, broccoli and lettuce. *Jour. Amer. Chem. Soc.* 53 (5) : 1909-1912. 1931.—Fresh spinach contained 0.31% of oxalic acid. Citric acid and a small quantity of malic acid were separated by the ester distillation method. Analysis of broccoli shows that the leaves and buds have similar composition and nutritive value. Both buds and leaves contain protein somewhat in excess of that reported in spinach. The predominating organic acid in broccoli is citric acid. It also contains *l*-malic acid and small amounts of oxalic and succinic acids. The proportion of citric and malic acids is 3: 2. The organic acids of lettuce were oxalic acid, 0.011%; *l*-malic acid, about 0.065%; citric acid, about 0.048%.—*Authors' summary.*

6819. **POPOW, N. A., A. A. KUDRJAWCEW, F. A. GUBAREW, und W. W. ROMANOWSKAJA.** Zur Frage über den Einfluss des Zentralnervensystems auf die Ernährungsprozesse. *Pflüger's Arch. Ges. Physiol.* 226 (3) : 377-392. 1930.—The corpus striatum of the cerebral hemispheres was removed in pigeons, and the processes concerned in weight regulation were found to be modified. Decerebrated birds and normal controls were fed autoclaved rice (artificial feeding in both cases); the experimental animals lost weight less rapidly than the controls, but became ill and died sooner. The operated animals were also more sensitive to the toxic effects of alcohol, morphine, etc. With complete starvation the loss of weight is slower and the survival period longer than in the controls. Feeding with starch gave results similar to those with autoclaved rice, but the differences between operated animals and controls were slight. Experiments using these diets with yeast added are reported; with rice and yeast the operated animals put on weight. Increase in weight was possible only when vitamin B was fed.—*H. C. Bazett.*

6821. **ROSENOW, L., und MAX ROSENOW. Der Einfluss eingesalzener Hefen auf das Wachstum junger Ratten.** *Biochem. Zeitschr.* 228(1/3): 163-164. 1930.—Addition of preserved (salted) yeast to bread fed to rats accelerated growth 30-60% in 24 days.

6822. **RUOTSALAINEN, ARMAS. Über die Resorption und Retention des Hühnereies (Stickstoff, Phosphor, Schwefel, usw.) bei Säuglingen.** *Zeitschr. Kinderheilk.* 46(3): 370-383. 1928.—Balance experiments were carried out on 2 infants, 11 and 3.5 mos. old, respectively, during 3 successive periods of 5 days each. In Periods I and III the ration was made up of Dryco dried milk powder (100 gm.), wheat flour (20 gm.), cane sugar (35 gm.), and water (1000 gm.); during Period II 20 gm. of the sugar was replaced by an isodynamic amount of well mixed egg (45 gm.). For the egg periods the N balances were positive, while the P and S balances of the younger child were positive and those of the older slightly negative.—*M. H. Keith.*

6823. **SEBRELL, W. H. An anemia of dogs produced by feeding onions.** [*U. S.*] *Public Health Repts.* 45(21): 1175-1191. 1930.—Five dogs were given daily supplements of cooked onions (approximately 5, 10, 15, 20, and 25 gm. per kgm. of body weight) in addition to the stock diet. Two dogs were given daily supplements of raw onions, 15 and 20 gm. per kgm. of body weight, respectively. Dogs receiving 5 and 10 gm. of onions per kgm. of body weight showed a slight and gradual reduction in the number of red cells and in the amount of hemoglobin, which became more marked when the quantity of onions was increased. With 15, 20, and 25 gm. of cooked onions and 15 and 20 gm. of raw onions per kgm. of body weight, there was a sudden and marked decrease in the number of red cells and in the amount of hemoglobin, with a considerable increase in the number of leucocytes and reticulated red cells. This decrease in red cells and hemoglobin reached its maximum in 7-12 days. There was then a rapid but slight increase, followed by a slow and gradual return toward the normal in spite of the continued administration of onions. All animals remained in excellent condition. The only evidence of abnormality was an extreme paleness of the mucous membranes of the mouth, and an increased rate of respiration in some cases at the severest stage of the anemia. In one dog the onion supplement was discontinued at the severest stage of the anemia and was followed by a more rapid and greater increase in red cells and hemoglobin than occurred in those animals in which the daily supplement was continued. In one dog after 32 days on 22 grams of onions per kgm. of body weight the daily supplement was increased to 34 gm. without increasing the severity of the anemia. After 35 days on this quantity the onion supplement was discontinued and was followed by a return of the blood findings toward the normal. In 1 dog after 32 days on 15 gm. of onions per kgm. of body weight the daily supplement was increased to 23 grams per kilo of body weight with a resulting definite decrease in hemoglobin and red cells and an increase in leucocytes, followed by a slow return toward the normal in spite of the continued ingestion of the onions.—*From author's summary.*

6824. **SEKINE, H., and Y. KAKIZAKI. On a synthetic diet for use in fish culture. I. Coefficient of utility of dietary protein.** [Japanese with English abstract.] *Jour. Imp. Fisheries Exp. Sta. Tokyo* 1(1, pt. 1): 143-153. 1930.—Three groups of trout-fry (*Salvelinus fontinalis* Mitchell) were kept for 8 weeks on diets containing 16, 36 and 64% of protein, respectively, the caloric value being the same in each case. The best result was obtained on the lowest protein diet (16%); the other 2 groups were not in such good condition, though some of them grew more quickly. The experimental results indicate that the 3 diets have the biological values, 0.335, 0.205, and 0.109, respectively. Hence, if A be a biological value of dietary protein, and x the percentage of protein in a diet, $A = e^{-0.742-0.0220x}$; thus, the utilisation of the dietary protein is expressed by Ax, and, from the equation given, the maximum value of Ax is about 44% of protein. It is concluded that in a synthetic diet the amount of protein content exceeding 44% goes to waste. —*From authors' summary.*

6825. **SULLIVAN, M. X., and W. C. HESS. Studies on the biochemistry of sulphur. X. The cystine content of meat and fish.** [*U. S.*] *Public Health Repts. Suppl.* 94. 1-13. 1931.—The cystine content of round steak, sirloin steak, haddock, halibut, and salmon was determined by estimating cystine in hydrolysates of the fresh material and of tissue powders dehydrated and defatted by acetone and ether; the Sullivan, the Okuda, and the Folin-Marenzi methods were used. The first 2 gave results of the same order of magnitude; the Folin-Marenzi results on the same hydrolysates were higher. The acetone-ether extracted material seems best suited for cystine determinations. The Sullivan and the Okuda methods give fish a higher cystine content than meat; the Folin-Marenzi method indicates no great difference between them. Sodium cyanide added before the addition of the uric acid reagent stops color formation by cystine but only partially checks color formation by the meat and fish hydrolysates. The Folin-Marenzi method gives a positive reaction with some non-cystine compound in the hydrolysates. The evidence at hand indicates that the cystine findings for meat and fish by the Sullivan and the Okuda methods are the more reliable. By these 2 methods the average cystine content of meat is about 0.8% on the dry ash-free basis, and by the 3, that of fish is about 1.2%. By using the cystine values obtained on the acetone extracted material and correcting for the moisture of the fresh material, the cystine content of meat as bought is approximately 0.19%, of fish as bought 0.26%. The prevention of humin formation by $TiCl_3$ gives no higher cystine values. The glutathione content of meat was slightly higher than that of fish. In both cases the cystine represented by glutathione is but a small part of the total cystine.—*Authors' summary.*

6826. **TAYLOR, ALONZO E. The national overweight.** *Scientific Monthly* 32(5): 393-397. 1931.—There are instinctive impulses and physiological tendencies in the direction of overweight, which will prevail unless restrained or counteracted. American economic circumstances permit an easy functioning of the influences making for overweight. Foodstuffs are available in extraordinary variety and profusion, and restraint in eating is lacking except in the poorest classes. Unless restrained the average overweight of people over 40 will become higher, and the effect of overweight on incidence of disease will be more conspicuous. Four factors may serve as restraining influences; education in nutrition, medical precept, life insurance admonition and, greatest of all, style.

6827. **TSO, ERNEST, and S. M. LING. Changes in the composition of blood in rabbits fed on raw and cooked soybeans.** *Proc. Soc. Exp. Biol. & Med.* 28(3): 219-220. 1930.—In the experiments reported there are no demonstrable changes in the blood composition of rabbits whether they are fed cooked or raw soybeans or a control diet of millet and cabbage except perhaps in cholesterol content. Uric acid is present in rabbit's blood only in negligible quantity. The blood cholesterol value is perhaps slightly higher in animals fed on soybeans than in controls. There is, however, no appreciable difference in cholesterol levels between rabbits fed on cooked and raw soybeans.

6828. **WHITNAH, CARRELL H. Indications of glucose in milk.** *Jour. Amer. Chem. Soc.* 53(1): 300-304. 1931.—To determine whether a large increase of blood sugar of cows would cause the appearance of glucose in milk, a method for estimating small amounts of glucose in milk has been developed. The sugar in the milk was estmated polarimetrically. The glucose was removed by fermentation with carefully washed baker's yeast; and the lactose remaining was estimated polarimetrically.

Changes in rotary power corresponding to glucose percentages varying from zero to 0.35% of glucose have been found in normal cow's milk.

6830. **ZIEGELMAYER, WILL. Die naturwissenschaftlichen Grundlagen des Kochens und der Ernährung. In Verbindung mit den Grundbegriffen der Kolloidchemie und der physikalischen Chemie.** 272p. Illus. Julius Beltz: Berlin, 1929. Pr. 8.50 M.—The style and subject matter of this book are chosen with a view to giving to the intelligent housewife the scientific basis for the selection, preservation, handling, and cooking of food materials. The work differs from most treatises on the subject mainly in taking the point of view that foods consist almost exclusively of colloids and that all the changes that they undergo are to be explained on the principles of colloid chemistry. The changes during storage, preparation for the table, and utilization in the body are not, in fact, due simply to the protein, carbohydrate and fat, but are much affected by the amounts of water and of mineral salts present and their relation to the protein or carbohydrate. The physico-chemical explanations of some of these changes are therefore discussed. A 26-page introductory chapter defines terms used in colloid chemistry, illustrating them by application to foods and food materials. Then follows a chapter on "Reasons for the Conversion of Starch into Sugar, a Colloid-disperse System into a Molecular-disperse System: True and Apparent Solution," showing the significance and the method of this change in plant and animal physiology. The section on Carbohydrates and Crude Fiber considers mainly breads and other cereal preparations, with some detail also on the potato and several pages on beer. A chapter headed "Protein Building Stones" includes lengthy discussions of milk and dairy products and of meats of all kinds. Other kinds of food are less fully treated but there are added chapters on digestibility of food, man's food requirements, and dietaries for infants and children.—*M. H. Keith.*

ENERGY METABOLISM

6831. **ANDERSON, I. A., R. A. CLEGHORN, J. J. R. MACLEOD, and J. M. PETERSON. The effect of evisceration on the respiratory metabolism of the decerebrate preparation.** *Jour. Physiol.* 71(4): 391-402. 1931.—By indirect calorimetry, employing Pearce valves, light Douglas bag and Haldane gas apparatus, the respiratory metabolism of decerebrate and decerebrate-eviscerate cats was measured simultaneously with measurement of the lactic acid and sugar concentrations and CO_2 content of the arterial blood. Following evisceration a slowly rising blood lactic acid concentration was accompanied by a falling blood CO_2 content and a raised R. Q. Respiratory quotients of 0.85 or less were obtained. Higher values were associated with lowering of the CO_2 content of the blood. With rising minute volume of expired air the respiratory movements caused an increasing O consumption. When the blood lactic acid reached about 80 mgm. %, the blood CO_2 content having fallen to 25-30 vols. %, the preparation rapidly deteriorated.—*I. A. Anderson.*

6832. **BORNSTEIN, A., und A. LOEWY. Über den Alkoholumsatz beim Menschen im Höhenklima.** *Biochem. Zeitschr.* 230(1/3): 51-67. 1931.—Experiments on 3 persons showed that the alcohol content of the blood in man rises more quickly and more abruptly in the mountains than in the lowlands. After the maximum was attained, the decrease was approximately the same in both places. The change in respiratory minute volume and respiratory frequency was just as great as in the lowlands. The respiratory quotient (R. Q.) in fasting experiments was lower in the mountains than in the lowlands. After taking alcohol the R. Q.—as an index of alcohol oxidation—sank more than in the lowlands, frequently to the level of oxidation of pure alcohol, but returned to the original values more quickly. After exclusive use of alcohol, no specific-dynamic action was found in the mountains or in the lowlands. It occurred in both places only after sugar was taken in addition to alcohol and was then distinctly more pronounced in the mountains.—*Authors' summary (transl.).*

6833. **BORSOOK, HENRY, and HOWARD M. WINEGARDEN. On the specific dynamic action of protein.** *Proc. Nation. Acad. Sci. U. S. A.* 17(2): 75-91. 3 fig. 1931.—In conjunction with data on the efficiency of the process of renal excretion, analyses of the data bearing upon the relation of the increase in metabolism following the ingestion of protein or amino acids reveals: A close correlation between the specific dynamic action of proteins or of amino acids and the increase, over the basal level of excretion, in the urinary N; that neither the direct experimental evidence nor the considerations of the energy relations support the view that the specific dynamic action of protein is necessarily due to the conversion of the deaminized fractions into glucose. The values of the specific dynamic action of amino acids and of proteins indicate that 25-60% is due to the work imposed upon the kidney. The remainder of the specific dynamic action of protein or amino acids is due to the metabolism of the N and C, though it is not possible, from the evidence, to estimate the proportion for which each is responsible. The hypothesis that the specific dynamic action of protein is due to at least two distinct processes, which do not proceed at similar rates, provides an explanation for some hitherto anomalous phenomena in the specific dynamic action of protein.—*H. Borsook.*

Q. of 9 eviscerated spinal preparations, with artificially maintained blood sugar, was determined under conditions excluding excessive ventilation, and found usually to be 1. In certain cases somewhat lower quotients were obtained, but the view that the usual quotient of 1 is due to excessive ventilation is shown to be untenable.

6835. **DHAR, N. R. Influence of temperature on metabolism and the problem of acclimatization.** *Allahabad Univ. Studies* 2: 313-328. 1926.—[See B. A. 1(2): entry 2686.]

6836. **EFIMOFF, W. W., M. N. SARCH, K. S. SAMYTSCHKINA, P. P. MITROFANOFF, O. A. SALZGEBER, A. J. LEWINA, und S. S. MARGULIS. Physiologische und biochemische Untersuchungen der Fliessarbeit des "Nerventypus." (Eigentümlichkeiten des Gaswechsels und der Biochemie des Blutes bei Nerventätigkeit.)** *Arbeitsphysiologie* 3(5): 372-396. 1930.—The studies were made on 17 workers in the manufacture of caps in which the work was done either by electric sewing machines or by hand and a conveyor system was used in a table at which 15 workers on each side were employed in various manipulations. The workers were in the main of a poor grade of health and the incidence of disease and mortality were much higher in this occupation than in other trades. The basal metabolism of 9 workers averaged 16% below the Benedict standards. The range of O absorption for the different kinds of work varied from 73 to 332 cc. per minute. The respiratory quotient during work varied between 0.80 and 1.10 in 75% of the measurements and was higher when the subjects worked 1 hour 50 min. with a 10 min. pause than when they worked 55 min. with a 5 min. pause. The high respiratory quotients are ascribed not to an increased formation of lactic acid but to an increase in other acid products or to an increase in the irritability of the respiratory center. There was no change in the organic P of the blood during the working day, but a decrease in the alkali reserve. The P elimination in the urine fell off during the working day. In general the changes in blood morphology as the result of the work were not large. The blood morphology according to Schilling's formula showed that the subjects were fatigued even before they began the day's work. The conclusion is drawn that light work with a conveyor system re-

quiring a high degree of attention is more fatiguing than the more strenuous work of ironing in which a conveyor system was used, and that 55 min. of work with 5 min. pause gave more favorable data than a working period of 1 hour 50 min. with a 10 min. pause. —*T. M. Carpenter.*

6837. **FARKAS, G., J. GELDRICH, und A. SZAKALL.** Über das Verhalten des Grundumsatzes beim Ernten. *Arbeitsphysiologie* 3(6): 468-476. 1930.—The basal metabolism of 6 subjects was determined by the Douglas bag method over varying lengths of time during the periods of harvesting, threshing and idle periods. The longest period covered was over 7 weeks. The metabolism was found to be about 10% higher in the most active period as compared with the minimum in periods of idleness.—*T. M. Carpenter.*

6838. **GIAJA, ALEXANDRE.** Prilog izučavanju energetike domaćih životinja. Termoregulacija tica. [Temperature regulation in birds.] [French résumé.] *Bull. Acad. Royal Serbe Sci. Arts, Belgrade* 137(65): 113-127. 4 fig. 1929.—A study of the basal metabolism of the goose, turkey, and cock is reported. These fowls show no noteworthy difference in basal metabolism, the values being around 900-1000 calories per sq. m. per day. Differences in environmental temp. of 0 to 20° make only slight differences in the energy loss by the goose and the cock. Heat loss due to plucking is greater at lower temp. (around 0) than around 20°. The plumage seems to have more heat-conserving efficiency at lower than at higher temp. It is possible that plucking causes profound disturbances in metabolism, and that the change in heat loss may be due to other causes than to the absence of plumage,—causes such as possible modification of the circulation in the skin. The value of alimentary expenditure for maintenance is not in agreement with the data derived from respiration calorimeter studies. Factors seem to operate in the former case which have no direct effect on calorimeter data, but which may have significance in physiology and from the point of view of practical nutrition.

6839. **GIAJA, ALEXANDRE.** Sur la thermorégulation des oiseaux partiellement plumés. *Compt. Rend. Soc. Biol.* 100(14): 1225-1226. 1929.—See preceding abstract.

6840. **GIANNONE, E.** Esiste un ritmo nictemerale nel metabolismo basale dei colombi? [Is there a nocto-diurnal rhythm of basal metabolism in pigeons?] *Boll. Soc. Ital. Biol. Sperim.* 5(3): 271-273. 1930.—In 11 experiments on 4 pigeons kept in thermic neutrality, the CO_2 output showed considerable individual differences. The data obtained do not corroborate the existence of a nocto-diurnal metabolic rhythm, the night diminution being irregular.—*M. Comel.*

6841. **HOCHREIN, M., J. MICHELSEN, und H. BECKER.** Schlaf, Schlaflosigkeit und körperliche Arbeit in ihrem Einfluss auf den Blutchemismus. II. Die Erholungsphase. *Pflüger's Arch. Ges. Physiol.* 226(6): 738-745. 1 fig. 1931.—A comparison has been made of the reactions to muscular work after a normal night with sleep and one without. While the resting conditions of the subjects show little differences under the 2 conditions the reaction to exercise is quite different and shows a relative instability of compensatory mechanisms. Observations were made on CO_2 content, the O capacity, lactic acid and water content of venous blood. The $BHCO_3$ in plasma at a constant CO_2 tension, proteinate lactate, chloride total base, and water content of the plasma were also determined, as well as the cell volume and blood sugar concentration. The pH of the serum was calculated. Data were also obtained on pulse rate, arterial pressure, O content of venous blood and O consumption per min., and the changes are expressed on the percentage basis. After a sleepless night lactic acid reaches a higher level during work and returns to the normal more slowly. The alkali reserve changes in the opposite direction. After a sleepless night the water content of the blood and plasma during rest is increased, but a blood concentration which occurs during exercise is exaggerated and the return to a normal level is slowed. After a sleepless night the actual metabolism accompanying the work appears to be increased and O consumption and circulation return to their normal level more slowly.—*H. C. Bazett.*

6842. **HORN, Z., und G. ÓNODY.** Über die sogenannte spezifisch-dynamische Wirkung der Nahrungsstoffe. II. Wirkung von Kohlenhydraten auf den Sauerstoffverbrauch von isolierten Zellen. *Biochem. Zeitschr.* 226 (4/6): 286-296. 1930.—In experiments designed to explain the mechanism of the specific dynamic action of foods the effects of the products of the digestion of carbohydrates on erythrocytes (goose) as examples of simple body cells were studied with Warburg respirometers. Glucose, fructose and galactose were found to increase the O consumption of these cells suspended in broth though not in proportion to the concentration of the carbohydrates.—*C. S. Robinson.*

6843. **HORN, Z.** Über die sogenannte spezifisch-dynamische Wirkung der Nahrungsstoffe. III. Wirkung des Blutserums auf die Oxydationen der Erythrocyten. *Biochem. Zeitschr.* 226(4/6): 297-307. 1930.—The addition of serum from goose, dog, human or rabbit blood increased the oxygen consumption of goose erythrocytes suspended in broth in proportion to the amount of serum added. The active constituents of the serum are not inactivated by temperatures up to 56° C. The concentration of blood sugar is without effect on the potency of blood serum. When serum is subjected to dialysis both dialysate and residue are active.—*C. S. Robinson.*

6844. **HORN, Z.** Über die sogenannte spezifisch-dynamische Wirkung der Nahrungsstoffe. IV. Wirkung von Hormonen auf die Zellatmung. *Biochem. Zeitschr.* 226 (4/6): 308-314. 1930.—Neither thyroxin nor insulin increased the O consumption of goose erythrocytes suspended in broth. Serum from thyroidectomized rabbits acted like serum from normal animals. Sera from diabetic men and dogs behaved in small amounts like normal sera but in larger amounts produced either no increase or an inhibition. The simultaneous use of insulin and carbohydrates did not augment the effect of the latter.—*C. S. Robinson.*

6845. **HOUGHTEN, F. C., W. W. TEAGUE, W. E. MILLER, and W. P. YANT.** Thermal exchanges between the bodies of men working and the atmospheric environment. *Amer. Jour. Hyg.* 13(2): 415-431. 1931.—Work tests were made on 4 normal ♂ subjects at effective temp. of −2.0-32.6° C. and relative humidities of 20 and 95%. All the subjects were normally clothed and had previously partaken of their regular diet. The work was performed on a special work machine and in the majority of tests the rate was 4578 kgm. per hr. A few tests were made at ½ and a few at double this rate. A special test is reported showing the increase in metabolic rates for different states of activity. The efficiency of the human body as an engine is shown to vary from 11 to 20% in performing this type of work. Metabolic processes as measured by gaseous exchange reach equilibrium very quickly after changes in state of activity. A minimum energy production or metabolic rate of 119 calories per sq. m. per hr. was found for men working at a rate of 4578 kgm. per hr. in the temp. range 6-24° C. effective temp. Energy production within, and total heat loss from the body, are shown to be functions of the effective temp. index for men normally clothed, working. Total heat loss is divided into loss by evaporation and combined loss by radiation and convection, both of which are shown to be functions of dry bulb temp. All curves for working men show similar characteristics to those for men seated at rest; but are of greater magnitude, the points of change occurring at lower temp. for men working. Excessive heat produced in the body due to work is shown to be dissipated largely by increased evaporation controlled by the availability of perspiration. Change from insensible to sensible perspiration takes place at 10.0 and 13.9° C. effective temp. with 95

and 20% relative humidity respectively.—*Authors' summary.*

6846. **KEETON, ROBERT W., HELEN MacKENZIE, SELMA OLSON, and LOUISE PICKENS.** The influence of varying amounts of carbohydrate, fat, protein and water on the weight loss of hogs in under-nutrition. *Amer. Jour. Physiol.* 97 (3) : 473-490. 1931.—Approximately mature hogs [2] confined in metabolism cages maintained their weight on basal requirements when such requirements were estimated according to Voit's figures of 19.1 calories per kgm. of body wt. On basal rations, hogs were in positive N balance. In cage life on rations 30% below basal requirements, including 0.94 gm. of protein per kgm. and wide variations in carbohydrate, they developed a negative N balance. Loss in weight paralleled the caloric deficiency. In cage life and on rations 20% below their basal requirements including 0.94 gm. protein per kgm. body wt., they remained in N balance but lost weight. All submaintenance rations, which were 20% below basal requirements, contained 15.28 calories per kgm. body wt. Three types of secondary variations were introduced: (a) Variations in carbohydrate and fat: To both animals 0.94 gm. of protein per kgm. body wt. was fed. To 1 animal no carbohydrate was given and to the other as much carbohydrate as was consistent with the calories selected. Fat furnished the remainder of the calories. (b) Variations of protein: To one animal a protein of 0.94 gm. per kgm. and to the other a protein of 0.03 gm. per kgm. was fed. Fat and carbohydrate furnished the remainder of the calories. (c) Variations of water; In this case the ration of both animals contained the same carbohydrate, fat and protein. To one animal water was given ad libitum, taking 24,191 cc. per day. To the other animal 1700 cc. per day was given. Through all of these variations the hogs lost wt. at the same rate. The loss was uniform without evidence of water retention, and parallel to the caloric deficiency. On the high fat ration the fatty acid to glucose in the metabolizing mixture approximated a value of 3.6, which is higher than the threshold of ketogenesis in normal men. The animals showed no ketosis. The weight loss of the hog fed 0.03 gm. of protein per kgm. can be ascribed to fat and its intimately associated fluids and protein. There was no significant destruction of body protein as shown by the N excretion. The hog with the limited intake of water (1700 cc.) after 19 days showed evidence of desiccation, absence of saliva and a dry mouth. Evidence is presented that this desiccation was not sufficient to alter appreciably the intra-cellular structure or activity.—*Authors' summary.*

6847. **KNOLL, W., und TH. MATTHIES. Kommt spontaner Ausgleich von Gewichtsverlusten nach Arbeitsleistung vor?** *Arbeitsphysiologie* 3 (6) : 525-528. 1930.—The authors weighed 3 riders after 1 hour's track riding, 40 rowers before and after a contest and 36 boxers in training and then weighed them again after ¾ to 1 hr. No food was taken and no urine was voided. There were further losses of weight during this time of 50 to 400 gm. which could be explained by the loss of water from naked skin or from clothes. Two subjects were investigated 4 to 14 times and the same kind of results obtained. No spontaneous recovery of weight took place. —*T. M. Carpenter.*

6848. **KOMMERELL, BURKHARD. Schilddrüse und Arbeitsstoffwechsel.** *Pflüger's Arch. Ges. Physiol.* 227 (1/2) : 1-23. 4 fig. 1931.—Dogs were used, and were made to work by running on a horizontal treadmill pulling a known load by means of a collar and harness with a weight hanging free over a roller. A load of 2-4 kgm. gave a metabolism of 540 to 750% above the basal level. In normal dogs the efficiency of the work was similar on a meat diet and on one poor in protein. Work done during the specific dynamic action of proteins was efficiently performed and Rapport's observations that this energy can be utilised for work was confirmed. The R. Q. during work was lower on a pure meat diet. The metabolism of work is somewhat lower in the thyroidectomised animal, and administration of thyroxin raises again the energy expended in work. This effect is particularly in evidence in lighter grades of work, and analysis indicates that the effect is due to an increased cost of free movement. While the increase in basal metabolism produced by thyroxin is to be ascribed to increased cell activity, that of exercise is of a different character, and may depend on the muscular movements being badly coordinated (compare tremors). It might then be considered as the opposite effect to that of training, where the muscle movements become more coordinated and efficient.—*H. C. Bazett.*

6849. **MANSFELD, G., und Z. HORN. Über die sogenannte spezifisch-dynamische Wirkung der Nahrungsstoffe. V. Die Wirkung von Nahrungsstoffen auf den Stoffwechsel der isolierten Lunge.** *Biochem. Zeitschr.* 234 (1/4) : 257-273. 1931.—A description is given of a method of determining the gaseous exchange of the isolated perfused lung in dogs. Glucose and fructose added to the perfusion blood, with insulin, augmented the O consumption of the lungs considerably in 3 of the 5 experiments, whereas the sugars applied as well as insulin, used separately, were ineffective. Of protein components, glycine was ineffective, while alanine considerably increased the consumption of O. The blood of a well nourished dog likewise caused an increase in O consumption in 1 of 4 experiments. The experiments, therefore, do not contradict the possibility that the specific-dynamic effect of foods is conditioned by the fact that the cells and tissues of higher organisms increase their O consumption corresponding to their food, as has been found for the unicellular organisms.—*Authors' summary (transl.).*

6850. **MARK, ROBERT E., und HELMUTH REINWEIN. Gaswechseluntersuchungen am Halbnierenhunde.** [Gaseous metabolism in unilaterally nephrectomized dogs.] *Arch. Exp. Path. u. Pharmakol.* 142 (1/2) : 78-85. 1930.—Discussion of tabulated results from experiments on 3 animals.

6851. **MUKHERJEE, HARENDRA NATH, and PRATUL CHANDRA GUPTA. The basal metabolism of Indians (Bengalis).** *Indian Jour. Med. Res.* 18 (3) : 807-812. 1931.—The basal metabolism of 18 normal Bengali young men averaged −13.3% (Aub and Dubois standards). The vital capacity is markedly low, i.e., on the average about 14.8% lower than Western standards. The pulse pressure appears to be low. The low basal metabolism of Bengalis is perhaps due to climatic and nutritional causes.—*Authors' summary.*

6852. **NECHELES, H. Basal metabolism in Orientals.** *Amer. Jour. Physiol.* 91 (2) : 661-663. 1930.—Orientals (6) with a low basal metabolic rate did not show any appreciable drop in basal metabolic rate during sleep. Two Orientals with a normal or high basal metabolic rate showed a considerable drop in basal metabolic rate during sleep. Westerners with normal and high basal metabolic rates showed a drop during sleep comparable to that of the 2nd group of Orientals. There is evidence that the lower basal metabolic rate of Orientals is partly due to a greater degree of habitual relaxation.—*Author's conclusions and summary.*

6853. **RAPPORT, DAVID. The nature of the foodstuffs oxidized to provide energy in muscular exercise. III. The utilization of the "waste heat" of metabolism in muscular exercise.** *Amer. Jour. Physiol.* 91 (1) : 238-253. 1929.—The experiments were performed on a single well trained dog, which was given the customary standard maintenance diet of about 60% carbohydrate, 25% fat, and 15% protein. The animal was caused to run for 10 min. at about 14.4 miles per hr. on a horizontal treadmill introduced into a closed system for obtaining the gaseous exchange. Employing the term "work" loosely to indicate the mass of the animal moved through horizontal distance, the "work" done was approximately 3,000 horizontal kgm. Experiments during the post-absorptive state, at least 18 hr. after the last food, were alternated with experiments after the ingestion of either fat, glucose or meat. Most of these latter experiments followed the

ingestion of fat. The exercise was preceded and followed by periods during which the resting metabolism was obtained, and the excess metabolism of exercise and recovery was calculated upon the difference between the exercise and recovery gaseous exchange, and that of the average of the pre- and post-exercise resting periods, as had been done in the previous work. The conclusions are: The specific dynamic action of fat, as well as that of glucose, is abolished during muscular exercise and recovery, i.e., this extra energy, which at rest appears as waste heat, is utilized as free energy in muscular work. This tends to confirm the non-specificity of the oxidative recovery process of muscular contraction. On the other hand both the "calorigenic" action of epinephrine and the specific dynamic action of tyrosine, like that of protein, cannot be used in muscular work. Hence the above mentioned non-specificity is limited, as certain oxidative exothermic reactions will not serve for this purpose. Incidentally, the experiments confirm the conception that the calorigenic action of epinephrine is due neither to muscular work nor to the specific dynamic action of carbohydrate.

6854. REGELSBERGER, HERMANN. Die Beurteilung unspezifischer Reaktionen mit Hilfe der alveolaren Kohlensäure. *Zeitschr. Ges. Exp. Med.* 60(5/6): 591-610. 10 fig. 1928.—In an effort to study the mechanism of non-specific "reiz" substances, proteins or metals, the author recommends the determination of the reaction of the respiratory center. Using the method of Haldane and Priestley, he determines the alveolar CO_2, the blood CO_2 bound and unbound. Study of the continuous curves of the alveolar CO_2 tension is of clinical significance. Variations in the normal tension curve is a more sensitive gauge of the effect of irritative substances than the temperature changes. There is an accentuation of the post digestive wave in the CO_2 tension curve. This is probably dependent on the specific dynamic action of the food.—*D. Perla.*

6855. RIDDLE, OSCAR, GUINEVERE CHRISTMAN, and FRANCIS G. BENEDICT. Differential response of male and female ring doves to metabolism measurement at higher and lower temperatures. *Amer. Jour. Physiol.* 95(1): 111-120. 1930.—From 589 measurements made at 20° and 30° C., on ♂♂ and ♀♀ of 16 standardized races of ring doves, it is definitely established that the metabolism of the ♂ suffers a greater decrease with increase of external temp. than does that of the ♀. Between these limits the decrease in ♂♂ is 28.1%, in ♀♀ 20.3%. These values are further and fully confirmed by 167 measurements on 10 additional races, and by still other data. Under extreme (and abnormal) depression of the metabolism by a temp. of 30° C. the metabolism of the ♀♀ is higher (7.1%) than that of the ♂♂. At 20° C. the measurements of all the 3 large racial groups indicate a higher normal metabolism in the ♂ (3 ÷ %). Additional but preliminary measurements made at 15° C. similarly indicate a higher metabolism in ♂♂ when measured at this temp. The heat production of certain species and races—like that of the ♂ sex—is much more depressed by a high external temp. than is that of other species or races. All races of common pigeons studied by the authors are much less affected than are the ring doves. Some races of ring doves—all of which races have been established on the basis of size of thyroid and pituitary—are much less depressed than other ring dove races. Measurement at these temp. was preceded during 24 hrs. by maintenance at the same temp., and with all the technique earlier found necessary to the accurate measurement of heat production in these animals. The measurements made at 30° C.—which is approximately the temp. that yields a minimum metabolism but with this varying somewhat for sex, race, and season—supply evidence that such minimum values are obtained on birds in a non-physiological state. There is already some evidence that this applies to still other animals. This differential response of the normal metabolism of the sexes to temp. is of much consequence not only in metabolism studies, but in growth, vitamin and nutritional research, and in experimental biology generally. In accurate measurements very different results with the 2 sexes may be obtained merely through keeping the animals at, or temporarily subjecting them to, a high or low environmental temp.—*Authors' summary.*

6856. ROSZTÓCZY, E. v. Sportärztliche Untersuchungen. II. Die Nachwirkung des Schwimmens und Ruderns auf den Stoffwechsel während des Trainings und nach dem Training. *Arbeitsphysiologie* 3(7): 564-578. 10 fig. 1930.—The basal metabolism and the mechanics of breathing were determined with the Krogh respiration apparatus on 30 athletes 15 to 31 years of age during and after training in swimming and rowing and on a group of normal controls. The results were obtained from 2 or 3 periods 10 to 12 min. in duration run during training 12 to 16 hrs. after last training period and after training ceased at 3 to 16 days after last practice. The average basal metabolism of 10 controls was ±3.7% from normal, of 12 subjects training, −23.2%; of 2 subjects after training who had taken up a new sport within 24 hours, −8.3%; of 13 subjects after training ceased, +13.6%, and of 3 subjects after a rest from training of 48-60 hrs., +12.3%. The depth of respiration increased in proportion to the body surface. The frequency of respiration had an inverse relationship to the body surface. The O absorption during training had an inverse relationship to the depth of respiration, but after training it had a direct relationship to the amplitude of breathing. During training the O absorption was in direct relationship to the frequence of breathing. After training the respiration rate increased along with the increased O absorption but did not attain normal control values. The volume of quiet breathing during training averaged 900 cc. per respiration.—*T. M. Carpenter.*

6857. ROTHSCHILD, P. Notiz über Atmung von Kaltblüter-Muskulatur in Gegenwart von Zucker und Hormonen. *Biochem. Zeitschr.* 217(4/6): 365-367. 1930.—O consumption of frog muscle in the summer without glucose ranged from 210 to 282 cu. mm. per gm. per hr.; with glucose from 201 to 300 cu. mm. per gm. per hr. In the fall O consumption per gm. per hr. was 212-348 without glucose; with glucose 305-456. Fructose was in effect equivalent to glucose; galactose, maltose and saccharose had no effect within the limits of error. Neither insulin in 10^{-5} to 10^{-14} per cc. of solution, adrenalin (10^{-5} to 10^{-8} concentration), nor thyroxin (10^{-5} to 10^{-8}) influenced O consumption of frog muscle.

6858. SIMONSON, E., und PETER DOLGIN. Rationalisierung industrieller Arbeit nach physiologischen Gesichtspunkten. III. Mitteilung. Weitere Untersuchungen über arbeitsphysiologische Rationalisierung des Formens. *Arbeitsphysiologie* 3(3): 254-275. 11 fig. 1930.—This is a continuation of previous studies (B. A. 4, Entries 24429, 24430) on the energy expenditure in moulding. A new form of hand press had been devised for pressing in the sand around the form. The experiments were carried out at the end of the usual day's work on 4 men. The energy output per piece with the new hand press was 5250 gm. calories as compared with 5820 in the former investigation with a hydraulic press. An excess amount of sand as well as dry sand increased the energy expenditure. The energy output in shovelling sand could be diminished about 200 gm. calories per piece when the sand was placed at a convenient height instead of on the floor. The respiratory quotients of the 4 subjects at rest were from 0.78 to 0.81, and the specific respiratory quotients of the excess gaseous exchange due to work varied from 0.64 to 0.735. The author's interpretation was that the previous work had so exhausted the store of carbohydrate that the energy for the later work of the day was derived from fat or from the transformation of fat to sugar. The energy expenditure in a day's work was calculated to be 2376 calories which would be supplied by 527 gm. of carbohydrate in about 1054 gm. of bread.—*T. M. Carpenter.*

6859. STEINHAUS, ARTHUR H., and THOMAS A.

JENKINS. Studies in the physiology of exercise. IV. Further concerning exercise and basal metabolism in dogs. *Amer. Jour. Physiol.* 95(1) : 202-210. 1930.—Basal metabolism data gathered in the latter 3 yrs. of a 5-yr. study on 3 ♂ dogs observed in and out of exercised states are presented and analyzed. Dietary additions to support body weight during exercise were marked by increases in basal metabolism; this is in accord with the findings of others. When care is taken to distinguish between effects due to exercise and those due to increased food intake, the observations lend further evidence to the view that an extended period of training which puts the animal in excellent athletic condition is without noticeable effect on basal metabolism per sq. m. per 24 hrs. It is proposed that the high degree of relaxation acquired by the trained animal may explain why it is possible to have muscular hypertrophy without increased basal metabolic rate. Marked spontaneous fluctuations around averages often much lower than those reported for normal dogs are noted. A position is developed which would explain the appearance of greater fluctuations coincident with the attainment of more nearly true basal conditions. There is some indication that the fluctuations are cyclic in nature. Whatever their cause it is clear that any study of the effects of drugs, hormones or other factors on basal metabolism must in some way reckon with these fluctuations. In the present work this was done (1) by extending the observations over a long period of time; (2) by holding at least 1 and usually 2 dogs as untreated controls to reflect the nature, trend, and extent of the spontaneous variations.—*Authors' summary.*

6860. TILT, JENNIE. The basal metabolism of young college women in Florida. *Jour. Biol. Chem.* 86(2) : 635-641. 1930.—The average metabolism of 52 subjects 17-25 yrs. old was −9.9 per cent (Harris-Benedict standards) and −10.6 per cent (Aub-Du Bois standards). Limited data indicate that there is no change in metabolism with change in season. Eight of the subjects who indulged in greater physical activity had an average metabolism agreeing closely with the average of the entire group.—*Author's summary.*

6861. WANG, CHI CHE, SOLOMON STROUSE, and MARIE ANDERSCH. Metabolism of obesity. VIII. Basal metabolism and insensible perspiration during a period of reducing weight. *Arch. Internal Med.* 46(6) : 1002-1013. 1930.—Metabolic tests (190) were made during a period of reducing weight by diet in 3 obese women, 1 of whom had diabetes. In the latter a steady decrease in basal metabolism was observed until thyroid extract was administered. In the other 2 subjects, the decrease was less marked. Per kgm. of body weight, the basal metabolism of 1 of the subjects (C.B.) increased gradually with the loss of weight, but no such relationship was observed in the other 2. The coefficient of correlation between the loss of body weight and the increase of heat produced per kgm. per 24 hr. showed a fair degree of inverse correlation, −0.71 in C.B. and only a very slight correlation in the other 2, −0.33 and −0.25, respectively. A slight tendency toward the lowering of the respiratory quotient was observed in C.B. but not in the others. In E.S., the pulse rate showed a tendency to decrease with the basal metabolism, but the values varied independently of the basal metabolism in the other 2 subjects. Insensible perspiration of 2 of the subjects showed marked fluctuation. The average insensible loss was 31 gm. per hr. in E.S. and 29 gm. in C.B. No definite relationship was found between insensible perspiration and basal metabolism in these 2 subjects.—*Authors' summary.*

PROTEIN METABOLISM

6862. ABDERHALDEN, EMIL. Die biologische Bedeutung von Zwischenverbindungen. *Naturwissenschaften* 18(20/21) : 429-431. 1930.—The importance of the chemical union in biological compounds, such as the OC-NH linkage in polypeptids, is discussed. This aspect is emphasized in a consideration of the phosphoric esters of glucose, hormone reactions, vitamins, immune bodies, and intermediary products of metabolism.—*W. H. Chambers.*

6863. ABDERHALDEN, EMIL, und SEVERIAN BUADZE. Fortgesetzte Studien über die Herkunft des Kreatins bzw. Kreatinins im tierischen Organismus, zugleich ein Beitrag zum Problem des Purinstoffwechsels. III. *Zeitschr. Ges. Exp. Med.* 69(5/6) : 561-576. 1930.—Administration of allantoin, uric acid, uracil, methylimidazole or caffeine had no influence on the excretion of urinary creatinine of an adult bitch. Dried powdered human placenta caused an increase in total creatinine excretion and daily injections of 1c.c. of Menformone had the same effect. Administration of hemoglobin or of globin increased the excretion of total creatinine, uric acid and allantoin. Completely hydrolysed globin, from which arginine and histidine were removed, had no effect. Addition of arginine had no effect and addition of histidine only a slight effect. A definite effect was obtained after both histidine and arginine were added to the globin hydrolysate from which these amino acids had been removed. The increased excretion of allantoin and uric acid after administration of globin points to the possibility of the synthesis of the purine bases.—*H. Zwarenstein.*

6864. BERGAMI, GINO. Uricolisi sperimentale nel preparato cardio-polmonare. [Uricolysis in the heart-lung preparation.] *Boll. Soc. Ital. Biol. Sperim.* 5(6) : 934-936. 1930.—Uric acid injected into blood in the heart-lung preparation is not destroyed. Addition of uricase to the circulating blood is followed by but slight diminution of blood uric acid.—*M. Comel.*

6865. BORNSTEIN, A. Die Zersetzung von Eiweiss und Aminosäuren der Nahrung, gemessen am Ammoniak des Blutes. *Biochem. Zeitschr.* 212(1/3) : 136-148. 1929.—When glycocoll, alanine, or asparagin were injected intravenously into fasting dogs, the ammonia of the blood rose sharply at once, followed by a similar increase of urea. When these substances were administered per os similar, but less marked, changes occurred. If meat was given to these animals there was no marked increase in ammonia until the 4th or 6th hr. These observations are dicussed in connection with Lusk's theory of specific dynamic action.—*A. G. Hogan.*

6866. BORNSTEIN, A., und H. F. ROESE. Über Ammoniakbildung aus Aminosäuren in überlebenden Organen. *Biochem. Zeitschr.* 212(1/3) : 127-136. 1929.—Blood from a fasting dog was perfused through the liver of another fasting animal. The ammonia of this blood remained constant or decreased. When glycocoll was added to the perfusion fluid the ammonia increased many times within a few minutes. Similar results were obtained with alanine, aspartic acid and asparagin, but leucin gave no increase. The lungs apparently bring about the same reaction as the liver, but to a much smaller extent. Results with the extremities were negative, with the kidney doubtful.—*A. G. Hogan.*

6867. BROOKS, F. P. The protein intake of medical students. *Amer. Jour. Physiol.* 89(2) : 403-405. 1929.—A study of 817 24-hr. urine specimens from 192 ♂ students over a period of 6 yrs. shows: An av. N excretion of 10.34 gms. which corresponds with a protein consumption of 71.3 gm. per 70 kgm. of body weight after adding 10% for protein lost in the feces. The protein consumption of students living at a mean temp. of 5.0-6.9° C. was approximately the same as of students living at 13.05-26.77 and −4.4 to 1.0° C. Hence protein habits within this range of climate and in this occupation are little affected by change of temp. The protein consumption of this class of individuals is far below the accepted dietary standards as was shown by Denis and Borgstrom and by Beard. The results further support the view of Chittenden that 60 gm. of protein per 70 kgm. body wt. was an ample allowance.—*Author's conclusions.*

6868. CALVERY, HERBERT O. Some chemical investigations of embryonic metabolism. 5. The tyrosine, tryptophane, cystine, cysteine, and uric acid content of the developing hen's egg. *Jour. Biol. Chem.* 87(3) : 691-

700. 1930.—These constituents were determined in 5 eggs each day throughout the period of development. The tyrosine content decreased but the tryptophane showed no decrease by either of the methods used; Sendju reported a marked decrease in both tryptophane and tyrosine. The cystine content was determined on 2 series of eggs by 2 methods. The values obtained by the Okuda method agree very well for the 2 series and with values previously reported by Sendju for the early stages but not for the later stages of development. The values obtained by a modification of the Folin and Marenzi method agree very closely for the 2 series of eggs but not at all with the values obtained by the Okuda method. They are much higher at the beginning of the period and show an increase throughout the entire period whereas the cystine content as determined by the Okuda method shows a marked decrease. The cysteine content was determined by 2 methods and the values agree very closely. It reaches a peak on the 8th day, thereafter it declines to a minimal value on the 15th day, and then reaches a 2nd peak at the time of hatching. The relationship of the cysteine content to the 3 periods of development, to the glutathione content, and to the activity of the tissue biologically is discussed.—*Author's summary.*

6869. CERECEDO, LEOPOLD R. Studies on the physiology of pyrimidines. III. The intermediary metabolism of uracil. *Jour. Biol. Chem.* 88(3): 695-700. 1930.—Experiments are described in which isobarbituric acid and isodialuric acid were fed to dogs maintained on a nitrogenous equilibrium. Evidence was obtained that isobarbituric acid and isodialuric acid, when fed in small amounts to dogs, are to a great extent metabolized to yield urea. It is assumed that in the metabolism of uracil we are dealing wih the following sequence of reactions: uracil → isobarbituric acid → isodialuric acid → urea + an unknown carbon compound. Following the feeding of isobarbituric acid and isodialuric acid a distinct drop in the output of inorganic sulfates was noted. This drop in the excretion of inorganic sulfates is due to a practically proportionate increase in ethereal sulfate. Pending the isolation of isobarbituric acid and isodialuric acid sulfate from the urine it is tentatively assumed that these compounds are excreted partly in the form of ethereal sulfates.—*Author's summary.*

6870. CHRISTMAN, A. A. Purine metabolism. 3. Diet and caging as factors in the allantoin excretion of the rabbit. *Jour. Biol. Chem.* 86(2): 477-489. 1930.—The daily allantoin excretion varies widely. The most striking variation is the decreased excretion when the rabbit is caged over a long period on a constant diet. A marked change may be obtained by a change in diet, which cannot be explained by the performed purines fed. The administration of $CaCl_2$ *per os* produced an increase in the excretion, rather than a decrease as reported by others. However, an increase in dietary Ca obtained by feeding milk was followed by a decreased excretion in several experiments. The uricolytic index of the rabbit was approximately 91.—*From author's summary.*

6871. CHRISTOMANOS, ANAST. A. Verhalten und Wirkung organischer Schwefelverbindungen im Hundeorganismus. I. Wirkung und Schicksal des Thiophens im Stoffwechsel des Hundes. *Biochem. Zeitschr.* 229 (1/3): 248-254. 1930.—A colorimetric method for estimating small amounts of thiophene has been worked out. After ingestion of thiophene by dogs, 5.7-12.17% of the quantity introduced appears conjugated in the urine. The hypothesis is made that a part of the introduced thiophene is changed to ethyl sulphide in the intermediary metabolism. In contradiction to the belief of earlier authors thiophene possesses no inhibiting influence on the total N metabolism. After the feeding of thiophene a characteristic clinical picture develops in dogs with ataxia phenomena predominating.—*Author's summary (transl. by C. W. Ackerson).*

6872. DOCK, WILLIAM. The relative increase in metabolism of the liver and of other tissues during protein metabolism in the rat. *Amer. Jour. Physiol.* 97(1): 117-123. 1931.—The rate of O consumption of rats fed on a diet containing 74% casein, and anesthetized with chloretone, was compared with that of controls fed on a diet containing no casein, immediately before and after ligating the blood supply of various regions of the body. The O consumption of the kidneys, in terms of O per min. per 100 sq. cm. of body surface, was practically the same in the 2 groups, although the total O intake of the former was 35% greater than the controls on low protein. Urinary secretion was not measured and no conclusions as to renal metabolism are drawn. The O consumption of the hind-quarters was only 8% greater in the rats on the high protein diet, while that of the abdominal viscera was 141% greater during protein than during carbohydrate feeding. At least 85% of the heat evolved as a result of the specific dynamic action of protein in chloretone-anesthetized rats is liberated in the abdominal viscera. It is concluded that the liver is probably the chief site, and possibly the only site, of the intermediary metabolism of those amino-acids which raise the metabolic rate, and that at least 80% of the specific dynamic action of these acids is due to the increased energy liberated by the hepatic cells during protein digestion.—*Author's summary.*

6873. EMERSON, OLIVER H., and LEOPOLD R. CERECEDO. Studies on the physiology of pyrimidines. 2. The metabolism of the nucleosides of uracil and cytosine. *Jour. Biol. Chem.* 87(2): 453-462. 1930.—These nucleosides were fed to dogs maintained in N equilibrium. Evidence was obtained that when fed in small amounts to dogs they are metabolized to yield urea. The behavior of the nucleoside cytidine is in marked contrast to the free base cytosine, which is partly excreted unchanged, partly deaminized to uracil. Cytidine, fed in doses of 4.0 to 5.0 gm. to dogs, seems to stimulate the metabolic processes of the cells. Ribose, the pentose sugar in the nucleoside molecule, is practically completely burned; certainly not more than a trace appears in the urine. The average C:N ratio in the urine of dogs under the experimental conditions was 0.65, remaining practically constant from day to day. In 7 of 8 experiments there was a rise in the ratio after feeding uridine and cytidine.—*Authors' summary.*

6874. FOSTER, G. L., and A. B. GUTMAN. On the fate of diiodotyrosine in the animal organism. *Jour. Biol. Chem.* 87(2): 289-294. 1930.—After diiodotyrosine was fed to rabbits approximately 10% of the total I in the urine was recovered as inorganic iodide, 60% as unchanged diiodotyrosine, 18% as 3,5-diiodo-4-hydroxyphenyllactic acid, and 12% could not be isolated.—*Authors' summary.*

6875. KAMIYA, TOKUO. The quantitative estimation of the glutathione in normal and pathological tissues. III. Relationship between the development and the glutathione content in the chick embryos. IV. Glutathione content in various organs of pigeons fed on polished rice and subjected to starvation, and also starved rabbits. V. Relationship between glutathione content and neurotomy in muscles of pigeons fed on polished and unpolished rice. *Nagoya Jour. Med. Sci.* 5(1): 1-5; 6-17; 18-23. 1930.—III. Analyses showed that the glutathione content in chick embryos taken as a whole increases gradually during the 1st half of the developmental period, reaching the maximum during the 12th-14th day and, from this period on, gradually decreasing. The liver is the richest organ, then brain, heart, leg-muscle and eye.—IV. In 7 normal pigeons fed on unpolished rice the greatest glutathione content was found in the liver; next came the suprarenal bodies, spleen, kidney, brain and pancreas; lung, nerve, heart, muscle and blood contained small amts. In 10 pigeons fed with polished rice there was a tendency for glutathione to decrease in the liver, heart and muscle, and to increase in the suprarenals, spleen and blood, but especially in the suprarenals, in which the glutathione content was sometimes double the normal. In 2 starving pigeons the glutathione content of liver, kidney, lung, heart and

muscle tended to decline below normal (muscle below β-avitaminosis); in the spleen, pancreas and suprarenals it increased (suprarenals 3 times normal); the glutathione content of the heart was normal. In 7 starving rabbits the glutathione content of spleen and suprarenals increased progressively, and that of liver, kidney, pancreas, stomach, lung, brain, muscle, ovary and testicle progressively decreased.—V. In 25 pigeons the right sciatic nerve was severed, the left remaining as control; 15 birds were kept on normal diet and 10 were placed on polished rice; 3 of the normal diet series and 2 of the polished rice were killed respectively on the 3rd, 6th, 10th, 15th and 20th days, and the glutathione content of the 2 legs compared. In both the normal and the avitaminosis series the neurotomized leg progressively decreased in weight and increased in % of glutathione content; the glutathione content of the control leg decreased, but more in the polished rice than in the normal diet series.

6876. LOEWY, A. Skiläufe im Hochgebirge unter Aufnahme eines phosphorhaltigen Trankes. *Arbeitsphysiologie* 3(3): 276-286. 1930.—The urines of 25 participants in 28 and 18 kilometer run of the Swiss military patrol on skis were collected at the end of the run and the total N, ammonia, urea, preformed and total creatinin and the pH were determined. In contrast to the findings of Hopf (Arbeitsphysiol 1, 433 (1929)) the ammonia was under 1% of the total N and the percentage relation of the creatinin was normal. The urines were not so acid as those of Hopf; many were neutral or alkaline. The results are ascribed to the ingestion of 250 to 300 ccm. of a beverage containing 0.25 to 0.3 gm. of P previous to the runs. The preparation was "Eviunis" made from green plants and contained a P-vitamin complex in which the P was combined in an organic form as Ca and Mg salts of inosite hexaphosphoric acid.—*T. M. Carpenter.*

6877. LOEWY, A. Beobachtungen über den Eiweissabbau in übergrossen Höhen. Ein Beitrag zur Frage nach den Grenzen der Akklimatisation an das Höhenklima. *Arbeitsphysiologie* 3(7): 596-604. 1930.—Ten urines were obtained from 6 members of Dyhrenfurt's expedition to the Himalayas when they were at altitudes between 5150 and 7300 m., and in all but one case after strenuous mountain climbing. The urines were collected in sterile air-tight bottles containing powdered thymol and shipped to the author at Davos. In terms of total N the urea N average 75.4%, the ammonia nitrogen 5.05%, the preformed creatinine-N 3.74%, the total creatinine-N 4.80%, uric acid-N, 2.22%, amino acid-N 0.94%, and the undetermined-N 12.5%. The urines were nearer to normal than those obtained by Hopf (Arbeitsphysiologie 1, 433 (1929) on ski runners in the 2nd winter Olympic. The approach to normality of the urines of the Himalaya expedition cannot be explained by the inhalation of O as only one sample was obtained after this procedure and its composition was close to that obtained from the same subject without such inhalation. The nearness to normality can be due to the extensive acclimatisation at the high altitudes. The acclimatisation began at 2700 m. and the urines were collected 49 to 86 days later. Meanwhile the subjects had gradually attained the higher altitudes.—*T. M. Carpenter.*

6878. McCLELLAN, WALTER S., VIRGIL R. RUPP, and VINCENT TOSCANI. Clinical calorimetry. 46. Prolonged meat diets with a study of the metabolism of nitrogen, calcium, and phosphorus. *Jour. Biol. Chem.* 87(3): 669-680. 1930.—The results of the analyses of many samples of meat are presented. They agree in general with the findings in other available reports. Observations were made to determine the efficiency of absorption of the foodstuffs from the intestinal tract. The loss of N in the feces of K. A. was 4.5% of the intake and for V. S. 7.5%. The loss of fat for K. A. was 3.0% and for V. S., 9.2%. The use of the meat diets by the 2 subjects studied did not reduce the efficiency of absorption from the intestinal tract. One subject (K. A.) remained in N equilibrium while receiving meat with an average daily intake of 19.9 gm. and the other (V. S.) showed a slight negative balance with an intake of 18.7 gm. per day. The daily intake of Ca was 0.05-0.15 gm. The average daily excretion of calcium for one subject was 0.44 gm., and for the other 0.47 gm. Both men showed negative Ca balances when taking meat alone. In spite of the high P intake, K. A. showed a positive P balance of only +2.34 gm. for the entire period of meat ingestion, while V. S. showed a balance of −5.34 gm. This was due to the increased excretion of P in the urine since the P in the feces decreased when the meat diet was taken. The influence of the acid nature of the diet on mineral balances is discussed.—*From authors' summary.*

6879. MACKAY, EATON M., and LOIS LOCKARD MACKAY. Age and the effect of unusual diets. *Jour. Biol. Chem.* 86(2): 765-771. 1930.—Evidence is presented which indicates that cystine added to the diet is no more toxic for young than for old rats. The apparent difference in the effect appears to be due to the larger dose received by the young rat because its food and hence cystine intake is higher in relation to body size than that of the adult. Likewise a higher protein diet seems to produce a greater change in the kidney weight of young than of old rats because the food and therefore protein intake of the former is much greater. These results are considered in relation to the effect of unusual diets and age in general.—*Authors' summary.*

6880. MARENZI, AGUSTIN D. El hígado y la eliminación de fenoles en la sangre. [Liver and elimination of phenols from blood.] *Rev. Soc. Argentina Biol.* 7(1): 27-35. 1931.—In hepatectomised dogs conjugation of phenols occurs as in normal animals, though disappearance from the blood is somewhat slowed. Hence the liver is not an indispensable factor in these processes.—*J. T. Lewis.*

6881. MARENZI, AGUSTIN D. Papel del riñon en la eliminación de los fenoles de la sangre. [Kidney and elimination of phenols from blood.] *Rev. Soc. Argentina Biol.* 7(1): 36-57. 1931.—In hepatectomised dogs the remaining kidney was tied off. After injection of phenol, the free blood phenol rose rapidly and remained high for 1 hour, returning to normal in 2 hrs. Total phenol increased and remained high, conjugation occurred as in normal animals. After extirpation of one kidney and ligature of blood vessels of the other the same results were obtained. In other experiments both kidneys were tied off and a kidney was transplanted to the neck by connecting the carotid and jugular with the renal vessels; phenol was injected intravenously and determined in the blood entering and leaving the kidney and in urine. Results obtained show that phenols are retained in the kidney before being excreted. In severe experimental nephritis provoked by salts of mercury and uranium, phenols are not excreted, and the blood curves are identical with those of nephrectomised animals.—*J. T. Lewis.*

6882. MARENZI, AGUSTIN D. ¿Existe algún órgano encargado especialmente de la conjugación de los fenoles? [Conjugation of phenols.] *Rev. Soc. Argentina Biol.* 7(1): 58-68. 1931.—Tying off all abdominal viscera in dogs markedly retards but does not suppress conjugation after injection of phenol. Extirpation of the intestine has the same effect; while hepatectomy and nephrectomy, extirpation of the spleen, stomach and colon have no influence on conjugation. This conjugation therefore is common to all tissues but especially marked in the intestine.—*J. T. Lewis.*

6883. MEYER-BISCH, R., und F. TECHNER. Über das Schicksal parenteral verabfolgten Schwefels. *Biochem. Zeitschr.* 231(1/3): 110-112. 1931.—The total and the hydrolyzable S in 3 bovine and 6 rabbit livers were first determined and the rabbit values compared with those from rabbit livers after parenteral S injection. No change in Hb and leukocyte count occurred after the injection. The same experiments were made on 2 dogs. In neither rabbits nor dogs was any change found in the water content, in the total S, or in the hydrolyzable S. It is therefore improbable that the liver plays a particularly

active rôle in the changes in S metabolism after parenteral administration.

6884. **POTICK, DORA, y PEDRO M. RÉ. Modificaciones del triptófano de los órganos y sangre durante el ayuno prolongado.** [Tryptophane of tissues and blood in prolonged fasting.] *Rev. Soc. Argentina Biol.* 7(1): 82-92. 1931.—Comparing tryptophane content of tissues of dogs killed after 18 hrs. fast, with those of dogs submitted to 6 to 11 days fasts showed a decrease in the latter in the following tissues: muscle, kidney, spleen, brain, adrenal, blood plasma and corpuscles and an increase in pancreas, thyroid and liver.—*J. T. Lewis.*

6885. **ROMINGER, E., und HUGO MEYER. Untersuchungen des Stickstoffumsatzes beim gesunden Säugling.** *Zeitschr. Kinderheilk.* 50(5): 509-519. 1931.—Investigations lasting 6-54 days (4 with human milk, 10 with cows' milk—in 11 infants) showed an av. daily +N balance between +0.30 and +0.54 for breast feeding, between +0.66 and +1.07 for artificial feeding (1 artificially fed child had a +N balance of only 0.36 but previous to the experiment had had a diet high in salt); the N intake was 1.12-1.39 and 1.79-4.44 respectively. The high N balance appeared to entail no pathologic consequences and was the result of a special storing ability and tendency in artificially fed children. No periods of N flooding were found; the N retention was not entirely due to requirements but also to the supply; if the supply was reduced the N balance was reduced only gradually. In spite of the N retention the N outgo (corresponding to protein breakdown) was high in comparison to the breast fed child, explaining the higher caloric requirements of the artificially fed infant.

6886. **SANNICANDRO, G. Glutatione della cute.** [Glutathion of the skin.] *Gior. Ital. Derm. e Sifil.* 71 (4): 1374-1376. 1930.—Glutathion was not found in the epidermis. Methods but not subjects, details or numbers of experiments are stated.

GROWTH

6887. **ANDERSEN, E. BUCH, und A. FISCHER. Über die Wachstums- und Hemmungsfunktion bei Gewebekulturen in vitro.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 114(1): 26-53. 9 fig. 1928.—At various stages of growth the areas of the tissue cultures were measured. The fundamental law of growth derived by the authors is a proportionality between the area of the culture and the square of its age: $A_t = K_1^2 t^2 + A_0$, in which A_t is the area at any age, t, and A_0 is the initial area of the culture. Assuming the initial area to be zero, the area at any age, t, may be written: $A_t = K_1^2 t^2$, or $\sqrt{A_t} = K_1 t$. If the radius, r, of the culture is assumed to be proportional to $\sqrt{A}$: $dr/dt = k$, in which $k = K_1/\sqrt{\pi}$. If the inhibition in the rate of growth of r at any time is assumed to be proportional to r, the preceding equation may be modified to: $dr_t/dt = k - ar_t$, which upon integration becomes $r_t = k/a(1 - e^{-at})$ or $\sqrt{A_t} = k/a\sqrt{\pi}(1 - e^{-at})$. The last equation was fitted to data obtained from pairs of carcinoma cultures reported by Fischer and Laser; each pair was derived from the same parent culture. The values of k obtained from two such pairs were 0.443 and 0.432, for the first pair, and 0.347 and 0.312 for the second. The corresponding values of a were 0.102 and 0.101 for the first pair, and 0.134 and 0.116 for the second. The effect of the pH of the medium upon the values of the constants in the growth curve was studied, using data on the growth of fibroblasts and carcinoma tissue reported by Fischer. The value of k had a maximum at pH = 6.70 for each culture. The values of a declined continuously as the pH increased, the decrease being more rapid in the case of carcinoma tissue. Data were obtained on the growth of fibroblasts and carcinoma tissue when reared separately and together in the same medium. The values of k for the growth curves of fibroblasts, carcinoma tissue, and fibroblasts plus carcinoma tissue, were, respectively, 0.589, 0.508, and 0.687. The corresponding values of a were 0.287, 0.157, and 0.205. Data on the growth of carcinoma tissue reared in media containing different proportions of rat serum and Tyrode solution are likewise recalculated. The values of k obtained for the growth curves of carcinoma tissue reared in media containing 25%, 50%, and 100% rat serum were, respectively, 0.321, 0.418, and 0.291; the corresponding values of a were 0.126, 0.091, and 0.100. The values of k and a for a fibroblast culture reared in a 50% rat serum medium were, respectively, 1.02 and 0.458. The values of the constant, k, must be regarded as relative, since they were dependent on the degree of magnification with which the images of the cultures were projected. The values of a, however, are absolute for they are independent of the degree of magnification.—*W. Hendricks.*

6888. **BAHRS, ALICE M. The modification of the normal growth-promoting power, for planarian worms, of the digestive mucosa of the rabbit, through diet, fasting, and age.** *Physiol. Zool.* 4(2): 189-203. 1931.—Definite regions of the digestive mucosa from freshly killed rabbits formed the exclusive diets for experimental groups of planarian worms, each consisting of 30 measured worms, the gains in length of which were determined at the end of the 3 to 4-week feeding period. The growth-promoting power of the digestive tract was resident only in the mucosa. When rabbits received a diet of alfalfa hay and rolled barley, the 6 regions of the digestive mucosa used exhibited the following order in growth-promoting power: esophagus and colon < stomach and cecum < small intestine < vermiform process of the cecum. By feeding rabbits the inadequate diets of bread and raw carrot or rolled barley, the growth-promoting power of the vermiform process suffered the greatest reduction. Starving the rabbits 48 hrs. also resulted in a loss in the growth-promoting power of the fundus of the stomach, duodenum, cecum, and vermiform process. In rabbits over 1 yr. old, the fundus of the stomach, duodenum, cecum, and vermiform process had a lower growth-promoting power than the same parts from rabbits 2-3 mos. old.—*Author* (*courtesy Wistar Bibl. Serv.*).

6889. **BUSH, S. F., and J. S. HUXLEY. Distribution of growth activity in Eupagurus.** *Nature* [*London*] 126 (3172): 240-241. 1930.—Investigations of the relative growth of parts in the hermit crab, *Eupagurus prideauxi*, show that the conception of growth gradients can be extended from the growth of single appendages to that of the body as a whole. What may be loosely called the "growth potential" is distributed in an orderly fashion through the animal body, in a series of growth gradients, which apparently interact so that an active growth center in one appendage is correlated with increased growth-activity in limbs immediately posterior to it and with decreased growth-activity in those immediately anterior.

6890. **HAMMETT, F. S., and S. P. REIMANN. Cell proliferation response to sulfhydryl in mammals.** *Jour. Exp. Med.* 50(4): 445-448. 1929.—The sulfhydryl group stimulates cell proliferation in mammals as in lower organisms. The fact that the stimulation is exhibited in such a wide diversity of species, including both plants and animals, is justification for the belief that it is the expression of a fundamental biological phenomenon. Literature and discussions of the subject are cited.—*F. S. Hammett.*

6891. **KON, S. K. Lactation v. improved growth in stock albino rats.** *Lancet* 220(5614): 778. 1931.—Letter. After failure of modified Evans' diet to remedy faulty lactation, a modification of Steenbock's diet by the replacement of yellow maize by rye, the inclusion of dried ox liver instead of 2% alfalfa, addition of carrots, and of 10% roller dried milk instead of the unlimited supply of fresh milk was tried. This diet gave rapid growth but did not improve lactation in the author's rats. He suggests that the failure is due to differences in the composition of the foodstuffs.

6892. **KOPEĆ, S. O wpływie przerywanego głodzenia na długość zycia formy dojrzałej Drosophila melanogaster. [Influence of intermittent starvation on longevity of**

adult D. melanogaster.] [French summary.] *Acta Biol. Exp.* [*Warsaw*] 1 (Paper 4) : 1-20. 1928.

6893. **KUBÁNYI, E. Callusbildung und Säurebasengleichgewicht.** *Arch. Klin. Chir.* 158 (1/2) : 203-213. 6 fig. 1930.—Callus formation after artificial fracture was studied in relation to acid-base equilibrium. In 135 animals (guinea pigs and rabbits) kept under identical nutritional and hygienic conditions, fractures were produced; the blood of one series was alkalinized by injection of $NaHCO_3$, that of the other acidified by injection of HCl. The animals were killed at varying intervals and the calluses examined. The proliferation during the 1st 2-3 wks. was more intense in the alkalinized than in the acidified series. This difference in favor of the alkalinized animals, surprisingly, is confined to the period when the callus consists mainly of granulation tissue. The cause is questionable; an explanation borrowed from Balint is that it may be due to the swelling (i.e., hydration) of the tissue colloids, which promotes cell respiration. The relation between the acidified and alkalinized series is reversed in the later weeks. During the period of calcification the callus formed more rapidly in the acid-treated animals; the author is inclined to believe that the acid reaction promotes Ca deposit. No explanation is offered, but an agreement is remarked between these findings and those of Balint, that in experimental tuberculosis calcification of the foci occurred more rapidly in acid-treated than in alkali-treated or untreated animals.

6894. **OLIVO, O. M. Accrescimento ponderale e coefficiente mitotico dell'accrescimento nel cuore embrionale di pollo incubato a temperatura inferiore alla normale. [Growth in weight and mitotic coefficient of growth in embryo chick hearts incubated at subnormal temps.]** *Boll. Soc. Ital. Biol. Sperim.* 5 (6) : 882-884. 1930.—During the first stage of incubation growth is progressively retarded with lowering of temp. (36.5° and 34.5° tested) below normal (39.5°). In the second stage growth at low temp. is accelerated, and surpasses the values for normal embryo hearts, due almost exclusively to hyperplasia of the contractile tissue. The mitotic coefficients at 34.5° are much higher during the second stage than those at 39° C., this difference being sufficient to account for the increased growth.—*M. Comel.*

6896. **RAPER, H. S. The synthetic activities of the animal cell.** *Lancet* 219 (5584) : 509-512; *Nature* [*London*] 126 (3185) : 762-766. 1930.—The raw materials for synthesis in the cell consist of 20 amino-acids, 2 purine bases, 3 pyrimidine bases, 3 hexoses, glycerol, and higher fatty acids. Synthesis may be from unidentified raw materials and even when their identity is postulated on available evidence, it is difficult to prove, as in the cases of adrenalin and thyroxin. The raw materials even when known may be synthesised by unknown chemical reactions as in the production of fat from carbohydrates. Syntheses from known raw materials may be accomplished by chemical processes as yet only partially understood. Thus more than the mere reversal of the action of the enzyme or enzymes which hydrolyse glycogen may be necessary to explain its synthesis. The site of protein synthesis is probably in the nucleus rather than in the cytoplasm.—*C. A. Kofoid.*

6897. **[SCHMALHAUSEN, I.] ШМАЛЬГАВЗЕН, І. Визначення питомої продуктивности росту як метода порівняльного досліджування. [Determining the specific productivity of growth as a method of comparative investigations.]** [English summary.] Всеукраінська Академія Наук, Труди Фізично-Математичного Відділу (Збірник Праць Біологічного Інституту No. 4.) (*Acad. Sci. Ukraine, Mém. Cl. Sci. Phys. et Math.*) (*Trav. Inst. Biol.*) 12 (4) : 329-342. 1929.—The author calls specific productivity of growth (u) the "whole amount of material produced by a unit of volume or weight of living substance during a certain time, or during the whole period of growth." That quantity is given by the formula $u = k \log (t_2/t_1)/(1/0.4343)$, (1), t being the time. The total productivity is obtained by summing up the productivity for the separate periods. In large animals u reaches the value of 20-25, in small ones half of that. In fishes the embryonic productivity is small, the postembryonic larger; in birds and mammals the relation is reversed; in man the embryonic productivity is 21, the postembryonic 3.3. The initial and final size (m and v) of an organism are given by $v = me^u$, (2). The volume (m) of the embryo at the time 1, which may hardly be determined directly, may be calculated from the data about further growth by the formulae (1) and (2). The method may also be used for comparing the growth of different breeds, sexes, and experimental animals.—*B. J. Luyet.*

6898. **SLONAKER, JAMES ROLLIN. The effect of different per cents of protein in the diet. III. Intake and expenditure of energy. IV. Reproduction.** *Amer. Jour. Physiol.* 97 (1) : 15-21; (2) : 322-328. 1931.—III. Rat groups I, II, III, IV, and V, 10 ♀♀ in each group, were fed continuously throughout life on diets containing 10, 14, 18, 22, and 26% of protein respectively. Up to approximately 150 days of age the av. daily food consumption from greatest to least was in the order of groups I, II, III, IV, and V. During the 1st 120 days the av. % increase in body wt. from greatest to least was V, IV, III, II, I. Group V averaged 306% and I 112%. During the 1st 120 days the av. spontaneous running activity from greatest to least was III, I, IV, II, V. During the 1st 120 days the energy available for growth and basal metabolism from greatest to least was I, II, III, IV, V. The protein content of this energy was 570, 673, 742, 845, and 969 calories respectively. For the whole life span the av. daily food intake in gm. from greatest to least was group III, 20.11; V, 19.94; I, 18.36; II, 17.92; IV, 16.00. The av. total miles run was group III, 2795; II, 2735; V, 2683; I, 2622; V, 2546. The av. number of miles run daily was group I, 3.28; III, 3.09; II, 3.03; IV, 3.01; V, 3.00. The av. life span from longest to shortest was in the order of groups II, III, V, IV, I. The order of number of young born from greatest to least was groups II, III, I, IV, V; the number of young nursed and weaned was in the same order. The order of av. maximal wt. was group III, 307; II, 294; I, 288; V, 253; and IV, 247 gm. These results indicate that a diet containing between 14 and 18% protein would result in greatest efficiency in maximal growth, spontaneous activity, reproduction and life span in the rat. They also show that during the growing period the diets containing the larger per cents of protein produced the greater per cents of gain in body wt.—IV. The groups of rats were those described in the preceding chapter. The mortality of the ♂♂ of the 1st matings was in general greater than that of the ♀♀. The mortality of both sexes was least in groups II and III. It was greatest in group V. Sterility was more pronounced in the ♂♂ than in the ♀♀ in each group. Group II had the highest per cent of fertile animals in each sex and group V the lowest. The order of fertility in both sexes from highest to lowest was group II, I, III, IV, V. The extreme per cents of fertility in the ♂♂ were group II, 87 and in group V, 33. In the ♀♀ they were 100 and 50% respectively. From longest to shortest reproductive spans the order in both sexes was group II, I, III, IV and V. The ♂♂ of group I, II, III had longer reproductive spans than the ♀♀ of these groups. In groups IV and V the reverse obtained. The av. number of litters and the av. number of young born per pair from greatest to least was in the order of groups II, I, III, IV, V. The size of the litter was in the order of I, II, III, IV, V. The sex ratio of the young at birth was highest in group II and lowest in group V. The ratio was below normal in all groups. Results suggest a greater pre-natal mortality of ♂♂ than of ♀♀. With exception of group V, a higher per cent of ♂♂ in each group were reared and weaned than ♀♀. Group II had the greatest per cent of young weaned (72%) and

group V the lowest (49%). Post-natal mortality was in general greater in the ♀♀ than in the ♂♂, indicating a greater vitality of the ♂♂. The length of the gestation period was the shortest in groups I and II and increased in the order of V, IV, III. The differences in the length may be due to the age of the mother and the size of the litter. In general the order of efficiency in reproduction of these 5 diets from greatest to least was II, I, III, IV, V.—*Author's summaries.*

6899. **TEISSIER, GEORGES. Dysharmonies biochimiques dans la croissance larvaire de Tenebrio molitor L.** *Compt. Rend. Soc. Biol.* 100(14): 1171-1173. 1929.—The chemical constituents of *T. molitor* seem to follow the author's law of disproportionality relating the growth of parts to the growth of the whole body. There was no sudden chemical change prior to metamorphosis. No details of experimental technique are given.

6900. **TERAO, ARATA. Change of vitality with age as based on the living unit of organisms. I. Oxygen consumption in the Daphnid, Simocephalus exspinosus.** *Proc. Imp. Acad. [Tokyo]* 7(1): 23-25. 1 fig. 1931.—Computations based on Obreshkove's data show that the relationship between O consumption per unit of living matter, and age in days, is linear: $y=65.855\ e^{-.0282x}$ where y is % rate of O consumption compared with that at 1st instar; x is age in days; and e the base of the Napierian logarithms.

6901. **WEISS, P. Die Spannungsverteilung im Medium bestimmt die Wachstumsrichtungen der Zellen.** *Zool. Anz. Suppl. Band (Verhandl. Deutsch. Zool. Ges. E. V.)* 3: 164-169. 1 fig. (1927) 1928.—Fibroblasts obtained from embryonic chick hearts were explanted and reared in culture media under mechanical stresses. The media were prepared by dipping glass frames of various geometrical designs into blood plasma and coagulating the films of plasma which became suspended in the frames; surface tension subjected the media to stresses which were dependent upon the designs of the frames. The growth of the fibroblasts proceeded along the lines of maximum stress, the directional effect increasing as the stresses were increased. This effect was not due to any mechanical force upon the growing tissue itself, but to the fibrous nature of the culture medium when subjected to strain. The shape of the cells is determined by the amount of liquid present and tends to become more spherical as the amount of liquid is increased. The cellular components of blood do not show similar behavior when reared in such media.—*W. Hendricks.*

6902. **WERTHEIMER, ERNST. Stoffwechselregulationen. XIII. Über die Sonderstellung von Zellen mit stärkster Wachstumstendenz im Organismus.** *Pflüger's Arch. Ges. Physiol.* 225(1): 118-130. 1930.—Cells with very strong tendency to grow are beyond the regulatory control of the total organism. This is seen in the eggs of frogs, the embryos of mammals, the rapidly growing uterus of the pregnant ♀, in the placenta at the height of its growth, and in carcinoma and sarcoma. This autonomy, that is, the relative independence of the growing cells of the regulation of the entire organism, is seen also in newborn animals. A marked division may be made between animals which are born "young" and those born "old," that is, those which after birth show very strong tendency to growth and those which show a less marked tendency. Rats and mice belong to the 1st class and guinea-pigs to the 2nd. Comparative experiments were made on these animals (number not stated). The 1st were very insensitive to thyroxin, insulin, and epinephrine, while the guinea-pig was more sensitive to them. Rats and mice showed a quite surprising resistance toward all kinds of suffocation; guinea-pigs did not. The autonomy of the vigorously growing cells of the newborn showed itself most clearly after decapitation and exsanguination of the animals. Newborn rats and mice showed until 2, or often 3 hrs., after these operations distinct phenomena of life and reflex responses to stimulation of the skin. As the age increased these indications of life continued for shorter and shorter periods until, on about the 13th day of life, even a few seconds after decapitation of the rat, such reflex responses could no longer be elicited. These phenomena could not be observed in the newborn guinea-pig; it behaved about like a 13-day old rat. The autonomy of the single cells disappears along with their articulation into the regulation of the total organism, and the capacity of the single cells for independent survival becomes correspondingly less. Thus, for instance, the more distinct and more permanent the regulation of respiration becomes, the shorter is the period of survival of the cell. The regulation of temperature appears when the autonomy of the cells is lost. In the guinea-pig both these regulatory mechanisms are well developed at birth. Just as morphologically ontogeny is a recapitulation of phylogeny so physiologically a similar order of development is followed, that is, from the highest autonomy of the cell, down to its strictest subordination to the governing regulation. The hearts of very young animals may remain functionally active after the death of the animal without any special effort to preserve their function. In newborn mice and rats (not guinea-pigs) no rigor mortis is to be seen.—*From author's summary (transl.).*

6903. **WULZEN, ROSALIND, and ALICE M. BAHRS. Unbalance in planarian nutrition.** *Physiol. Zool.* 4(2): 204-213. 1 fig. 1931.—When planarian worms are fed diets consisting of certain proportions of egg white, liver, and starch, they develop a pathological condition characterized by a definite syndrome. Other proportions of the same food substances are entirely harmless for the worms, and fasting develops no such syndrome. When represented on coordinates showing percentages of liver, starch, and egg white, the area of damage is found to be so arranged that with increasing percentages of egg white there must be a decreasing percentage of liver and starch in order to secure damage, and, conversely, with increasing percentages of liver and starch, the percentages of egg white necessary to produce damage must decrease.—*Authors (courtesy Wistar Bibl. Serv.).*

Nat.* (II) 1930(3/4): 267-279. 1930.—Jensen's rat sarcoma and Vienna mouse sarcoma were added to normal tissues in Ringer's solution, rat serum, and embryonal extract for various periods. The tumor cells promoted the growth of the normal rat tissues. Technic, graphs and details are given.—*From author's summary (transl. by W. Browning).*

VITAMINS

6905. **ABDERHALDEN, EMIL. Studien über das Wesen der Wirkung des Vitamin-B-Komplexes.** *Pflüger's Arch. Ges. Physiol.* 226(6): 723-737. 1931.—Pigeons were fed on polished rice until familiar symptoms of polyneuritis (loss in weight and decrease in body temp.) occurred. Feeding of desiccated tissues, such as liver, kidney, brain, muscle was somewhat effective in alleviating symptoms but never prevented their onset and final resulting death. Liver ranked as most effective, but did not compare in efficacy with yeast preparations. Heating of tissues above 100° destroyed their efficacy. The improvement in condition of polyneuritic pigeons was approximately the same whether tissues of healthy or neuritic birds were fed.—*E. P. Laug.*

6906. **ABDERHALDEN, EMIL, und VLASSIOS VLASSOPOULOS. Studien über das Wesen der Wirkung des Vitamin-B-Komplexes. II.** *Pflüger's Arch. Ges. Physiol.* 226(6): 808-815. 2 fig. 1931.—The action of dehydrase, an enzyme supposed to be intimately connected with the O uptake by tissues, and therefore with tissue metabolism, has been found to be materially decreased in the tissues of pigeons suffering from the effects of vitamin B deficiency. Addition of yeast to diet causes an apparent increase in dehydrase action and also an alleviation of symptoms.—*E. P. Laug.*

6907. **BLACKBERG, S. N. Vitamin A and B content of canned sweet potatoes.** *Proc. Soc. Exp. Biol. & Med.* 26(3): 254-256. 1928.—Preliminary paper. Fed to rats

on diets lacking (1) vitamins A and D, and (2) vitamin B, canned sweet potatoes showed an abundance of vitamin A, and a small amount of vitamin B.

6908. **BÜRGI, EMIL.** Die Pflanzenfarbstoffe und das Wachstumsvitamin A. *Deutsche Med. Wochenschr.* 56 (39): 1650-1652. 1930.—The author summarizes experiments in which the inhibited growth of rats on a vitamin-A-free diet was restored to normal by crude chlorophyll, pure phaeophytin, Na-chlorophyllin or pure chlorophyll, each of which was as effective as butter. (The chlorophyllin was given subcutaneously; the other substances in the food.) Bürgi concludes that the fat-soluble growth factor is either identical with chlorophyll or is built up in the body from chlorophyll. At the same time, the possible existence of more than one growth-promoting factor must be recognized.

6909. **CADY, OSMAN HORACE, and JAMES MURRAY LUCK.** Studies in the chemistry of vitamin A. *Jour. Biol. Chem.* 86(2): 743-753. 1930.—Cod liver oil, butter, and a concentrated alcohol extract of alfalfa were treated with SO_2. The active principle of cod liver oil was rapidly and completely destroyed; that of alfalfa suffered no appreciable destruction; the vitamin A activity of butter was lessened. Alfalfa and spinach, when sulfured in the dry and green conditions, experienced no loss of vitamin A activity. Phosphorus pentachloride, chlorine, acetyl chloride, nitrous fumes, and Benedict's alkaline copper reagent destroyed the active principle in cod liver oil. Prolonged treatment with $NaHSO_3$ had the same effect. H_2S, ethylene, NH_3, and Benedict's reagent after neutralization exhibited no destructive action. Formaldehyde had little effect. H_2O_2 brought about a partial loss. Attempts to regenerate the vitamin A potency of oils inactivated by SO_2 and O were unsuccessful. It is concluded that vitamin A activity is the property of a specific atomic grouping rather than of a specific molecule. The active principle in cod liver oil is probably not identical with that in alfalfa. An alternative explanation is that alfalfa contains substances, absent from cod liver oil, that exercise a protective function against the destructive action of SO_2. The latter explanation in considered less acceptable. The active principle of cod liver oil possesses aldehyde properties.—*Authors' summary.*

6910. **CHANUTIN, ALFRED.** Vitamin B "complex" in a concentrated aqueous liver extract. *Virginia Med. Month.* 57(10): 637-638. 1931.—A liver extract tested for its effect on pernicious anemia has been assayed for the vitamin B "complex" (anti-neuritic and anti-pellagra factors). It has been found relatively rich in this "complex" when contrasted with other foods already studied.—*Author's summary.*

6911. **COLLAZO, J. A., P. RUBINO, y B. VARELA.** Hipervitaminosis experimental de las ratas con grandes dôsis de ergosterina irradiada de Windaus. [Effects of large doses of irradiated ergosterol.] *Rev. Assoc. Méd. Argentina* 41(271/272): 707-716. 3 fig. 1928.—White rats, 3 weeks old, were given Diet No. 3143 (McCollum) and kept in darkness. Each group of 8 received food and water ad libitum, one lot had also 5 mgm. daily of irradiated ergosterol, another 3 drops daily of cod liver oil, the third was left as control. In 3 to 5 weeks all animals receiving ergosterol died; symptoms were stabilisation of weight followed by loss up to 40%, low temperature, damp skin, hairs erect, diarrhea towards the end, slowness of gait, slight paralysis and in 2 cases spastic paralysis. Post mortem showed atrophy of liver, spleen and pancreas, but normal bone formation.—The other lots had no symptoms.—*E. A. Molinelli.*

6912. **COWGILL, GEORGE R., H. A. ROSENBERG, and J. ROGOFF.** Studies in the physiology of vitamins. XIV. The effect of administration of large amounts of water on the time required for development of the anorexia characteristic of a deficiency of the vitamin B complex. *Amer. Jour. Physiol.* 95(3): 537-541. 1930.—Experiments on 5 dogs, 1 of which was a control, indicate that the administration of large amounts of fluid by mouth to an animal subsisting on a diet relatively free from undifferentiated vitamin B markedly shortens the time required for the appearance of the anorexia characteristic of a lack of this dietary essential. This result is not in harmony with the hypothesis that the symptoms of B deficiency are essentially those of a toxemia. A practical application of these results is suggested in the clinical treatment of the marasmus in infants due to lack of vitamin B by administration of fluid together with the missing vitamin.—*Authors' summary and conclusion.*

6913. **CUGNAC, A. de.** Essais de purification de la vitamine antinevritique (facteur hydrosoluble B) par precipitations fractionnées. *Bull. Soc. Chim. Biol.* 11: 443-465. 1929.—Extracts made from beer yeast by Seidell's method were subjected to fractional precipitation from water, acetic acid, acetic ether, and formic acid by various precipitants such as graduated concentrations of alcohol, acetone, and ether, and the various products were tested for ability to protect pigeons against polyneuritis, the original extract being employed as a check. —*J. S. Caldwell.*

6914. **EATON, A. G., F. E. CHIDESTER, and N. K. SPEICHER.** The influence of manganese iodide and ethyl butyrate on rats furnished a vitamin A-free diet. *Amer. Naturalist* 65(697): 187-190. 1931.—Manganese iodide, given in presence of irradiated ergosterol, does not prolong the lives of rats on a vitamin A-deficient diet more than 6 weeks and adds little to their growth, even when small quantities of ethyl butyrate are added.

6915. **EDDY, WALTER H.** An improvement in the quantitative assay of the antiscurvy vitamin (C). *Amer. Jour. Publ. Health* 19(12): 1309-1320. 5 fig. 1929.—The methods of Sherman and Höjer for the assay of vitamin C are compared. The first is based on autopsy findings as to condition of bones and the presence of hemorrhages, the latter on the microscopic appearance of the teeth. Eddy substantiates Höjer's claims and finds the method more sensitive than Sherman's. The minimum protective dose by Höjer's method is approximately twice that by Sherman's.—*J. Waddell.*

Influence of vitamins B, G and undifferentiated B on the effects produced by protein-rich diets upon the kidney of the rat. *Amer. Jour. Physiol.* 97(1): 210-214. 1931. —Groups (18) of rats were maintained from 30 to 86 days of age on diets containing 18 and 90% casein supplemented with necessary vitamins, 14 groups being subjected to right unilateral nephrectomy at the beginning of the experiment (30 days of age). Histological examination revealed no pathological renal lesions. Renal enlargement due to the high-protein ration occurred in intact rats as well as in those having one kidney. This increase in the size of the kidneys was neither lessened nor prevented by the use of any amt. or combination of vitamins B, G and undifferentiated B employed.—*Authors' summary.*

6917. **GUHA, B. C.** Chemistry of vitamin B_2. *Nature [London]* 127(3207): 594-595. 1931.—If vitamin B_2 is a single chemical entity, on the basis of present evidence it is probably not a base, an acid, or a peptide, but a neutral substance. It is fairly readily adsorbed by neutral precipitates.

6918. **HESS, ALFRED F., J. M. LEWIS, und HELEN RIVKIN.** Der Stand der therapeutischen Wirkung von bestrahlten Ergosterol. *Strahlentherapie* 34(3): 443-456. 1929.—The treatment of young infants with rayed ergosterol should be based on a biological estimation of its anti-rachitic action. Neither toxic symptoms nor hypercalcemia need be feared if the correct dose is given. Rayed dry milk was found valuable for prevention of rickets and tetany, but rayed cereals played no rôle in controlling rickets.—*R. G. Turner.*

6919. **HOTTINGER, A.** Zur Wirkungsweise des D-Faktors. *Strahlentherapie* 34(3): 639-645. 7 fig. 1929.—In 4 cases of rickets in children with acid reacting feces healing took place under vigantol administration in spite of dietary alkalinization of the intestine. Rickets and the

healing process are not related to the acidity of the intestine.—*H. A. Mattill.*

6920. **HOTTINGER, A. Untersuchungen über bestrahltes Ergosterin. V. Stoffwechselversuche zur Ermittlung der biologischen Wirkungsweise.** *Zeitschr. Kinderheilk.* 47(3/4): 341-371. 4 fig. 1929.—The effects of large doses of irradiated ergosterol were studied by means of Ca and P balances and examination of urine for signs of acidosis, together with x-ray examination, on 2 normal infants, 2 with florid rickets, 1 beginning rickets, 1 rickets with tetany, 1 healing rickets, and 2 dogs with spontaneous rickets (1 spontaneously healing). During the first 24 hrs. after ingestion of vitamin D, the Ca output in the normal breast-fed or bottle-fed infant rises markedly, in the rachitic infant it falls and the Ca balance improves. The same is true, though less marked, of the P balance; the P balance improves slowly and mainly by improved absorption from the intestine. Urine analysis indicates a temporary acidosis in the normal infant after vitamin D ingestion; the acidosis of rickets remains long and disappears completely only with definite healing. In tetany the Ca balance rises but less P is retained under the influence of vitamin D.—*M. H. Keith.*

6921. **KESSLER, A. Experimental studies on injuries to pigeons caused by rice of different ages and various milling processes.** *Far East. Assoc. Trop. Med. Trans. 7th Cong. Brit. India* 3: 409-422. 1927[1928].—Undermilled rice loses its vitamin content after some months, as already shown in Otto's experiments cited by De Langen. Heat and long storage destroy the vitamin content of rice devoid of the usual coating, as shown by husked 3-yr. old and steamed 6-yr. old rice. Rice remains with its full vitamin content for 3 yrs. if kept unhusked at moderate temp. Only unhusked rice should be used for export and import or other transport, especially in countries where it forms the principal food. —*Author's conclusions.*

6922. **KING, EARL J., und G. EDWARD HALL. Hypervitaminose bei Hühnern.** *Biochem. Zeitschr.* 229(4/6): 315-322. 1930.—Of 18 Plymouth Rock fowls on a standard diet, 9 received daily for 41 days the dose of ergosterol (0.016 mgm.) regarded as curative for rachitis; these remained normal. The other 9 were divided into 3 equal groups, of which the 1st received 0.6 mgm., the 2nd 1.8 and the 3rd 3.6 mgm. ergosterol daily for the 1st 41 days and respectively 9, 27 and 54 mgm. daily thereafter until killed, a dose several hundred times larger than the therapeutic. During the 1st part of the experiment the hypervitaminosis produced anemia and weakness in the legs, especially marked in those receiving the largest amount of ergosterol. The blood became thick and scarcely fluid. No Ca deposits were found in the organs but the bones became softened and bent. There was a decrease in phosphatase in the bones and kidneys.

Zeitschr.* 229 (1/3): 115-127. 1930.—For guinea-pigs on a diet of autoclaved hay and oats the prophylactic dose of sauerkraut juice was 30 cc., an activity of 5-10% of that of orange juice, and about equal to that of raw cows' milk.—*Author's summary (transl. by A. Spohn).*

6925. **McCARRISON, R. The effects of high protein diets on the thyroid gland. Part 1. With a statistical note by K. B. MADHAVA.** *Indian Jour. Med. Res.* 18, (2): 619-661. 16 fig. 1930.—A high concentration of animal protein in the diet did not cause thyroid enlargement in growing rats whether the diets were rich or poor in fat-soluble vitamins or in iodine. The general effect of the experimental diets was to cause the thyroid gland to be smaller than normal. A less common effect, thyroid enlargement, was not related to an insufficient absorption of I but to deficiency of fat-soluble vitamins especially in diets having a low content of animal protein. Deficiency of fat-soluble vitamins was not the only factor concerned; the existence of an unknown positive goitrogenic agency is postulated. High protein diets had a marked effect in increasing the volume of urine, in causing albuminuria and the excretion of I in the urine. The ingestion of large amounts of animal protein, in association with an insufficiency of vitamin A, was very prone to cause disease of urinary, respiratory and gastro-intestinal tracts.—*From author's summary.*

Ital.* 2(4): 625-638. 4 fig. 1930.—Human milk added to a rickets-producing diet healed rickets in young rats but the results were not constant.

6927. **McKINNIS, RONALD B., and C. G. KING. The nature of vitamin C. A study of its electrical transference.** *Jour. Biol. Chem.* 87(3): 615-623. 2 fig. 1930.—A new type of electrical transference apparatus, which protects the solution from alkali, O, Cl, and heat liberated during electrolysis, as well as O from the air, was devised and used for a study of the acid-base properties of vitamin C. The activity of lemon juice in the anode, cathode, and middle compartments after 5 hrs. electrolysis was measured for antiscorbutic value by feeding to guinea pigs. Evidence was found for the rapid diffusibility of vitamin C through collodion membranes. Comparative measurements were made for the transfer of amino acids in acid and faintly alkaline solutions, showing a marked concentration in the cathode chamber in acid solution and in the anode chamber in alkaline solution (pH 7.2). Vitamin C showed no distinct transference towards the cathode in strongly acid solution (pH 0.9) nor in natural lemon juice (pH 2.4), and it is therefore not a salt-forming N compound such as an amino acid. In slightly alkaline solution there was evidence of a concentrating effect in the anode chamber, indicating that the active substance is acidic in nature. These findings are in harmony with previous evidence concerning the chemical nature of vitamin C.—*Authors' summary.*

6928. **MASSENGALE, O. N., and MILDRED NUSSMEIER. The action of activated ergosterol in the chicken. 1. The effect on the calcium and inorganic phosphorus of the blood serum. 2. The prevention of leg weakness.** *Jour. Biol. Chem.* 87(2): 415-422, 423-426. 1930.—I. In birds receiving a diet lacking in vitamin D with a ratio of Ca to P of 8:1, the serum Ca increased during the 1st week and remained above normal for 8 weeks; the inorganic P decreased rapidly during the first 3 weeks and then remained approximately stationary. The addition of activated ergosterol (=4000% cod liver oil) caused a marked increase of the Ca but only a slight increase of the P. When the ratio of Ca to P was 5:1, the Ca remained above normal for 5 weeks but there was a steady decrease of the P, though not as much as when the ratio was 8:1. The addition of the activated ergosterol caused both Ca and P to become approximately normal. When activated ergosterol was fed to birds on high Ca rickets-producing diets, there were marked changes in the Ca of the blood serum within 48 hrs. The serum Ca and P of birds of the age used in this experiment (18 weeks) remained approximately normal when they received a rickets-producing diet in which the ratio of Ca to P was 1.6:1. The addition of activated ergosterol had no marked effect on either the Ca or phosphate of the serum until after 15 to 35 days, when an increase in serum Ca was noted. When the birds received a diet low in Ca and P, both the serum Ca and inorganic P decreased. Activated ergosterol caused a marked increase in serum Ca but only a slight increase in phosphate. After 35 days the Ca of the serum was approximately normal, yet the inorganic P remained subnormal.—II. Activated ergosterol,

in concentrated or dilute solutions, was much less effective than the rat equivalent amount of cod liver oil in preventing leg weakness in chickens.—*Authors' summaries.*

6929. **MAURER, E.** Über die Vitamingehalt der Hefe. *Zeitschr. Kinderheilk.* 47(2): 202-214. 1929.—A survey of the literature on the vitamins of yeast and the consequent value of yeast in the diet.—*M. H. Keith.*

6930. **NAHMMACHER, HANS.** Der Einfluss des D-Vitamins auf die Entwicklung des Neugeborenen, nach Darreichung von Vigantol an dieses selbst, die Wöchnerin und die werdende Mutter. *Arch. Gynäkol.* 142(3): 618-648. 1930.—In an exhaustive discussion of 426 cases of infants (316 without and 110 with vigantol), 887 puerperae (661 without and 226 with vigantol), and 207 pregnant women (162 without and 45 with vigantol) Nahmmacher finds that vigantol increases the physiologic loss of weight in the newborn, is negative in effect when given to the lactating mother, and delays birth by about 10 days when given to the pregnant woman.

6931. **PELCZAR, K.** Über den Verlauf der Taubenavitaminose B unter dem Einfluss einer nicht vollwertigen Eiweissernährung. *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B. Sci. Nat. (II) [Zool.]* 1928(3/7): 219-249. 1929.—Pigeons were fed vitamin B-deficient diets, one containing casein and gelatin (adequate NH_2 acids) another gelatin alone, another oats with the essential amino-acids in very small amounts. The more generous the intake of amino acids the earlier the symptoms appeared, the more typical was their manifestation and the earlier the decline. The diets poor in amino acids caused paralysis and rather marked emaciation, but without the typical convulsions and opisthotonus observed on the protein-rich diet. About the 10th day loss of appetite developed; in force fed birds, regurgitation was especially common on the diet poor in amino-acids; much food remained undigested in the crop. Fasting considerably prolonged life and the more frequent the vomiting, especially during the early stages, the longer was the survival period. Loss of appetite and regurgitation apparently represent defense mechanisms. Studies of N metabolism indicated fluctuating balances on both diets; there was a much greater negative balance in the birds on the protein-poor diet, probably caused by the greater loss of food through vomiting. There was no change in the amino-acid or undetermined N in the blood, but an increase in the uric acid.—*K. E. Mason.*

6932. **PETERS, RUDOLPH A.** The Harben lectures, 1929. Co-ordinative bio-chemistry of the cell and tissue. Lecture II. The ministers of metabolic change. Experimental researches upon the number, nature and distribution of the water soluble vitamins. *Jour. State Med.* 38(1): 3-30. 5 fig. 1930.—Experimental evidence is given for the existence of 3 factors in yeast required for the nutrition of the rat, and 3 for the pigeon. Various factors in yeast needed for the growth of yeast and of other microorganisms are discussed.—*H. C. Koser.*

Pediatr.* 28(3): 177-202. 3 pl. 1930.—Experiments on an unspecified number of rats indicate that there is ample margin between the antirachitic and the toxic action of vitamin D, and that osseous, vascular, renal, splenic and trophic injuries begin with overdosage.

6934. **POULSSON, E.** Vitaminreserve des männlichen und des weiblichen Geschlechts. *Deutsche Med. Wochenschr.* 56(40): 1688-1689. 1930.—Birnbacher had shown by statistics taken in Vienna, during the World War, that the previously rare disease hemeralopia and its sequel xerophthalmia had greatly increased, owing presumably to the insufficiency of fat in the diet. Out of 330 cases, however, only 38 were in ♀♀, and of these only 2 in the period of greatest sexual activity, between the ages of 15 and 30. Poulsson offers the theory that reserves of vitamins A and D are stored in the subcutaneous fat layer, with which women are so much better provided than men that they are less easily chilled, can dispense with heavy clothing and can endure swimming for longer periods. In water man is the weaker vessel, not because his muscles are more easily fatigued, but because he is more easily chilled. Preliminary studies on the subcutaneous fat in human and bovine ♂ and ♀ tend to support this theory.

6935. **ROSE, WILLIAM B. [et al.].** Studies in the physiology of vitamins. VIII. **WILLIAM B. ROSE, and CHARLES J. STUCKY.** The effect of parathormone on normal and vitamin B-deficient rats. IX. **WILLIAM B. ROSE, CHARLES J. STUCKY, and LAFAYETTE B. MENDEL.** Hemoglobin, sugar and chloride changes in the blood of vitamin B-deficient rats. X. **WILLIAM B. ROSE, CHARLES J. STUCKY, and GEORGE R. COWGILL.** Further contributions to the study of gastric motility in vitamin B deficiency. XI. [Same authors.] The effect of insulin on gastric atony in vitamin B deficiency. XII. [Same authors.] The effect of parathormone on gastric motility in vitamin B-deficient and normal dogs. *Amer. Jour. Physiol.* 91(2): 513-519; 520-530; 531-546; 547-553; 554-562. 1930.—VIII. Parathormone was tested for the possible presence of vitamin B by biologic assay on 12 albino rats 26 days old (same litter), placed on a basal vitamin B-deficient ration. Three controls receiving yeast supplement throve. Six rats receiving a parathormone supplement lost weight and developed symptoms of B-avitaminosis until yeast was substituted for parathormone, when abnormally rapid growth ensued. Three rats receiving daily parenteral injections of parathormone declined and died after the 3rd injection. Likewise 3 normal rats weighing 114-128 gm. died on the day following the 3rd daily subcutaneous injection of 30 units of parathormone; but 4 young rats survived 4 successive daily injections of the same dose per unit weight. To learn whether hypercalcemia (to which rats are said to be immune, but which is said to be caused by parathormone in dogs), was the cause of death, 7 normal rats were given subcutaneous injections of parathormone, and their blood Ca determined and compared with the blood Ca of 11 normal untreated rats. The Ca in the serum of the parathormone-treated rats averaged about 42% higher than in the untreated rats. The parathormone preparation employed does not contain any appreciable amount of vitamin B.—IX. A basal vitamin B deficient ration was fed to 14 albino rats weighing 198-264 gm. A control group was given on an average the same amount of food and water as the rats on deficient diet consumed, together with supplements of material rich in vitamin B. Blood samples, obtained by cardiac puncture from each rat of both groups from week to week during the course of the vitamin deficient and realimentation periods, were analyzed for hemoglobin, sugar and chlorides. There was definite increase in hemoglobin during the deficient period, followed by a pronounced reduction in this constituent during the 1st wk. of realimentation. This evidence of the development of anhydremia came from the control rats as well as from the deficient animals, and may be accounted for by the diminished food and water consumption incident to B-avitaminosis. No significant differences in the blood sugar levels of control and deficient rats appeared, and vitamin B has no specific rôle in regulating blood sugar level. Values for individual rats were erratic, and averages of all the blood sugar data during each wk. suggest that the changes were due largely, if not entirely, to inanition. There was a tendency to a decrease in blood chlorides in B-avitaminosis, as well as in the control animals. These results are in accord with those found in vitamin B deficient dogs—and are probably a result of starvation.—X. The occurrence of anorexia in vitamin B deficiency led to a search for its physiologic basis by studying gastric motility. Control dogs were employed, each receiving the same amount of food and water daily as was consumed by a corresponding deficient-diet animal. A technique was developed which made it possible to record hunger contractions continuously over a period

of 24 hrs. or longer. Records of gastric motility were made at frequent intervals during the course of vitamin B deficiency and recovery therefrom. Tracings were never taken when neuromuscular symptoms were present. The data indicate that: (1) Disturbances of gastric motility developed in all dogs suffering from vitamin B deficiency. (2) This depression of the motor power of the stomach may become so pronounced as to yield evidence of complete gastric atony (recorded for over 100 hrs. in 1 dog) in some cases. Atony may occur long before nervous manifestations are apparent (approximately 10 days in these experiments). (3) Complete anorexia over a period of wks. is not necessarily associated with gastric atony. Shallow hunger contractions and slight tonus changes have been recorded 1 day prior to the onset of nervous manifestations. (4) The avidity for food does not appear to depend upon the vigor of the hunger contractions under the conditions of these experiments. (5) The "water-and-food" control animals likewise showed evidence of a variable decrease in total gastric activity. However, none of the controls developed gastric atony. (6) Apparently the decrease in gastric contractions is not due to any specific and direct effect of a lack of vitamin B in the diet. However, a deficiency of this food essential seems to accentuate the disturbances described. The blood sugar level remained well within the normal range in all cases, so that hyperglycemia does not appear to enter into the mechanism involved. (7) Evidence suggests that the water intake of the organism may be one of the factors which affects the muscular contractions of the stomach. (8) Gastric stasis was present in some vitamin B-deficient animals.—XI. To determine whether insulin would restore hunger contractions in dogs showing long-maintained gastric atony due to B-avitaminosis, a group of dogs was fed a vitamin B-deficient ration. Insulin was administered to 2 dogs which had lost their hunger contractions completely and manifested prolonged atony of the stomach long before neuromuscular symptoms made their appearance. An injection of the hormone in a dose which is effective in normal dogs failed to elicit a response from the gastric musculature. In 1 animal 3 successive injections of insulin resulted in a partial restoration of the hunger contractions, which, however, were very slight and associated with low gastric tonus. Dogs in the advanced stages of B-avitaminosis seem to be peculiarly sensitive to insulin. The hormone appears to have precipitated generalized neuro-muscular symptoms in the 2 animals here studied. The results suggest that this heightened response to insulin is not readily shared by the musculature of the stomach in dogs manifesting gastric atony due to B-avitaminosis.—XII. Parenteral injections of parathormone produced no significant effect on gastric atony in 3 dogs suffering from B-avitaminosis. Tracings of the motility of the stomach of 4 normal dogs were indistinguishable from similar tracings made after the hormone was injected, when the dose employed was insufficient to produce marked hypercalcemia. In 1 animal, depression of the motor function of the stomach occurred during the latter half of a continuous 24 hr. gastric tracing and during this period the serum Ca was elevated over 50% above the normal level.

6936. SALMON, W. D., and N. B. GUERRANT. Liver extract as a source of vitamins B and G. *Science* 73 (1887): 243-244. 1931.—The liver extract (No. 343, Eli Lilly & Co.) tested on rats was an excellent source of vitamin G; it is not such a good source of vitamin B. It contained 4-5 times as much vitamin G but only about 1/5 as much vitamin B as a sample of brewer's yeast. The vitamin B content of the extract compared favorably with that of pure dried baker's yeast commonly on the market.

6937. SCHEUNERT, ARTHUR. Ueber das Vorkommen von antirachitischen Vitamin in Grünfutter und Heu. *Berliner Tierärzt. Wochenschr.* 46(40): 746-751. 4 fig. 1930.—While it is certain that the usual meadow grasses and the hay from them may contain vitamin D, there is a great variation in the amount present. The cause of this variation is not yet discovered. Fertilization seems to exert no significant effect; and experiments have corroborated the belief that sun drying acts favorably and rain and lack of sunshine act unfavorably. Of 3 varieties of mountain hay, 2 obtained from altitudes of about 900-1400 meters showed a high content of vitamin D, while the content of 1 from a height of 2000 m. was less. Succulent grasses and hay, especially legumes, are the most important feeds for the control of and prevention of disturbances in the Ca and phosphate metabolism. The manner in which the hay has been cured is of first importance.—*Author's summary (transl. by V. G. Heller).*

6938. SCHIEBLICH, MARTIN. Zur Wertbestimmung von Vitamin-D-Präparaten. II. *Biochem. Zeitschr.* 230 (4/6): 312-319. 1931.—Tests on rats showed that the curative dose was always higher, sometimes much higher than the protective dose. The great variations between the two are to be attributed to varying general injury which can not be evaluated roentgenologically. The line test, in general, gave the same results as the roentgenological method. Access to feces did not influence the results in the protective experiments. If several animals are kept in a cage mutual licking transfers small amts. of vitamin D.—*From author's summary (transl.).*

6939. SCHMIDT, WERNER, and CARL L. A. SCHMIDT. The relation of bile to the intestinal absorption of vitamin A in the rat. *Univ. California Publ. Physiol.* 7(13): 211-221. 1930.—With the vaginal smear picture as a criterion to determine the absorption of the vitamin, exclusion of bile from the intestinal tract by ligating and sectioning the common bile duct did not lead to the continuous appearance of cornified cells in the vaginal smears of animals which had been maintained on a diet adequate in vitamin A. When the abdomens of animals which had been maintained on a diet low in vitamin A were opened and closed surgically without however inducing icterus, subsequent administration of cod liver oil restored the vaginal smear picture to normal. When icterus was induced in animals which had been maintained on a diet low in vitamin A the subsequent administration of cod liver oil per os led to the reappearance of the normal vaginal smear picture in a certain percentage of the animals. This in interpreted as indicating absorption of vitamin A from the gastrointestinal tract in the absence of bile. Both the mortality and the percentage of icteric rats which failed to respond to cod liver oil when administered subcutaneously or per os is high. A possible reason for this is discussed. In experimental icteric rats it was possible to restore the normal vaginal smear pictures by administration of cod liver oil per os, then again to deplete the storage of vitamin A to a level such that only cornified cells were found in the vaginal smears and a second time to restore the normal pictures by giving cod liver oil per os.—*Authors' summary.*

6940. SCHMITZ, ERNST, und ERICH GEORGE. Beitrag zur Frage der Einheitlichkeit des B-Vitamins. *Biochem. Zeitschr.* 204(1/3): 165-178. 5 fig. 1929.—Groups of pigeons were fed (1) a normal diet; (2) the normal diet plus sunflower seeds; (3) rice alone; and (4) rice plus sunflower seeds. The blood lipids, body weight and the weights of various organs were compared. The first 2 groups reacted in much the same way, maintaining weight fairly well. The 3rd group developed polyneuritis, lost weight rapidly and died within 5 weeks. The 4th group maintained weight for 5 mos., following the controls very closely, then it began to lose weight and to show the development of polyneuritic symptoms which continued until death in the 8th month. The authors think that a true picture of the effect of removing one component of vitamin B has thus been obtained.—*M. Fay.*

6941. SEIDELL, ATHERTON, and VICTOR BIRCKNER. Experiments on the isolation of the antineuritic vitamin. *Jour. Amer. Chem. Soc.* 53(6): 2288-2295. 1931.—The procedure involving adsorption of the antineuritic

vitamin upon fuller's earth and subsequent extraction, benzoylation and acetone precipitation has yielded, without the use of any precipitating agents, final products the most active of which was curative in 0.03-mgm. doses, by the Smith rat method. This is an activity about ¼ greater than that of the Jansen and Donath crystals. It is more than twice as great on the N basis. Products of somewhat lower activity were obtained in considerably larger yields. Apparently, small variations of conditions at certain stages of the process may effect greatly the quantity and quality of the final product. Especial attention has been given to the effect of varying the ratio of the benzoylating reagents and of the reaction temp. on the quality and yield of the final concentrate. —*Authors' summary.*

6942. SHELOW, ELIZABETH, and JOHN R. LOOFBOUROW. The antirachitic activation of ergosterol by soft x-rays. *Bull. Basic Sci. Res.* [*Univ. Cincinnati*] *Ser.* 4. 3(1): 47-64. 4 fig. 1931.—The possibility of the antirachitic activation of ergosterol by soft x-rays from a Shearer tube was investigated, because of the much greater absorption of these rays by biological materials as compared with ordinary Coolidge tube rays. Previous workers had, for the most part, found Coolidge tube radiations ineffective. Irradiation of ergosterol dry and in alcoholic solution under various conditions produced changes in the ultra-violet absorption spectra comparable to those obtained by irradiation with ultra-violet light. These changes were obtained whether or not air was present. Two series of animal experiments showed healing of rickets by 0.002 mgm. daily doses of soft x-rayed ergosterol exposed 5 to 30 min. at 40,000 to 50,000 volts. In the 2nd series, samples irradiated for longer periods of time showed less protection, indicating destruction of the vitamin D by prolonged irradiation, as in the case of ergosterol irradiated with full ultra-violet.—*J. R. Loofbourow.*

6943. SHERMAN, HARTLEY EMBREY. Relative content of water-soluble vitamin B in thirty oriental foods. *Philippine Jour. Sci.* 38(1): 9-36. 37 fig. 1929.—The vitamin content of these foods was tested by feeding varying quantities of them to white mice, and later to albino rats, kept on a diet lacking vitamin B. Results obtained with mice and with rats agreed, and led to the following conclusions: "the following foods are deficient in vitamin B, and do not protect from beriberi at any feeding level: Chinese persimmon (*Diospyros kaki* L.); water chestnut (*Eleocharis tuberosa* Naves); fermented rice, or lao mi (*Oryza sativa*); and locust seed (*Robinia pseudoacacia*). Hsiang ch'un, the leaf of *Cedrela sinensis,* contains a poison which causes violent convulsions and death when fed in concentrated form. Wo sun (perhaps a variety of *Lactuca sativa*), hao tzu kan (*Chrysanthemum coronarium* L.), and p'ieh lan (apparently a variety of *Brassica campestris*) are not growth producing when fed at high levels, even when added to a complete diet, thus apparently showing the presence of substances that are harmful in very great concentrations. All of the other foods tested—ch'ia ts'ai (*Phaseolus aureus* Roxb.), huang tou (*Soya max* L.), huang tou ya (sprouts of *S. max*), ch'ing tou (green variety of *S. max*), ch'ing tou ya (sprouts of the green variety of *S. max*), hung kao liang (red variety of *Sorghum vulgare* Pers.), pai kao liang (white variety of *S. vulgare*), t'zu ku (*Sagittaria sagittaefolia*), wo kua (probably a variety of *Cucurbita pepo*), huang hua ts'ai (probably *Hemerocallis flava*), chieh ts'ai ying (probably a variety of *Brassica campestris*), hu tzu (variety of *Lagenaria vulgaris*), ssu kua (*Luffa cylindrica*), weng ts'ai (a Chinese variety of *Ipomoea reptans* Poir.), upo (a Philippine variety of *Lagenaria vulgaris*), chico (*Achras sapota* L.), tou fu (bean curd from *Soya max*), hsi hu lu (probably a variety of *Cucurbita pepo*), tung kua (a Chinese variety of *Benincasa hispida* Cogniaux), kan lu (not identified), and papaya (*Carica papaya* L.) —are sources of vitamin B in varying amounts. Chico, hsi hu lu, and tung kua are low in this vitamin."

6944. SHERMAN, HARTLEY EMBREY. Relative water-soluble vitamin C content of nine oriental fruits and vegetables. *Philippine Jour. Sci.* 38(1): 37-46. 10 fig. 1929.—Vitamin C content was tested by feeding these to guinea pigs on a basal diet deficient in vitamin C, and observing, post mortem, for scurvy. Pomegranate, Chinese cabbage, and hsiang ts'ai (*Coriandrum sativum* L.) were rich in vitamin C; hung kuo, pich'i (*Eleocharis tuberosa* Naves), and ou (*Nelumbium speciosum* Willd.) were good sources of it; p'ieh lan (probably *Brassica oleracea caulorapa*) contained only a small amount; hung tsao (probably *Polygonum orientale* L.) and wo sun (a variety of *Lactuca sativa*) contained very little.

6945. SHERMAN, HARTLEY EMBREY. Certain proteins added to Mung bean, or to white or red Sorghum vulgare, increase the fertility of mice. *Philippine Jour. Sci.* 38(1): 47-67. 26 fig. 1929.—A diet consisting of mung bean, or of white or red *Sorghum vulgare* as the only protein, gave normal weight of white mice, but subnormal reproduction. For increased fertility, and for good growth of the 2nd generation, the best supplements (of those tested) for a mung-bean (*Phaseolus aureus* Roxburgh) diet are small quantities of fat-free peanut, of gelatine, or of casein; the best supplements for the white variety of edible sorghum (*Sorghum vulgare*) are small quantities of mung bean, of fat-free soy bean, or of fat-free peanut. Not one of the foods tested as supplements to the red variety of *Sorghum vulgare* was able to raise to normal the rate of reproduction of the 1st generation, nor the number of young of the 2nd generation surviving the period of lactation; but casein was a better supplement than was mung bean, fat-free peanut, or fat-free soy bean.

6947. STEENBOCK, HARRY, BLANCHE RIISING, ARCHIE BLACK, and BYRON THOMAS (with the cooperation of ALICE M. WIRICK, and FLORA HANNING). Cereals and rickets. II. Antirachitic activation of cereals. *Jour. Amer. Med. Assoc.* 93(24): 1868-1874. 1 fig. 1929.—Various cereals were made antirachitically active by ultraviolet radiation. This activity remained stable: (1) when autoclaved at 15 lbs. pressure followed by drying at 60 C. for a few days; (2) when stored for 16 mos. at 60 C. or at a lower temp.; (3) when cooked. Vitamin A and the vitamin B complex were found to be labile to ultraviolet radiations, but may be sufficiently stable to withstand the minimum exposure to insure maximum antirachitic activation. Commercial irradiation of cereals was standardized to prevent change in palatability, destruction of vitamins and hypervitaminosis.—*M. Collins.*

6948. STEUDEL, H., und E. PEISER. Über den Nachweis des Vitamins A. *Hoppe-Seyler's Zeitschr. Physiol. Chem.* 174(3/4): 191-195. 1 fig. 1928.—Of two samples of oil tested for vitamin A by the antimony chloride reaction of Price and Carr, and by feeding in appropriate amounts to young rats as the sole source of vitamin A, the oil which gave the higher color reading proved less potent in preventing keratomalacia. The author concludes that the biological test is the only accurate test thus far devised for vitamin A.—*M. Fay.*

6949. SUPPLEE, G. C., ODESSA D. DOW, and G. E. FLANIGAN. The concentrated water soluble fraction of milk as a source of vitamin B. *Jour. Dairy Sci.* 11 (5): 420-426. 1 pl. 1928.—The data given show that the solids of the water soluble fraction of milk, when properly prepared and concentrated, are highly potent in vitamin B content and compare favorably with dried yeast as a source of the growth promoting and antineuritic factor.—*Authors' summary.*

6950. TŮMA, VLADIMIR. K histologii mléčné žlázy u normálnich a avitaminoscních krys. [The histology of the mammary gland of normal rats and rats fed on a diet deficient in vitamins.] *Rozpravy Ceske Akad.*

Věd a Umění Třida II (Matematicko-Přírodnická) 37 (3): 1-9. 1 pl. 1928. (Also in *Bull. Internat. Acad. Sci. Bohême 1928; Compt. Rend. Assoc. Anat. 23ème réunion à Prague, 1928.*)—Of 2 groups of rats, 1 was fed a diet without vitamins, the other the same diet with the addition of cod-liver oil. Histological comparison of the mammary glands of the 2 groups showed the normals to contain mast cells, fibrocytes, small lymphocytes, histiocytes, plasma cells, eosinophilic granulocytes and young lipoblasts in the interstitial tissue. In the rats fed on a dict deficient in vitamins the mast cells showed marked variations, were less numerous than in the normal, and the granules, usually tinctorially reactive to basic aniline dyes, gave the same reaction but did not react to stains specific for lipids or fats. The author concludes that the mast cell lipid substance is reduced in rats on a diet deficient in vitamins. He further believes that the mast cells may play a rôle in the metabolism of vitamins.—*V. Tůma (transl. by J. E. Kindred).*

Jour.* [*London*] 87 (4): 164-170. 1931.—The results obtained after a single dose of wheat germ oil administered intramuscularly are termed so satisfactory that they encourage further experiments.

6952. **WEATHERBY, LEROY. Vitamins C, D, and E.** *California Avocado Assoc. Year Book* 1930: 100-105. 1930.—Avocado as the sole source of vitamin C slightly prolonged the lives of guinea pigs, but not throughout the required experimental period. Vitamin D was found to be present in avocados. Blood P, the line test, and the rachitic rosary test all indicated that the symptoms of rickets were practically prevented by 5 gm. of fresh avocado or by 0.5 cc. of avocado oil per rat per day. The presence of vitamin E in avocados was indicated by the cure of female sterility in rats. The experimentation was not sufficiently exhaustive to warrant conclusions as to male sterility. These determinations were made on the Calavo, which has a high oil standard.—*L. Weatherby.*

6953. **WOLFF, L. K., J. OVERHOFF, und M. van ECKELEN. Ueber Carotin und Vitamin A.** *Deutsche Med. Wochenschr.* 56 (34): 1428-1429. 1930.—The authors briefly report, without details, that diseases caused by lack of vitamin A can be cured by pure carotin. Feeding studies indicate that the minimum dose of carotin per rat is 2-3 γ per day. Determinations of vitamin A and carotin in a large series of products indicated that vitamin A occurs either not at all or in inappreciable quantities in the plants, and that the source of vitamin A is carotin, transformed into that vitamin in the animal organism. This idea is strengthened by the fact that vitamin A is colorless; carotin is yellow; the vegetable portions to which vitamin A is attributed are colored yellow, while animal products often contain vitamin A but no color (egg yolk and butter contain both carotin and vitamin A). It is further confirmed by experiments on 4 rabbits, in which small pieces of liver, removed for preliminary analysis, showed either no vitamin A or very small amounts. Injection of carotin dissolved in oil into 3 of the rabbits was followed 3 days later by appearance of 370-1000 units of vitamin A in the liver. Feeding of carotin to the 4th rabbit had similar results.

6954. **ANONYMOUS. Report of the committee on beri-beri of the Philippine Islands.** *Far East. Assoc. Trop. Med. Trans. 7th Cong. Brit. India* 3: 423-443. 1927[1928].—Eighty per cent remaining external layers of the grain of rices, determined by staining and inspection method, may be recommended as standard for the selection of rices for institutions and armies but not as a legal standard. In the determination of the percentages of remaining external layers, the Gram I staining and inspection method should be used. The production of highly-milled rice (0-20% external layers) should be discouraged. Any rice having 1.77% of P_2O_5 plus fat, but not less than 0.4% P_2O_5, or any rice having not less than 0.62% P_2O_5, or any rice having not less than 0.50% P_2O_5 and with at least 75% of the external layers of the grain remaining, is suggested as the tentative chemical index. The production of vitamin-containing home vegetables should be encouraged. A wide campaign of education for the spread of knowledge about beri-beri-prevention should be continued.—*Committee's recommendations.*

ANIMAL PHYSIOLOGY

DIGESTIVE SYSTEM AND DIGESTIVE SECRETIONS

6955. **BARCO, PAOLO. Ricerche su alcune modificazioni del ricambio dopo la derivazione completa della bile. (Studio sperimentale.) [Some modifications of metabolism after the complete diversion of the bile.]** *Arch. Ital. Chir.* 26 (1): 50-70. 1930.—In 4 dogs with biliary fistulae completely removing the bile from the system, the Ca, P, lactic acid, and alkaline reserve of the blood, and the pH and organic acids of the urine were determined on the 30th, 60th, 90th and 120th days after the operation. Barco concludes that complete deprivation of bile results in a progressive state of acidosis and osteomalacic changes continuing to death.

6956. **BAXTER, HAMILTON. Further studies on the composition of saliva in different phases of the secretion.** *Amer. Jour. Physiol.* 97 (3): 450-458. 1931.—It had previously been shown that the composition of saliva from a dog with a permanent parotid fistula changes in different phases of the secretory period, the 3 phases then recognized being: (1) the 1st min. while the dog was being stimulated by food, etc.; (2) 1st min. of after-flow; (3) succeeding period of after-flow. For the present study, a 4-phase experiment was devised, phase 1 being separated into 2 30-sec. periods, phases 1A and 1B. Experiments were performed on 5 dogs with permanent salivary fistulae. Two dogs had each a single parotid fistula; 1 had a single submaxillary fistula and 1 parotid fistula; and 1 had 2 parotid fistulae. The saliva was collected according to the Pavlov method. The 4-phase type of experiment showed that the salivary secretion of the parotid and mixed glands is qualitatively and quantitatively different in the various periods. The Cl concentration in saliva from the parotid and mixed glands diminishes steadily from phase 1A to phase 3. The concentration of Cl has no relation to the amt. of organic matter secreted. In pilocarpine saliva, notwithstanding the increased secretion, there is invariably a fall in the organic and inorganic moieties, which cannot be attributed to exhaustion of the available supply. Therefore, the secretion of salts in the saliva under the influence of pilocarpine is not dependent only on the rate of secretion. Atropine injected in progressively greater amts. diminishes the total output of fluid parts and of ash in all 3 phases of salivary secretion. In the 3rd phase, however, it increased the total output of organic substances (diminished during the 1st and 2nd phase), when the dose of atropine injected did not exceed 2 mgm.

6957. **BECK, GALLUS. Neue Beiträge zur Zweikomponententheorie des Hungers. (Versuche mit Hühnern.)** *Zeitschr. Psychol. Physiol. Sinnesorg. Abt. I., Zeitschr. Psychol.* 118 (4/6): 283-349. 1930.—The hunger experiments were made on 4 2-yr. old fowls, fasted

for 24 hrs. before an experiment. The average intake of food with free choice was first determined on this basis; maximum food taken on a laying day was less than the minimum on normal days; more food was taken when H_2O was freely available than when it was present only during feeding; during moulting there was a decrease and a recovery in weight, which was preceded, not paralleled, by loss of appetite, recovery far beyond the average, then regression to another stable intake about 11% higher than before moulting. Since food intake is dependent upon vision, not taste or smell, it paralleled illumination. More food was eaten when successive small portions were given, when it was constantly present, and when the animals were stimulated by the sight of food or others eating. Three periods of increased hunger were found each day—5 a.m., 3 p.m., and 7 p.m.

6958. **BENDIXEN, H., und A. ANGELOWA. Über den Einfluss des Speichels auf die Magensekretion.** *Zeitschr. Klin. Med.* 115(3/4): 612-622. 1931.—By continuous intubation gastric samples were obtained every 10 min. from 24 patients (2 healthy, 22 with various troubles) after test meal of 30 gm. flour in 1 liter water, first with the saliva expectorated, then with it swallowed; experiments were also made introducing 300 cc. physiological saline (2 patients) or distilled water (1 patient); in 9 patients the expectorated saliva was introduced through the tube, in 3 instances with no porridge; in 6 patients the pepsin content was tested. It was found that the saliva increased the production of HCl and pepsin. Either a hematogenic or a neurogenic stimulation was possible, the latter the more probable.

6959. **BRODY, HENRY, and MOSES SAMUEL SHILING. A note on the relation of salivary secretion to the oxygen tension of the inspired air.** *Amer. Jour. Physiol.* 91(2): 399-404. 1930.—The effect of diminishing the O tension of the inspired air upon the rate of submaxillary secretion in dogs was studied. The response, during anoxemia, was unchanged when the gland was stimulated through the chorda tympani. There was a marked decrease in the secretion rate during anoxemia when the stimulus was pilocarpine.—*Authors' summary.*

6960. **BUDDE, OTTILIE. Untersuchungen zur Verdauungsphysiologie des Säuglings. XII. Über den Lösungszustand von Kalk und Phosphat im Chymus.** *Zeitschr. Kinderheilk.* 50(4): 482-495. 1930.—In vitro tests of the influence of digestive processes on the ultrafiltrability of Ca and P of milk showed that of the total Ca about 70% in human milk, and 20-30% of cows' milk is ultrafiltrable and about 36% and 52% respectively of the total P. Acidification and proteolysis increases the amt. of ultrafiltrable Ca and phosphate. Coagulated milk did not have a higher content in ultrafiltrable Ca and P than the original. Lipolysis considerably reduced the ultrafiltrable portion by the formation of Ca-soap. The ultrafiltrability of Ca and the formation of Ca-soap was not influenced by bile or the salts of biliary acids, nor by oxidation or desaturation of fatty acids. The Ca precipitating action of lipolysis predominated over the dissolving action of proteolysis in the action of the duodenal juice on whole milk, reducing the ultrafiltrable Ca. Boiling milk, but not pasteurization (30 min. at 70°) reduced the ultrafiltrable Ca.—*Author's summary (transl.).*

6961. **COLOMBI, CAMILLO, e ULRICO SACCHI. Ricerche sulla secrezione dello stomaco in un uomo portatore di fistola gastrica. [Studies on gastric secretion in a man with gastric fistula.]** *Boll. Soc. Ital. Biol. Sperim.* 5(3): 401-403. 1930.—Data were collected which show the importance of psychic stimuli for gastric secretion, as well as its psychic inhibition. Secretion during rest was observed, confirming Carlson's findings.—*M. Comel.*

6962. **DRAGSTEDT, LESTER R., and JAMES C. ELLIS. The fatal effect of the total loss of gastric juice.** *Amer. Jour. Physiol.* 93(2): 407-416. 1 fig. 1930.—To permit the complete loss of gastric juice under conditions otherwise as normal as possible and without obstructing the gastro-intestinal tract anywhere, use was made of the method of Lim, Ivy, and McCarthy, modified to leave the vagus nerves to the isolated stomach largely intact. Daily observations were made on 6 dogs that survived the operation. Total loss caused death in 5-8 days. The continued loss of gastric juice produced changes in the blood chemistry similar to those occurring after pyloric obstruction. The symptoms in 4 dogs were temporarily relieved, the blood chemistry returned toward the normal and life prolonged, by the intravenous injection of 2,000 to 3,000 cc. of Ringer's solution per 24 hrs. The isolated stomach, prepared by the method described above with intact blood and vagal supply, secreted in 24 hrs. as much as 1000-2600 cc. of gastric juice. The gastric glands can continue to secrete gastric juice of high free and total acidity even when the blood chloride has been reduced to less than ½ of its normal concentrations and an extreme alkalosis exists.

6963. **DRAGSTEDT, LESTER R., M. LAURENCE MONTGOMERY, and JAMES C. ELLIS. A new type of pancreatic fistula.** *Proc. Soc. Exp. Biol. & Med.* 28(2): 109-110. 1930.—The duodenum is cut across 2 cm. distal to the pylorus and again about 8 cm. lower down, just below the entrance of the lower pancreatic duct. The pyloric antrum is resected and the lower duodenum anastomosed to the open end of the stomach by the end to side suture. The common bile duct is sectioned near its entrance into the duodenum and implanted either into the stomach or upper jejunum. The upper short section of duodenum containing the entrance of the pancreatic ducts (usually 2 or more in the dog) is converted into a closed sac by inversion and closure of both ends. An external fistula of this duodenal-pancreatic sac is then established by means of a special gold plated cannula.

6964. **DRAGSTEDT, LESTER R., M. LAURENCE MONTGOMERY, WARREN B. MATTHEWS, and JAMES C. ELLIS. Fatal effect of the total loss of pancreatic juice.** *Proc. Soc. Exp. Biol. & Med.* 28(2): 110-111. 1930.—Total elimination of pancreatic juice in dogs leads to death in 4-6 days. Secretion of pancreatic juice continues till death, but in gradually reduced quantities. There is a reduction in plasma base, a decrease in plasma chlorides, an increase in N.P.N. and urea, and increased acidity of the blood.—*A. J. Carlson.*

6965. **FINKLEMAN, B. On the nature of inhibition in the intestine.** *Jour. Physiol.* 70(2): 145-157. 1 fig. 1930.—An inhibitory nerve-smooth muscle preparation is described, and on this strictly parallel effects are produced by nervous and chemical inhibition. Ephedrine antagonizes both nervous and adrenaline inhibition. When the preparation is brought into equilibrium with a fairly high concentration of adrenaline, neither nervous nor adrenaline inhibition can be elicited. A method is described for obtaining pendular movements of isolated pieces of rabbit gut not immersed in Ringer-Locke. When the movements of such a piece of gut are inhibited by stimulating the nerve, a substance appears in the fluid passing over the surface which has the power of inhibiting a 2nd piece of gut. Hence it is argued that the inhibitory nerves to plain muscle act by liberating peripherally an inhibitory substance.—*Author's summary.*

6966. **FOIT, RICHARD. Nová gastro-duodenálna (Sonda). [New gastro-duodenal tube.]** [With French, English and German summaries.] *Bratislavské Lekarske Listy* 9(1): 56-59. 1 pl. 1929.—The tube consists of a single piece of elastic rubber (largest diam. 7 mm.) with an arrangement for automatic removal of duodenal juice. With this tube, the author found that if the gastric acidity increases, the alkalinity in the duodenum increases also, and vice versa. However, the alkalinity of the duodenal content did not exceed pH 8.3 in any case examined.—*From English summary.*

6967. **GILMAN, ALFRED, and GEORGE R. COWGILL. The effect of histamine upon the secretion of gastric pepsin.** *Amer. Jour. Physiol.* 97(1): 124-130. 1931.—Studies of the response of the pepsin secreting glands

to histamine stimulation were made in 7 gastric pouch dogs of the Pavlov and Heidenhain type. With increased volume of secretion in response to histamine stimulation, there was a relative decrease in pepsin concentration, indicating that the histamine had not stimulated pepsin secretion. A parallelism between pepsin and neutral chloride concentration in the gastric juice was also observed.—*Authors' conclusions.*

6968. GOLDSTEIN, BORIS. Zur Physiologie des isolierten Pankreas. III. Über die Wirkung des sympathischen Nervensystems auf die fermentbildenden und sekretorischen Prozesse im isolierten Pankreas. IV. Über die Wirkung des Sekretins auf die Adrenalinsekretion der isolierten Nebenniere. *Zeitschr. Ges. Exp. Med.* 74(1/2): 128-134; 135-137. 1930.—III. Adrenalin, used as a sympathetic stimulant, produced a decrease in the enzyme content of the secretion of the isolated pancreas, if the increased vascular contraction was compensated for by the increase of pressure under which the Ringer-Locke's solution was forced through. On perfusing one pure Ringer-Locke's solution after the adrenalin action, the enzyme concentration was increased; but this rise is much less than by the action of pilocarpin. The amount of fluid increased insignificantly under the effect of adrenalin. Sometimes the rise of the strength of the enzyme in the secretion and in the Ringer-Locke's solution proceeds during the adrenalin action. Adrenalin which is perfused through the gland simultaneously with secretin produces at first a decrease of enzyme concentration in the secretion and later an increase; the amount of fluid is not influenced or insignificantly increased. The cited results are explained on the supposition that the sympathetic nervous system influences the pancreatic secretion in two ways: it increases the enzyme formation process and it holds back the enzyme (perhaps also other organic materials) in the cell, probably owing to an action upon cell permeability.—IV. Secretin increases greatly the adrenalin secretion, during its action upon the isolated adrenal, whereby the secondary effect is characteristic. The acid-stimulating secretion arises possibly as a result of a double action of secretin: (1) An immediate stimulation of the pancreas; (2) a stimulating of the sympathetic nervous system, which is excited through an increase of adrenalin secretion due to the effect of secretin.—*Author's summary (transl. by P. E. Claus).*

6969. HALPERT, BÉLA, and JULIAN H. LEWIS. Experiments on the isolated whole gall bladder of the dog. *Amer. Jour. Physiol.* 93(2): 506-520. 1 fig. 1930.—A specially constructed cannula permitted accurate estimation, at any time, of the fluid content of the viscus and the measurement of the movements in terms of hydrostatic pressure. Spontaneous rhythmic contractions were obtained regularly and tonic contractions occasionally. The former represented a power to displace a column of about 0.1-2.3 cc. of Locke's solution against a hydrostatic pressure of approximately 13-16.5 cm. of the same fluid, and occurred at a rate of 1-3 or more per min. Tonic contractions rarely occurred spontaneously and rarely reached a higher level than that representing a power to displace more than a column of 1-2 cc. of Locke's solution, under the same conditions. The effect of histamine, pilocarpine and atropine was about the same as on smooth muscle in general. The effect of epinephrine was inconstant, affecting sometimes only the tonus or the rhythmic contractions and sometimes both. Pituitrin, cholecystokinin [Ivy-Oldberg] and Koehler's extract of the suprarenal cortex had no appreciable influence upon either the tonus or the rhythmic contractions. When the fluid content of the gall bladder was increased or decreased, adjustment of tonus soon occurred and the pressure in the viscus eventually returned to about its previous level and the curve gradually resumed its former shape. This latter observation strongly suggests that the function of the muscular coat of the gall bladder is that of effecting adjustment in size to the varying content, rather than the emptying of the viscus.—*Authors' summary.*

6970. HIRSCH, G. C. Eine vorläufige Mitteilung über den Rhythmus der holokrinen Sekretion in der Mitteldarmdrüse von Astacus leptodactylus. *Tijdschr. Nederlandsch. Dierkd. Ver. Ser. 3* 1(2): 58-63. 2 fig. 1928.—The holocrine secretions of *Astacus* show a rhythmic cycle; indeed the activity of the entire gland exhibits a definite rhythm. The rhythm of the active forms of the secreting cells and the ferment stand in direct relation to the rhythmic increase of cell division, but an explanation as to the cause of this rhythm is still wanting. Cell division at the blind end of the cecum does not suffice to keep up the required number of B cells. Cell materials to replace those forming the holocrine secretion flow in two streams from opposite directions, from the blind end as well as from the dorsal cecum of the actual midgut toward the middle to form the B cells which there discharge into the lumen.—*W. L. Schmitt.*

6971. HUKUHARA, T. Die normale Dünndarmbewegung. (Mit Hilfe der Bauchfenstermethode und Kinematographie.) *Pflüger's Arch. Ges. Physiol.* 226(4/5): 518-542. 6 fig. 1931.—After a survey and critique of data yielded by other methods, the author describes in detail the results of his studies on intestinal movements in the dog, cat, rabbit and guinea pig by means of cinematographic records taken through an abdominal window. The movements seen in the empty intestine duplicate the movements in the intestine of a fed animal. Antiperistalsis was never observed. On the basis of these studies the author offers some slight modifications of the conceptions arising from Cannon's early work with the x-ray method.—*M. H. Friedman.*

6972. IZUMITA, TOMOTAKE. Über die Entleerungszeit des Mageninhaltes bei dem gesunden japanischen Säugling. *Jahrb. Kinderheilk.* 128(1/2): 108-117. 1930.—The evacuation time in 32 healthy children aged 1-10 yrs. was studied by Demuth's roentgenologic method for ½ galactosan (a substitute for larosan), human milk, whole milk, ¾ milk, ½ milk and ¼ Mariott's lactic acid milk. The evacuation time was individually variable, in some cases a difference of 3 hrs. existing between different feedings of the same food. The different foods also were characterized by different evacuation times, so that it was necessary to make several studies of each child. The longest average evacuation time for any food was for ¼ lactic acid milk, then in descending order ½ galactosan, whole milk, ¾ milk, human milk and ¼ milk. The acidity of the gastric juice bore no relation to the evacuation time.

6973. IZUMITA, TOMOTAKE. Über die Azidität des Magensaftes bei gesunden Neugeborenen und Säuglingen. *Jahrb. Kinderheilk.* 129(5/6): 319-334. 1930.—Healthy infants from the children's clinic and the children's dispensary were studied. They were of average length and weight and in a good nutritional condition. There were 35 cases in all, age 1-12 months; and 52 new-born, 3 hours to one week of age. The acidity of the gastric juice of healthy Japanese infants was: total acidity 4-26, average 12.3; free HCl 0.0-18.0, average 6.0; pH, 2.0-4.2. A positive Gunzberg's test was secured in 84% and negative in 14% of the cases. Individual fluctuations in the acidity of the infants were very pronounced whereas daily fluctuations were very small. The acidity increased with age. The gastric acidity in male infants was higher than in the females.—*E. G. Schmidt.*

6974. KAWAMURA, KOICHI. The influence of vitamin B on the intestinal secretion. The method of the quantitative estimation of the protein enzyme of the intestinal juice. *Japanese Jour. Exp. Med.* 7(2): 157-175. 1929.—Thiry-Vella fistulae were made in healthy dogs, and when the animals were sufficiently recovered from the operation they were placed on vitamin B adequate and vitamin B deficient diets. The amount of secretion of intestinal juice and the quantity of enzymes it contained were estimated. Vitamin B deficient diets caused a marked decrease in the secretion of intestinal juice; the addition of rice bran extract and vitamin B caused an increase of the secretion. The quantity of

enzyme was found to be small when the amount of secreted intestinal juice was great. Meat apparently causes an increase of the secretion of the intestinal juice. A certain quantity of intestinal juice is secreted during a period of starvation. Vitamin B deficient diets cause lack of appetite.—*E. B. Boldyreff.*

6975. **KOKAS, E. von. Vergleichend-physiologische Untersuchungen über die Bewegung der Darmzotten.** *Pflüger's Arch. Ges. Physiol.* 225(2/3): 416-420. 2 fig. 1930.—The animals studied were deeply narcotized; through a small opening in the abdominal wall a loop of intestine was drawn out, opened and examined. In the dog, cat and fox the villi were finger-shaped, and on stimulation underwent contraction by shortening and rumpling (like a glove-finger pushed off hastily) without increase in diameter. In the rabbit, rat and guinea-pig, the villi were flat, somewhat tongue-shaped, and contracted laterally, by a circular constriction of the muscularis mucosae. Both the shortening of the finger-like villi and the lateral contraction of the tongue-like villi had the effect of rhythmically emptying the chyle-spaces within. In the hedgehog both the finger-shaped and the tongue-shaped villi were present; only the finger-shaped villi moved in the pump-like extension and contraction lengthwise.

6976. **LANDAU, ANASTAZY, et JERZY GLASS. Les rapports entre la fonction sécrétoire de l'estomac et les équilibres chloré et acido-basique de l'organisme. I. L'influence de l'excitation et de l'inhibition de la fonction sécrétoire de l'estomac sur l'équilibre chloré et acido-basique de l'organisme. II. L'influence de la mobilisation du chlore tissulaire par le novasurol et l'influence du régime hypochloruré sur la sécrétion gastrique.** *Arch. Malad. Appar. Digest. et Malad. Nutrit.* 20(8): 907-935; (9): 1017-1051. 1930.—I. Stimulation of the secretory function of the stomach by means of Ehrmann's alcohol test meal results in: the reduction to the lower limits of normal of total blood chloride due to a reduction in plasma chlorides; an increase in the alkaline reserve of the blood to the upper limits of normal; a decrease in urinary excretion of chloride which parallels the degree of gastric secretion; and a variable effect on urinary acidity. Following inhibition of secretion by atropine there is a decrease in free and total acidity of the gastric contents and a slight decrease in the chloride secretion; a reduction below normal limits in both plasma and corpuscle chloride; and a slighter reduction in the alkaline reserve of the blood, less decrease in chloride excretion in the urine and higher urinary acidity than after the test meal without atropine.—II. When the alcohol test meal is given simultaneously with an intravenous injection of Novasurol to mobilize tissue chlorides there results a slight decrease in plasma chloride, an increase in corpuscular chloride to the upper limits of normal and a biphasic reaction on the stomach during the first phase of which there is an increase in concentration of chloride and acidity of the gastric secretion associated with the increased mobilization of tissue chloride for 1½ hours, followed by a 2nd phase with a decrease in chloride and free and total acidity during which time there is an exaggerated elimination of chloride in the urine. After a period of salt privation there is an initial increased secretion of chlorides and acid by the stomach, an elevation of blood chloride and an increased elimination of urinary chloride but the stimulation is of shorter duration and at the end of the 2nd hour the concentration of chloride in the gastric juice and in the urine is diminished.—*F. R. Vanzant.*

Gastroenterol.* 1(3): 147-154. 3 fig. 1929.—A confirmation of the fact that the co-ordination of activity in the esophagus is maintained by the vagus nerves, and not by the sympathetic, and not by any nerves in the wall of the tube itself. Stimulation of one part of the esophagus tends to inhibit the activity of parts a few centimeters caudad.—*W. C. Alvarez.*

6980. **OPPEL, W. W. Schicksal der Fructose im tierischen Organismus. II. Rufen die Verdauungssäfte eine Umwandlung der Fructose in Glucose hervor?** *Biochem. Zeitschr.* 230(4/6): 269-284. 1931.—Fructose solutions with gastric, intestinal, or pancreatic juice and toluol, at various pH, showed no change to aldose in the course of 20 hrs. in the thermostat; likewise none during 1-5 hrs. without toluol. The digestive juices contain no ferment which in vitro can change one monosaccharide to another.—*From author's summary (transl.).*

6981. **POLLAND, W. SCOTT, and ARTHUR L. BLOOMFIELD. Normal standards of gastric function.** *Jour. Clin. Investigation* 9(4): 651-658. 1931.—In "normal" adult hospital patients (i.e., without digestive symptoms and secreting a juice with free HCl over 10), the fasting gastric juice was aspirated, 0.1 mgm. histamine per kgm. body weight was hypodermically injected, and the total secretions aspirated over successive 10-min. periods until the flow of juice had subsided to the basal level. The greatest 10-min. volume of secretion and the highest titratable acidity were considered indices of stomach function. Wide variations in volume were observed, with progressive decrease in amount with advancing age. About ½ determinations, however, fell within 21-35 cc. Considerable variation was also observed in highest titratable acidity; however, about ¾ of the values lie above 100. The acid values show a decline with advancing age when the figures in various decades are averaged.

6982. **ROMEO, MARIO. Sulle modificazioni indotte nelle vie biliari dalla legatura del coledoco. (Ricerche sperimentali.) [Modifications produced in the biliary passages by ligature of the bile duct.]** *Clin. Chirurg.* 33(6): 695-718. 10 fig. 1930.—Of a series of 9 dogs in which the bile-duct was ligated, 2 died in a few days with symptoms of hypercholemia; the other 7 were killed 5-130 days after operation. In a 2nd series of 11 dogs, 3 likewise died after ligature of the bile-duct. In the other 8 the ligature was removed 3-80 days after being tied; the dogs were killed 8-60 days after removal of the ligature. The most conspicuous dilatation of the whole biliary tree occurred from the 5th to the 40th day, while after that day the caliber of the passages, while dilated, never attained the excessive size encountered in the earliest phases of obstruction. The biliary passages, both within and without the liver, though dilating readily when obstructed, underwent prompt reduction with equal readiness when the obstruction was removed, provided the obstruction had not remained in place more than about 40 days.

Sperim.* 5(6): 902-904. 1930.—In decerebrate dogs following pneumothorax the cardiac output diminished initially; a resultant increase occurred during the 2nd, 3rd and 4th hours. Occlusion of one bronchus, while followed by increased respiratory rate, pulse frequency and minute vol., was not followed by change of cardiac output.—*M. Comel.*

6987. CHURCHILL, EDWARD D., and OLIVER COPE. The rapid shallow breathing resulting from pulmonary congestion and edema. *Jour. Exp. Med.* 49(4): 531-537. 1929.—In a series of cats the right lung was isolated from the rest of the circulation of the animal by ligating the corresponding branches of the pulmonary artery and the pulmonary veins. Ventilation of this lung was maintained by the normal respiratory movements of the animal with the lung in its normal position in the closed pleural cavity. A cannula was inserted into the occluded branch of the pulmonary artery and joined to a reservoir filled with fresh blood. By changing the height of the reservoir it was found possible to alter the intravascular pressure in this isolated lung without modifying the dynamics of the systemic circulation or altering the gaseous respiratory exchange. A sudden elevation of intravascular pressure with consequent production of pulmonary congestion and edema was followed by a slowing of the heart rate, a fall in systemic blood pressure and a temporary inhibition of respiration, succeeded by rapid shallow breathing. As a chemical effect on the respiratory center is excluded by the nature of the preparation, the conclusion is reached that the rapid shallow breathing attending pulmonary congestion and edema is due to the stimulation of nerve endings (vagal) in the lungs. —*E. D. Churchill.*

[Analysis of the O absorption curve of hashed muscles as a function of the CH. *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 8(5/6): 255-257. 1928.—The O absorption curve of hashed frog muscles is expressed by the equation: $y = ax + bx^2 + cx^3 + dx^4$ where y is the amount of O absorbed, x the pH value of the phosphate buffer solution and a, b, c, d 4 parameters. Mathematical analysis of this equation by means of the differential calculus showed a maximum value for pH near 7, and 2 inflection points near pH 6.5 and 6.0. By these values three regions of O absorption are delimited, the 1st of intense respiratory exchange (physiological), the 2nd of reduced O absorption, the 3rd pathological. The O absorption decreases quickly, becoming nil for acid pH values.—*M. Comel.*

6989. COOMBS, HELEN C., and F. H. PIKE. The nervous control of respiration in kittens. *Amer. Jour. Physiol.* 95(3): 681-693. 1930.—Ontogenetic development of the vagus-phrenic portion of the respiratory mechanism has been completed at birth and is functionally active from that time onward. A closer relationship between the vagus and phrenic nerves in respiratory regulation than between the vagus and dorsal spinal nerve roots is demonstrated. Development of the mechanism for adequate thoracic respiration is not completed before the end of the 3rd wk. after birth in the kitten, as is shown by its lack of ability to compensate for failure of diaphragmatic respiration. The functional relationship of the nuclei in the corpora quadrigemina to the costal respiratory mechanism is not established earlier than 10 days after birth and possibly later.—*Authors' conclusions.*

6990. CROW, W. B. Voice and the vocal apparatus. 29p. W. Heffer & Sons, Ltd.: Cambridge, 1930. Pr. 1s.—A description of the fundamental facts of structure and function of the human vocal apparatus introducing some comparisons, as between skeleton of larynx and thorax, and points in the historical development of our knowledge of the voice. Analogies of vocal apparatus with musical instruments are explained because the latter have evolved from projecting vocal action into the external world. The relation between genital and vocal apparatus is discussed, and the basis of this relation in bodily polarity. The phylogeny of the voice is outlined, and must be viewed as the addition of various components to primitive locomotor movements. Speech is one of the final components.—*W. B. Crow.*

Physiological effects of work in compressed air. *Nature [London]* 126(3181): 606-608. 1930.—A discussion of the problem of decompression and methods used to prevent collapse due to absorption of N. Mention is made of the tendency of higher pressure to produce mental aberrations.

6992. DANIELOPOLU, D., I. MARCOU, et G. G. PROCA. Sur le réflexe respiratoire sino-carotidien. Filets centripètes sino-carotidiens excitateurs et inhibiteurs. *Compt. Rend. Soc. Biol.* 106(9): 734-737. 1931.—The diphasic form of this reflex is produced sometimes with the vagus intact, more often when it is cut. Variations in the duration of mechanical stimulation modified the form of the diphasic reflex in chloroformed dogs, a short stimulus producing an inhibition; a longer one, an inhibition followed by an excitation after the stimulus was removed; and a still longer one causing inhibition and excitation to occur during the application of the stimulus. These results are comparable to those produced with electrical stimulation. It is concluded that the centripetal fibers of the carotid sinus are double, being both inhibitors and stimulators of the respiratory centers. Excitation of the sinus produces a reflex in which either of two groups of fibers can predominate. The vagus, which influences the tonus of the respiratory centers, consists also of two groups of fibers, inhibitors and stimulators.—*E. Weiner.*

6993. **DILL, D. B., H. T. EDWARDS, A. FÖLLING, S. A. OBERG, A. M. PAPPENHEIMER Jr., and J. H. TALBOTT.** Adaptations of the organism to changes in oxygen pressure. *Jour. Physiol.* 71(1): 47-63. 1931.—The investigation included observations on the acid-base equilibrium and the form and position of the CO_2 and O dissociation curves in human blood, with the changes at the altitudes of 10,000 and 14,000 ft. The venous blood, equilibrated at 37.5°, of 8 visitors, was compared with that of 3 Leadville residents (10,000 ft.). The results indicate that the O dissociation curve of human blood after complete acclimatization at 10,000 ft. and after 4 days at 14,000 ft. has about the same position as at sea-level when H-ion concentration is constant. The carbonic acid dissociation curve of oxygenated blood is lowered 1/10 at 10,000 ft. and slightly more after 4 days at 14,000 ft. Chloride concentration in cells and in serum increases slightly, but its distribution between cells and serum is practically unchanged. The ratio, $(HCO_3)c/(HCO_3)s$, increases about 3% at 10,000 ft. and somewhat more at 14,000 ft. The increase may be related to decrease in alkaline reserve, since a similar change is found when alkaline reserve is decreased in exercise. The pressure head of O from lungs to blood remains positive even after acclimatization at 10,000 ft. No evidence of secretion of this gas was found. CO_2 pressure in alveolar air decreases to $\frac{3}{4}$ its sea-level value at 10,000 ft. and to $\frac{2}{3}$ at 14,000 ft. The calculated reaction of arterial serum shows an average decrease in pH value of 0.03 at 10,000 ft. and of 0.8 at 14,000 ft., but the change is too small to shift the O dissociation curve of arterial blood outside its normal sea-level range. The O transport capacity may be decreased by 1/5 in normal men at 10,000 ft. It is suggested that this large effect is due to an indirect effect of a small change in O saturation of arterial blood upon the limiting value for cardiac output. This explanation is consistent with the experiments of Furusawa, Hill, Long and Lupton, showing that man can increase his O transport capacity by 2/5 at sea-level by breathing 40% O.

6994. **GAY, HAROLD H. A comparison of the effects of low alveolar oxygen, of sodium cyanide and of sodium sulfide upon respiratory movements and the response of muscle to direct, indirect and reflex stimulation.** *Amer. Jour. Physiol.* 95(3): 519-526. 1930.—Dogs (number not stated) weighing 10-30 kgm. were used. The contractions of the anterior tibialis muscle when stimulated reflexly, indirectly through its motor nerve, and directly was recorded during the administration of NaCN, Na_2S, and gaseous mixtures low in O. When submaximal induction shocks were used there was a definite increase in contraction to each type of stimulation. When supermaximal stimuli were employed the effects were missing or small. Since these results are obtained during constant ventilation when the tissues are assumed to turn acid it is concluded that the general increase in excitability of the muscle, nerve, and cord occurs independently of acid changes for CO_2 produces a general decrease in excitability. It is concluded that impairment of oxidations may result in a chemical control of ventilation, peripheral to the respiratory center proper, by action on sensory nerve fibers, by central action on the cord, and by direct action on striated muscle.

6995. **GOIFFON, R., et R. PARENT. Influence du rythme de la ventilation sur le quotient respiratoire.** *Arch. Malad. Appar. Digest. et Malad. Nutrit.* 20(8): 968-972. 1930.—Patients often do not breathe naturally under the basal metabolism test. If the breathing is hurried the respiratory quotient is diminished; if the respiratory rate is retarded, the quotient is increased. It is therefore important to observe any change of breathing rhythm during a metabolism test.

6996. **GREELEY, PAUL O., and CHARLES E. GREELEY. Circulatory changes during periodic breathing produced by moderate obstruction to the cerebral arteries.** *Amer. Jour. Physiol.* 95(2): 371-381. 2 fig. 1930.—Periodic breathing was induced in dogs under morphine and urethane anesthesia by moderate occlusion of the cerebral blood vessels. This was accomplished by placing one of the common carotid arteries in a compression chamber, thus making possible partial or complete occlusion of this artery. The remaining cerebral arteries were occluded and de-occluded as conditions required. Pulmonary ventilation and mean blood pressure were recorded. Volume flow of blood was followed in the carotid and femoral arteries thermoelectrically with small thermopile vessels of short lag. The vertebral and external jugular venous flows were recorded by the enclosed drop method and intestinal venous flow by the external drop method. Periodic changes occurred in mean blood pressure, in femoral and carotid arterial blood flows, in vertebral, external jugular, and splanchnic venous flows, and in depth and rate of respiration. Changes in blood flow were synchronous with the periodic variations in mean blood pressure. In contrast to this general periodicity there were no obvious rhythmical changes in heart rate. Ventilation increased during decreasing blood pressures and blood flows, and decreased with increasing pressures and flows. With the conditions provided no apneas developed. The absence of periodic changes in heart rate suggested that the changes in mean blood pressure may be due to periodic activity of the vasomotor center. It is concluded that the periodic changes in ventilation are related to the periodic changes in the circulatory system but since volume flow of blood and mean blood pressure vary with each other the periodic changes in ventilation may be a result of periodic chemical changes in the respiratory center produced by fluctuations in blood flow or of the reflex effects of periodic stretching and contraction of the aorta and of the carotid sinus. The relative importance of these 2 effects cannot yet be evaluated.—*Authors' summary.*

6997. **GREELEY, CHARLES E., and PAUL O. GREELEY. Circulatory changes during periodic ventilation with apneas produced by marked curtailment of blood flow to the brain.** *Amer. Jour. Physiol.* 95(2): 382-395. 1 fig. 1930.—Periodic respiration with pronounced apneas, produced by marked occlusion of cerebral blood vessels, was studied [in dogs]. The blood flow to the brain was curtailed by various methods. Increasing curtailment of blood flow was accompanied by initial stimulation of respiratory movements, followed by a period of partial or complete depression. After this depression, periodicity of ventilation sometimes followed. The periodicity of ventilation thus established was accompanied by periodic changes in mean blood pressure, volume flow of blood, and heart rate. The respiratory groups were initiated during decreasing flow of blood and decreasing blood pressure. In some experiments they terminated in apnea while blood pressure and blood flow were still decreasing and in others they extended for a short period into the increasing blood pressure and increasing blood flow. Since apnea was initiated towards the close of decreasing blood flow or beginning of increasing blood flow, it was suggested that apnea was produced by both severe depression and by processes of recovery. Accordingly apneas were designated as depression and recovery apneas. In experiments in which periodic changes in heart rate occurred, slowing of the heart was in the main associated with decreasing mean blood pressure and decreasing flow of blood, and augmentation with increasing blood pressure and increasing flow of blood. It is thus suggested that the cardio-inhibitory center is stimulated like the respiratory center by the same chemical mechanism. It was suggested that the rapid rate and gross change in chemical state of the medullary centers coupled with their impaired functional activity provide conditions for periodic activity. A decreased blood flow brings about a decrease in the chemical and physical transport of acid, a decrease in oxidations with a consequent broken coördination of the dual function of hemoglobin all resulting in an altered state of oxidations, and increased acidity of the respiratory center and an over ventilation of the blood. An increased blood flow of oxygenated blood now reverses these processes.

Oxidative and non-oxidative removal of lactic acid and the liberation of free base and improved transport of acid combine to bring about a new state of oxidation and a decrease in acidity. The absence of changes in heart rate in 1 series of experiments with marked periodicity of ventilation, blood pressure, and blood volume flow indicates that periodicity may have its origin in periodic changes of the vasomotor center. However, the volume flow of blood ran parallel in the splanchnic, femoral, submaxillary, and cerebral blood vessels. Direct evidence of active vasomotor changes was, therefore, not obtained. These results suggest that periodic chemical stimulation of the circulatory centers produces periodic changes in ventilation of a central chemical origin. Since decreasing blood pressure may reflexly stimulate pulmonary ventilation this phenomenon may be looked upon as a possible modifying factor.—*Authors' summary.*

6998. GRIFFITH, FRED R. Jr., GEO. W. PUCHER, KATHERINE A. BROWNELL, JENNIE D. KLEIN, and MABLE E. CARMER. Studies in human physiology. III. Alveolar air and blood gas capacity. IV. Vital capacity, respiratory rate and volume, and composition of the expired air. *Amer. Jour. Physiol.* 89(2): 449-470; (3): 555-583. 1929.—III. This paper is the 3rd installment of a series describing the physiological changes observed in 2 men and 3 women during the 2-yr. period 1925-1927. Statistical measures are given of: the intra-individual variability of these functions; the degree of correlation between the components of the alveolar air and the barometric pressure; and the correlation between the alveolar CO_2 tension and the blood CO_2 capacity. The striking effect of menstruation on the alveolar CO_2 percentage and tension is the most definite effect of menstruation that the authors have observed in all of the functions of which they have kept record. The alveolar air shows a seasonal variation in composition which the authors believe is related, the O directly and the CO_2 inversely, to the av. barometric pressure. The blood gas capacity also shows a seasonal variation; the CO_2 capacity is quite conclusively lowest during the summer; this is also true of the O capacity for 1926 and reasons are given for believing that this is probably the typical effect. In addition, the blood gas capacity shows a progressive increase throughout the 2 yrs. which the authors were unable to account for except, perhaps, as a stimulating effect on blood regeneration of taking the weekly blood samples.—IV. For each of the functions studied (variations in vital capacity, rate and volume of the respiration and composition of the expired air) are given the statistical constants defining the modes and means and the extent and degree of variability. In addition the authors calculated the degree of correlation between the rate and minute and tidal volumes of the respiration; and between these and the O consumption and CO_2 production. There is an unusually high correlation between the volume of pulmonary ventilation and the CO_2 output; reasons are given for believing that this is not due to increased breathing washing out increased amts. of CO_2, but is an expression of the fundamental control of pulmonary ventilation by the rate of CO_2 production. The results of the 2 yrs. are sharply separated as regards the minute and tidal volumes and the composition of the expired air; this was due to the dead space in the apparatus for collecting the expired air being large (about 50 cc.) during the 1st yr. and small or practically negligible during the 2nd. The large dead space was associated not only with large absolute values for these functions, but occasioned, also, a much greater degree of variability. Going to sleep (dozing) during the collection of the expired air decreases the minute volume 3-4%; it is not clear to what extent this is due to variations of rate or of tidal volume. Menstruation had no effect on vital capacity or the rate of respiration; on the other hand, the volume of pulmonary ventilation and the composition of the expired air are definitely affected. It is shown that the menstrual variations in metabolism, pulse rate, composition of the alveolar air and blood gas capacity described in previous reports may be consistently correlated with the changes described here. Neither the vital capacity nor the respiratory rate can be seen to have a seasonal variation; the tidal and minute volumes and the composition of the expired air, however, show the most definite and uniform variation of any of the functions studied except the basal pulse rate. —*From authors' summaries.*

6999. HECKSCHER, H., H. FADDERSBÖLL, und E. MORGENSEN. Untersuchungen betreffend die Konstanz der alveolaren Ventilation und die Schwankungen des alveolaren Kohlensäureprozents und des alveolaren Sauerstoffdefizits bei willkürlichen Variationen der Frequenz und Tiefe der Respiration. *Pflüger's Arch. Ges. Physiol.* 226(3): 418-430. 1930.—Seventeen healthy young adults were made to breathe through valves from a Krogh spirometer. Each experiment comprised 4 5-min periods: 1st and 3rd unrestricted breathing, 2nd at a rate of 12, and 4th at a rate of 6 per min., depth to be that which was "natural" at each rate. In most cases alveolar CO_2 fluctuated quite markedly during these periods, indicating that the automatic reciprocal variation of volume with rate is variable in different individuals and is usually imperfect. Estimation of alveolar ventilation from total ventilation minus dead-space confirmed this conclusion, showing all variations from very slight to 150% at different rates of breathing. Evidently hyperventilation occurred in some of the periods, hypoventilation in others. The quotient, alveolar CO_2%/ alveolar O deficit, was found to vary directly with alveolar ventilation. Aveolar CO_2 can readily be lowered to a markedly subnormal level by voluntary hyperventilation, but it can be raised only relatively slightly above normal by voluntary hypoventilation.—*C. F. Schmidt.*

7000. HECKSCHER, HANS. Untersuchungen über das Sauerstoffdefizit und die Kohlensäurespannung in der Alveolarluft. *Pflüger's Arch. Ges. Physiol.* 226(3): 431-447. 1930.—Patients with metabolic diseases (thyroid disorders, obesity, gout, etc.), were made to breathe from a Krogh spirometer, alveolar air being collected directly in 3 periods: at the start, after 10 min., and after 20 min. 102 experiments were made on 96 individuals. Alveolar CO_2 was found to be lower than normal if the preceding inspiration was deep, higher than normal if it was shallow. The observed range was from 4% to 6.48% (30 to 50 mm. Hg.). Alveolar O deficit (i.e., O absorption per unit of alveolar ventilation) varied from 2.21 to 7.65%, calculating alveolar from total ventilation by means of Lindhard's formula for dead-space correction. Given constancy of metabolism and ventilation, the ratio alveolar CO_2/alveolar O deficit should equal the R. Q.; in 51 experiments this constancy was present, yet the ratio varied from 0.63 to 1.36, average 0.92. The variation is due to inaccuracies in Lindhard's formula for estimating the dead-space. Assuming R. Q. to be 0.83, dead-space was calculated from the above ratio: it varied from 110 to 280 cc., and increased with depth of respiration (e.g., from 140 to 250 cc. with an increase in depth from 280 to 720 cc.). Alveolar CO_2 values below 4% and above 6.5% must be regarded as very unusual.—*C. F. Schmidt.*

7001. HELFF, O. M. Studies on amphibian metamorphosis. VI. The effects of lung extirpation on the life, oxygen consumption, and metamorphosis of Rana pipiens larvae. *Jour. Exp. Zool.* 59(1): 167-178. 1 fig. 1931.—A technique was developed whereby one or both lungs of the frog tadpole could be extirpated. The operative mortality is high, especially following double extirpation. The larval lung is not essential for life, as evidenced by the survival and normal activity of 36 cases of single and 19 cases of double extirpation. Comparison with unoperated controls gave no evidence of delayed transformations. The young frogs lived 1-3 weeks following complete metamorphosis. The effect on O consumption following single and double lung extirpation was determined by O-consumption tests (Winkler method) made just prior to and at variable

intervals following extirpation. A decided drop in O consumption occurred following both single and double extirpations, being somewhat more pronounced in the latter case. The most pronounced drop was experienced when the second O test was made ½ hour following extirpation. This amounted to 14-21% in the case of single extirpations and 18-30% where double extirpations had been made. O-consumption tests made at 3-, 15-, and 27-hr. intervals following extirpation gave evidence of a decided, though less pronounced, drop. It is concluded that the lungs of *R. pipiens* larvae are functional for a considerable period prior to the onset of metamorphosis.—*Author (courtesy Wistar Bibl. Serv.)*.

7002. **HELFF, O. M., and K. I. STUBBLEFIELD. The influence of oxygen tension on the oxygen consumption of Rana pipiens larvae.** *Physiol. Zool.* 4(2): 271-286. 1931.—The results of over 400 Winkler O-consumption tests show that anuran larvae possess remarkable respiratory regulation throughout considerable ranges of O tension. The following abbreviated results were obtained: Twenty larvae were tested, individually, for 5 consecutive 90-min. periods. The average amount of variation in O consumption was approximately 12% between any 2 periods. Twenty-four larvae were tested, individually, at 90-min. intervals under decreasing O tensions produced by their own respiration. The larvae (average weight, 4.7 gm.) possessed respiratory regulation between approximately 10S and 23% saturation, partial pressure, 26°C. Approximately the same variations in O consumption were found as previously determined under constant O tensions. To determine more accurately the lower limit of regulation, 20 larvae were tested, individually, as above, but at 1 hr. intervals and in approximately 4 times the initial amount of water which had previously been reduced to about 40% saturation. The lower limit of regulation was thus determined as approximately 22% saturation. Asphyxiation occurs very rapidly at or below the lower limit of regulation and is complete between 21 and 18% saturation. The results are discussed and suggestions offered relative to the nature of the respiratory mechanism controlling O consumption.—*Authors (courtesy Wistar Bibl. Serv.)*.

7004. **HESS, W. R. Kritik der Hering-Breuerschen Lehre von der Selbststeuerung der Atmung.** *Pflüger's Arch. Ges. Physiol.* 226(2): 198-211. 6 fig. 1930.—The classical literature on the Hering-Breuer reflexes is reviewed, particularly in the light of recent work which has indicated the presence of action currents in the diaphragm even at the end of expiration. Diaphragmatic tonus was investigated in rabbits with a widely opened thorax; the degree of diaphragmatic contraction was found to be decreased by an experimentally produced rise in intrapulmonary pressure even during apnea due to over-ventilation. These changes in tone commenced after a latency of 0.07 to 0.22 sec. and required several seconds for completion. They might be induced during spontaneous respiratory movements and then were only fully in evidence ¾ of a respiratory phase after the change in pressure. In a curarised animal the frequency of the action currents in the phrenic was slowed by a rise of intrapulmonary pressure. Reflexly induced movements of the diaphragm are not inspiratory or expiratory movements but variations in tone which affect the depth of respiration by determining the expiratory level from which inspiration starts, and with which regulation of the respiratory rate is coordinated. Reflex apnea may be produced in a vagotomised animal by forcible separation of the rib stumps; reflex changes induced by thoracic stimulation require further investigation.—*H. C. Bazett*.

7005. **HIESTAND, WILLIAM A. The influence of varying tensions of oxygen upon the respiratory metabolism of certain aquatic insects and the crayfish.** *Physiol. Zool.* 4(2): 246-270. 1 fig. 1931.—Nymphs of the dragon fly, *Nasiaeschna penthacantha*, larvae of the caddis fly, *Limnephilus rhombicus*, and the crayfish *Cambarus virilis*, were used. Oxygen consumption and carbon-dioxide output were measured as the animals lowered the O tension of the water by their own respiration. The respiration of all forms was independent of varying O tensions for the greater part of the range of tensions. Free CO_2 or a lowered pH stimulated the rate of respiration of *Nasiaeschna* nymphs. The rate of O consumption of *Limnephilus* and *Cambarus* was influenced by the rate at which the O tension of the water diminished. If these animals were allowed sufficient time, they could regulate their respiration over a considerable range of tensions. High O tensions in no way altered the normal rate of O consumption. Evidence is given to show that O is stored in the tissues. Oxygen consumption does not behave as a simple physical diffusion process in these forms. The presence of respiratory pigments is indicated.—*Author (courtesy Wistar Bibl. Serv.)*.

7006. **JACOBS, WERNER. Untersuchungen zur Physiologie der Schwimmblase der Fische. I. Über die "Gassekretion" in der Schwimmblase von Physoklisten.** *Zeitschr. Wiss. Biol. Abt. C. Zeitschr. Vergleich. Physiol.* 11(4): 565-629. 34 fig. 1930.—Morphologic and physiologic methods were combined in the study of the nature of the "gas secretion." A certain amount of gas was removed by puncture from the swim-bladder of the fishes studied (river perch) and the ensuing decrease in volume of the fishes was measured and the gas analyzed. The fish secreted gas to replace that removed, the increase in volume was measured, and at a given stage the fish was again punctured, the gas glands were fixed, and the gas mixture removed was analyzed. The gas removed from the swim-bladder at first had, on the average, about the composition of atmospheric air: CO_2 2.54%, O 19.37%, and N 78.09%. The loss of volume by puncture was replaced first by O and next by CO_2; the average composition on 2nd puncture was CO_2 21.4%, O 42.9%, and N 35.7%. During increase of volume after puncture the CO_2 content of the swim-bladder increased rapidly until it reached a certain proportion (about 24%), which was never surpassed: the O content, on the other hand, increased steadily until the volume was completely replaced. This was apparently due to the fact that, after a certain degree of CO_2 tension was reached in the swim-bladder, an amount diffused out, through the bladder walls, equal to the amount flowing in from the gas glands, while the walls of the swim-bladder were relatively impermeable for O. While exact measurement was not possible, it appeared that the "replacement gas" consisted of about ⅔ CO_2, about ⅓ O, and a little N. After the volume had been restored, the excess CO_2 disappeared quickly from the swim-bladder (in the course of hours or a few days), the O more slowly (in the course of weeks), while N increased until at last the pre-puncture proportions were attained. CO_2 evidently plays an important part under the normal alterations of air-pressure and the slight changes of water-pressure on the swim-bladder under normal conditions. In the gas glands of all animals various cell forms occur, connected transitionally with each other. The cells of gas glands are typical glandular cells; they produce a fluid secretion which is stored in the cell in granular form and apparently given off into the numerous capillaries of the glandular tissue; the gas glands are therefore to be classed with the endocrine glands. In the different glands the different cell-forms occur in varying relative proportions. Comparative cell counts in animals with highly active and non-active gas glands confirm the conclusions drawn from cytologic study; changes in the structure of the gland are in direct relation to compensatory increase in volume necessitated by puncture. Curves of increase in volume, made from repeated measurements of volume on several animals under parallel conditions, show that increase in volume after puncture

is not continuous, but rhythmic. The outlines of the individual were conditioned on the one hand by a rhythmic activity of the gas glands and on the other by the tension resistance which the gases have to overcome in order to penetrate the swim-bladder. The capillaries in gas glands activated by puncture have a much wider lumen than those in non-punctured animals. These facts furnish the basis for a new working hypothesis of the mechanism of gas secretion.—*Author's summary (transl.).*

7007. **KAGAN, E. M., und P. M. KAPLAN. Reaktion auf Einatmung von Luftgemischen mit gesteigerter CO_2-Konzentration als Index der körperlichen Leistungsfähigkeit.** *Arbeitsphysiol.* 3(1/2): 27-60. 2 fig. 1930.—The reaction of the breathing to inhalation of air containing 2.8-3.4% CO_2, 4.6-5.8% CO_2, 2.9 to 8.8% CO_2, was studied by means of an open circuit using Douglas bags, mouthpiece and Elster meter. Two groups of subjects were used, load carriers (6-8), and mental workers (3-8). The rest or fore period was 5 min. and the periods of inhalation of the different mixtures were 2.5 and 5 min. The recovery after inhalation was followed in 3 successive periods, totalling 12.5 min. The volume of lung ventilation, the respiration rate, the composition of inspired and expired air, the gaseous exchange and the R.Q. were determined. The alveolar CO_2 was calculated from an assumed dead space which was varied according to the depth of respiration, and the amount of CO_2 retained during the periods of inhalation of CO_2 containing air as well as the extra CO_2 eliminated in the recovery periods. The results are given in detail. Although the mental workers reacted differently from the load carriers, the individual variations in each group are large and the authors conclude that the intensity and character of the reaction of the respiration to the inhalation of air mixtures containing 3 to 8% CO_2 can in no way serve as an index to the physical capacity for work.—*T. M. Carpenter.*

7008. **KELLER, ALLEN D. Nervous control of respiration. I. Observations on the localization of the respiratory mechanism in the isthmus, pons and upper medulla of the cat.** *Amer. Jour. Physiol.* 89(2): 289-309. 3 pl. 1929.—An operative method is described by which the floor of the 4th ventricle can be exposed without interfering with the respiratory or vasomotor mechanisms, reflex polypnea occurring spontaneously or being induced experimentally. The light anesthesia polypnea mechanism is very sensitive to surgical manipulation, can be entirely eliminated without affecting the ordinary mechanism of quiet respiration and the region about or just caudal to the inferior colliculi is especially sensitive. Polypnea is not dependent on centers situated in the reticular formation, or on fiber tracts crossing the mid-line or passing cephalad or caudal through the medial stems of the isthmus, pons, or upper medulla. If polypnea is dependent on cephalic centers, the centers as well as the fiber tracts passing to and from the centers are located in the extreme lateral stems of the pons and upper medulla. Although lesions that cut the lateral stems eliminate polypnea, this does not necessarily mean that anatomical structures concerned with respiration are destroyed. It is demonstrated that the typical respiratory acceleration response that can be obtained through a sciatic during light anesthesia can still be obtained with the brain-stem hemi-sectioned through the upper medulla level. Section of the opposite side of the stem eliminated the response. Short rapid respiratory excursions superimposed upon the inspiratory phase of the slower ordinary respiratory excursions as a result of unilateral lesions were elicited reflexly through a sciatic stump or by means of a heat beam. Ordinary quiet respiration was slowed by sectioning only 1 lateral stem through the pons region just as by sectioning the whole brain-stem at this level. Sectioning the opposite lateral stem after the 1st has been sectioned caused a further slowing of the respiratory rate. An animal can respire in a normal and coordinated manner with vagi cut and with 1 lateral stem sectioned through the caudal region of the pons. In the cases observed section of the opposite lateral stem at this level eliminated coordinated respiratory movements.—*Author's summary and conclusions.*

7009. **KIMURA, KOTARO. Veränderungen des Stoffaustausches zwischen Blut und Gewebe durch experimentelle Überventilation bei normalen und pathologischen Gewebszuständen.** *Tohoku Jour. Exp. Med.* 15 (3/4): 199-235. 1930.—30 minutes of 5-fold artificial overventilation in normal lightly anesthetized dogs resulted in the following changes in the blood: A considerable rise in O saturation of arterial and of venous blood, accompanied by a decrease in CO_2 content somewhat greater in venous than in arterial blood. Pronounced fall in O capacity. Hemoglobin and serum protein diminish, the latter somewhat less than the former. Blood chloride increases slightly while serum chloride falls. All values tend to return to normal 30 to 60 min. after cessation of overventilation. These results point toward dilution of the blood and are probably occasioned by a loss of fluid by tissue cells and a return to normal on cessation of overventilation. After cantharidine poisoning, O saturation, especially venous, rises during overventilation, less however than in the normal dog since, following cantharidine, gas exchange between blood and tissues is disturbed and respiration of the blood cells themselves is diminished. Alterations in blood concentration following overventilation are less and appear more slowly after cantharidine poisoning than in the normal and the return to previous conditions is delayed. In uranium poisoning, the alteration in blood chemistry is the same as in cantharidinized tissues but less marked.—*D. A. McGinty.*

7010. **LANIEZ, GABRIEL. Les puissances hémithoraciques évaluées grâce à une méthode simple.** *Jour. Physiol. et Path. Gén.* 29(1): 42-44. 2 fig. 1931.—By means of a movable belt placed successively in 4 positions round the thorax, a graphic record is got of the movements of each side. From this, the work done and the contraction force of each side of the thorax is calculated. A typical ratio found was, right: left = 20: 17.—*W. R. Fearon.*

7011. **McGINTY, DANIEL A. The regulation of respiration. XXXIV. The carbon dioxide content of the intact brain of the frog in relation to changes of oxidation.** *Amer. Jour. Physiol.* 93(2): 528-535. 1930.—Intact living frogs were equilibrated for ¾-2 hrs. in gaseous mixtures containing varying amounts of CO_2 in room air, in high and low O gaseous mixtures and in room air during simultaneous administration of NaCN in the dorsal lymph sac. At the end of the equilibration period, the frog brain was removed quickly, with due precaution to prevent gas exchange, and analysed for total CO_2 by the $Ba(OH)_2$ electrical conductivity method. The total CO_2 content of the brain in a high O gaseous mixture, in room air, in a low O mixture and in room air during cyanide poisoning were 27.4, 22.8, 13.3 and 9.9 volumes % respectively. When CO_2 was added to these mixtures the same relative positions of the curves held true. These results indicate an increased buffering capacity of the brain when oxidations are improved and a decreased buffering capacity when oxidations are impaired. Applying the Henderson-Hasselbalch equation it is computed that for a CO_2 pressure of 25 mm. Hg the pH of the brain in the order of the conditions named would be approximately 7.33, 7.28, 7.19 and 7.10. Conversely, for a pH of 7.2 the CO_2 pressure would be approximately 36, 33, 23 and 16 mm. Hg. It is, therefore, suggested that the decreased CO_2 pressure and H-ion concentration of the blood commonly associated with temporarily impaired oxidations may be accompanied by an increased acidity of the brain. When the curves of these experiments are compared with CO_2 dissociation curves of frog's blood or of those of excised muscle and nerve obtained with other methods it appears that frog's brain is better buffered than frog's muscle or nerve but less well than frog's blood. The significance of the relative buffering capacity of brain compared to that of blood, muscle and nerve is discussed.—*Author's summary*

7012. **NACK, ARTHUR, and GEORGE WULP. Regulation of respiration. XXXII. The site of action of sodium sulphide as related to peripheral chemical control of pulmonary ventilation.** *Amer. Jour. Physiol.* 89(2): 315-321. 1929.—The site of stimulation of respiratory movements by Na_2S was studied by injection into the femoral and external jugular veins, into the common carotid artery, internal carotid artery, the vertebral artery and the abdominal aorta at, above and below the level of the bronchial arteries; 395 injections were made in 19 dogs under varying conditions, such as with the vagus nerves intact and with the stellate ganglia intact and removed. Intravenous injection of Na_2S elicited temporary stimulation of respiratory movements commonly followed by temporary depression or apnea. Similar injections into the cerebral arterial circulation produced the same general effects. The abrupt response following injection into the internal carotid or the vertebral artery, compared with the markedly delayed response to intravenous injection and the absence of response to injection into the external carotid artery indicated central chemical action of Na_2S. Preponderance of central chemical action is suggested by the similarity of results obtained by administration before and after double vagotomy and double removal of the stellate ganglia. The failure to establish a difference in latent periods before and after vagotomy in favor of peripheral chemical stimulation of the afferent endings in the lungs and the failure to stimulate respiratory movements by administration of Na_2S into the bronchial arteries is suggestive of the absence or minor significance of peripheral chemical stimulation.—*From authors' summary and conclusions.*

7014. **[PETROV, I. R.]** ПЕТРОВ, И. Р. Экспериментальные исследования об изменении функции некоторых центров при анемии головного мозга. [Functional changes of respiratory centers during cerebral anemia.] [French résumé.] Архив Биологических Наук. (*Arch. Sci. Biol.*) 30(4): 433-442. 6 fig. 1930.—About 50 experiments were conducted on dogs and rabbits, with anemia produced repeatedly for short periods. Different stages were observed in the functional changes of respiration. Excitation of the respiratory center, increased during the first anemia, was considerably lowered after the series of consecutive anemizations, and even a brief cessation of respiration could be observed. At times, the augmented excitability of respiratory centers remained constant during the entire period of anemia; then it assumed a periodic character—respiration of Cheyne-Stokes type; still later this excitability was considerably lowered. After a series of repeated anemias, one could observe strong respiratory movements, which, according to Lumsden, are due to paralysis of the "pneumotaxic" center. This was followed by the exclusion of the "apneastic" center—the "gasping" respiration—and, finally, by complete cessation of respiration, due to paralysis of the respiratory center. However, the functioning of this center can be restored after a certain time, provided the circulation of blood in the brain is reestablished. If the circulation is preserved, absence—for an hour or more—of excitation of the respiratory center does not always imply its paralysis; its excitability by a reflex irritation may be preserved even during the cerebral anemia.

7015. **PUPILLI, GIULIO. Sympathicotomie cervicale et respiration. 2. Les effets de la sympathicotomie cervicale sur les échanges gazeux pulmonaires et sur la portée circulatoire dans la veine pulmonaire chez la "Testudo graeca" décérébrée.** *Boll. Soc. Med. Parma* 21(2): 113-130. 1928.—In the decerebrated *Testudo graeca,* following a plane which passes just before the caudal extremity of the optic lobes, bilateral sympathectomy in the neck induces a decrease in the rate of blood circulation in the pulmonary vein and a decrease in the gaseous exchanges in the lung. The two phenomena are of a transitory nature.—*G. Pupilli (transl.).*

Sperim.* 5(5): 788-790. 1930.—In *Testudo graeca* following decerebration and sympathectomy a change of the breathing was observed, the respiration assuming a periodic rhythm.—*M. Comel.*

7017. **RAHN, H., und F. KLEINKNECHT. Die Atemführung beim Riemenrudern.** *Arbeitsphysiologie* 3(5): 397-408. 2 fig. 1930.—The breathing during rowing was studied with respect to the synchronism of the phases of inspiration and expiration with the pulling and reaching forward periods of rowing. The study was made on 24 males and 9 females in an indoor rowing tank. The phases of rowing and of inspiration and expiration were registered simultaneously. Five different types of breathing were found which could be roughly divided into two classes: (A) inspiration corresponded with the stroke; (B) inspiration corresponded with the reaching forward after the stroke. B occurred more frequently in rapid rowing and with beginners. As the rowers trained, they gradually changed to the A class.—*T. M. Carpenter.*

7018. **READ, HÉCTOR. Der Einfluss der Mundatmung und der Spirographie auf die Lungenventilation.** *Beitr. Klin. Tuberk.* 76(1): 121-128. 1930.—A review of some hundreds of respiratory curves as well as some thoracographs showed that respiration through the mouth was usually uniform during physical and mental rest. In many patients attachment of the nasal clamp produced a few deeper or irregular inspirations. The alveolar CO_2 tension was determined in 10 subjects with a Knipping apparatus, samples being taken at the beginning and at the end of 15 and 45 min. mouth breathing, and after a subsequent 15 min. nasal respiration. With 1 exception (epistaxis) the variation was not more than 0.22% CO_2 or 4.0%. Mouth breathing did not induce respiratory insufficiency. In a series of 25 subjects 2 samples were taken, the 2nd at the end of 10 min.; in 18 the variations were up to 0.17% CO_2—less than 5%, in 7 the variations were between 0.22-0.55% CO_2—more than 5%. Thus, in ¼ of the subjects respiration was affected; hypoventilation, due to previous hyperventilation, existed.

7019. **RICHARDS, DICKINSON W., Jr., and MARJORIE L. STRAUSS. Carbon dioxide and oxygen tensions of the mixed venous blood of man at rest.** *Jour. Clin. Investigation* 9(3): 475-532. 2 fig. 1930.—For the investigation of mixed venous blood gases in man at rest, 2 normal subjects were studied. The methods employed were simple, involving the rebreathing of gas mixtures from a bag, and the taking of instantaneous samples at intervals of 5 sec. during the rebreathing period. The latter lasted usually about 30 sec., sometimes as long as 50 sec. Thus it was found that an equilibrium can be regularly established, for CO_2 with certain high O mixtures, and for both CO_2 and O with certain low O mixtures. These 2 equilibria represent essentially the same CO_2 content levels in the (venous) blood of the subject. The mixtures of rebreathed gases that can be used to establish such equilibria can be varied within small but fairly well defined limits. To accept these equilibria as representing the state of the mixed venous blood at rest involves certain assumptions; these have been described in the 1st part of the present study. Previous workers have shown that (a) with proper technique complete mixture of lung-bag gases is attainable; (b) "true" and "oxygenated" mixed venous CO_2 levels are the same. The authors' experiments have confirmed the above and have further shown that (c) the error due to progressive O absorption during the oxygenated mixed venous equilibration is small, (d) lung gases and blood are in approximate equilibrium at the

end of a "true" mixed venous equilibration, (e) the method of intermittent rebreathings gives false "mixed venous" equilibria in 1 of the subjects studied. No further evidence has been obtained as to the presence or extent of error due to (a) altered respiratory movements during the procedure, or (b) recirculation within the time of the procedure, of small amounts of blood; but the comparison of the authors' arteriovenous differences with those recently obtained by Lauter with direct cardiac puncture, suggests that the error involved is small.

7020. SAPEGNO, ENNIO. Resistenza alla depressione barometrica e soppressione della funzione vagale. [Resistance to low barometric pressure and suppression of vagal function.] *Boll. Soc. Ital. Biol. Sperim.* 5(6): 895-897. 1930.—Vagotomised animals showed a diminished resistance to experimental barometric depression. The resistance of animals treated with atropin was also diminished—more than in animals which underwent unilateral vagotomy, less than in animals with bilateral vagotomy.—*M. Comel.*
